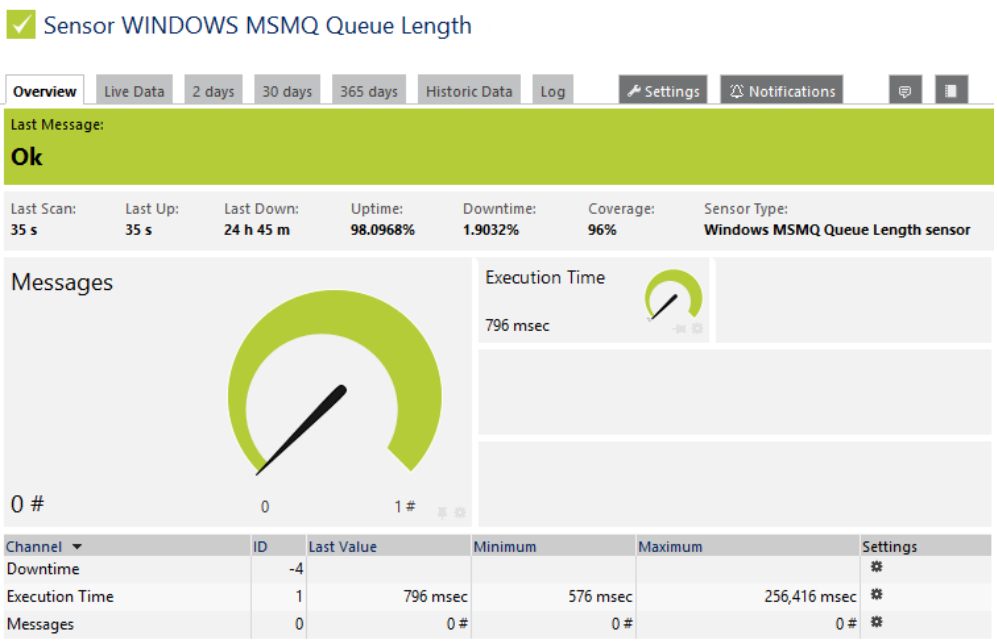
For more general information about settings, please see the **Object Settings** 159 section.

6.8.203 Windows MSMQ Queue Length Sensor

The Windows MSMQ Queue Length sensor reads the number of messages in a Microsoft Message Queue of the parent device.

It shows the following:

- Total number of messages in the queue
- Execution time



Windows MSMQ Queue Length Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_msmq_queue_length.png

Remarks

- Requires 2368 .NET 4.0 or 4.5 to be installed on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires 2368 Windows credentials in the parent device settings 324.
- Requires 2368 the MSMQ service to be running on both the probe and the target system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: How do I activate Message Queuing in my Windows installation?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Note: Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

Requirement: Message Queuing Service

In order for this sensor to work, the MSMQ "Message Queuing" service must be started both on the target system and on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. Additionally, the MSMQ "Message Queuing" service must also be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Depending on your Windows version you may first need to install the Microsoft Message Queue (MSMQ) Server.

Note: When installing Microsoft Message Queue (MSMQ) Server, make sure you install it including the Directory Service. Depending on your Windows installation this might have different names, such as

- MSMQ Active Directory Domain Service Integration
- Directory Service Integration
- Active Directory Integration

For details, please see **More** 2376 section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the message queues you want to monitor. PRTG creates one sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Message Queue	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. If there are no message queues available, you will see a corresponding message. Note: This sensor cannot monitor sub-queues.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Message Queue	Shows the name of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Message Queue Type	Shows the type of the queue that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Min. Message Age	Optionally define an age in minutes the message has to be old to be counted. If set, messages younger than this age are not regarded. If you leave this field blank, the sensor will not check for the message age. Please enter an integer value or leave the field empty.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

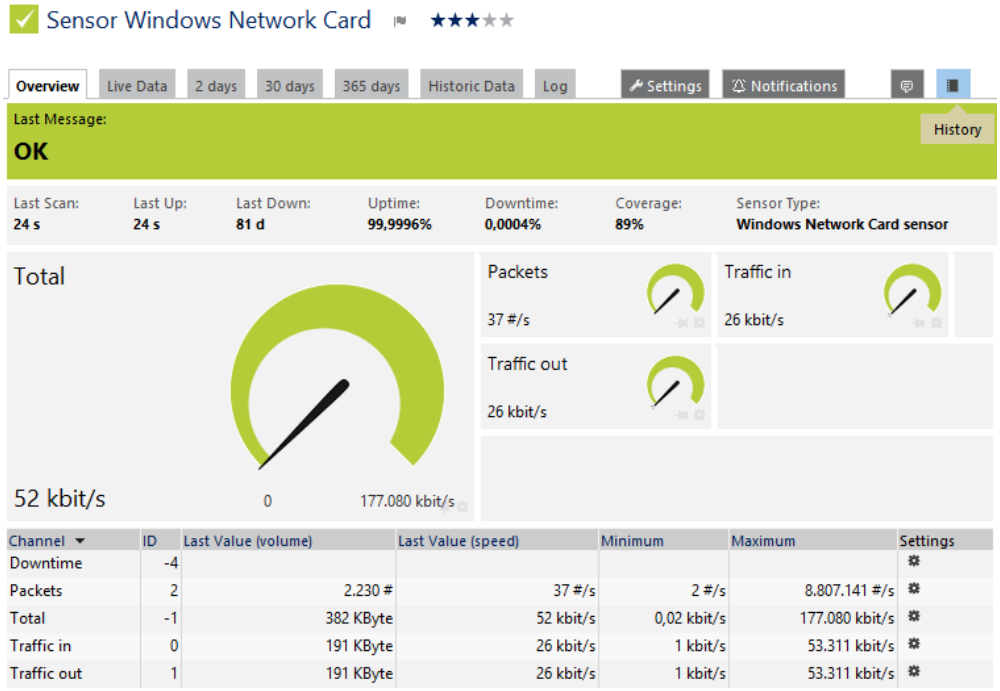
For more general information about settings, please see the **Object Settings** 159 section.

6.8.204 Windows Network Card Sensor

The Windows Network Card sensor monitors bandwidth usage and traffic of a network interface using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Total traffic on the network card
- Traffic in and traffic out
- Number of packets per second.



Windows Network Card Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_network_card.png

Remarks

- This sensor type supports teamed network adapters ("NIC teaming") on Windows Server 2012.
- Requires 2379 Windows credentials in the parent device settings 324.
- Requires 2379 Windows 2008 or later on the probe system.
- Requires 2379 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2379 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network cards you want to monitor PRTG creates one sensor for each interface you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SPECIFIC

Network Interface	Select the network card(s) you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Selected Interface	Shows the name of the network card that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how to show different channels for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic.
  Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option.
- **Show in and out traffic as positive and negative area chart**: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way.
  Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option.
  Note: You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the **Sensor Channels Settings** 2711).

Stack Unit

This setting is only available if you choose stacked graphs above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

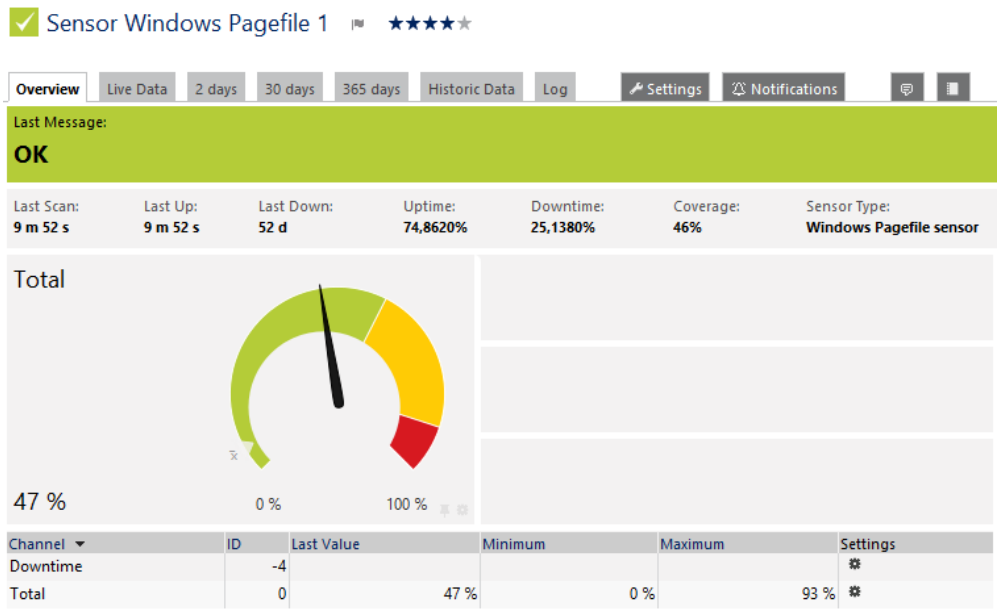
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.205 Windows Pagefile Sensor

The Windows Pagefile sensor monitors the Windows pagefile usage via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

- It shows the pagefile usage in percent.



Windows Pagefile Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_pagefile.png

Remarks

- Note: This sensor does not work with Windows 2000, because the respective WMI class does not exist on this operating system!
- Requires 2390 Windows credentials in the parent device settings 324.
- Requires 2390 Windows 2008 or later on the probe system.
- Requires 2390 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2389 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

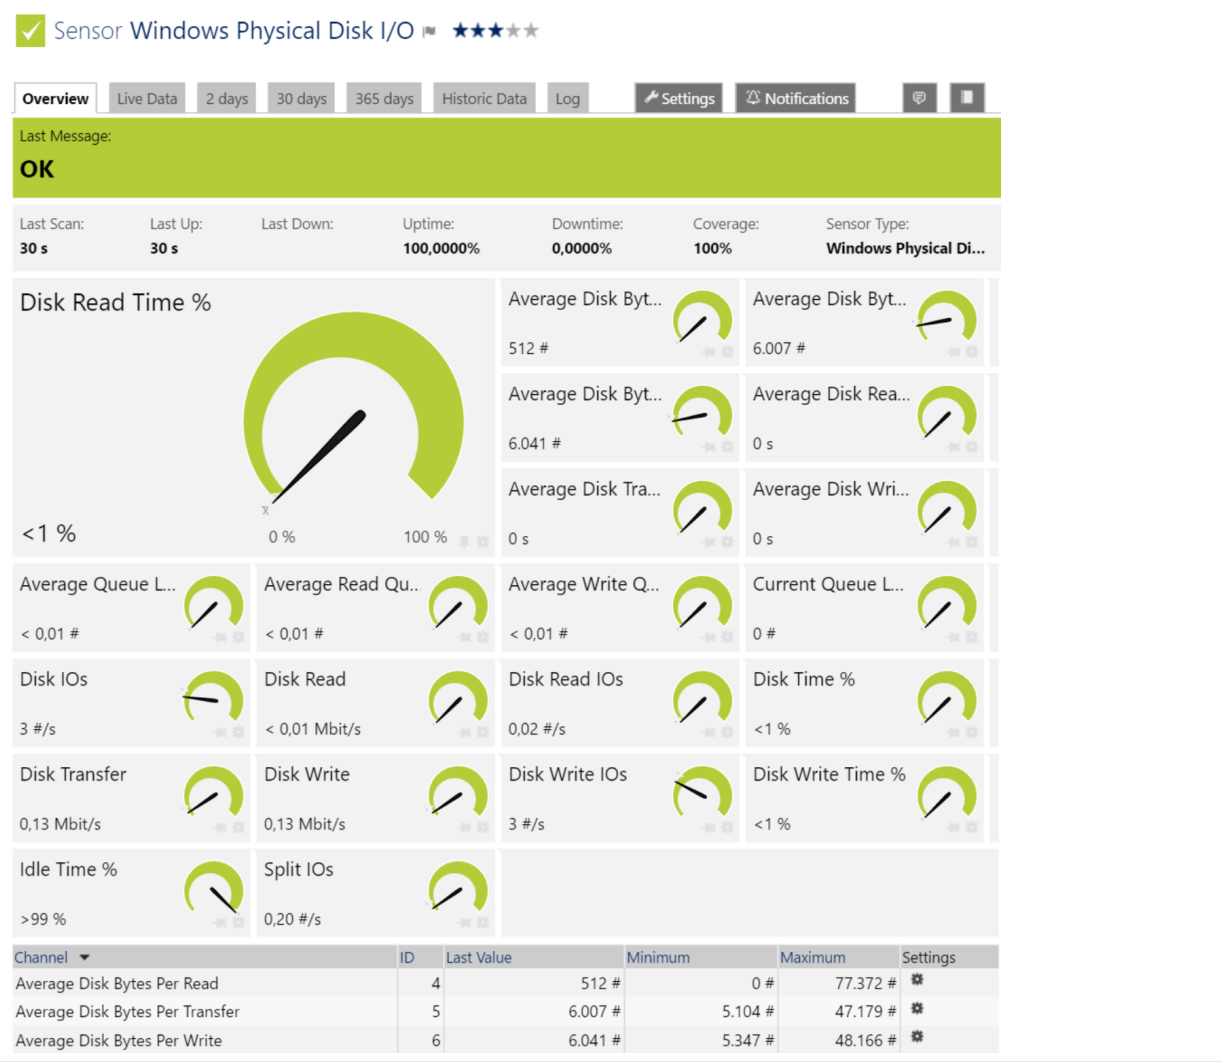
6.8.206 Windows Physical Disk I/O Sensor

The Windows Physical Disk I/O sensor monitors the input/output parameters of a hard disk in a windows environment via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

The sensor provides the following information:

- Disk Latency
- Disk Bandwidth
- Disk Queue data
- DIsk IOs

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Click here to enlarge: http://media.paessler.com/prtg-screenshots/Windows_Physical_Disk_IO_Sensor.png

Remarks

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- Requires 2399 Windows credentials in the parent device settings 324.
- Requires 2399 Windows 2008 or later on the probe system.
- Requires 2400 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2399 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disk(s) you want to monitor. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s)	Select the disk(s) you want to monitor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PHYSICAL DISK SPECIFIC

Physical Disk(s)	Shows the disk this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- http://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

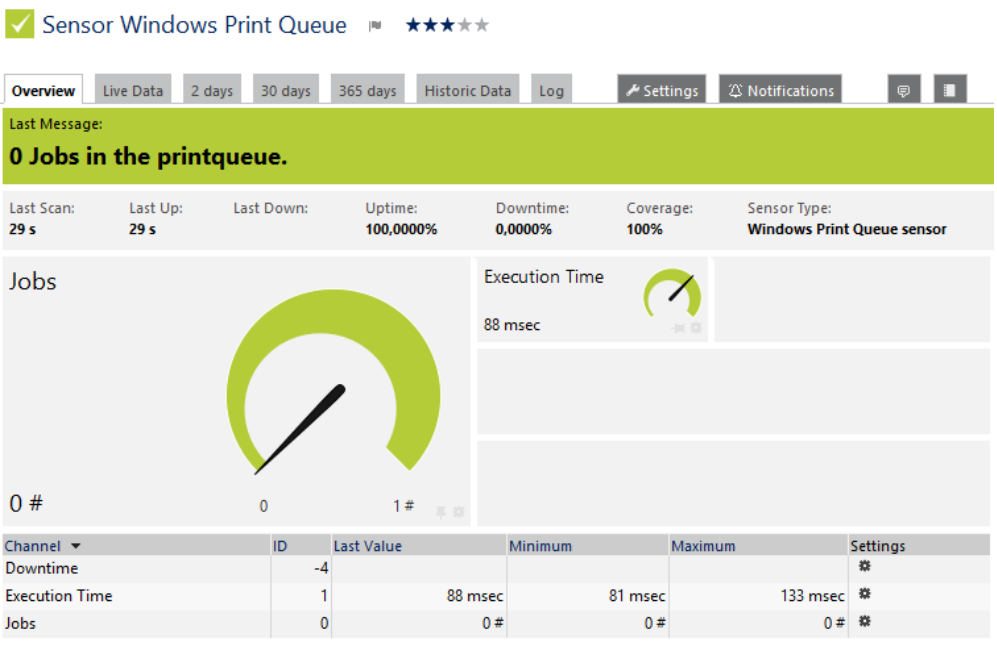
6.8.207 Windows Print Queue Sensor

The Windows Print Queue sensor reads the print queue on its parent device and returns the number of jobs in the print queue. It can monitor queues for all printers that are installed locally. For example, you can use this sensor to monitor all print queues on your Windows print server and retrieve information about all available jobs which are longer in the queue than defined.

It shows the following:

- Number of jobs in the queue
- Execution time

Additionally, this sensor can change to a defined status if there is a printer problem. See section **Sensor Settings** 2410 for available parameters.



Windows Print Queue Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_print_queue.png

Remarks

- Requires 2409 .NET 4.0 or higher to be installed on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires 2409 Windows credentials in the parent device settings 324.
- Requires 2409 the Print Spooler Windows service to be running on the target device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- You can add a 'change' trigger 2840 to this sensor to get a notification when the number of jobs in the queue changes.

- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Note: Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

Requirement: Print Spooler Service

In order for this sensor to work, the Spooler "Print Spooler" service must be started on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the print queues you want to monitor. PRTG creates one sensor for each task you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Print Queue	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. If there are no print queues available, you see a corresponding message. Note: If a printer name changes after you created a sensor for its queue, please add the sensor anew.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Print Queue	Shows the name of the task that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Advanced Status Option	You can optionally define specific **Sensor States** 135 for several return messages of the monitored printer. Choose between: ▪ **Hide**: Do not define sensor states for specific return messages. ▪ **Show**: If you choose this option, you can define sensor states for various messages which the monitored printer reports.
Door Open Manual Feed Required Needs User Intervention Offline Out of Memory Out of Paper Paper Jammed Paper Problem Paused Printer Error Printer Not Available Toner Low Toner Out	These settings are only available if you select the advanced status option above. For each reported problem of the monitored printer, you can define the status which the sensor shows. Choose between: ▪ **Ignore**: The sensor remains in the current status if this message is reported by the printer. ▪ **Warning**: The sensor shows the **Warning** status if this message is reported by the printer. ▪ **Error**: The sensor shows a **Down** status if this message is reported by the printer.

SENSOR SETTINGS

Min. Print Job Age (Sec.)	Optionally define the age of the print job in seconds. If set, jobs younger than this value are not regarded. If you leave this field blank, the sensor will not check for the print job age. Please enter an integer value or leave the field empty.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

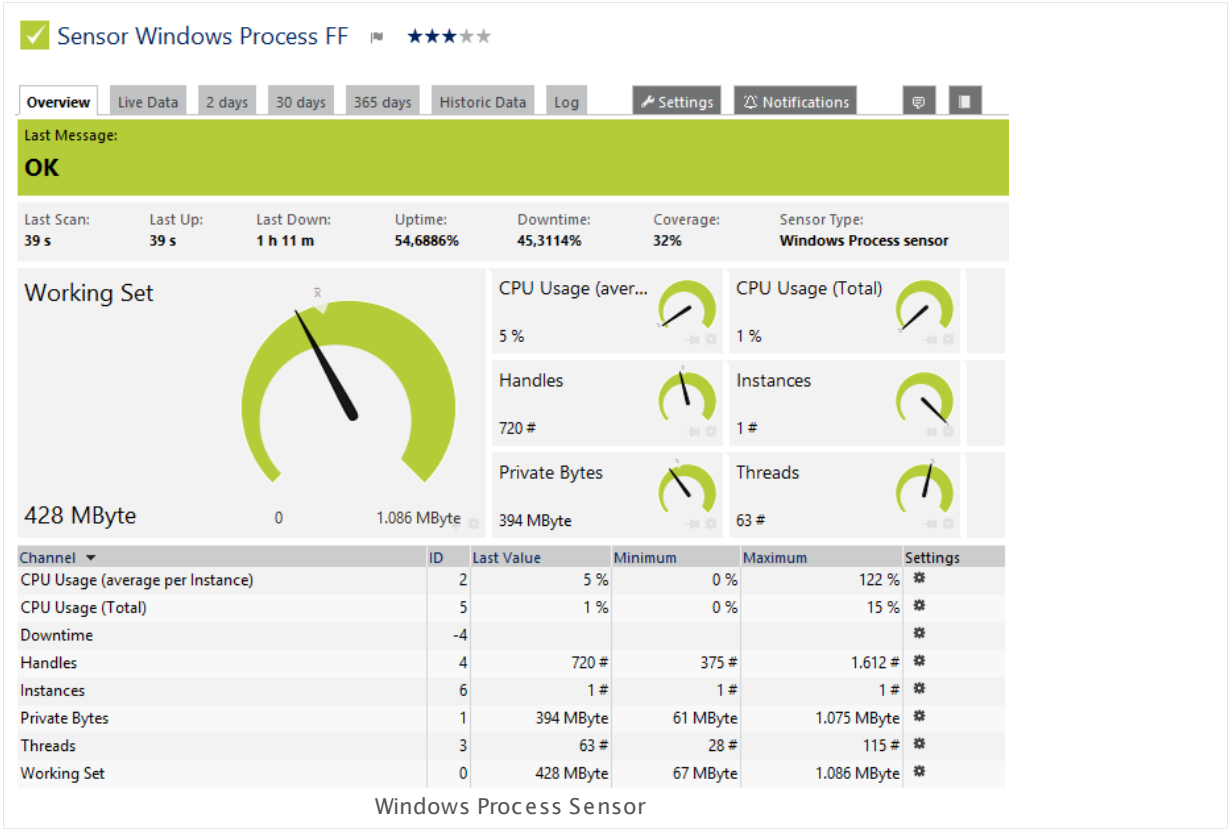
6.8.208 Windows Process Sensor

The Windows Process sensor monitors a Windows process using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It shows the following parameters about the process:

- Absolute working set in bytes
- Private bytes
- Number of threads
- Number of handles
- Number of instances
- Average CPU usage (if there are multiple instances running)
- Total CPU usage

For the "total CPU usage" value of a process, all CPU usage values are summed up. The total is divided by the number of all CPUs and the maximum value is 100%. This corresponds to the CPU usage of all instances of this specific process. Regarding the "per instance" value, the summed up CPU usage value is divided by the number of all instances. It shows the average CPU usage of a single instance of the process on one CPU.



Windows Process Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_process.png

Remarks

- Requires 2421 Windows credentials in the parent device settings 324.
- Requires 2421 Windows 2008 or later on the probe system.
- Requires 2421 the Windows Remote Registry service to be running on the target computer.
- Does not support 64-bit processes 2420 on devices with the address "localhost", "127.0.0.1", "::1". Use the IP address in the network instead.
  Note: This sensor cannot show values above 4 GB for 64-bit processes if you run the probe on a 64-bit Windows system. Please add this sensor to a probe running on a 32-bit Windows to monitor 64-bit processes.
- Uses a hybrid approach 2420 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Monitoring 64-bit Processes

This sensor type does not support 64-bit processes on devices with the address **localhost**, **127.0.0.1** (IPv4 address), or **::1** (IPv6 address) in PRTG. This is the case for probe devices, for example. The sensor works on all other target devices in your network. So if you want to monitor 64-bit processes on your local machine, add this device 244 to PRTG with one of the IP addresses under which it is reachable in the local network (for example, 10.0.10.20 instead of 127.0.0.1) and create the sensor on this device.

Note: This sensor type cannot show values above 4 GB for 64-bit processes if you run the PRTG probe with this sensor on a 64-bit Windows system. The WoW64 (Windows 32-bit on Windows 64-bit) emulation layer for 32-bit applications like PRTG limits monitoring values from 64-bit systems or processes to 4 GB and caps off greater values. To avoid this issue that is caused by Windows and to correctly monitor 64-bit processes, please add this sensor to a probe that runs on a 32-bit Windows system.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS PROCESS MONITOR

Executable	Enter the name of the process that you want to monitor. Provide the name of an executable file without the .exe extension (for example, enter firefox to monitor firefox.exe). The sensor goes into a **Down** status if the process is not active on the device.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

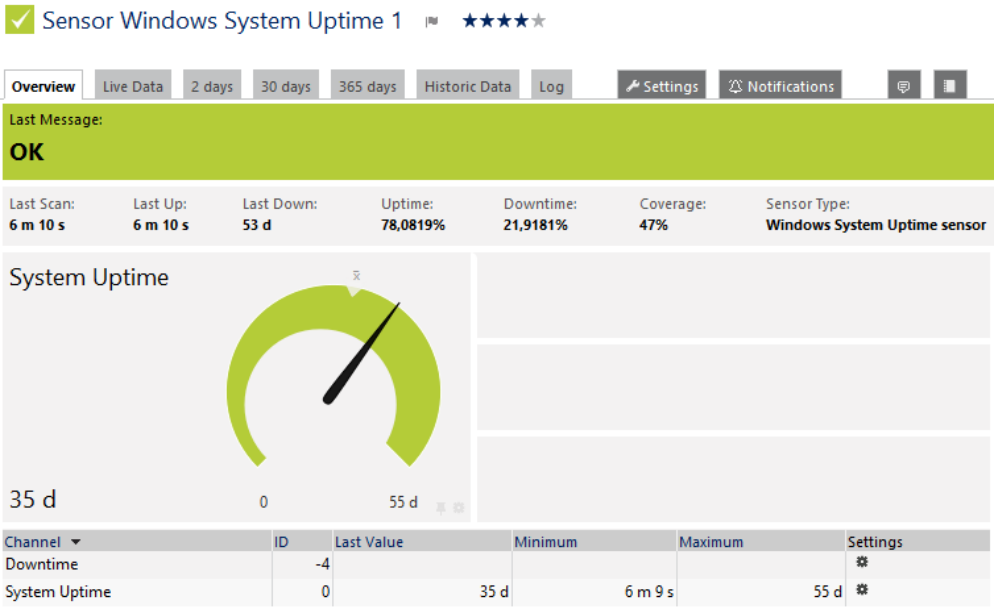
For more general information about settings, please see the **Object Settings** 159 section.

6.8.209 Windows System Uptime Sensor

The Windows System Uptime sensor monitors uptime of a Windows system using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

- It shows the total uptime of the system in days, hours, minutes.



Windows System Uptime Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_system_uptime.png

Remarks

- Requires 2430 Windows credentials in the parent device settings 324.
- Requires 2430 Windows 2008 or later on the probe system.
- Requires 2430 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2429 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- http://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

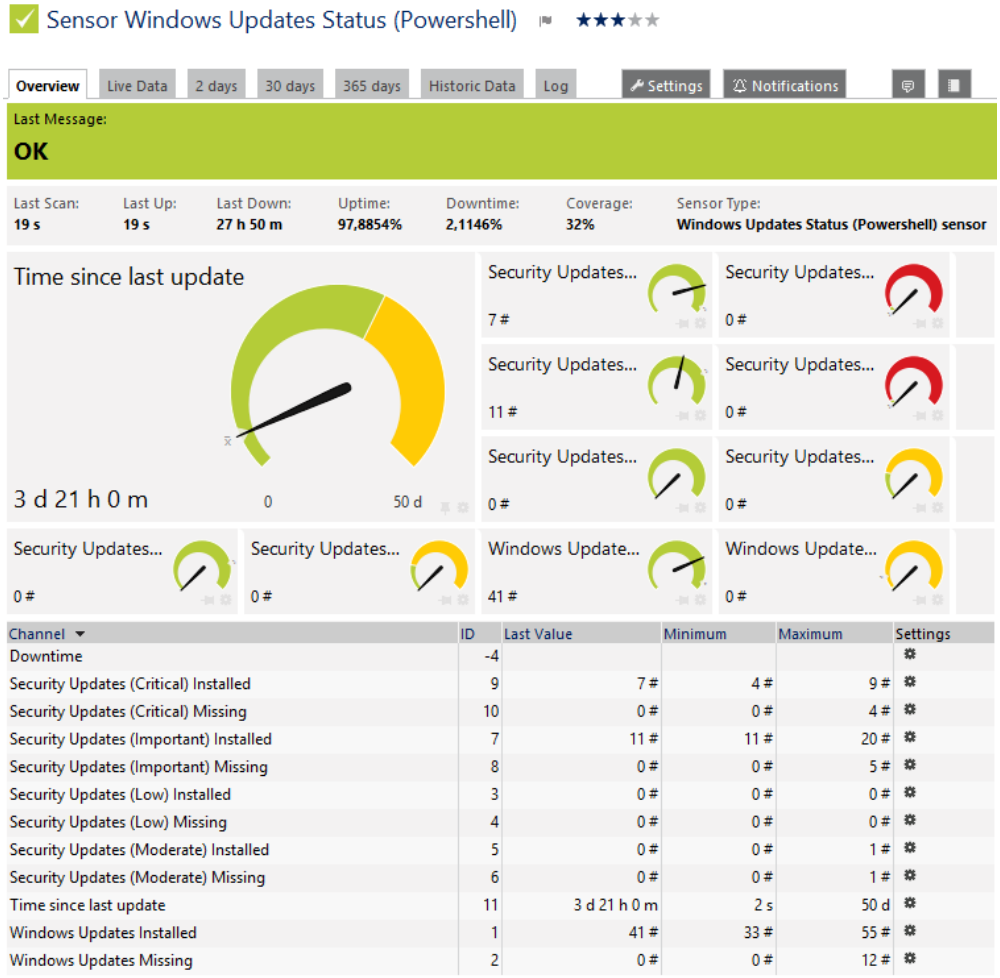
6.8.210 Windows Updates Status (Powershell) Sensor

The Windows Updates Status (Powershell) sensor monitors the status of Windows updates on a computer and counts the available and installed Windows updates—either from Microsoft or from the local Windows Server Update Services (WSUS) server.

It can show the following:

- Elapsed time since the last update
- Installed Windows updates
- Missing Windows updates
- Installed security updates with low, moderate, important, and critical priority
- Missing security updates with low, moderate, important, and critical priority

You can find the considered updates in Server Manager (WSUS) under **Roles | Windows Server Update Services | Update Services | Computers | Reports**.



Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Security Updates (Critical) Installed	9	7 #	4 #	9 #	
Security Updates (Critical) Missing	10	0 #	0 #	4 #	
Security Updates (Important) Installed	7	11 #	11 #	20 #	
Security Updates (Important) Missing	8	0 #	0 #	5 #	
Security Updates (Low) Installed	3	0 #	0 #	0 #	
Security Updates (Low) Missing	4	0 #	0 #	0 #	
Security Updates (Moderate) Installed	5	0 #	0 #	1 #	
Security Updates (Moderate) Missing	6	0 #	0 #	1 #	
Time since last update	11	3 d 21 h 0 m	2 s	50 d	
Windows Updates Installed	1	41 #	33 #	55 #	
Windows Updates Missing	2	0 #	0 #	12 #	

Windows Updates Status (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_updates_status_powershell.png

Remarks

- Requires 2439 .NET 4.0 or higher to be installed on the probe system.
- Requires 2439 Remote PowerShell to be enabled on the target system and PowerShell 2.0 on the probe system.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- The minimum scanning interval for this sensor is **1 hour**.
- Knowledge Base: PowerShell Sensors: FAQ
- Note: If the sensor cannot determine the "Time since last update" (for example, because the list of updates is empty), it will show the value **-1s** and turn into a **Warning** status 135.
- Note: We recommend that you set the scanning interval 2442 of this sensor to at least 12 hours to limit the load on the server being monitored.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Remote PowerShell

The Windows Updates Status (Powershell) sensor uses PowerShell commands. To monitor devices with this sensor, **Remote PowerShell** access has to be enabled on the target computer. Also ensure that you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For detailed information, please see **More** 939 section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is **5985**.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

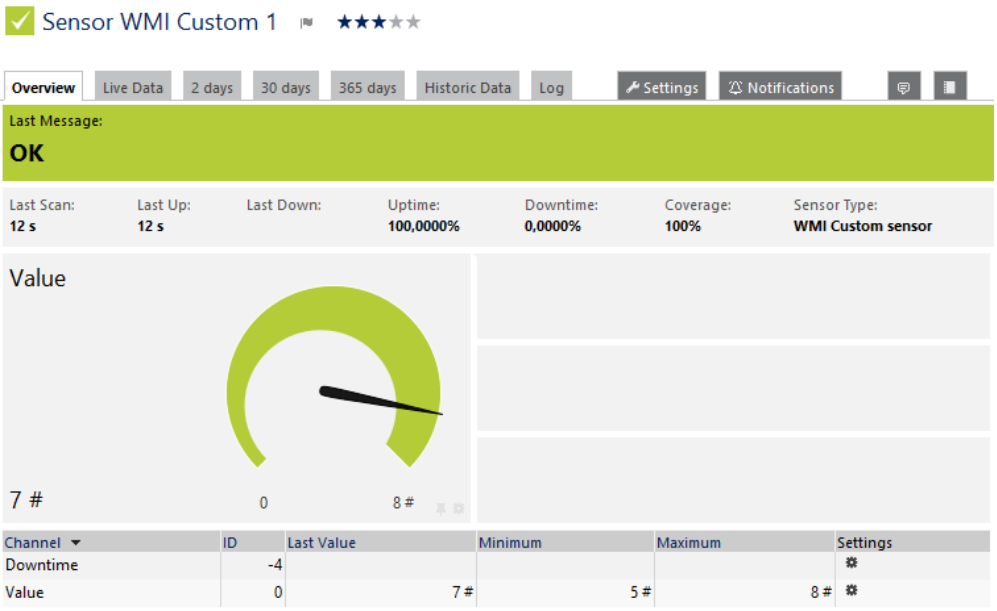
6.8.211 WMI Custom Sensor

The WMI Custom Sensor performs a custom query via Windows Management Instrumentation (WMI).

- It shows the retrieved value.

Note: Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.

Save the file with the query into the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. See the section **Data Storage** 3135 for more information about how to find this path.



WMI Custom Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_custom.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

CUSTOM QUERY SPECIFIC

Channel Name	Enter a name for the channel in which PRTG shows the received data. This name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's channel settings 2711.
WQL File	Select a file that this sensor will use from the list. The sensor executes it with every scanning interval. The menu contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** subfolder of your PRTG installation. Please store your script there. If used on a remote probe, you must store the file on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node. For more information on how to find this path, please see **Data Storage** 3135 section. Note: Your query must return an integer or float value. Strings are not supported!

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
WQL File	Shows the WQL file that this sensor executes with every scanning interval. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH1>** or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH2>** or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH3>** or leave the field empty.

CUSTOM QUERY SPECIFIC

If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
Unit String	Enter a unit for the data that the sensor receives from your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.
Multiplication	Define a multiplier for the received values. By default, this is set to **1** in order to not change received values. Please enter an integer value.
Division	Define a divisor for the received values. By default, this is set to **1** in order to not change received values. Please enter an integer value.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

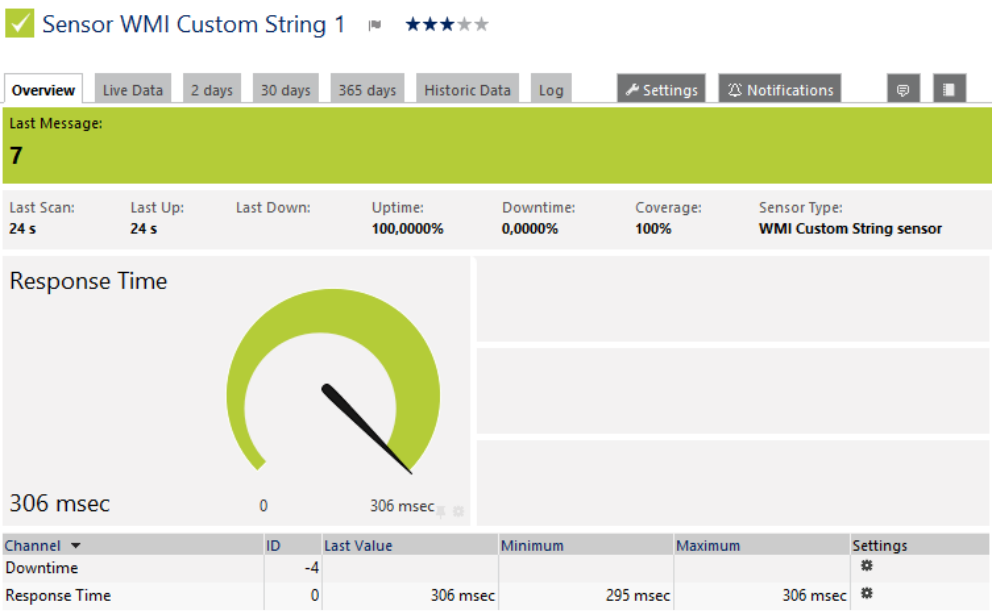
For more general information about settings, please see the **Object Settings** 159 section.

6.8.212 WMI Custom String Sensor

The WMI Custom String sensor performs a custom string query via Windows Management Instrumentation (WMI).

- It shows the retrieved string value in the sensor message.
- It shows also the response time.

Note: Your Windows Management Instrumentation Query Language (WQL) query code must be stored in a file on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.



WMI Custom String Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_custom_string.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

CUSTOM QUERY SPECIFIC

Channel Name	Enter a name for the channel in which the received data will be presented. The name will be displayed in graphs and tables. Please enter a string. You can change the name later in the sensor's channel settings 2711.
WQL File	Select a file that will be used for this sensor from the drop down menu. It will be executed with every scanning interval. The menu contains WQL scripts from the **\Custom Sensors\WMI WQL scripts** sub folder of your PRTG installation. Please store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see **Data Storage** 3135 section.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CUSTOM QUERY SPECIFIC

Namespace	Enter the namespace for the query.
WQL File	Shows the name of the file that this sensor uses. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Placeholder <#PH1>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH1>** or leave the field empty.
Placeholder <#PH2>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH2>** or leave the field empty.
Placeholder <#PH3>	In your WQL script, you can use up to three placeholders that you can assign a value to using this field. Please enter a string for variable **<#PH3>** or leave the field empty.
Unit String	Enter a unit for the data that will be received by your script. This is for displaying purposes only. The unit will be displayed in graphs and tables. Please enter a string.

CUSTOM QUERY SPECIFIC

If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
Response Must Include	Define which string must be part of the data that is received form the WMI object. You can either enter plain text or a **Regular Expression** 3105. If the data does not include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
Response Must Not Include	Define which string must not be part of the data that is received form the WMI object. You can either enter plain text or a **Regular Expression** 3105. If the data does include the search pattern, the sensor will be set to an error state. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. ▪ **Regular Expression**: Treat the search pattern as a **Regular Expression** 3105.
Maximum Length of String	Define the maximum allowed length of the string that will be received from the WMI object. If it is longer than this value, the sensor will be set to an error status. Please enter an integer value or leave the field empty.
Extract Number Using Regular Expression	Define if you want to filter out a numeric value from the string received from the WMI object. You can convert this into a float value, in order to use it with channel limits (see **Sensor Channels Settings** 2711). ▪ **No extraction**: Do not extract a float value. Use the result as a string value.

CUSTOM QUERY SPECIFIC

	▪ **Extract a numeric value using a regular expression**: Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the example 2467 below.
Regular Expression	This setting is only visible if number extraction is enabled above. Enter a **Regular Expression** 3105 to identify the numeric value you want to extract from the string returned by the WMI object. You can use capturing groups here. Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.
Index of Capturing Group	This setting is only visible if number extraction is enabled above. If your regular expression uses capturing groups, specify which one will be used to capture the number. Please enter an integer value or leave the field empty.
Decimal Separator	This setting is only visible if number extraction is enabled above. Define which character to use as decimal separator for the number extracted above. Please enter a string or leave the field empty.
Thousands Separator	This setting is only visible if number extraction is enabled above. Define which character to use as thousands separator for the number extracted above. Please enter a string or leave the field empty.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Example: Number Extraction with Regular Expression

If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on 1 (**not on 0**). Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number 3.555, i.e., the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As **Index of Capturing Group** enter 3. This will extract the desired number 3.555.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains "3.49%), 1 Min (3.555), 5 Min (3.90"
- Group 2 contains "3.49"
- Group 3 contains "3.555"
- Group 4 contains "3.90"

Please keep in mind this note about index and capturing groups when using number extraction.

Note: It is not possible to match an empty string using PRTG's regex search with sensors.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

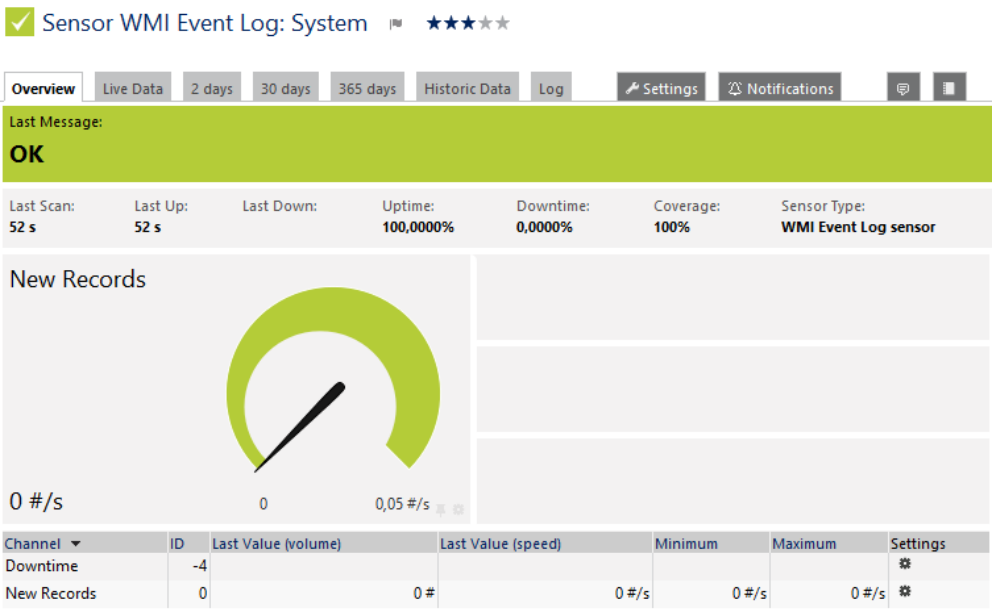
For more general information about settings, please see the **Object Settings** 159 section.

6.8.213 WMI Event Log Sensor

The WMI Event Log sensor monitors a specific Windows log file using Windows Management Instrumentation (WMI).

- It shows the number of new records per second.

You can set the sensor to a desired status individually according to a new event log entry. For details and how to find out the correct filter, see section **More** 2478.



WMI Event Log Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_event_log.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.
- Knowledge Base: My Event Log sensor ignores changes in the event log. What can I do?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the log files you want to monitor. PRTG creates one sensor for each log you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI EVENT LOG MONITOR

Log File	The Windows event log provides several different log files. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI EVENT LOG MONITOR

Log File	Shows the Windows log file that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

FILTER EVENT LOG ENTRIES

Event Type	Specify the type of event that this sensor processes. Other event type cannot be processed. Choose between the following event types: ▪ **Any**

FILTER EVENT LOG ENTRIES

	▪ **Error** ▪ **Warning** ▪ **Information** ▪ **Security Audit Success** ▪ **Security Audit Failure**
Filter by Source	Filter all received events for a certain event source. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event source. • **On**: Enable filtering by event source.
Match String (Event Source)	This field is only visible if you enable source filtering above. Enter a source from which the events come from. Only events from a source matching this string are regarded, other events are ignored. Please enter a string.
Filter by ID	Filter all received events for a certain event ID. If you enable this option, this sensor processes only messages that match the defined value(s). Choose between: • **Off**: Do not filter by event ID. • **On**: Enable filtering by event ID.
Match Value (Event ID)	This field is only visible if you enable ID filtering above. Enter an event ID which the events must have. Only events with an ID that matches this value are regarded. Note: The **Event Log (Windows API) Sensor** 629 supports more than one event ID. Using this sensor type, you can enter a comma separated list of event IDs to filter for more than one ID. Note: The **WMI Event Log Sensor** 2469 supports filtering for only one ID.
Filter by Category	Filter all received events for a certain event category. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event category. • **On**: Enable filtering by event category.

FILTER EVENT LOG ENTRIES

Match String (Event Category)	This field is only visible if you enable category filtering above. Enter a category which the events must have. Only events with a category that matches this string are regarded. Please enter a string.
Filter by User	Filter all received events for a certain event user. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event user. • **On**: Enable filtering by event user.
Match String (Event User)	This field is only visible if you enable user filtering above. Enter a username that the events must to be assigned to. Only events with a username that matches this string are regarded. Please enter a string.
Filter by Computer	Filter all received events for a certain event computer. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event computer. • **On**: Enable filtering by event computer.
Match String (Event Computer)	This field is only visible if you enable computer filtering above. Enter a computer name which the events must be assigned to. Only events with a computer name that matches this string are regarded. Please enter a string.
Filter by Message	Filter all received events for a certain event message. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event message. • **On**: Enable filtering by event message.
Match String (Event Message)	This field is only visible if you enable message filtering above. Enter a message that the event must contain. Only events with a message matching this string are regarded. Please enter a string.

Note: For the **WMI Event Log Sensor**, you can use the percent sign (%) as placeholder for any or no character (as known from the asterisk sign (*) in Windows search) in combination with a substring. For example, you can enter **%RAS%** for any event source containing the string **RAS**.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

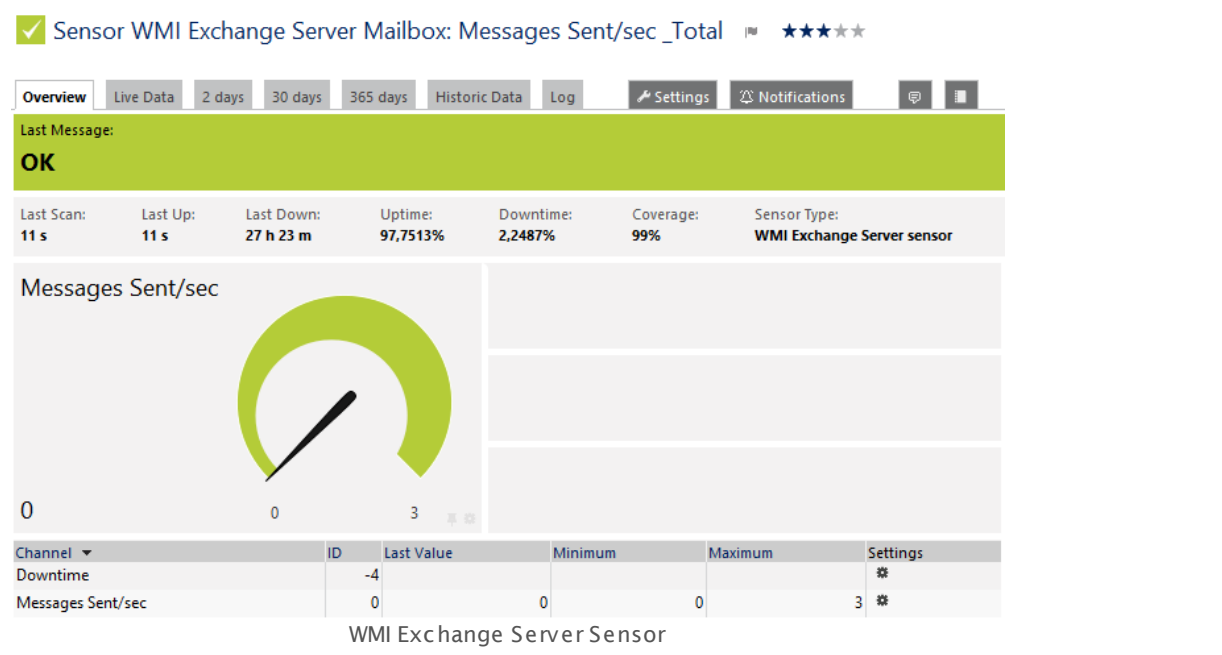
6.8.214 WMI Exchange Server Sensor

The WMI Exchange Server sensor monitors a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI).

It can show the following:

- Queue size
- Average delivery time
- Logon operations per second
- Sent, delivered, and submitted messages per second
- Messages queued for submission
- Remote Procedure Call (RPC) packets operations per second
- RPC latency, requests, and slow packets
- RPC sent, slow, outstanding, and failed requests (store interface)
- Read and write bytes RPC clients per second
- Number of active and anonymous users
- Database page faults per second
- Log record stalls per second
- Log threads waiting
- Database cache size in bytes and miss in percent
- Current unique users (OWA)
- Average response time (OWA)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Exchange Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_exchange_server.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Note: Existing former "WMI Exchange Server 2003/2007 Sensors" from previous PRTG versions will continue to monitor your Exchange server in PRTG 9, but newly added Exchange server sensors will be of the "WMI Exchange Server Sensor" type which is able to monitor Exchange servers regardless of their version.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters of the Exchange server you want to monitor. PRTG creates one sensor for each performance counter you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

EXCHANGE SERVER DATA READINGS ACCESSIBLE USING WMI

Performance Counter	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. The available options depend on your Exchange server configuration. PRTG shows all possible performance counters with name and instance description (if available). You might be able to select aspects regarding: ▪ **SMTP Server**: Queue Lengths ▪ **MSExchangeIS Mailbox**: Queue Sizes, Delivery Times, Operations, Messages ▪ **MSExchangeIS Public**: Queue Sizes, Delivery Times, Operations, Messages ▪ **MSExchangeIS**: Packets, Operations, Clients, Latency, Requests, Users ▪ **MS Exchange RPC Client Access**: Active User Count, User Count, Connection Count ▪ **MS Exchange OWA**: Current Unique Users, Average Response Time Note: Depending on your Exchange server version, not all counters might be available.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between:

READINGS ACCESSIBLE USING WMI

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.215 WMI Exchange Transport Queue Sensor

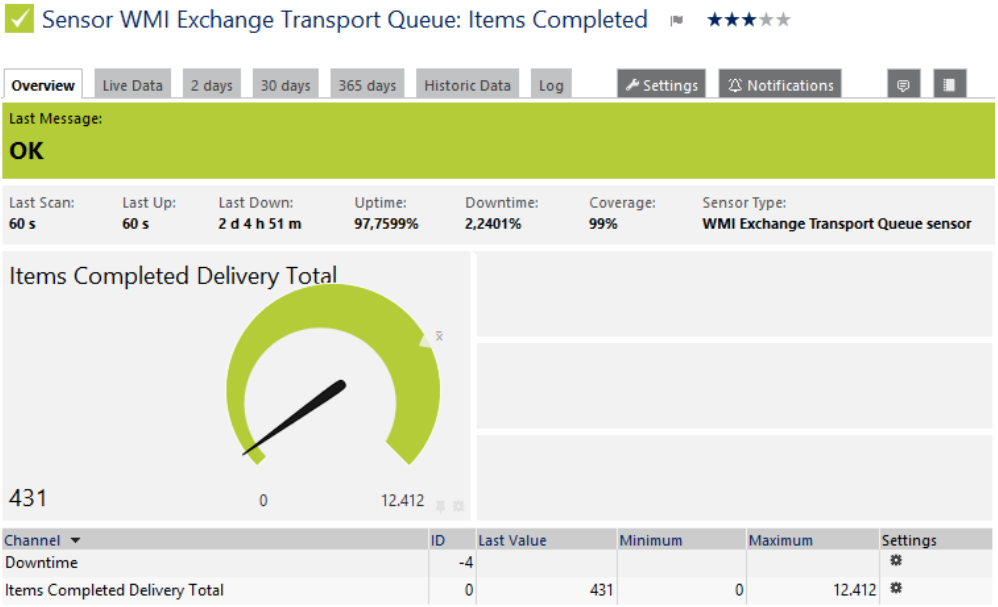
The WMI Exchange Server sensor monitors the length of transport queues of a Microsoft Exchange Server 2003, 2007, 2010, or 2013 using Windows Management Instrumentation (WMI). It shows the same information as shown in Windows System Monitor ('perfmon'). See section **More** 2495 below for an explanation of the transport queue types.

This sensor can show the following:

- Active Mailbox Delivery Queue Length
- Active Non-Smtp Delivery Queue Length
- Active Remote Delivery Queue Length
- Aggregate Delivery Queue Length (All Queues)
- Aggregate Shadow Queue Length
- Categorizer Job Availability
- Items Completed Delivery Per Second
- Items Completed Delivery Total
- Items Deleted By Admin Total
- Items Queued For Delivery Expired Total
- Items Queued for Delivery Per Second
- Items Queued For Delivery Total
- Items Resubmitted Total
- Largest Delivery Queue Length
- Messages Completed Delivery Per Second
- Messages Completed Delivery Total
- Messages Completing Categorization
- Messages Deferred Due To Local Loop
- Messages Deferred during Categorization
- Messages Queued For Delivery
- Messages Queued for Delivery Per Second
- Messages Queued For Delivery Total
- Messages Submitted Per Second
- Messages Submitted Total
- Poison Queue Length
- Retry Mailbox Delivery Queue Length
- Retry Non-Smtp Delivery Queue Length
- Retry Remote Delivery Queue Length

- Shadow Queue Auto Discards Total
- Submission Queue Items Expired Total
- Submission Queue Length
- Unreachable Queue Length

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Exchange Transport Queue Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_exchange_transport_queue.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.
- Knowledge Base: Types of Transport Queues in Microsoft Exchange

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the transport queues you want to monitor. PRTG creates on sensor for each queue you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI EXCHANGE TRANSPORT QUEUE SPECIFIC

MSExchangeTransport Queues	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. The available options depend on your Exchange server configuration. PRTG shows all possible queues with name and instance description (if available). Note: For performance reasons, we recommend to only select necessary items!

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

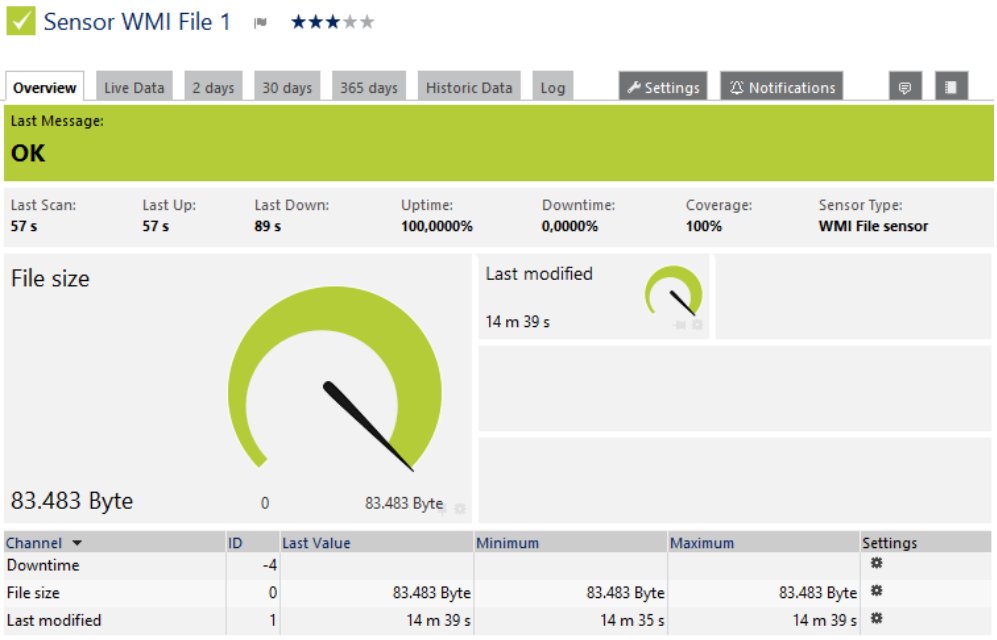
For more general information about settings, please see the **Object Settings** 159 section.

6.8.216 WMI File Sensor

The WMI File sensor monitors a file using Windows Management Instrumentation (WMI).

It shows the following:

- File size
- Elapsed time since its last modification



WMI File Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_file.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI FILE MONITOR

File Name	Enter the name of the file that this sensor checks. Enter the full local path. The file must exist on the computer your local or remote probe is running on. UNC paths are not allowed here. For example, when you create this sensor on a device under the local probe, the file has to be accessible on the local system.

WMI FILE MONITOR

If Timestamp Changes	Define what to do when the timestamp of the file changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that the timestamp has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification [2719] whenever the timestamp changes.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** [3135] section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

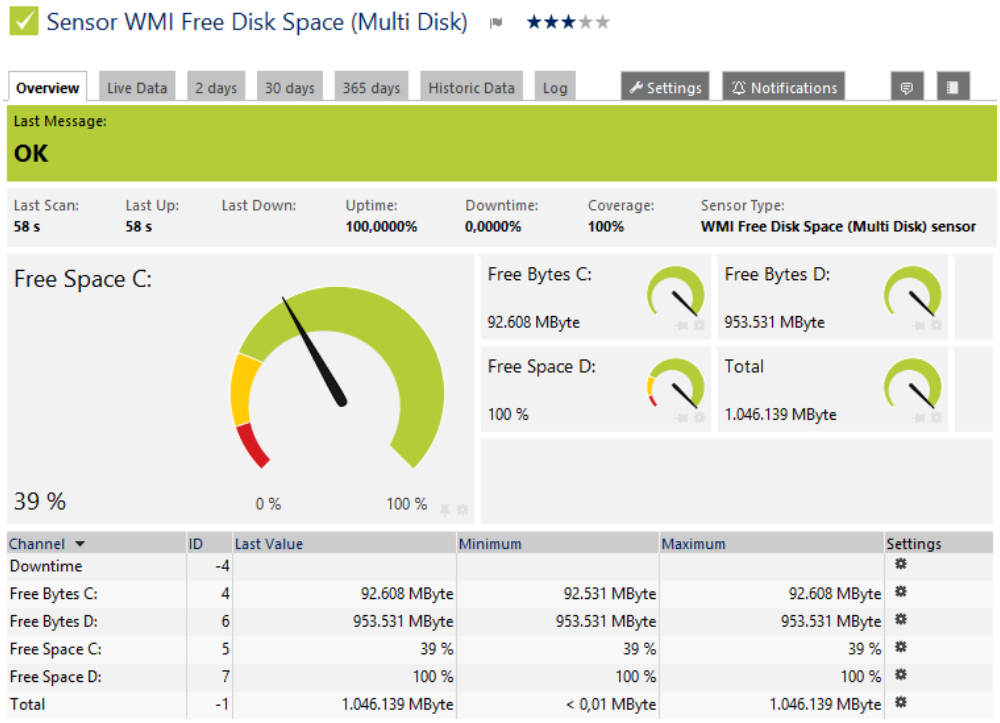
6.8.217 WMI Free Disk Space (Multi Disk) Sensor

The WMI Free Disk Space (Multi Disk) sensor monitors the free disk space of one or multiple drive(s) using Windows Management Instrumentation (WMI).

It shows the following:

- Free disk space in percent and bytes for each disk
- Disk space of a system in total

This sensor monitors logical partitions of a hard or fixed disk drive. PRTG identifies logical disks by their drive letter, such as C.



WMI Free Disk Space (Multi Disk) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_free_disk_space_multi_disk.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI DISK FREE CONFIGURATION

Drive	From the drop down menu, select the drive(s) you want to monitor. We recommend that you use the default value. You can choose **All** to monitor all available drives, or you can choose one specific drive letter to monitor this single drive only. The data in the drop down menu may also contain drive letters that do not exist on your device. The drive setting cannot be changed once the sensor is created.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI DISK FREE CONFIGURATION

Drive	Shows the drive(s) that this sensor monitors. This is either **All** or a specific drive letter. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status, depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor **Channel** settings.

Note: All limits that you define here are valid additionally to the limits defined in the particular **Channels** settings! The limits are valid simultaneously, so the first limit that is breached applies.

Percentage Limit Check	Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between:

SET LIMITS CHECKED AGAINST ALL DISKS

- **Only use the limits in the settings of the percentage channels**: Do not define sensor limits which are valid for all percentage channels. The sensor only uses limits which you define in the settings of the particular "free space in percent" channels to determine the status.
- **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

SET LIMITS CHECKED AGAINST ALL DISKS

Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings**. The limits set here and in the channel settings are valid simultaneously!

Size Limit Check

Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between:

- **Only use the limits in the settings of the byte size channels**: Do not define sensor limits which are valid for all byte size channels. The sensor only uses limits which you define in the settings of the particular free space in bytes channels to determine the status.
- **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.

Upper Error Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty.

Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings**. The limits set here and in the channel settings are valid simultaneously!

Upper Warning Limit

This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty.

Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings**. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Warning Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: ▪ **Deactivate alarm (default)**: Select this option if you do not want an alarm for a removed disk. ▪ **Activate alarm**: Select this option if you want to be alerted if a monitored disk is removed.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.218 WMI HDD Health Sensor

The WMI HDD Health sensor connects to the parent device via Windows Management Instrumentation (WMI) and monitors the health of IDE disk drives on the target system, using Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.). This is built into most modern IDE hard disk drives.

It can show the following, among others:

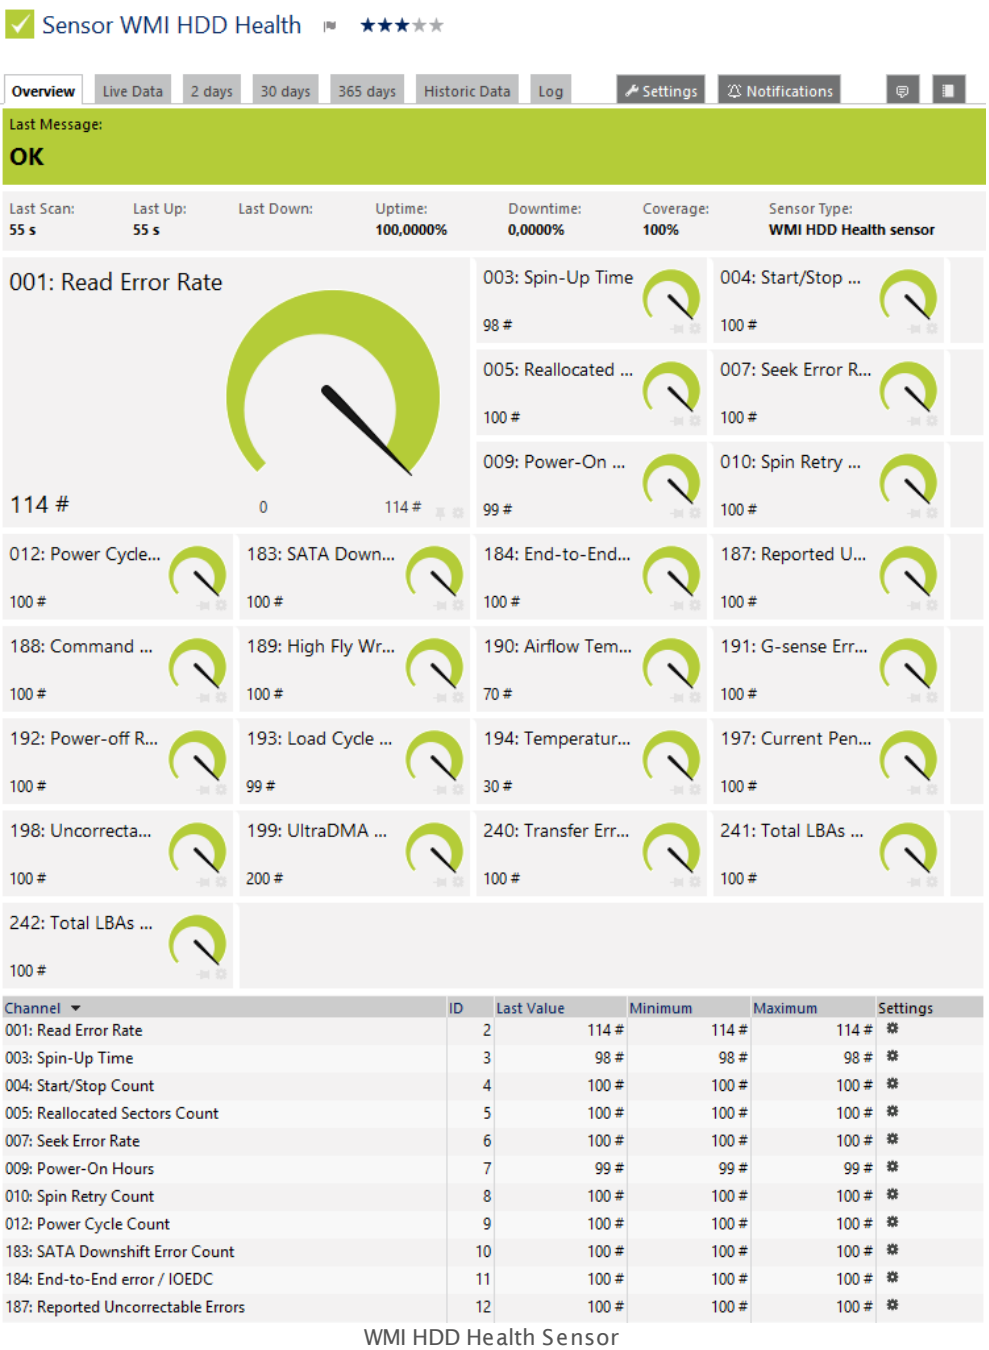
- Read Error Rate
- Spin-Up Time
- Start/Stop Count
- Reallocated Sectors Count
- Seek Error Rate
- Power-On Hours
- Spin Retry Count
- Calibration Retry Count
- Power Cycle Count
- Power-off Retract Count
- Load Cycle Count
- Temperature Celsius
- Reallocation Event Count
- Current Pending Sector Count
- Uncorrectable Sector Count
- UltraDMA CRC Error Count
- Write Error Rate
- Transfer Error Rate
- Total LBAs Written
- Total LBAs Read

Which channels the sensor actually shows might depend on the monitored device and the sensor setup. The channel names indicate the ID of the S.M.A.R.T. attribute, followed by a colon, and the typical meaning of the channel. The sensor can also show other attributes that the target device returns, but some channels will have the name **Unknown Channel**. This happens if PRTG cannot match the ID of a found attribute with an internally defined channel name.

Note: Some vendors do not agree on attribute definitions and define meanings other than the common one.

Every attribute of a disk assumes a value. PRTG shows these attributes as channels with their last, minimum, and maximum value. These channel values change over time and indicate the disk health—higher values correspond to a better health. The disk's attributes come with a threshold, defined by the manufacturer of the drive. If a channel value is lower than this threshold, the sensor is automatically set to a **Warning** status. This indicates that the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the HDD might break soon.

Note: For some attributes are no thresholds defined and thus cannot be judged for a status other than **Up**. You can **Define Lookups** 3095 and use them with affected channels to get the desired status for a return value.



WMI HDD Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_hdd_health.png

Remarks

- Note: This sensor officially requires Windows Vista or later running on the target machine which holds the hard disk drives you want to monitor. The sensor may not work reliably when the target machine runs on Windows 2003 or Windows XP. Due to a known bug in those systems, the sensor may not be able to detect available hard disk drives.

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the IDE disks you want to monitor. PRTG creates one sensor for each IDE device you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SMART SPECIFIC

IDE Devices	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. . The items shown in the list are specific to the parent device you create the sensor on.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SMART SPECIFIC

Serial No.	Shows the serial number of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size (GB)	Shows the size in Gigabyte of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the monitored disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.219 WMI Logical Disk I/O Sensor

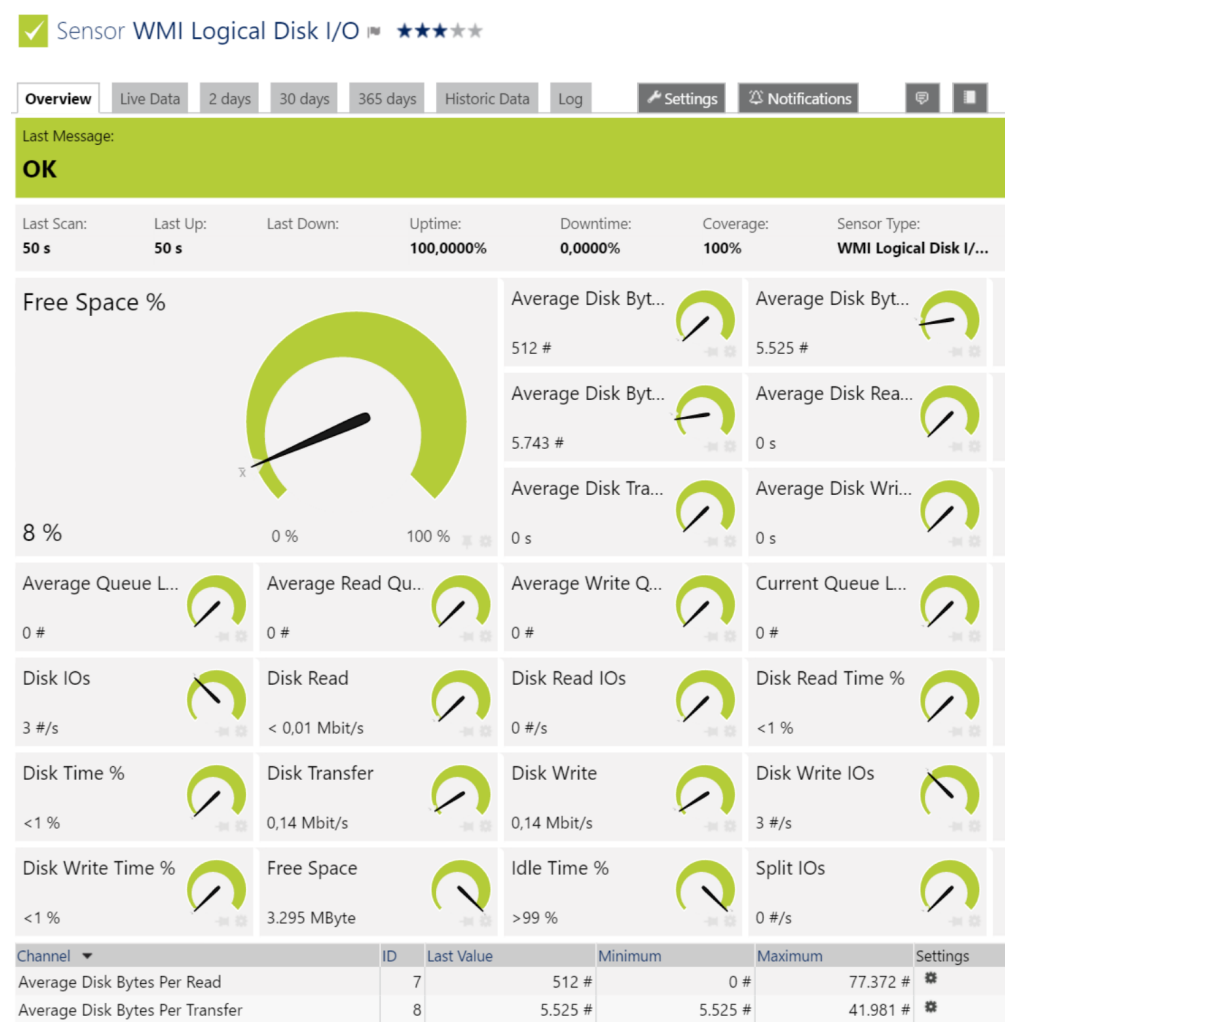
The WMI Logical Disk I/O sensor monitors the parameters of a logical disk belonging to a windows device using Windows Management Instrumentation (WMI).

The sensor provides the following information:

- Free space
- Disk latency
- Disk bandwidth
- Disk Queue data
- Disk IOs

This sensor shows performance data from counters that monitor logical partitions of a hard drive. The system monitor identifies logical disk instances by their identifier, such as C. The sensor reads the logical disk object in the system monitor and returns the values.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Click here to enlarge: http://media.paessler.com/prtg-screenshots/WMI_Logical_Disk_IO_Sensor.png

Remarks

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disk(s) you want to monitor. PRTG creates one sensor for each counter you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)	Select the disk(s) you want to monitor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI LOGICAL DISK I/O SPECIFIC

Logical Disk(s)	Shows the disk this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

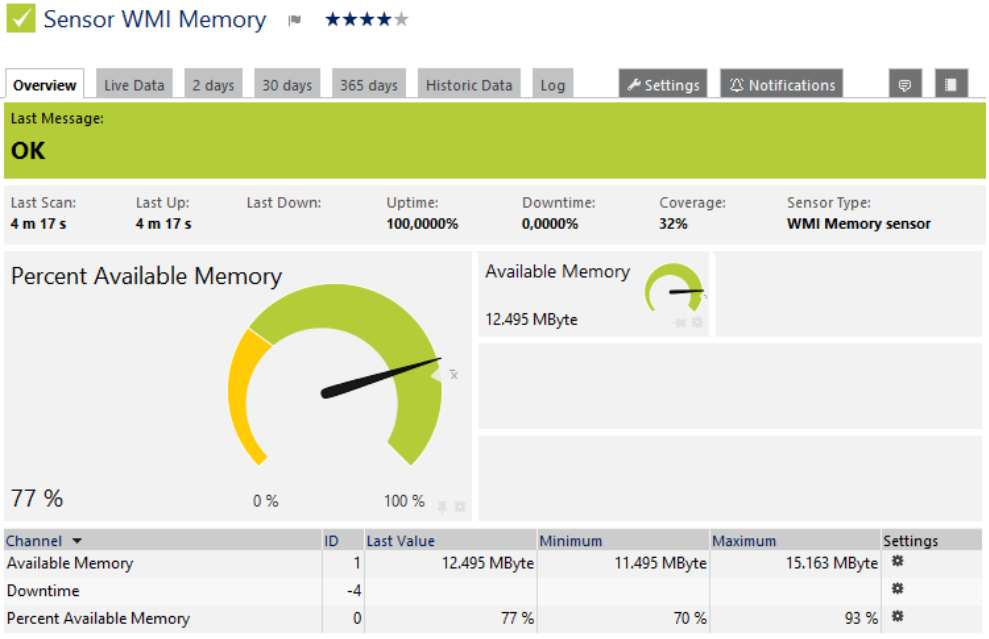
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.220 WMI Memory Sensor

The WMI Memory sensor monitors available (free) system memory on Windows systems using Windows Management Instrumentation (WMI).

- It shows the available memory in percent and bytes.



WMI Memory Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_memory.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

WMI ALTERNATIVE QUERY

Errors and Invalid Data	This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do that in the future) some WMI classes over the various Windows/ ServicePack/patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible, PRTG features an alternative query that might work in your specific configuration. When you keep getting errors for this sensor, please try enabling the alternative query method below.
Alternative Query	Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between: • **Use default (recommended)**: Use PRTG's standard method to query WMI. This is the best setting in most cases. • **Use alternative (if default does not work)**: Use an alternative method to query WMI. If you keep getting errors with the default setting, please try this setting.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

6.8.221 WMI Microsoft SQL Server 2005 Sensor (Deprecated)

IMPORTANT NOTICE

This sensor type is deprecated.

Monitoring of Microsoft SQL Server 2005 using PRTG is discontinued. It cannot be monitored with PRTG any more with the latest updates of SQL Server 2005. The reason for this is a software update delivered by Microsoft in August 2012. The following updates cause this issue:

- **Security Update for SQL Server 2005 Service Pack 4 (KB2716429)**
- **Security Update for SQL Server 2005 Service Pack 4 (KB2716427)**

We have made reasonable effort to fix this from our side but we were unable to. We do not have instructions to circumvent this issue at this time. Please ask the vendor to fix this.

More

Knowledge Base: Why does my WMI Microsoft SQL Server 2005 Sensor not work anymore?

- http://kb.paessler.com/en/topic/44713

The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

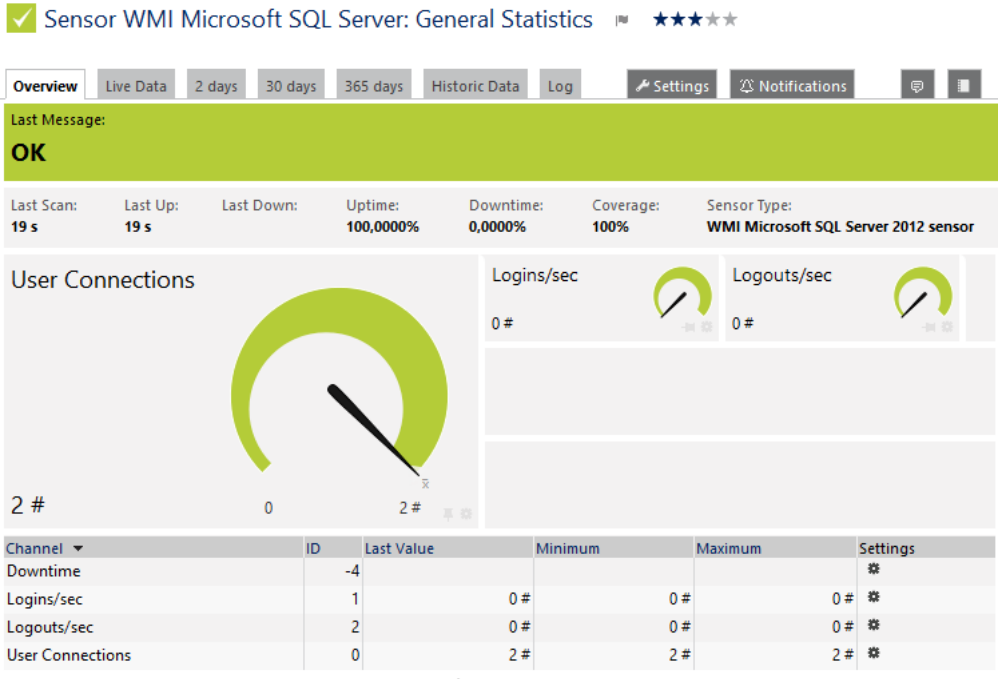
User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.

CHANNEL OVERVIEW

Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.
Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.

CHANNEL OVERVIEW

Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) which you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second.

SQL COUNTER SPECIFIC

- **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second).
- **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages.
- **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb).
- **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time.
- **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second).

Depending on your selection, PRTG creates a sensor with the specified channels.

Note: To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

SQL SERVER SETTINGS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.222 WMI Microsoft SQL Server 2008 Sensor

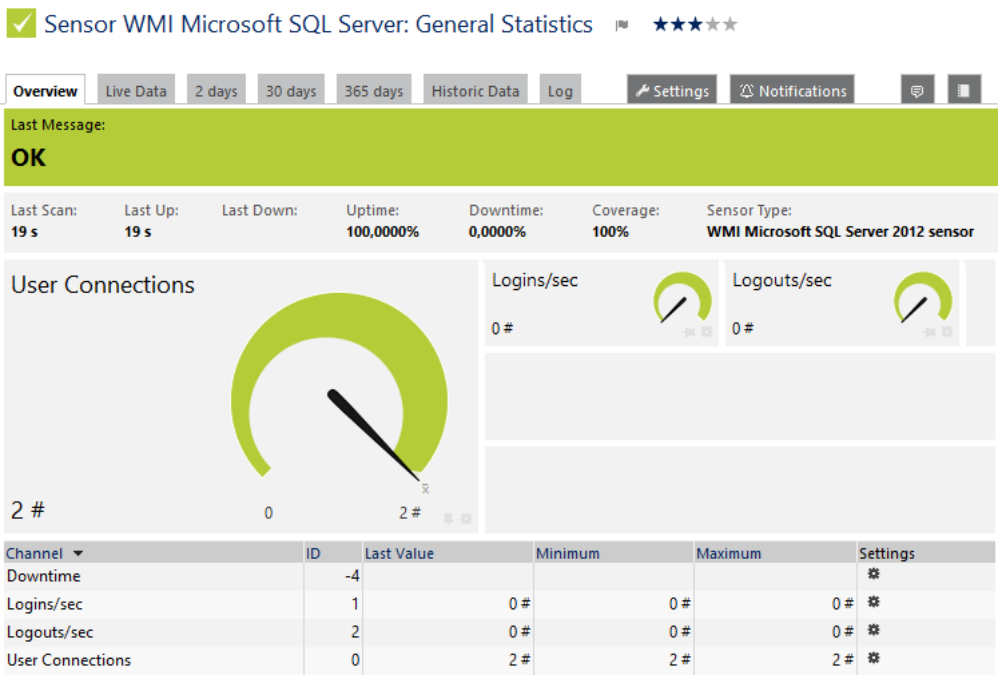
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) which you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels. Note: To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SQL SERVER SETTINGS

Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.223 WMI Microsoft SQL Server 2012 Sensor

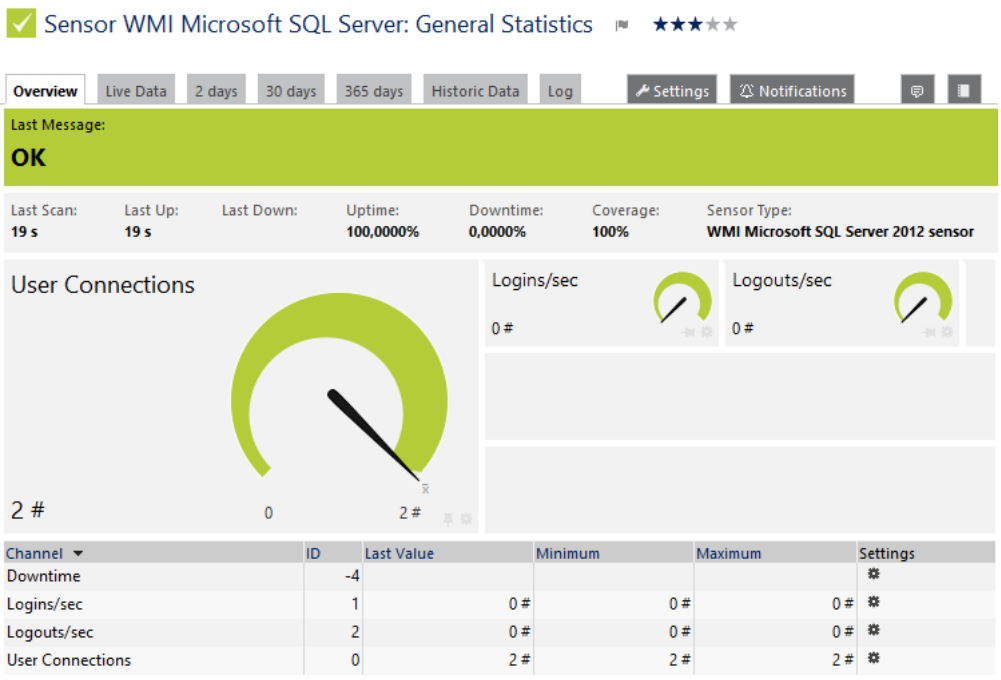
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) which you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels. Note: To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SQL SERVER SETTINGS

Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.224 WMI Microsoft SQL Server 2014 Sensor

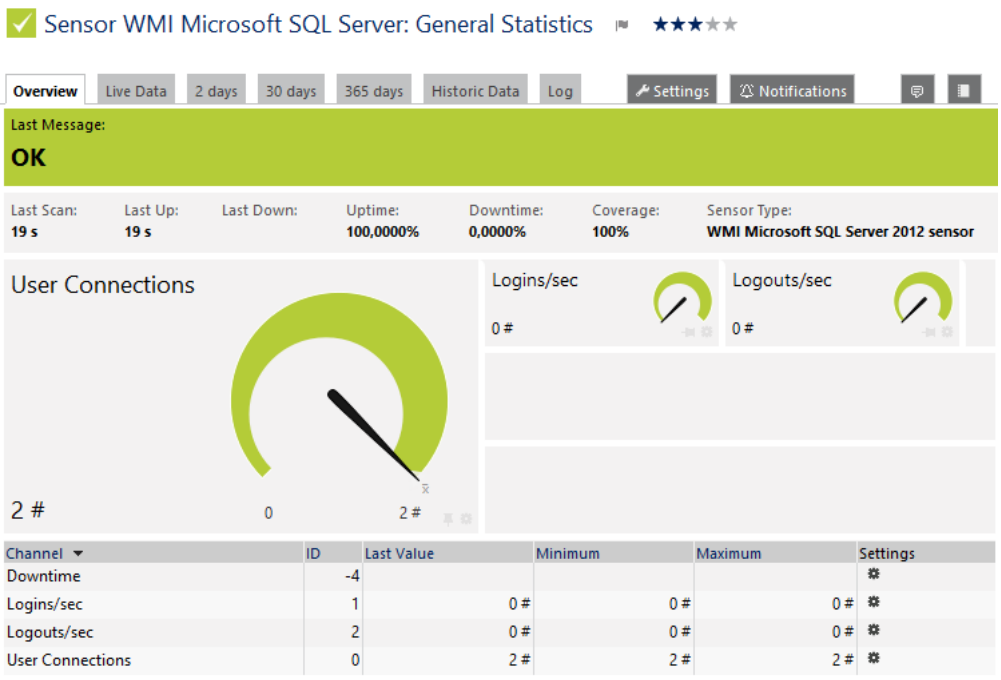
The WMI Microsoft SQL Server sensor monitors the performance of a Microsoft SQL server via Windows Management Instrumentation (WMI). This sensor can monitor **SQL General Statistics**, **Access Methods**, the **Buffer Manager**, the **Memory Manager**, the **Locks Manager**, and **SQL Statistics**. The channels that are actually available for a sensor depend on which performance counters you choose during setup.

CHANNEL OVERVIEW

User Connections	Number of user connections. Because each user connection consumes some memory, configuring overly high numbers of user connections could affect throughput. Set user connections to the maximum expected number of concurrent users.
Logins	Total number of logins started per second.
Logouts	Total number of logout operations started per second.
Full Scans	Number of unrestricted full scans per second. These can be either base-table or full-index scans.
Page Splits	Number of page splits per second that occur as the result of overflowing index pages.
Table Lock Escalations	Number of times locks on a table were escalated.
Buffer Cache Hit Ratio	Percentage of pages found in the buffer cache without having to read from disk. The ratio is the total number of cache hits divided by the total number of cache lookups since an instance of SQL Server was started. After a long period of time, the ratio moves very little. Because reading from the cache is much less expensive than reading from disk, you want this ratio to be high. Generally, you can increase the buffer cache hit ratio by increasing the amount of memory available to SQL Server.
Database Pages	Number of pages in the buffer pool with database content.
Stolen Pages	Number of pages used for miscellaneous server purposes (including procedure cache).
Page Life Expectancy	Number of seconds a page will stay in the buffer pool without references.
Connection Memory (KB)	Total amount of dynamic memory the server is using for maintaining connections.

CHANNEL OVERVIEW

Optimizer Memory (KB)	Total amount of dynamic memory the server is using for query optimization.
Total Server Memory (KB)	Total amount of dynamic memory (in kilobytes) that the server is using currently.
Target Server Memory (KB)	Total amount of dynamic memory the server can consume.
SQL Cache Memory (KB)	Total amount of dynamic memory the server is using for the dynamic SQL cache.
Lock Requests	Number of new locks and lock conversions per second requested from the lock manager.
Deadlocks	Number of lock requests per second that resulted in a deadlock.
Average Wait Time	Average amount of wait time (in milliseconds) for each lock request that resulted in a wait.
Batch Requests	Number of Transact-SQL command batches received per second. This statistic is affected by all constraints (such as I/O, number of users, cache size, complexity of requests, and so on). High batch requests mean good throughput.
SQL Compilations	Number of SQL compilations per second. Indicates the number of times the compile code path is entered. Includes compiles due to recompiles. After SQL Server user activity is stable, this value reaches a steady state.
SQL Re-Compilations	Number of SQL recompiles per second. Counts the number of times recompiles are triggered. In general, you want the recompiles to be low.



WMI Microsoft SQL Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_microsoft_sql_server.png

Remarks

- This sensor can only be added to a device (computer) running a Microsoft SQL database.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the instances of the Microsoft SQL server you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SQL SERVER SETTINGS

MS SQL Server Instance	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Display name and service name are provided as returned by the SQL server.
SQL Server Version	Enter the version of the SQL server. Usually, you can keep the default value.

SQL COUNTER SPECIFIC

SQL Performance Counters	You see a list of different performance counters that the sensor can monitor for the instance(s) which you selected above. Every sensor that PRTG creates for the server instances monitors the performance counter you select here. Choose from: ▪ **General Statistics**: Read general performance counters. This shows the number of user connections, and the number of logins and logouts per second. ▪ **Access Methods**: Read access method counters. This shows the number of full scans, page splits, and table lock escalations (per second). ▪ **Buffer Manager**: Read buffer manager counters. This shows the buffer cache hit ratio in percent, and the number of database pages and stolen pages. ▪ **Memory Manager**: Read memory manager counters. This shows the connection memory, optimizer memory, total server memory, target server memory, and SQL cache memory (in kb). ▪ **Locks**: Read locks counters. This shows the number of lock requests and deadlocks (per second), and the average wait time. ▪ **SQL Statistics**: Read SQL statistics. This shows the number of batch requests, SQL compilations, and SQL re-compilations (per second). Depending on your selection, PRTG creates a sensor with the specified channels. Note: To monitor several performance counters for an instance, please add the sensor several times.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SQL SERVER SETTINGS

Service	Shows the service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SQL SERVER SETTINGS

Name	Shows the name of the server instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class Name	Select whether PRTG selects the name of the WMI class used for monitoring automatically. Choose between: ▪ **Automatic**: Choose WMI class automatically. We recommend this setting. ▪ **Manual**: Manually enter a WMI class name. Use this if your server instance returns an error code in automatic mode.
WMI Class	This field is only shown if you enable manual WMI class selection above. This setting is intended for experienced users only. Enter the WMI class name that the sensor uses for monitoring your server instance.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SQL COUNTER SPECIFIC

SQL Performance Counters	Shows the performance counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

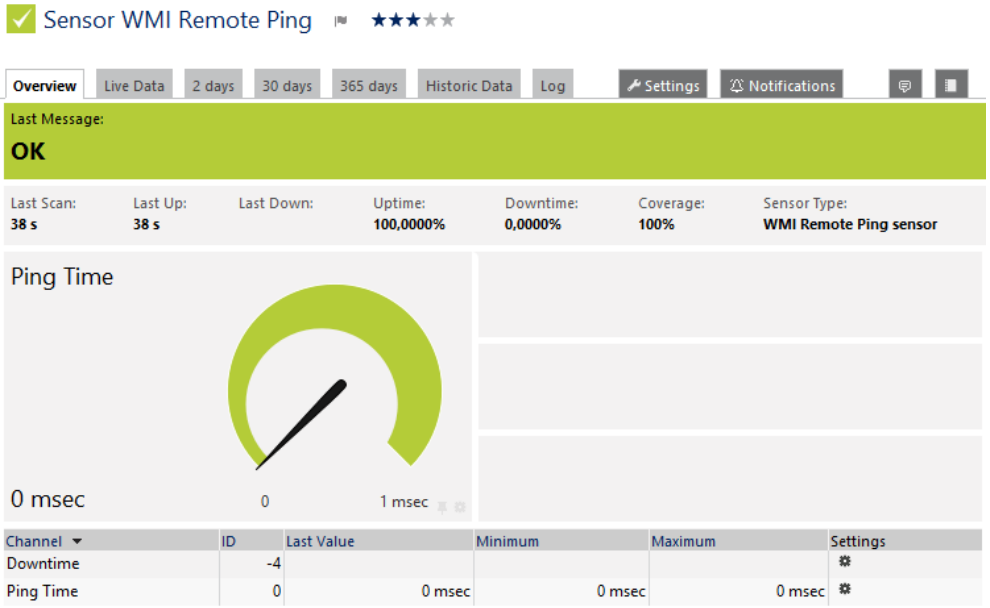
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.225 WMI Remote Ping Sensor

The WMI Remote Ping sensor connects remotely to a Windows system using Windows Management Instrumentation (WMI), then performs an Internet Control Message Protocol (ICMP) echo request ("Ping") from this device to a specified target.

- The sensor shows the Ping time from the remote device to the target device that is being pinged.



WMI Remote Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_remote_ping.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI REMOTE PING CONFIGURATION

Target	Enter the DNS name or IP address of the target device the Ping is sent to. The sensor remotely connects to its parent device via WMI. Then it performs a Ping request from this remote device to the target device/server. Please enter a string.

WMI REMOTE PING CONFIGURATION

Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. Please enter an integer value. The maximum timeout value is 300.
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. Please enter an integer value. We recommend that you use the default value.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.226 WMI Security Center Sensor

The WMI Security Center sensor monitors the security status of a Windows computer using Windows Management Instrumentation (WMI). It can monitor all security products that are controlled by Windows Security Center / Windows Action Center.

- It shows the status code of the monitored product and sets the sensor status accordingly. A sensor status showing **Up** indicates that the product is up to date and the access scan is running.

Possible return values for status codes are:

Status Code	Meaning: Status of Monitored Security Product Is ...	Will Result in Sensor Status
0	Unknown	Down
1	Not running, Out of date	Down
2	Running, Out of date	Warning
3	Not running, Up to date	Down
4	Running, Up to date	OK

WMI Security Center Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_security_center.png

Remarks

- This sensor requires Windows Vista or later on the target computer. The Windows Security Center / Windows Action Center is only available on client Windows versions. Because of this, this sensor type does not run on Windows Server operating systems (Windows Server 2003, 2008, 2012)!
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the security center products you want to monitor. PRTG creates one sensor for each product you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI SECURITY CENTER SPECIFIC

Security Center Products	You see a list showing the **Name** and **Type** of all security products found in the Windows Security Center on the target device. If there are no products, you see a corresponding message. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SECURITY CENTER SPECIFIC

Display Name	Shows the name of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	Shows the type of the product monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

6.8.227 WMI Service Sensor

The WMI Service sensor monitors a Windows service using Windows Management Instrumentation (WMI).

It can show the following:

- Execution time of the monitoring request.

Additionally, if you enable **Monitor extended values** in the sensor settings, it can show these parameters:

- CPU usage in percent
- Pagefile usage in bytes
- Number of handles
- Number of threads
- Working set in bytes

Note: The "Running (msec)" channel of this sensor shows the execution time of the monitoring request. It does not refer to the time the Windows service has been running! As of PRTG version 13, the name of this sensor channel is **Sensor Execution Time**.

WMI Service Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_service.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Windows services you want to monitor. PRTG creates one sensor for each service you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI SERVICE MONITOR

Service	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Name and description are provided in the language of the device's Windows installation. Later on the sensor shows a **Down** status 135 if the service is not running.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SERVICE MONITOR

If Service is Not Running	Select whether the service will be (re-)started if it is stopped or paused. Choose between: ▪ **Start/Restart service**: PRTG tries to start the service if it is not running when scanning the device. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever PRTG (re)starts the service. ▪ **Do nothing**: PRTG does not start any service on the device automatically. Note: If you select the start/restart option and the sensor detects that the monitored service does not run, PRTG will try to restart the service during this scan and postpones the next sensor scan for one interval. With this following scan, the sensor checks if the service runs now: if starting the service was not successful or the service failed again, the sensor will show a **Down** status 135 and not try to start the service again. If the service runs after a (re-)start attempt, the sensor will continue monitoring as usual.

WMI SERVICE MONITOR

If Service is Restarted	This setting is only visible if you select the restart option above. Define what to do if PRTG restarts the service. Choose between: ▪ **Ignore changes**: No action is taken on change. ▪ **Trigger 'change' notification**: The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
Monitoring	Select whether you want to monitor CPU usage and other useful performance counters. Choose between: ▪ **Just check if service is running**: PRTG only monitors the channel "Sensor Execution Time". ▪ **Monitor extended values**: PRTG monitors also other useful performance counters. Note: Extended monitoring might cause a "Class not found" error on some Windows systems.
Service	Shows the Windows service this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows the description for the service. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

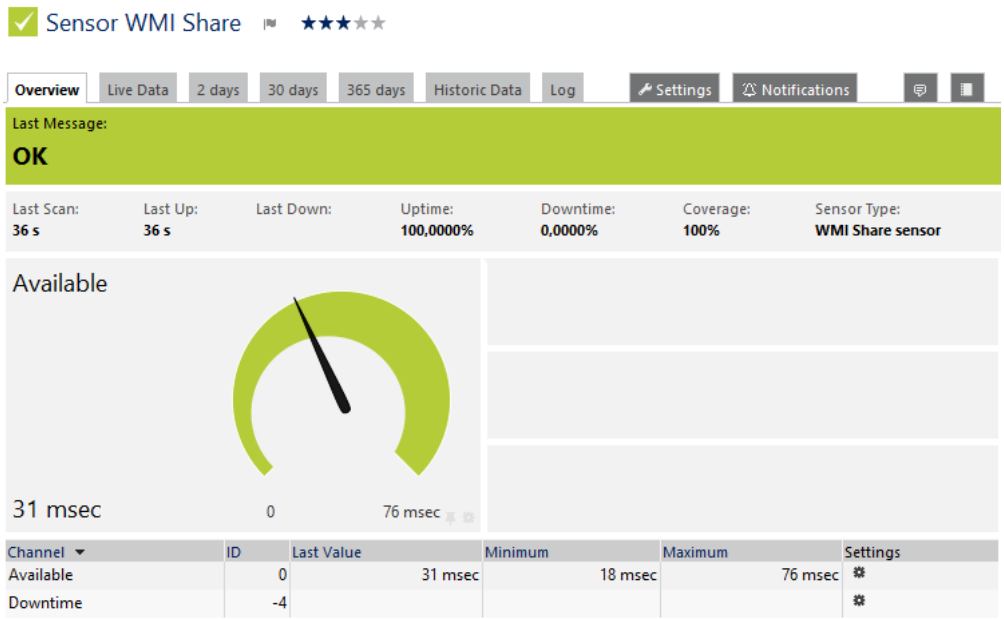
For more general information about settings, please see the **Object Settings** 159 section.

6.8.228 WMI Share Sensor

The WMI Share sensor monitors a shared resource on a Windows system using Windows Management Instrumentation (WMI).

- It shows the availability of the share.

You can define the sensor to show a **Down** status [135] for different share status messages.



WMI Share Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_share.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe [83]. Above this number, please consider using multiple **Remote Probes** [3109] for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** [3005].

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually [256]. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the shares you want to monitor. PRTG creates one sensor for each share you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI SHARED RESOURCE

Share	Select the shares you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: To provide any shares, the LanmanServer "Server" Windows service must be running on the target computer. If it is not, there are no shares and you see a **No Share available** message here.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI SHARED RECOURCE

Shared Recource	
Description	Shows information about the shared resource that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	
TypeID	

TRIGGER ERROR STATE ON FOLLOWING CONDITIONS

Select under which conditions the sensor shows a **Down** status 135 from the list below. As long as the share returns OK, the sensor status is **Up**. Choose a **Down** condition by adding a check mark symbol in front of the according line. Choose none, one, or several from the following conditions.

Note: While in Down status, a sensor does not record any data in all of its channels.

Error	Set sensor to **Down** status if the share returns an error status. A share in this status is not operational. This condition is selected by default.
Degraded	Set sensor to **Down** status if the share returns a degraded status. A share in this status is still operational. This condition is selected by default.
Unknown	Set sensor to **Down** status if the share returns an unknown status.

TRIGGER ERROR STATE ON FOLLOWING CONDITIONS

Pred Fail	Set sensor to **Down** status if the share returns a "predicted fail" status. This indicates that an element works properly but predicts a failure (for example, a SMART-enabled hard drive). A share in this status is still operational. This condition is selected by default.
Starting	Set sensor to **Down** status if the share returns a starting status. A share in this status is not operational.
Stopping	Set sensor to **Down** status if the share returns a stopping status. A share in this status is not operational.
Service	Set sensor to **Down** status if the share returns a service status. This can apply during disk mirror-resilvering, reloading a user permissions list, or other administrative work on the monitored device. Not all such work is online, but the managed element is neither OK nor in one of the other states. A share in this status is not operational.
Stressed	Set sensor to **Down** status if the share returns a stressed status.
Nonrecover	Set sensor to **Down** status if the share returns a "non recover" status. This condition is selected by default.
NoContact	Set sensor to **Down** status if the share returns a "no contact" status. This condition is selected by default.
LostComm	Set sensor to **Down** status if the share returns "lost communication" status. This condition is selected by default.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

6.8.229 WMI SharePoint Process Sensor

The WMI SharePoint Process sensor monitors a Microsoft SharePoint server using Windows Management Instrumentation (WMI).

It can show the following:

- Number of current page requests
- Number of active threads
- Number of currently executed SQL queries
- Global heap size
- Object cache always live size
- Template cache size
- CPU utilization in percent

WMI SharePoint Process Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_sharepoint_process.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the SharePoint processes you want to monitor. PRTG creates one sensor for each process you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI PROCESS MONITOR

SharePoint Processes	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI PROCESS MONITOR

SharePoint Process	The name of the SharePoint process that is monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

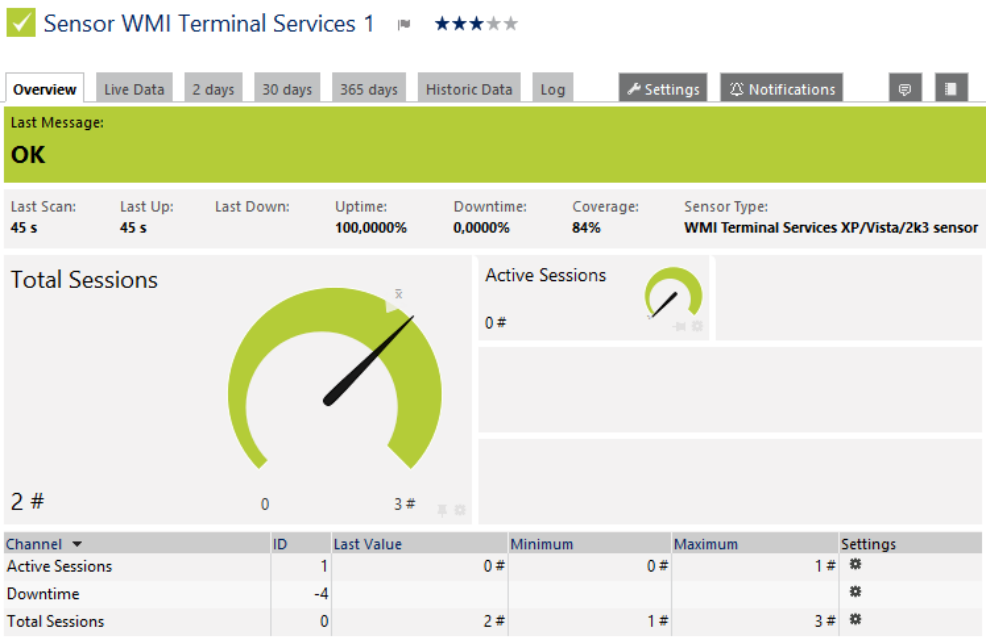
For more general information about settings, please see the **Object Settings** 159 section.

6.8.230 WMI Terminal Services (Windows 2008+) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session



WMI Terminal Services Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_terminal_services.png

Remarks

- Note: For "Total Sessions", this sensor type returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/ Vista/2003 or the one for Windows 2008 and later.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

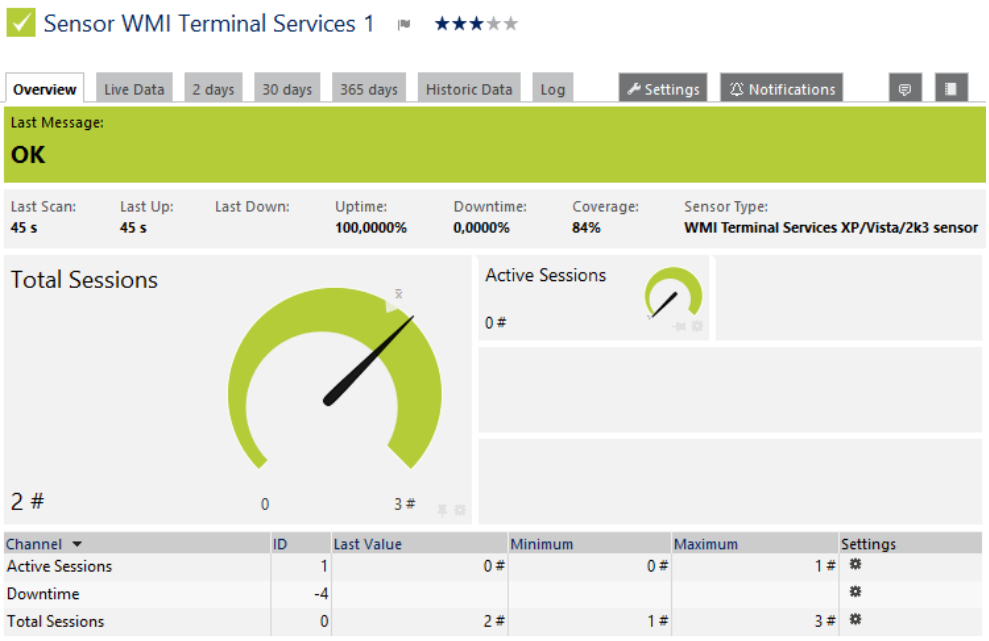
6.8.231 WMI Terminal Services (Windows XP/Vista/2003) Sensor

The WMI Terminal Services sensor monitors the number of sessions on a Windows Terminal Services (Remote Desktop Services) server using Windows Management Instrumentation (WMI).

It shows the following:

- Number of active sessions: sessions with a currently logged in user, including used published applications
- Number total sessions (including inactive sessions): inactive sessions can be sessions with a disconnected user that has not logged out, or system services using a session



WMI Terminal Services Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_terminal_services.png

Remarks

- Note: For "Total Sessions", this sensor type returns the number of active and inactive sessions, plus two additional sessions: one for the console, and another for the services. So, the number of total sessions may actually be higher than expected.
- Depending on the OS that you want to monitor, select either the sensor for Windows XP/ Vista/2003 or the one for Windows 2008 and later.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

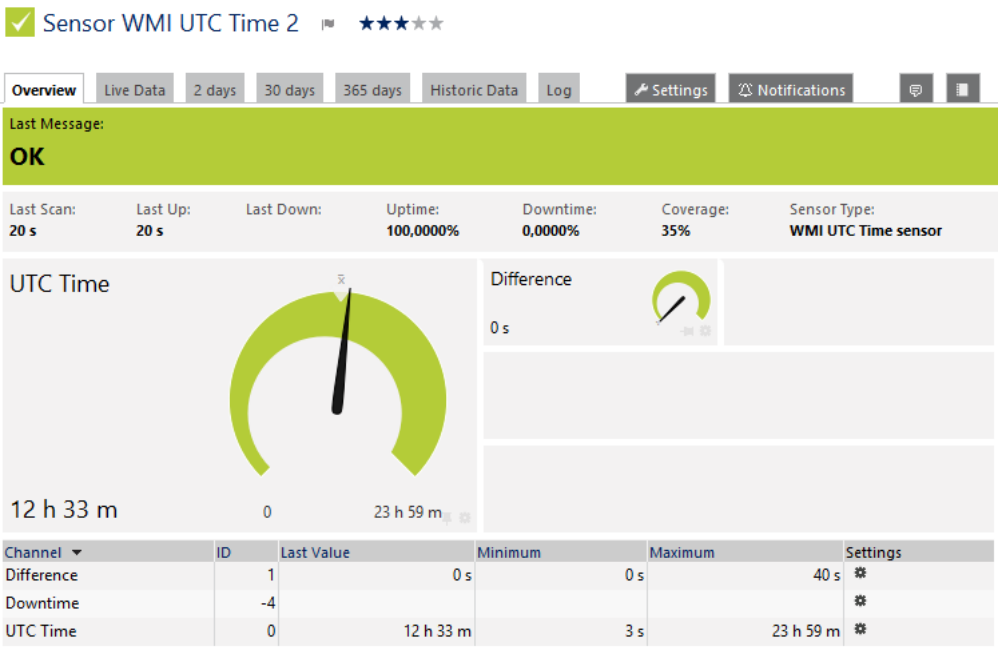
For more general information about settings, please see the **Object Settings** 159 section.

6.8.232 WMI UTC Time Sensor

The WMI UTC Time sensor monitors the UTC (Coordinated Universal Time) time of a target device using Windows Management Instrumentation (WMI).

It shows the following:

- UTC time of the target device
- Time difference between the PRTG system time and the target device in seconds



WMI UTC Time Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_utc_time.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

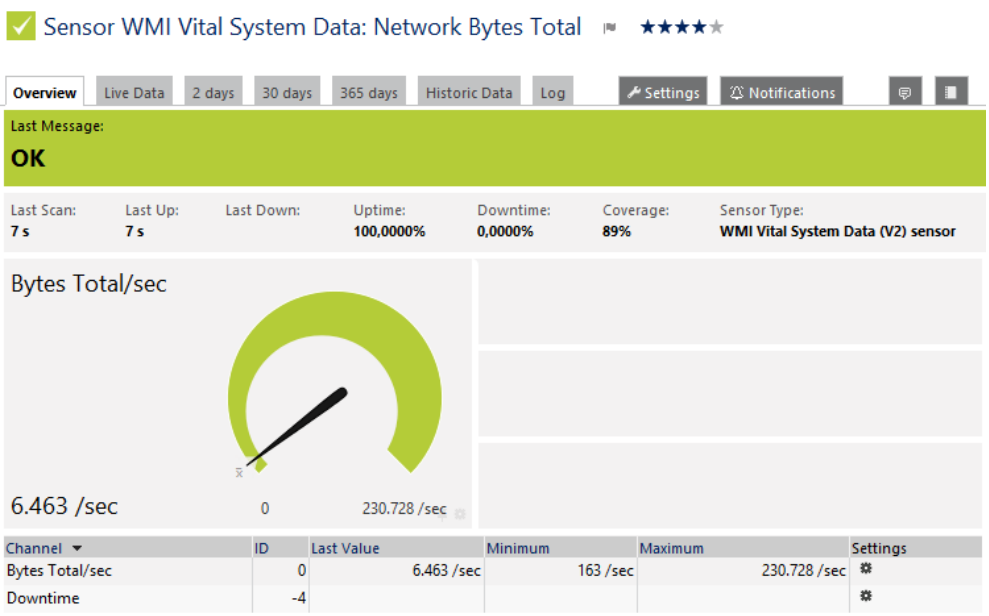
6.8.233 WMI Vital System Data (V2) Sensor

The WMI Vital System Data sensor monitors vital system parameters (CPU, thread, memory, network, pagefile) using Windows Management Instrumentation (WMI).

It can show the following:

- CPU usage: Processor, privileged, and user time
- CPU queue length
- Thread context switches
- Free physical memory
- Total visible memory
- Memory page faults, reads, and writes per second
- Memory pool paged and nonpaged bytes
- Memory committed bytes
- Network sent, received, and total bytes per second
- Network packets outbound errors
- Pagefile usage in percent
- Physical disk time in percent
- Current physical disk queue length
- Physical disk reads and writes per second
- Server bytes received, transmitted, and total
- CLR memory time in GC in percent
- CLR memory bytes in all heaps
- Thrown CLR exceptions per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



WMI Vital System Data (V2) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_vital_system_data.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG creates one sensor for each counter you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VITAL SYSTEM DATA READINGS ACCESSIBLE USING WMI

Performance Counter	You see a list of available vital system data values the sensor can monitor on the target device. The available options depend on your configuration. PRTG shows all possible performance counters with name and instance description (if available). Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head. You can choose between the following counters: ▪ **CPU** ▪ **Thread** ▪ **Memory** ▪ **Network** ▪ **Pagefile**

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

READINGS ACCESSIBLE USING WMI

Display Name Instance	These fields show the parameters that are used to query data for this sensor from the target device.Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WMI Class	
Counter	
Time Stamp	
Time Frequency	
Counter Type	
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

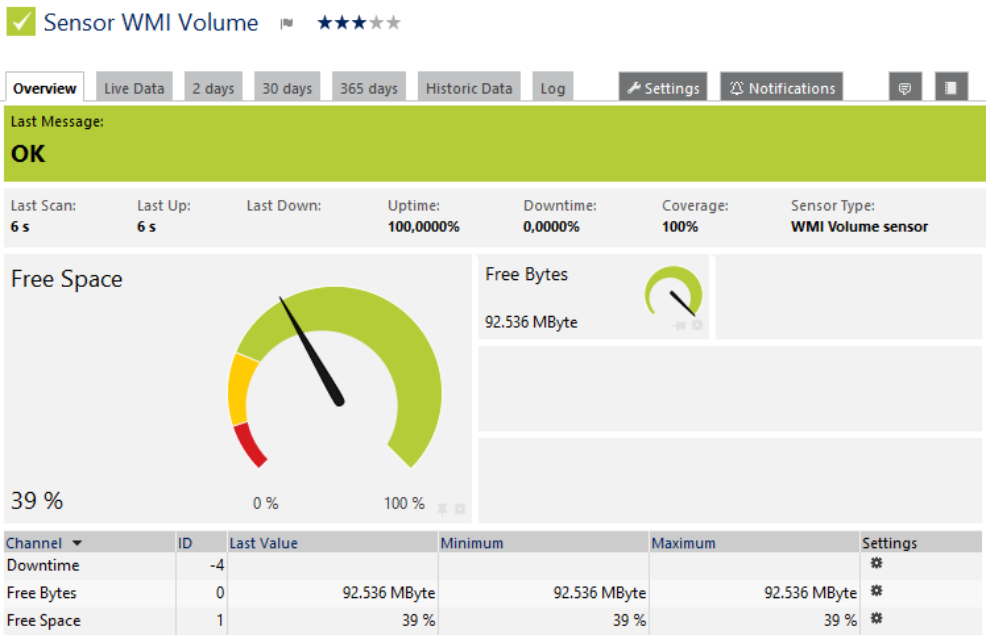
For more general information about settings, please see the **Object Settings** 159 section.

6.8.234 WMI Volume Sensor

The WMI Volume sensor monitors the free disk space on one drive or one logical volume using Windows Management Instrumentation (WMI). For each drive or logical volume, PRTG uses one sensor.

- It shows free space in percent and total.

This sensor monitors an area of storage on a hard disk. It can monitor local volumes that are formatted, unformatted, mounted, or offline. A volume is formatted by using a file system, such as File Allocation Table (FAT) or New Technology File System (NFTS), and might have a drive letter assigned to it. One hard disk can have multiple volumes, and volumes can span multiple physical disks. The sensor does not support disk drive management.



WMI Volume Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wmi_volume.png

Remarks

- This sensor is not supported on Windows XP and earlier.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.
- For a general introduction to the technology behind WMI, please see manual section **Monitoring via WMI** 3005.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volumes you want to monitor. PRTG creates one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI VOLUME SPECIFIC

Volumes	Select the volumes you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI VOLUME SPECIFIC

DeviceID	Shows the unique identifier of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Drive Type	Shows the type of the disk drive that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID Selection	Specify the way how sensor identifies the volume. Choose between: ▪ **Use system device ID (recommended)**: This is usually the best option for this sensor type, because the device ID will not change when the volume is renamed. ▪ **Use drive letter**: In a Microsoft cluster environment, the device ID will change when the cluster is switched to another node. In this case, use the drive letter option to avoid issues regarding this.
Drive Letter	This field is only visible if you select the drive letter option above. Enter the letter of the drive you want to monitor followed by a double dot, for example, C:

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

My WMI sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/1043

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.235 WSUS Statistics Sensor

The WSUS Statistics sensor monitors various statistics on a Windows Server Update Services (WSUS) server using Windows Management Instrumentation (WMI).

It can show the numbers of the following:

- Approved updates
- Computers having update errors
- Computers needing updates
- Computers not synchronized for 7 days
- Computers registered
- Computers up to date
- Declined updates
- Expired updates
- Not approved critical or security updates
- Not approved updates
- Total updates
- Unapproved needed updates
- Updates needed by computers
- Updates needing files
- Updates up to date
- Updates with client errors
- Updates with server errors
- Updates with stale update approvals
- Number of WSUS infrastructure updates not approved for installation

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
Approved updates	0	3,090 #	3,090 #	4,606 #	
Computers having update errors.	1	11 #	7 #	269,412 #	
Computers needing updates.	2	115 #	114 #	245 #	
Computers not synchronised for 7 days	3	8 #	4 #	102 #	
Computers registered	4	185 #	182 #	267 #	
Computers up to date	5	58 #	0 #	59 #	
Declined updates.	6	8,536 #	6,573 #	8,536 #	
Downtime	-4				
Expired updates.	7	0 #	0 #	0 #	
Not approved critical or security updates.	8	0 #	0 #	8 #	
Not approved updates.	9	0 #	0 #	733 #	
Total updates.	10	11,626 #	10,754 #	11,826 #	
Unapproved, needed updates.	11	0 #	0 #	106 #	
Updates needed by computers.	12	710 #	703 #	1,560 #	
Updates needing files.	13	26 #	0 #	703 #	
Updates up to date.	14	0 #	0 #	2,811 #	
Updates with client errors.	15	26 #	8 #	80 #	
Updates with server errors.	16	26 #	0 #	41 #	

WSUS Statistics Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/wsus_statistics.png

Remarks

- Requires .NET 4.0 or higher on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- Requires WSUS 3.0 Administration Console on the probe system.

- Requires 2698 Windows credentials in the parent device settings 324.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Note: Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

Requirement: WSUS 3.0 Administration Console

In order for this sensor to work, Microsoft's WSUS 3.0 Administration Console must be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

WSUS Server Port	Define the port where the WSUS server service runs on. The default value is **8530**. Please enter an integer value.
Connection Security	Define if you want to use SSL encryption for the connection to the WSUS server or if you prefer unencrypted connections. Choose between: ▪ **Use SSL** ▪ **Do not use any encryption**

SENSOR SETTINGS

Note: If you want to use SSL encryption, you have to configure your Windows Server Update Services (WSUS) accordingly (see also the **More** 2706 section below).

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.9 Additional Sensor Types (Custom Sensors)

Users can create and use their own, self-written custom sensors in PRTG Network Monitor to go far beyond PRTG's standard sensor set. You can create your own sensors using Windows Management Instrumentation Query Language (WQL), visual basic scripting, PowerShell, batch scripting, SQL queries, by compiling an EXE or DLL file (using any Windows software development tool), and by running Python scripts.

Basics

For a general introduction, please see the sections about EXE/Script sensors and the API documentation 3086 which contains details about the necessary return format for these sensors. WMI Custom sensors allow executing WQL requests.

- **EXE/Script Sensor** 699
- **EXE/Script Advanced Sensor** 711
- **Python Script Advanced Sensor** 1318
- **SSH Script Sensor** 2205
- **SSH Script Advanced Sensor** 2217
- **Application Programming Interface (API) Definition** 3086
- **WMI Custom Sensor** 2448

Additionally, some types of SQL sensors execute script files with SQL queries:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

Custom Sensors Included in PRTG

After installing PRTG Network Monitor, you will already find a selection of custom EXE/Script, Python, and WMI WQL script sensors in the PRTG program directory 3135, as well as scripts with SQL queries for specific database sensors 2707. Many of these are sample projects that you can edit and improve for your needs.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXE

- Demo Batchfile - Returns 200.bat
- Demo Batchfile - Set sensorstate to error.bat
- Demo Batchfile - Set sensorstate to warning.bat
- Demo Cmd - Returns 200.cmd
- Demo Dll - Returns a random integer.dll
- Demo EXE - Returns a random integer.exe

- Demo EXE - Returns number of files in folder (parameter).exe
- Demo EXE - Returns user of process.exe
- Demo Powershell Script - Available MB via WMI.ps1
- Demo Powershell Script - InterruptsPerSec via WMI.ps1
- Demo Powershell Script - Returns a fixed integer value.ps1
- Demo Powershell Script - Returns a random integer value.ps1
- Demo Powershell Script - Returns Random Integer and Warnings.ps1
- Demo VBScript - InterruptsPerSec via WMI.vbs
- Demo VBScript - Multiplies two integers(2 parameters).vbs
- Demo VBScript - Returns a fixed float value.vbs
- Demo VBScript - Returns a fixed integer value.vbs
- Demo VBScript - Returns a random value.vbs
- Demo VBScript - Returns number of svchost processes.vbs
- Demo VBScript - Returns user of process.vbs
- Demo VBScript - Returns warning depending on number of svchost processes.vbs
- Demo VBScript - Timezone via WMI.vbs
- Demo VBScript - UTCTime via WMI.vbs
- Load_Test_CPU_1_Mio_Primes.exe
- Load_Test_CPU_10_Mio_Primes.exe
- Load_Test_Disk_Write_Read_1000_files.exe
- Load_Test_Disk_Write_Read_10000_files.exe
- Load_Test_Memory_Allocate_And_Free_400MB.exe

To create a new sensor based on one of these files, create a new **EXE/Script Sensor** 699 and choose the respective file from the **EXE/Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\EXEXML

- Demo Batchfile - Returns static values in four channels.bat

To create a new sensor based on one of these files, create a new **EXE/Script Advanced Sensor** 711 and choose the respective file from the **EXE/Script** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\python

- sensor_example.py

This Python example script just returns fixed values in two channels to demonstrate the usage. To create a new sensor based on this file, create a new **Python Script Advanced Sensor** 1318 and choose the file from the **Python Script** list in the sensor settings.

SQL Query Files Included in PRTG—Folder: \Custom Sensors\sql\<dbms>

- Demo Serveruptime.sql

You can find this demo SQL query script in each subfolder for each supported database management system (dbms): **\mssql**, **\mysql**, **\oracle**, **\postgresql**

To create a new sensor that uses one of the scripts in the dbms folders, create the according sensor type (see above for supported sensors 2707) and choose the respective file from the **SQL Query File** list in the sensor settings.

Custom Sensors Included in PRTG—Folder: \Custom Sensors\WMI WQL scripts

- Demo WQL Script - Get Win32LogicalDiscFreeMB.wql
- Demo WQL Script - Get Win32OsBuildnumber.wql
- Demo WQL Script - Get Win32PercentProcessorIdleTime.wql
- Demo WQL Script - Get Win32PercentProcessorTime.wql

To create a new sensor based on one of these files, create a new **WMI Custom Sensor** 2448 and choose the respective file from the **WQL File** list in the sensor settings.

Downloading Pre-Built Custom Sensors

A good resource to find custom sensors that PRTG users share is our Knowledge Base. Search for the tag **custom-script-exe** to find a lot of custom sensors.

Sensor Settings Overview

For information about sensor settings, please see the following sections:

- **Sensor Settings—** 347 **List of Available Sensor Types** 348
- **Additional Sensor Types (Custom Sensors)** 2707

- Sensor Channels Settings 2711
- Sensor Notifications Settings 2719

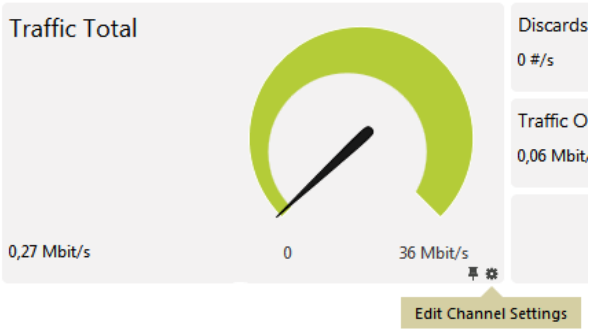
6.10 Sensor Channels Settings

A sensor has one or more channels in which it handles the actual monitoring data. In the channel settings you can define how to display the data from the sensor's different channels displayed in graphs, gauges, and tables. Additionally, the channel data can determine the sensor status[135]. Use the limit settings to achieve this.

On the sensor's **Overview** tab, click the gear icon of a specific channel gauge to change its settings. Click the pin symbol on the left of the gear icon in a gauge to make this channel the primary channel of the selected sensor.

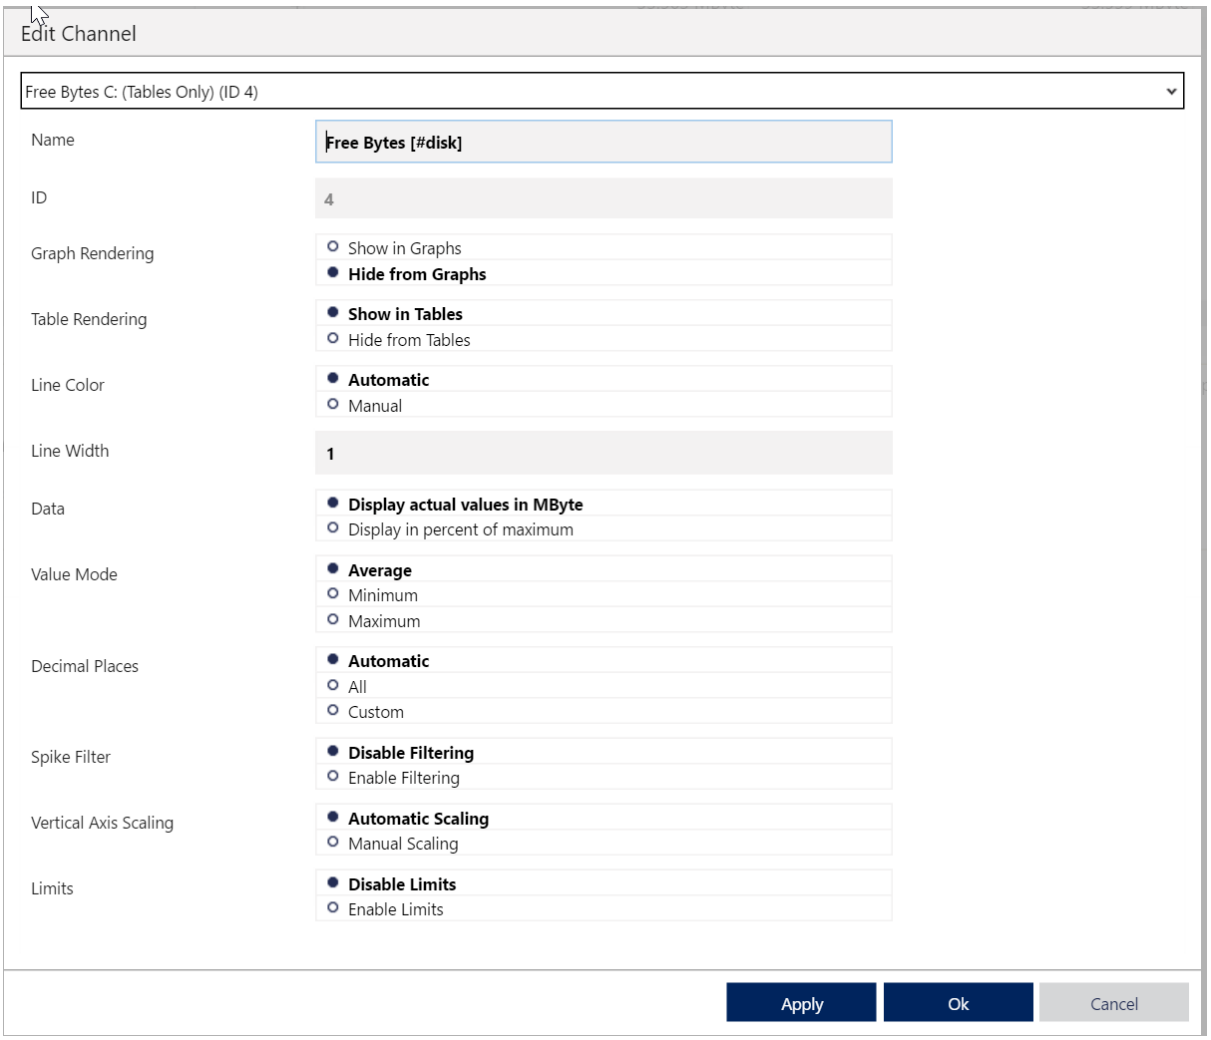
You can also open the settings of a channel by clicking the respective gear icon in the channels data table underneath the gauges.

Note: For lookup[3095] channels, we recommend that you stay below 120 lookup values to get expressive gauges. For non-primary lookup channels, the upper limit is around 40 lookup values.



The Gear Icon of an SNMP Traffic Total Channel to Open Channel Settings

The available options are nearly the same for all sensor types. An exception applies to the "Downtime" channel which is automatically calculated and does not offer all settings. Channels with "absolute" values additionally have an option for defining the **Value Mode**. You can quickly choose another channel of the selected sensor via the dropdown list on the top of the channel settings dialog.



Channel Settings for a Memory Sensor

Available Channel Settings

EDIT CHANNEL

Name	Enter a meaningful name to identify the channel (not editable for script sensors after sensor creation). The name will appear in graphs and tables. You can automatically add the sensor's ID to the name by using the placeholder **[#id]**.
Unit	This field is only visible for script sensors, the SNMP Custom sensor, and the SNMP Library sensor. Enter a string describing the unit of the returned values. This is for display purposes only. Please enter a string.

EDIT CHANNEL

Scaling Multiplication	This field is only visible for channels with a custom unit. If you want to multiply the received raw data with a certain value, enter the multiplier here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value. Note: The following sensor types provide the scaling factor for received values with custom units in their sensor settings: ▪ Sensor Factory Sensor 1376 (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor 1469 ▪ SNMP Custom Sensor 1577 ▪ SNMP Dell Hardware Sensor 1659 ▪ SNMP Library Sensor 1849 ▪ WMI Custom Sensor 2450
Scaling Division	This field is only visible for channels with a custom unit. If you want to divide the received raw data with a certain value, enter the divisor here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value. Note: The following sensor types provide the scaling factor for received values with custom units in their sensor settings: ▪ Sensor Factory Sensor 1376 (you can use multiplication and division in the channel definition) ▪ SNMP APC Hardware Sensor 1469 ▪ SNMP Custom Sensor 1577 ▪ SNMP Dell Hardware Sensor 1659 ▪ SNMP Library Sensor 1849 ▪ WMI Custom Sensor 2450
Value Lookup	This field is only visible for script sensors, the SNMP Custom sensor, and the SNMP Library sensor. Select the lookup 3095 file that you want to use with this channel.
ID	Shows the ID of the channel. You cannot change it. PRTG uses it for unique identification. For example, you need the ID when using Sensor Factory 1374 sensors. There are a few special channel IDs which are fixed: ▪ -1 is for sum channels of traffic channels (for example, of the SNMP Traffic Sensor 2071).

EDIT CHANNEL

	▪ -4 is for the **Downtime** channel (you can use it, for example, for an uptime percentage calculation in a **Sensor Factory Sensor** 1374). ▪ -2 (coverage) and -3 (error) are used internally.
Graph Rendering	Define if you want to show this channel in data graphs 140. Choose between: ▪ **Show in Graphs**: Sensor graphs contain the data of this channel. ▪ **Hide from Graphs**: Sensor graphs do not contain data of this channel. Note: If you choose to hide this channel in graphs, it will also not appear in a **Report** 2786 if you include this graph.
Table Rendering	Define if you want to show this channel in data tables 137. Choose between: ▪ **Show in Tables**: Sensor data tables contain the data of this channel. ▪ **Hide from Tables**: Sensor data tables do not contain the data of this channel. This option hides the channel gauge as well, but the channel will still be available in the data table of the sensor's **Overview** tab. Note: If you choose to hide this channel in data tables, PRTG will also not use it for the calculation of the "sum" (total) channel of this sensor!
Line Color	Define the color of the channel display in graphs. Choose between: ▪ **Automatic**: PRTG sets the color of this channel in graphs automatically. ▪ **Manual**: Individually define the color of this channel. You can enter the desired color code below.
Color (#rrggbb)	This option is only available if choose manual line color above. Enter a color in hexadecimal RGB notation (as in HTML/CSS), or choose a color from the visual color selector. The field with the hexadecimal color value will change to the selected color automatically.
Line Width	Define the width of the channel line in graphs. Enter an integer value in pixels. The maximum line width is 25px, but we recommend that you use values between 1 and 7 only to get optimal results.

EDIT CHANNEL

Data	This setting is available for most channels. Define how to display data. Choose between: ▪ **Display actual values in** [unit]: Display the values in the unit shown. ▪ **Display in percent of maximum**: Calculate and show percent values based on a maximum value. Provide a maximum below. Note: If you choose this option, you cannot display the data of traffic sensors on a positive/negative graph.
Maximum ([unit])	This field is only visible if you choose the percent of maximum setting above. Enter a value to use as maximum. Please pay attention to the given unit. PRTG calculates all percent values based on this value. Please enter an integer value.
Value Mode	This setting is only available for sensor channels which return absolute values. It is not available for sensors showing difference values, such as traffic channels. Depending on this setting, the channel cannot only show averages, but also minimum or maximum values in the graphs for the respective time spans. Choose between: ▪ **Average**: The channel shows average values. ▪ **Minimum**: The channel shows minimum values. ▪ **Maximum**: The channel shows maximum values. See this Knowledge Base article for more information about the value modes: http://kb.paessler.com/en/topic/60238
Decimal Places	Define how many decimal places of the channel's data to display in graphs and tables. Choose between: ▪ **Automatic**: PRTG automatically defines how many decimal places are used for optimal viewing results. ▪ **All**: Display all available decimal places. ▪ **Custom**: Manually define the number of decimal places. If you choose this option, an additional field will appear. Please enter an integer value.
Spike Filter	You can use a spike filter to correct faulty monitoring data. Sometimes, sensors report enormously high or far too low values. This can be because of an error in data transmission, or because of incompatibilities of the physical device you are monitoring. This can make graphs unreadable. A spike filter can compensate for these flaws. If you enable a spike filter, values above and below a certain limit are disregarded in the monitoring data for graphs and tables.

EDIT CHANNEL

	Choose between: ▪ **Disable Filtering**: Display all data as it retrieved. Do not filter out spikes. ▪ **Enable Filtering**: Enable a filter to remove spike values. Additional fields appear below. Note: This does not change monitoring data itself but only the presentation of the data. This setting is valid for all data of this channel, including historic data. Note: The spike filter option is not available for the channel **Downtime**.
Spike Filter Max. Value [unit]	This field is only visible if you enable the spike filter above. Enter the maximum value to show in the channel data. PRTG disregards all data above this value in graphs and tables. Please enter an integer value or leave the field empty.
Spike Filter Min. Value [unit]	This field is only visible if you enable the spike filter above. Enter the minimum value to show in the channel data. PRTG disregards all data below this value in graphs and tables. Please enter an integer value or leave the field empty.
Vertical Axis Scaling	Define how to display the vertical axis for the channel in graphs. Choose between: ▪ **Automatic Scaling**: PRTG automatically uses the optimum scaling. Usually the scaling ranges from the minimum to the maximum value. PRTG uses one single scale for each unit label only. ▪ **Manual Scaling**: Define the scaling manually. Additional fields appear below. Defining manual axis scaling can make low values better visible in your graph, but it may result in a graph with multiple vertical axis for the same unit label. Note: Settings for this option are ignored if you enable the Chart Type **Stack channels on top of each other** or **Show in and out traffic as positive and negative area chart** (available for traffic sensors) on the sensor's **Settings** tab.
Vertical Axis Maximum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the maximum value to use on the vertical axis for the channel. Please enter an integer value.
Vertical Axis Minimum [unit]	This field is only visible if you enable vertical axis scaling above. Enter the minimum value to use on the vertical axis for the channel. Please enter an integer value.

EDIT CHANNEL

Limits	Define if you want to use thresholds for this channel. The channel can affect the status of the sensor [135] it is part of. With limits you can define when the sensor will show a **Warning** or **Down** status, depending on the channel data. For example, you can use this function to set a traffic sensor (which is usually never in a down state) to error when the monitored values reach critical limits. Choose between: ▪ **Disable Limits**: Do not use the channel data to control the sensor status. ▪ **Enable Limits**: Define limits. Additional fields appear below. The sensor of this channel will enter a **Warning** or **Down** status when limits are undercut or overrun. Note: The limits option is not available for the channel **Downtime**. Note: If a channel uses lookups [3095], we strongly recommend that you control the sensor status only via the lookup definition. If you define limits in addition here, the sensor will use both the channel limits and the status as defined in the lookup file. In this case, channel limits will determine the overall status of the sensor and overwrite the sensor message while the channel gauge still shows the status as defined in the lookups. Note: You can show limits in graphs (highlighted in yellow or red) if you select exactly one channel with a limit in a graph.
Upper Error Limit [unit]	This field is only visible if you enable limits above. Specify an upper limit for a **Down** status. If the channel values overrun this value, the sensor will be **Down**. Please enter an integer value or leave the field empty. Note: While a sensor shows a **Down** [135] status triggered by a limit, it will still receive data in its channels.
Upper Warning Limit [unit]	This field is only visible if you enable limits above. Specify an upper limit for a **Warning** status. If the channel values overrun this value, the sensor will be **Warning**. Please enter an integer value or leave the field empty.
Lower Warning Limit [unit]	This field is only visible if you enable limits above. Specify a lower limit for a **Warning** status. If the channel values undercut this value, the sensor will be **Warning**. Please enter an integer value or leave the field empty.

EDIT CHANNEL

Lower Error Limit [unit]	This field is only visible if you enable limits above. Specify a lower limit for a **Down** status. If the channel values undercut this value, the sensor will be **Down**. Please enter an integer value or leave the field empty. Note: While a sensor shows a **Down** 135 status triggered by a limit, it will still receive data in its channels.
Error Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a **Down** status. Please enter a string or leave the field empty.
Warning Limit Message	This field is only visible if you enable limits above. Enter an additional message. It will be added to the sensor message when showing a **Warning** status. Please enter a string or leave the field empty.

Click **Ok** to store your settings and to close the settings window. Click **Apply** to save the changed settings while the **Edit Channel** window remains open. This functionality is useful if you want to change the settings of other channels of the current sensor as well. You can select another channel via the drop-down menu on top of the settings window. You can close the settings window without saving with by clicking **Cancel**.

Note: If you have changed any settings and click **Cancel** or choose another channel via the drop-down menu without applying the changes, PRTG will ask you to confirm this step. **Discard Changes** will ignore any edits and closes the window or shows the settings of another selected channel. Click **Save** to apply your changes.

Knowledge Base: What is the Value Mode in channel settings?

- http://kb.paessler.com/en/topic/60238

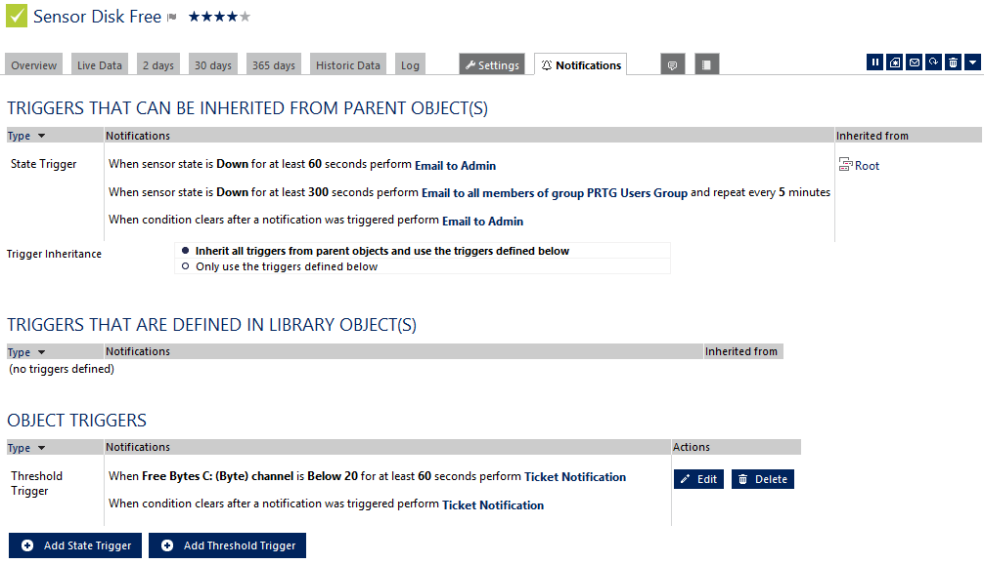
Sensor Settings Overview

For information about sensor settings, please see the following sections:

- **Sensor Settings—** 347 **List of Available Sensor Types** 348
- **Additional Sensor Types (Custom Sensors)** 2707
- **Sensor Channels Settings** 2711
- **Sensor Notifications Settings** 2719

6.11 Sensor Notifications Settings

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs.



Example of Notification Trigger Settings

Click here to enlarge: http://media.paessler.com/prtg-screenshots/notification_trigger.png

Although the sensors activate a trigger, you can set notification triggers higher in the hierarchy (for example for groups or devices). Because of this you can define triggers for multiple sensors using the inheritance mechanism 94. Monitoring objects with inherited triggers show these in section **Triggers That Can Be Inherited From Parent Object(s)** on the **Notifications** tab.

PRTG already includes a default notification trigger for the **Root Group** 90. This default trigger provokes the standard notification **Email and push notification to admin** if there is any sensor in down status 135 in your PRTG installation for at least 10 minutes.

You can also define notification triggers in **Libraries** 2770. Sensors which are in a library with defined triggers show these triggers in section **Triggers That Are Defined in Library Object (s)** on the **Notifications** tab.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2877.

2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2852.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2836.
4. Checking and setting up **Notification Triggers** for objects. These provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2719.

Note: We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2841 and one SMS notification 2843. If delivery via email fails (due to a email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2721 and a notification via a delivery method other than the one for the first trigger. Or by sett up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2759 section.

Available Notification Triggers Settings

On an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The available options are the same for all objects. When defining triggers for probes, groups, or devices, they can be inherited down to sensor level.

TRIGGERS THAT CAN BE INHERITED FROM PARENT OBJECT(S)

You see a list of all notification triggers that are defined higher in the hierarchy. The list is empty and shows the message **(no triggers defined)** when you have not set any triggers in probes, groups, or devices above the current object in the **Object Hierarchy** 89. You can see the **Type** of trigger and the **Notifications** that the monitoring objects executes once this trigger is activated.

Trigger Inheritance	Define if you want to use the triggers shown above on the current object. Choose between: ▪ **Inherit all triggers from parent objects and use the triggers defined below**: Use the triggers shown above. If the defined condition is met, the corresponding trigger is activated and the notification provoked. Click the notification name to open its settings page 2836. Click the name of the monitoring object in the column **Inherited from** to open its **Overview** tab. ▪ **Only use triggers defined below**: Do not use the triggers shown above. Do only use the triggers that you define below in section **Object Triggers** for this object. This setting is valid for all triggers shown above. It is not possible to only select some of the triggers.

In section **Triggers that are defined in library object(s)** you see all notification triggers that are set for **Libraries** 2770 which contain the currently selected sensor.

TRIGGERS THAT ARE DEFINED IN LIBRARY OBJECT(S)

You see a list of all notification triggers that are defined in libraries which include the currently selected sensor. The list is empty and shows the message **(no triggers defined)** when you have not set any triggers in libraries that contain the current sensor. You can see the **Type** of trigger and the **Notifications** that the sensor executes once this trigger is activated.

Click the notification name to open its settings page 2836. Click a library name in the column **Inherited from** to view this library.

Note: You cannot turn off trigger usage for the current sensor from a library here. If you do not want to use any notification triggers from a library for this sensor, open the library and remove this sensor from it or refine the triggers on the **Notifications** 2783 tab.

You can set up one or more of the following triggers, each with different setting options. Which trigger types are visible depends on the kind of object you edit:

- Add State Trigger 2721
- Add Speed Trigger 2723
- Add Volume Trigger 2725
- Add Threshold Trigger 2727
- Add Change Trigger 2728

You can create all notification triggers by forming sentences in "natural language". There are different options available for every type.

Add State Trigger

Define a trigger that is activated when a sensor changes its current status. This is the most common reason to send out notifications. Click the **Add State Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2836 to be executed.

STATE TRIGGER

When sensor state is [...]	Select the condition that will trigger the notification. The trigger will be activated when a sensor enters the selected status. Choose from the drop down menu:

STATE TRIGGER

	▪ **Down**: The trigger is activated if a sensor changes to a **Down** status. ▪ **Warning**: The trigger is activated if a sensor changes to a **Warning** status. ▪ **Unusual**: The trigger is activated if a sensor changes to an **Unusual** status. ▪ **Partial Down**: The trigger is activated if a sensor changes to a **Down (Partial)** status (available in a cluster 87 configuration).
...for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification. This can avoid false alarms if a sensor 'flickers' and, for example, changes to a down status for just a few seconds. If the selected condition (the sensor status) persists after the defined time in seconds, the notification is triggered. Please enter an integer value.
...perform [...]	Select a notification that PRTG sends out if the selected condition (the sensor status) is true and the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger.
When sensor state is [...] for at least [...] seconds	Define an escalation latency in seconds. This "escalation" triggers a second notification if the number of seconds you enter here has passed since the sensor status has entered the defined condition. Use this to automatically escalate a notification in case a problem persists for a longer time. Please enter an integer value. Note: PRTG takes automatically the status from the first trigger condition above.
...perform [...]	Select a (second) notification that PRTG sends out if the selected condition (the sensor status) is true and the escalation latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger. Hint: Select a notification with another delivery method than above to ensure the delivery in case of technical issues with the first notification.

STATE TRIGGER

...and repeat every [...] minutes	Define an interval in minutes in which PRTG sends the escalation notification (defined above) repeatedly. The second (escalation) notification defined will be resent every x minutes which you enter here. Please enter an integer value. Note: If you enter 0, PRTG will not send repeating escalation notifications.
When condition clears after a notification was triggered perform [...]	Select a notification that PRTG sends out if the selected condition (the sensor status) is not true any more because the sensor status changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger. Note: PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select "no notification" above, you will get the notification about the cleared condition nevertheless if you define it here. The definition of an "escalation" notification does not influence notifications for cleared conditions.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

Add Speed Trigger

Define a trigger that is activated when the currently monitored speed in a sensor changes (for example, a traffic sensor). Click the **Add Speed Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2836 to be executed.

SPEED TRIGGER

When [...] **channel**	From the drop down menu, select the channel whose data PRTG considers for speed comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings 347), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...is [...]	Select the condition that will trigger the notification. Choose from the drop down menu:

SPEED TRIGGER

	▪ **Above**: The trigger is activated if the value of the selected channel exceeds a defined value. ▪ **Below**: The trigger is activated if the value of the selected channel falls below a defined value. ▪ **Equal To**: The trigger is activated if the value of the selected channel is the same as a defined value. ▪ **Not Equal To**: The trigger is activated if the value of the selected channel is different than a defined value.
[value]	Define the value to which PRTG compares the channel data. Please enter an integer value.
[scale]	From the drop down menu, select the unit in which you entered the **[value]** above. **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose between: ▪ **bit** ▪ **kbit** ▪ **mbit** ▪ **gbit** ▪ **tbit** ▪ **Byte** ▪ **KByte** ▪ **MByte** ▪ **GByte** ▪ **TByte**
[time]	Select the time for the scale (so you create a scale per time unit). Choose from the drop down menu: ▪ **second** ▪ **minute** ▪ **hour** ▪ **day** **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit PRTG will automatically convert values internally.

SPEED TRIGGER

..for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification. This can avoid false alarms if a channel reaches a limit for just a few moments. If the combined channel condition of **[value]**, **[scale]**, and **[time]** persists after the defined time span, the notification will be triggered. Please enter an integer value.
...perform [...]	Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is true and the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger.
When condition clears perform [...]	Select a notification that is triggered if the combined channel condition of **[value]**, **[scale]**, and **[time]** is not true any more because the channel value has changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger. Note: PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select "no notification" above, you will get the notification about the cleared condition nevertheless if you define it here.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

Note: No escalation notification and no repeat are available for this trigger type.

Add Volume Trigger

Define a trigger that is activated when a sensor (for example, a traffic sensor) reaches a certain volume limit in a specified time. Click the **Add Volume Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) 2836 to be executed.

VOLUME TRIGGER

When [...] **channel**	From the drop down menu, select the channel whose data PRTG considers for this comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings 347), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...has reached [value]	Define the value to which PRTG compares the channel data. If the channel data exceeds this value, a notification is triggered. Please enter an integer value.
[scale]	From the drop down menu, select the unit in which you entered the **[value]** above. **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally. Choose between: ▪ **Byte** ▪ **KByte** ▪ **MByte** ▪ **GByte** ▪ **TByte**
per [time]	Select the time for the scale (so you create a scale per time designation). Choose from the drop down menu: ▪ **Hour** ▪ **Day** ▪ **Week** ▪ **Month** **[scale]** and **[time]** together define the unit for the given value. If the channel data is shown in a different unit, PRTG will automatically convert values internally.
...perform [...]	Select a notification that is triggered if the **[value]** in the combined unit of **[scale]** and **[time]** is exceeded. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger.
Save	Click **Save** to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

Note: No escalation notification, no repeat, and no notification when condition clears are available for this trigger type.

Add Threshold Trigger

Define a trigger that is activated when a sensor reaches specific values. Click the **Add Threshold Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Define the settings as described below. Every trigger provokes one or more notification(s) [2836] to be executed.

THRESHOLD TRIGGER	
When [...] **channel**	From the drop down menu, select the channel whose data PRTG considers for this comparison. Select **Primary** to generally use the primary channel of a sensor (you can define this in the sensor settings [347]), or choose a specific channel name from the list (there are different channels for every sensor type). All following settings for this trigger are based on the chosen channel.
...is [...]	Select the condition that will trigger the notification. Choose from the drop down menu: ▪ **Above**: The trigger is activated if the value of the selected channel exceeds a defined value. ▪ **Below**: The trigger is activated if the value of the selected channel falls below a defined value. ▪ **Equal To**: The trigger is activated if the value of the selected channel is the same as a defined value. ▪ **Not Equal To**: The trigger is activated if the value of the selected channel is different than a defined value.
[value]	Define the value to which PRTG compares the channel data. Enter values in the smallest possible (base) unit, for example, in bytes or seconds. Please enter an integer value.
..for at least [...] seconds	Define how many seconds PRTG waits before it sends out a notification. This can avoid false alarms in case a channel reaches a limit for just a few moments. If the defined channel condition persists after the defined time span, the notification is triggered. Please enter an integer value.

THRESHOLD TRIGGER	
...perform [...]	Select a notification that is triggered if the defined channel condition is true and the latency time defined has elapsed. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger.
When condition clears perform [...]	Select a notification that is triggered if the defined channel condition is not true any more because the channel value has changed again. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings. You can also choose **no notification** to only use other conditions for this trigger. Note: PRTG sends notifications about cleared conditions if the time for the trigger activation elapsed (defined in the first line) and you choose a notification here. If you select "no notification" above, you will get the notification about the cleared condition nevertheless if you define it here.
Save	Click **Save** button to confirm your settings.
Cancel	Click **Cancel** to undo your changes.

Note: No escalation notification and no repeat are available for this trigger type.

Add Change Trigger

Define a trigger that is activated by an 'on change' trigger. Some sensors offer the option to send such a trigger whenever sensor values have changed. Click the **Add Change Trigger** button to add a new trigger, or click the **Edit** button next to an existing notification to change it. Then define settings as described below. Every trigger will provoke one or more notification (s) 2836 to be executed.

CHANGE TRIGGER	
When sensor changes perform [...]	Select a notification that is triggered whenever a compatible sensor sends a 'change notification'. You can enable this option in the settings 347 of some sensors. The notification trigger is activated immediately whenever a sensor sends an 'on change' trigger. Choose a notification from the drop down menu. The menu shows all notifications defined in the **Account Settings—Notifications** 2836 settings.

Note: There are no other options available for this trigger type.

Sensor Settings Overview

For information about sensor settings, please see the following sections:

- Sensor Settings—347 List of Available Sensor Types 348
- Additional Sensor Types (Custom Sensors) 2707
- Sensor Channels Settings 2711
- Sensor Notifications Settings 2719

Object Settings Overview

For more general information about object settings, please see section Object Settings 159.

Part 7

Ajax Web Interface—Advanced Procedures

7 Ajax Web Interface—Advanced Procedures

The Ajax-based web interface is your access to PRTG. Use it to configure devices and sensors, to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, using Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While you are logged in 110, the PRTG web interface permanently refreshes the data on the screen permanently (via Ajax calls) so it always shows the current monitoring results (you can set 2890 refresh interval and method individually).

Because the web interface works as a Single Page Application (SPA), you rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements are refreshed when necessary. The AJAX web interface shows all object setting dialogs as pop-up layers, so you never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible. The responsive design of the web interface ensures that it always adjusts to the size of your screen to see more information at a glance.

The following sections introduce more advanced procedures in the Ajax Graphical User Interface (GUI).

7.1 Toplists

Packet Sniffer and xFlow (NetFlow, jFlow, sFlow, IPFIX) sensor types can not only measure the total bandwidth usage, they can also break down the traffic by IP address, port, protocol, and other parameters. The results are shown in so-called **Toplists**. This way PRTG is able to tell which IP address, connection, or protocol uses the most bandwidth. PRTG looks at all network packets (or streams) and collects the bandwidth information for all IPs, ports, and protocols. At the end of the toplist period, PRTG stores only the top entries of each list in its database.

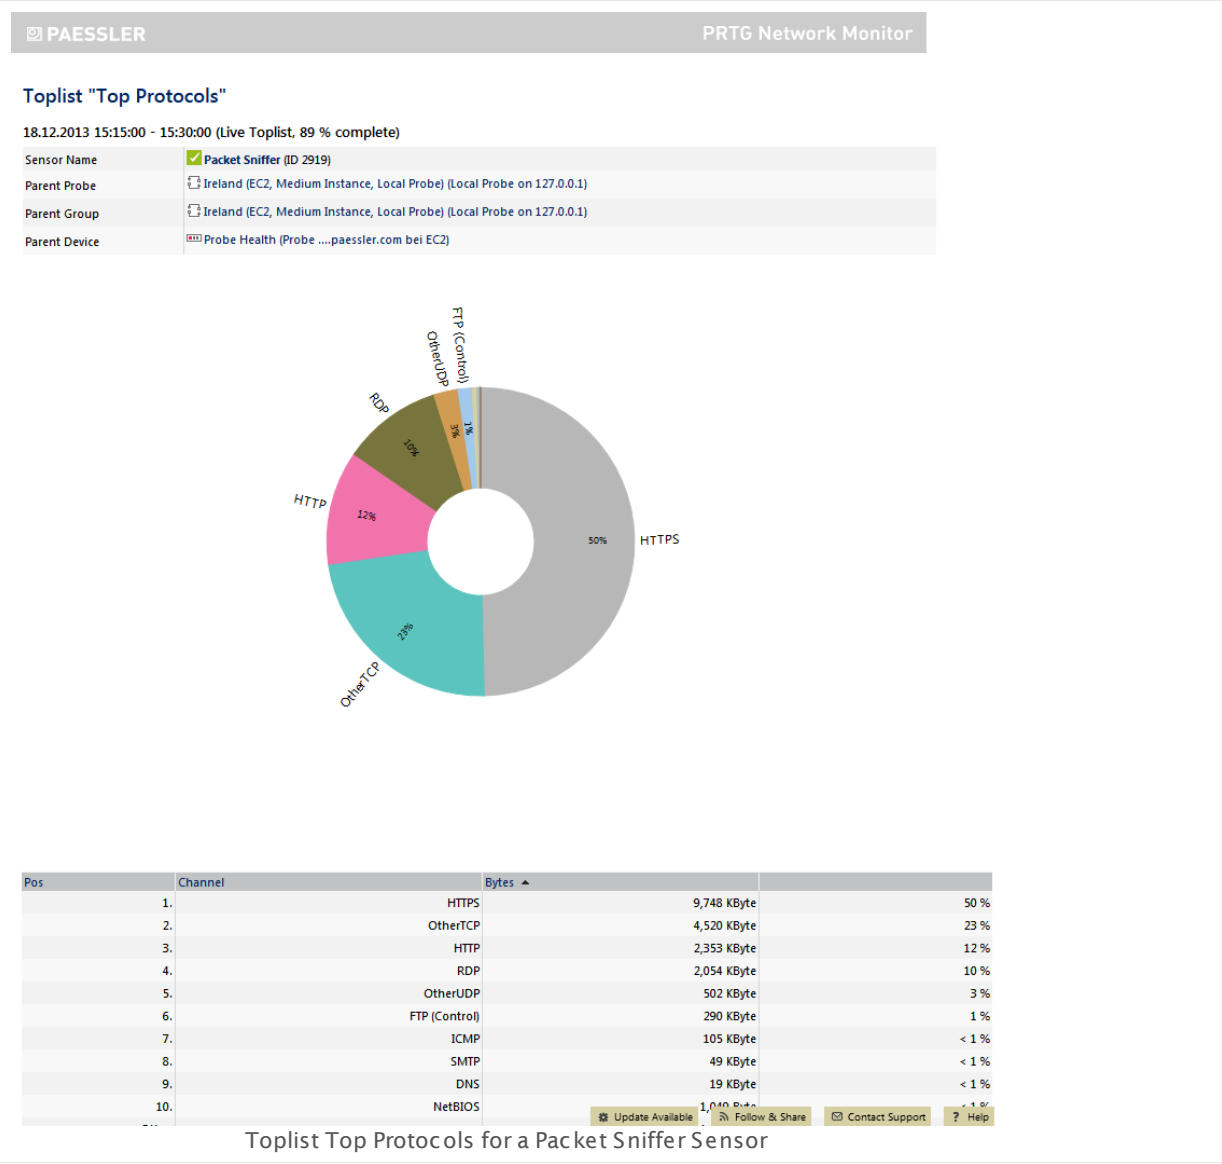
Only Top Entries are Stored

Storing all available analysis data in a database during the analysis process would create a huge amount of data which would be very slow to transfer between probe and core and also retrieving data would be too slow. By storing only the top 100 entries for short periods of time it is possible to reduce the amount of data to a minimum while still being able to identify devices with huge bandwidth usage.

Toplists Overview

Toplists are available for xFlow, IPFIX, and Packet Sniffer sensors 349 only. Toplist graphs are displayed right on the sensor overview page. By default, there are three different toplists predefined for each sensor:

- **Top Connections**: Shows bandwidth usage by connection.
- **Top Protocols**: Shows bandwidth usage by protocol.
- **Top Talkers**: Shows bandwidth usage by IP address.



Toplist Top Protocols for a Packet Sniffer Sensor

Click one of these items to view a distribution chart and a list of source and destination IP and port, protocols, kind of traffic in different channels, for example. It depends on the selected list which information is available. Click an entry in the Toplist periods list on the left side to view data for a certain time span. By default, a time span of 15 minutes is set. You can also manually define start and end time of the Toplist period you want to view. Use the date time picker to enter the date and time. Additionally, several table list options 178 are available.

To print a Toplist, click the **Print This Toplist** button to view a printer-friendly version. Use the print option of your browser to send it to your printer. With **Sensor Overview** you can return to the current sensor's overview tab. For a quick selection of other Toplists of the current sensor, click one of the Toplist icons at the top of the page.

In the sensor overview, you can add or delete new Toplists, or edit existing ones.

Add

Click the **Add Toplist** tile in the sensor overview to create a new Toplist. The available options are the same as for editing 2736 a list.

Edit

Click the small gear icon of a Toplist tile in the sensor overview to modify it.

TOPLIST

Name	Enter a meaningful name to identify the toplist.
Type	▪ **Top Talkers (Which IPs use the most bandwidth?)**: Shows bandwidth usage by IP address. ▪ **Top Connections (Which connections use most bandwidth?)**: Shows bandwidth usage by connection. ▪ **Top Protocols (Which protocols use the most bandwidth?)**: Shows bandwidth usage by protocol. ▪ **Custom (Create your own Toplist)**: Create your own list by selecting criteria below.
Toplist Fields	This setting is only available if you select a custom type above. Select the fields you want to add to the Toplist by adding a check mark in front of the respective field name. The available options depend on the type of sensor used. They are different for Packet Sniffer, NetFlow v5, v9 (and IPFIX), and sFlow. Note: For performance reasons, only select the fields you really want to monitor. Please see **Performance Considerations** 2738 section below.
Period (Minutes)	Define the interval for the Toplist in minutes. Please enter an integer value. Toplists always cover a certain time span. Once a time span has passed, the top results are stored and a new Toplist is started. Note: To avoid load problems on your probe system, please do not set this interval too long. Default setting is **15** minutes. Please see **Performance Considerations** 2738 section below.
Top Count	Define the length of your Toplist. Only this number of entries will be stored for each period. Please enter an integer value. Note: To avoid load problems on your probe system, please set this value as low as possible. Default setting is **100** to store the top 100 entries for each period. Please see **Performance Considerations** 2738 section below.

TOPLIST

Reverse DNS	Define if your you want to do a reverse Domain Name Service (DNS) lookup for IP addresses stored in the Toplist. Choose between: ▪ **Do a reverse DNS lookup for IPs**: Determine the domain name associated with an IP address and show it in the Toplist. ▪ **Do no reverse DNS lookup (faster)**: Show IP addresses only. Choose this option to increase performance.
Probe/Core Data Transfer	Define how the probe sends the Toplist data set to the core server. Choose between: ▪ **According to sensor interval (default)**: Send data in the interval defined in the settings of the sensor for which you create this Toplist. This can create a lot of bandwidth and CPU load with many sniffer sensors, complex traffic, or long Toplists. ▪ **Wait until Toplist period ends (less CPU and bandwidth usage)**: Send data once a Toplist period has finished. This will create less bandwidth usage and CPU load, but you cannot see the current Toplist in the web interface, only Toplists with finished periods. For more information, please see **Performance Considerations** 2738 section below.
Memory Limit (MB)	Define the maximal amount of memory in MB the probe will use for collecting the different connection information. Every Toplist adds its amount to the probe's memory consumption. Increase this value if the number of captured connections is not sufficient. Please enter an integer value.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Delete

Click the small trashcan icon of a Toplist tile in the sensor overview to delete it. Confirm with **Delete** to delete the list.

Details

Click on the windows symbol to show details of a Toplist.

Performance Considerations

If you create Toplists for data lines with considerable usage (for example, steady bandwidth over 10 Mbit/s) or if the traffic is very diverse (for example, many IPs/ports with only little traffic each) please consider the following aspects:

- The probe gathers all information needed for the Toplist in RAM memory during each period. Only the top 100 entries are transferred to the core. Depending on the Toplist type and traffic patterns the required memory can grow into many megabytes.
- Choose periods as short as possible (especially important when traffic has a high level of diversity) to minimize memory usage.
- Memory requirements can grow almost exponentially with each field used in the Toplist definition (depending on traffic pattern). Avoid complex Toplists for high and diverse traffic. For example, **Top Connections** (5 fields) needs a lot more memory than **Top Talkers** (1 field).
- If you experience high bandwidth usage between core and probe try to choose the **Wait until Toplist period ends** option in the Toplist settings 2736.
- If you experience Data incomplete, memory limit was exceeded messages, try to increase the memory limit in the Toplist settings but keep an eye on the memory usage of the probe process.
- To increase the performance of a Toplist, disable the reverse DNS lookup.

Notes

- When working with Toplists, be aware that privacy issues can come up for certain configurations of this feature. Using Toplists you can track all single connections of an individual PC to the outside world and you, as the administrator, must make sure it is legal for you to configure PRTG like this.
- Keep in mind that Toplists can be viewed through the web interface. You may not want to show lists of domains used in your network to others, so restrict access rights 101 to sensor types having Toplists.
- Note that diagrams, for example, for top connections are not meant to be used for detailed analysis. Rather they should indicate if there is an uncommon bigger change in this Toplist.

More

- **Monitoring Bandwidth via Flows** 3012
- **Monitoring Bandwidth via Packet Sniffing** 3010

7.2 Arrange Objects

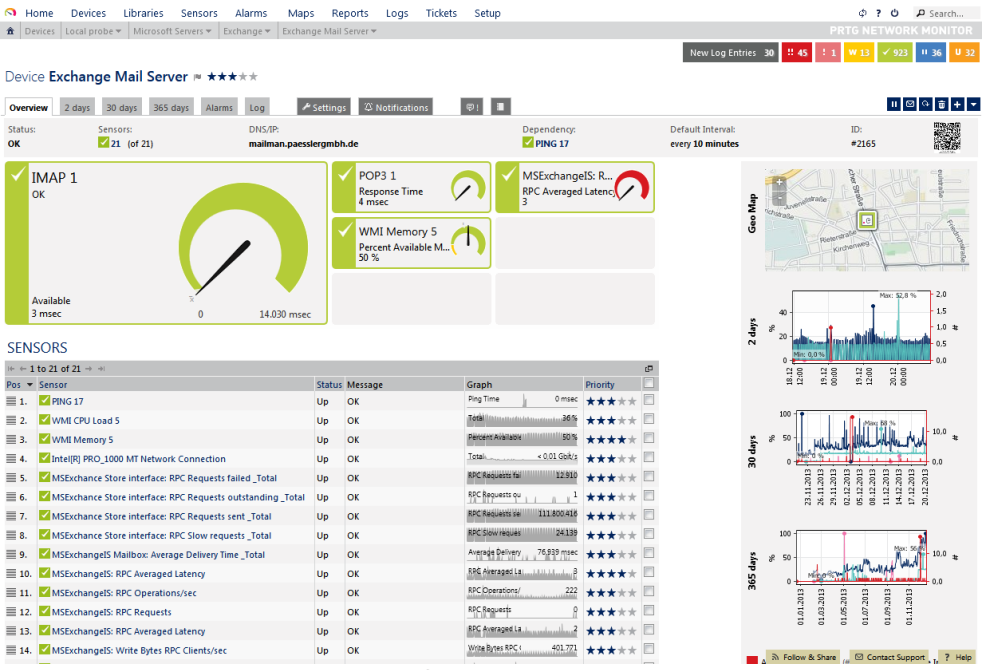
There are several options to move objects within the device tree, or to move objects from one probe or group to another.

Manage Tab in Device Tree

While viewing the device tree (or parts of it), click the **Management** tab to switch to a tree view in which you can move monitoring objects using drag&drop in your browser window. For more information, see section Manage Device Tree 258.

Device Details View: Arrange Sensors

When you view the **Overview** tab of a device, you see a list of all sensors on this device.



Arrange Sensors on a Device

Click the column headers **Pos, Sensor, Status,** or **Priority** to re-sort the sensor list. To change a sensor's position, click the small grip at the beginning of the row, drag it to the position you like, and drop it. Changes take effect immediately.

Context Menu: Move

You can also right-click any object in the device tree to show the context menu 186. Select the **Move** entry to move sensors, devices, or groups up and down, or to move groups or devices into other groups or on other probes.

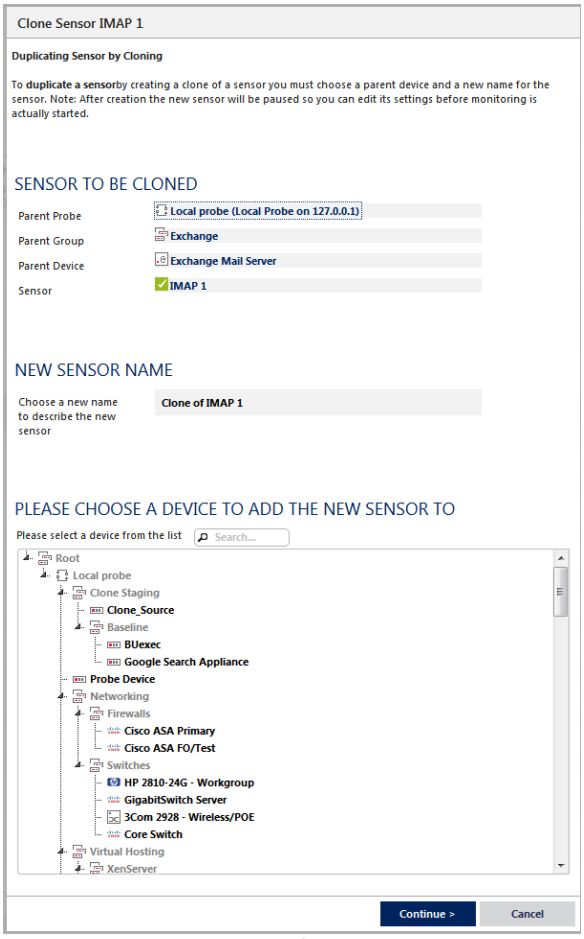
7.3 Clone Object

If you want to duplicate an object with the same settings, you can clone it. Cloning is available for groups, devices, and sensors. Unlike the results when using the **Create Device Template** 2747 option, a cloned device contains all objects of the original device, regardless of whether they bring about working sensors or not (which often depends on the settings of the cloned device).

Note: You cannot clone 'fixed' objects, such as the root group or a probe device.

Note: If you want to clone a sensor, a faster way is to use the **Manage Device Tree** 258 function.

To start, right-click an object in your device tree, and from the context menu 186, select **Clone...** to open an assistant.



Clone Dialog for a Sensor

Clone Object Settings

OBJECT TO BE CLONED

Object	Several fields show information about the object that you are going to clone. The available information varies depending on whether you are about to clone a group, device, or sensor.

NAME OF NEW OBJECT

New Object Name	Enter a meaningful name for the new object to identify it later in, for example, the device tree or lists. By default, PRTG uses the old name with a preceding Clone of.
New IP Address/DNS Name	This field is only available when you clone a device. Enter the IP address or DNS name for the new device.

PARENT GROUP/DEVICE FOR NEW OBJECT

From the device tree shown, choose an object you want to add the object clone to. If you clone a group or device, select a group. If you clone a sensor, select the device you want to add it to.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

You will be redirected to the overview 137 page of the new object that you cloned. By default, all sensors are initially paused 185 so you can change settings before monitoring starts. Please check the settings 159 and resume 185 monitoring.

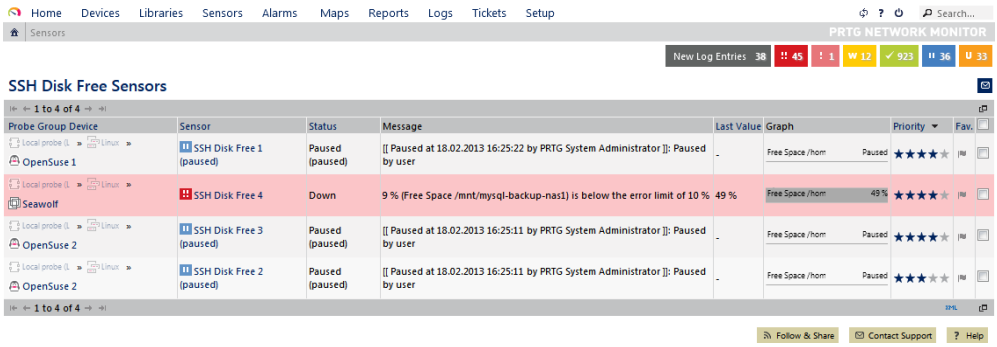
7.4 Multi-Edit

Device and sensor table lists, as well as some other lists, offer multi-edit functionality. With this, you can bulk edit the properties of many objects at a time. Multi-edit is also available in the **Management** tab if you select multiple objects by holding down the Ctrl key (see Manage Device Tree 259).

Note: You cannot change every setting type with multi-edit. PRTG only displays settings which all selected objects have in common.

Note: You cannot multi-edit the standard user groups 2896 "PRTG Administrators" and "PRTG Users Group".

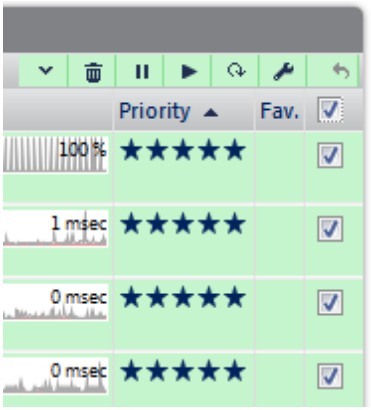


Example of a Table List

Start Multi-Edit in Lists

Start with viewing a table list. For example, choose **Sensors | By Type | ...** or **Devices | Device List | ...** from the main menu. Table lists are also available in the **Overview** tab of Libraries 2770, Maps 2810, Reports 2786, Notifications 2759, and Schedules 2856.

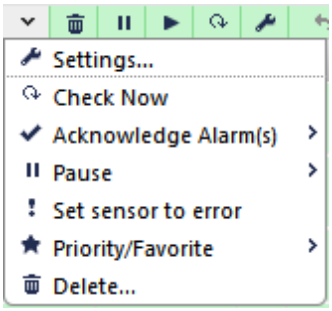
In a table list, start multi-edit by selecting objects using the check boxes on the right. You can also select all objects of the current page at once by clicking the check box in the table header. Use the **Item Count** option to view more items per page. As soon as you select one or more objects, the multi-edit menu will appear at the top of the table. Chosen objects are shaded in green.



Multi Edit Menu

Depending on the object type, different functions are available. For example, for sensor lists, some frequently used functions are available as quick buttons, such as **Delete**, **Pause**, **Resume**, **Check Now**, and **Settings**. Click one of those buttons to apply the respective function to all selected objects.

Other options are available in the drop down menu. Hover over the arrow symbol to show it.



Example of Multi Edit Drop Down Menu

The options in this menu vary depending on the kind of objects selected. Choose an entry to apply the according function to all selected objects.

Once you have selected the objects you want to change settings for, click the wrench symbol to enter the edit settings mode. For available settings, please see below.

Start Multi-Edit in Management Tab

In the device tree, start by clicking the **Management** tab.

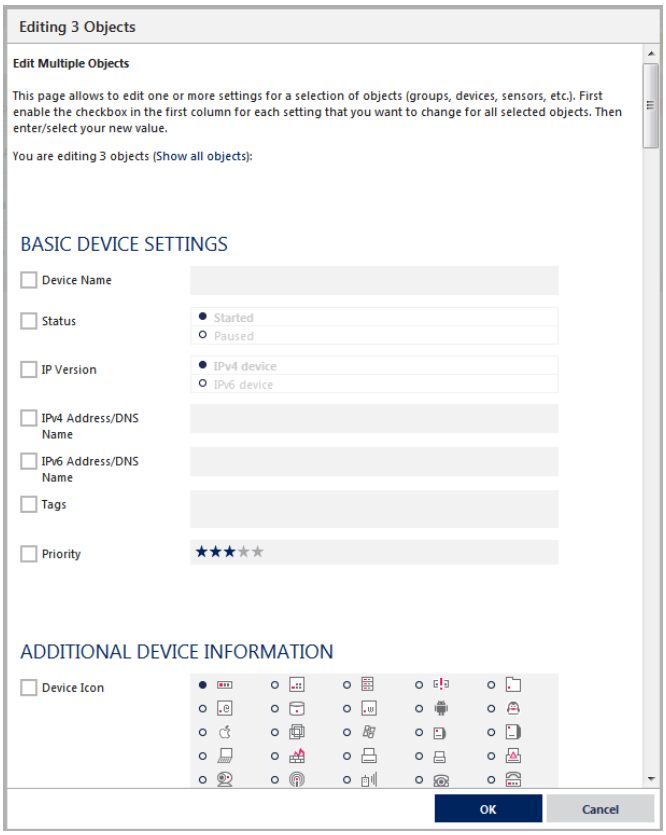
You can use Multi-Edit for object settings:

- Hold down the Ctrl key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you want to edit, change the according values, and click **Save**. The changes will be applied to all selected objects.

For available settings, please see below.

Edit Settings—Settings

The **Edit Multiple Objects** dialog box shows most of the settings which the selected sensors respectively devices have in common. For example, you can edit the name, tags, priority, scanning interval, and access rights.



Example of Device Settings in Multi-Edit Mode

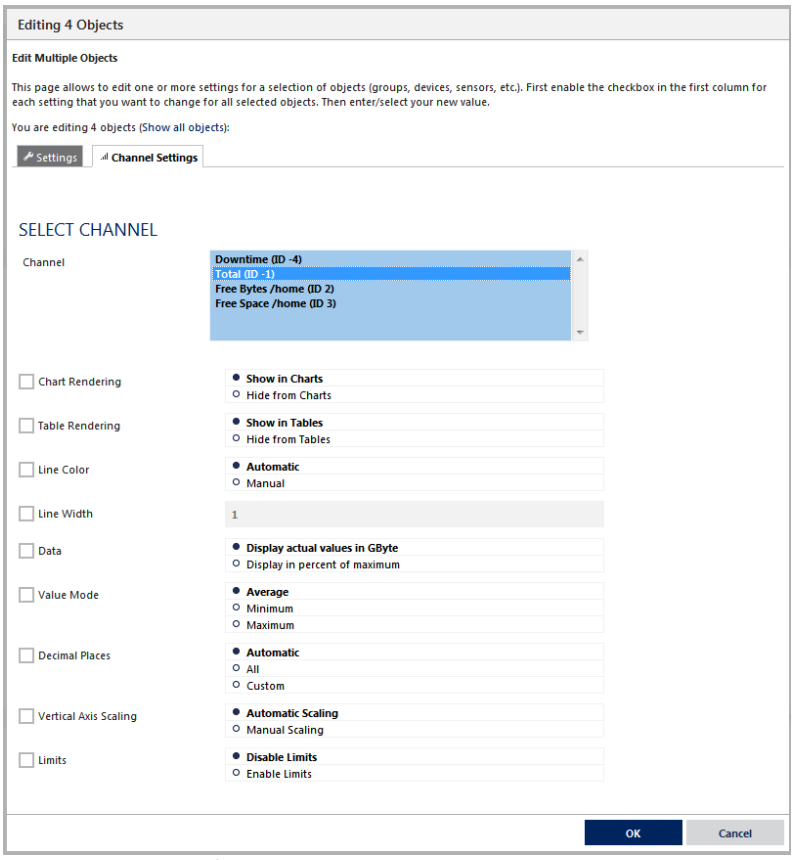
The available options depend on the selected objects and vary according to your selection. When editing multiple sensors, it may be useful to only choose one certain sensor type from the list, so that there are as much settings as possible available for multi-edit.

To change a property, add a check mark in front of the respective line and then change the settings. The new setting(s) will be applied to all objects you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X** or **Cancel** button, all changes to the settings will be lost!

Edit Settings—Channel Settings

The **Channel Settings** tab in the **Edit Multiple Objects** dialog box is only available when editing sensors. You can edit settings of all channels which the selected sensors have in common. Select a channel name from the **Channel** list. You can then edit, for example, display settings, colors, scaling, and limits.



Example of Sensor Channel Settings in Multi-Edit Mode

The available options depend on the selected sensors and vary according to your selection. It may be useful to only choose one certain sensor type from the list, so that there are as much channel settings as possible available for multi-edit.

To change a property, add a check mark in front of the respective line and then change the channel settings. The new setting(s) will be applied to all sensors you selected for multi-edit. All properties that are not activated with a check mark remain unchanged.

Click **OK** to store your settings. If you close the dialog box via the **X** or **Cancel** button, all changes to the settings will be lost!

Related Topics

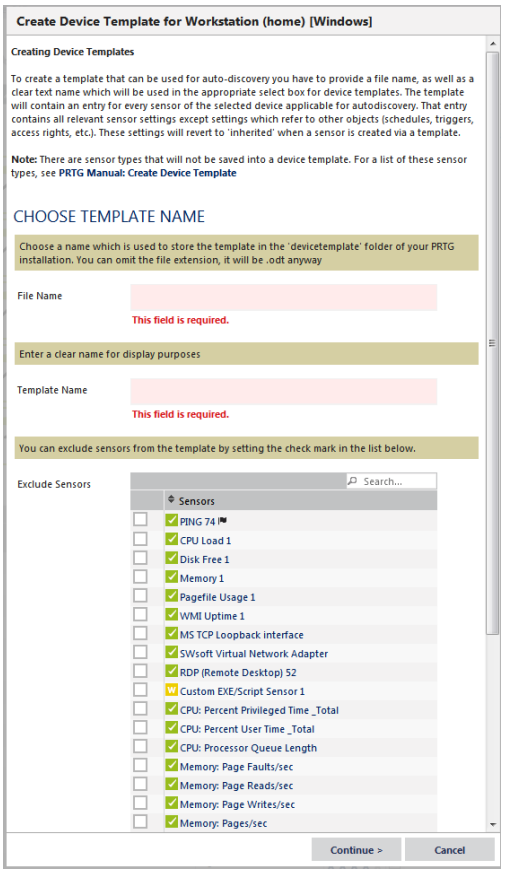
- Working with Table Lists 178

- Manage Device Tree 258

7.5 Create Device Template

If you want to add a certain device several times, you can create a device template from an existing device in your device tree. When creating a device template, PRTG will save information for nearly all sensors on this device to a template file that you can later use in combination with **Auto-Discovery** 219 (restrictions 2748 apply for a few sensor types). From the sensors, all relevant settings are saved, except settings that refer to other objects, such as schedules 99, notification triggers 2759, and access rights 101. PRTG will automatically revert them to **Inherit**.

To start, right-click a device in your device tree. From the context menu 186, select **Create Device Template...**. An assistant appears.



Create Device Template Assistant

Device Template Settings

CHOOSE TEMPLATE NAME

File Name	Enter a name under which PRTG will store the file. Template files have the extension .odt in the \PRTG Network Monitor \devicetemplates sub-directory of your PRTG core installation 3135 (of the Master node, if in a cluster 87). If a file with this name already exists in this directory, you will see an according error message.
Template Name	Enter a meaningful display name for the template as it will appear in the web interface.
Exclude Sensors	Select sensors that you do not want to include into the device template. Mark the corresponding checkboxes of the sensors which you do not want to include into the device template. Note: Sensors that cannot be saved into templates 2748 will not appear in this list. Note: Sensor types that dynamically scan for available monitoring items when you add the sensor to a device will not appear in this list. PRTG includes these sensors automatically into the template if they support template functionality. You cannot exclude them from the device template that you create.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

If your template file was saved successfully, you will see an according message. Click **OK** to finish. The device template is now stored in the program path of your PRTG core installation. Your device template file contains all sensors, including their settings, of the original device.

During your next auto-discovery, choose the **Automatic sensor creation using specific device template(s)** option and select the name of your newly created device template from the list. PRTG will then try to discover the stored sensor types on the new (or existing) device. If the physical device answers to a sensor request, the sensor is added to the PRTG device. For detailed information, please see **Auto-Discovery** 219 section.

Settings That Are Not Saved

There are a few settings that you cannot save into a device template, so PRTG will set them to default, for example, the Dependency Type setting **Master object for parent** (in **Schedules and Dependencies** section) and Result Handling settings **Write result do disk** (because this is intended for debugging purposes only). Also, settings in the **Access Rights** section are not saved to avoid security flaws.

Note: In general, you cannot save all Sensor Settings 347 and Sensor Channels Settings 2711 (for example, channel limits) of sensor types that dynamically scan for available monitoring items when you add the sensor. This affects, for example, traffic sensors where you can choose the interfaces you want to monitor in the add sensor dialog 256.

Furthermore, due to internal restrictions, the following sensor types will not be saved into a device template:

- **Business Process**
- **Core/Probe/Cluster Health**
- **DHCP**
- **Docker Container Status**
- **Dropbox**
- **Enterprise Virtual Array**
- **Google Analytics**
- **Google Drive**
- **IPFIX**
- **IPFIX (Custom)**
- **IPMI System Health**
- **jFlow V5**
- **jFlow V5 (Custom)**
- **Microsoft OneDrive**
- **NetApp cDOT Aggregate (SOAP)**
- **NetApp cDOT I/O (SOAP)**
- **NetApp cDOT Physical Disk (SOAP)**
- **NetApp cDOT System Health (SOAP)**
- **NetFlow V5**
- **NetFlow V5 (Custom)**
- **NetFlow V9**
- **NetFlow V9 (Custom)**
- **Packet Sniffer**
- **Packet Sniffer (Custom)**
- **Passive Application Performance**
- **QoS (Quality of Service)**
- **QoS (Quality of Service) Roundtrip**
- **Sensor Factory**

- **sFlow**
- **sFlow (Custom)**
- **SNMP Trap Receiver**
- **Syslog Receiver**
- **WMI Security Center**
- **WMI Volume** (use **WMI Free Disk Space (Multi Drive) Sensor** 2509 instead)

No Update of Device Templates

Once a device template is created, it is not possible to add additional sensors to it. If you want to create a template with an extended set of sensors, please create a new one.

Note: When saving a new device template, all internal IDs of the sensors in this template are updated. Because of this, when you apply a new template to an existing device, PRTG will newly create all sensors that this template contains on this device, even if these sensors were previously created using another device template!

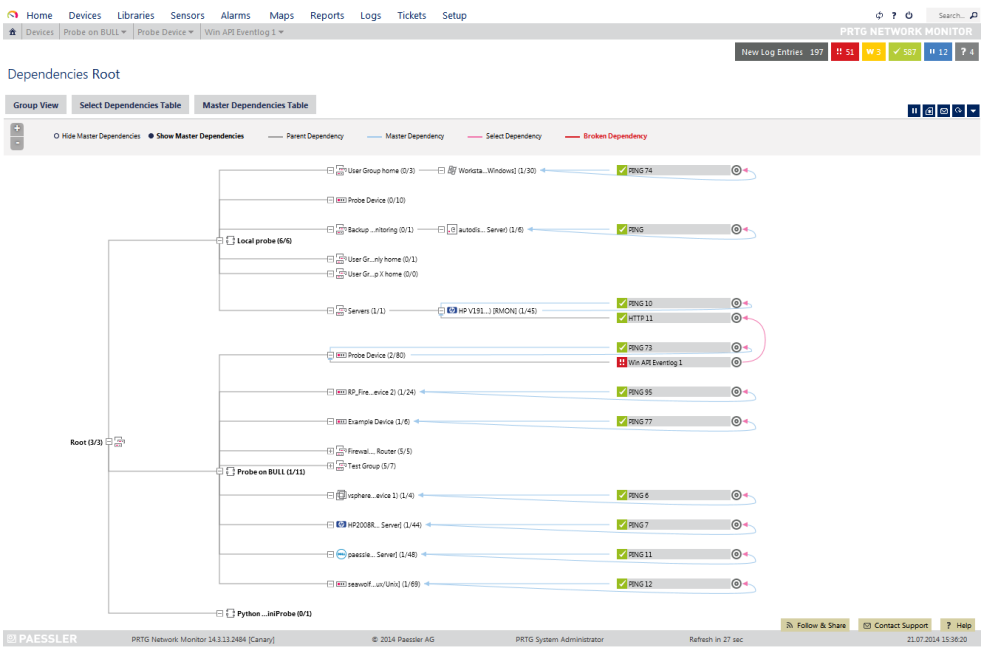
- **Clone Object** 2740
- **Manage Device Tree** 258

7.6 Show Dependencies

This function shows an overview of the dependencies configured for the objects in your setup. For a general introduction please see the Dependencies 98 section.

In the main menu, choose **Devices**. Point on the menu item **Dependencies** to show other menu items. Follow the menu path (it is specific to your setup) to view dependencies of the objects in a specific probe or group only.

- **Selected Dependencies** shows a table of manually set dependencies (section Select object in any object's settings).
- **Master Dependencies** shows a table of master dependencies.
- **Dependencies Graph** shows a visualization of device, group and sensor dependencies. See below 2751.



Dependencies Graph View

Dependencies Graph

Choose the menu item **Dependencies Graph** to see the device tree in the dependencies graph view with lines of different color connecting objects. Point on **Dependencies Graph** to show other menu items for the dependency graph (probes and groups). Click a probe or group menu item to show its dependencies directly. The lines in the dependencies graph symbolize dependencies between the monitoring objects in the device tree. Additionally, a color code 2752 is used for the dependencies.

Note: To show the Dependencies Graph, you need to access the PRTG web interface as a **PRTG System Administrator** user.

- Above the graph header bar, you can switch the dependencies view to tables of the currently selected object with the buttons **Select Dependencies Table** and **Master Dependencies Table**. The button **Group View** will show the **Overview** tab 126 of the currently selected object.
- Mark the radio button in the header bar to **Show Master Dependencies**. By default, **Hide Master Dependencies** is selected and only parent, selected, and broken dependencies are shown.
  Note: These buttons are not available in Internet Explorer for technical reasons. Please use Google Chrome 49 or later (recommended) or Mozilla Firefox 45 or later.
- Click the + or — buttons on the left in the header bar to zoom in or out of the graph.
- Click probe and group nodes to show the respective dependencies.
- Click device or sensor nodes to open the corresponding overview tab.
- Click the + or — boxes to expand or collapse probe and group nodes.
- Numbers in parentheses indicate how many child nodes of an object are shown.
- The **Highlight Connection** buttons to the right of sensors show the corresponding dependency line and parent and dependent objects in bold.

Color Code of Dependencies Graph

The line's colors show the kind and source of a dependency. This represents the **Dependency Type** as defined in the **Schedule, Dependencies, and Maintenance Window** settings of a probe, group, device, or sensor 218.

Note: You can find the color legend also in the graph header bar.

- **Gray**
  Gray lines show a dependency by inheritance (Use parent). The source of the dependency is the parent object on the left end of the line, for example, Root is the parent of Local Probe.
- **Pink**
  Pink lines show a dependency that was set manually (Select object). The source of the dependency points to the dependent with a pink arrow at the line's end.
- **Blue**
  Blue lines show a master dependency for a device (Master object for parent). The sensor which is set as the master points to the dependent device with a blue arrow head at the line's end. The arrow head from the dependent device to its master object is pink.
- **Red**
  The red color indicates broken dependencies, for example, if the master is not available.

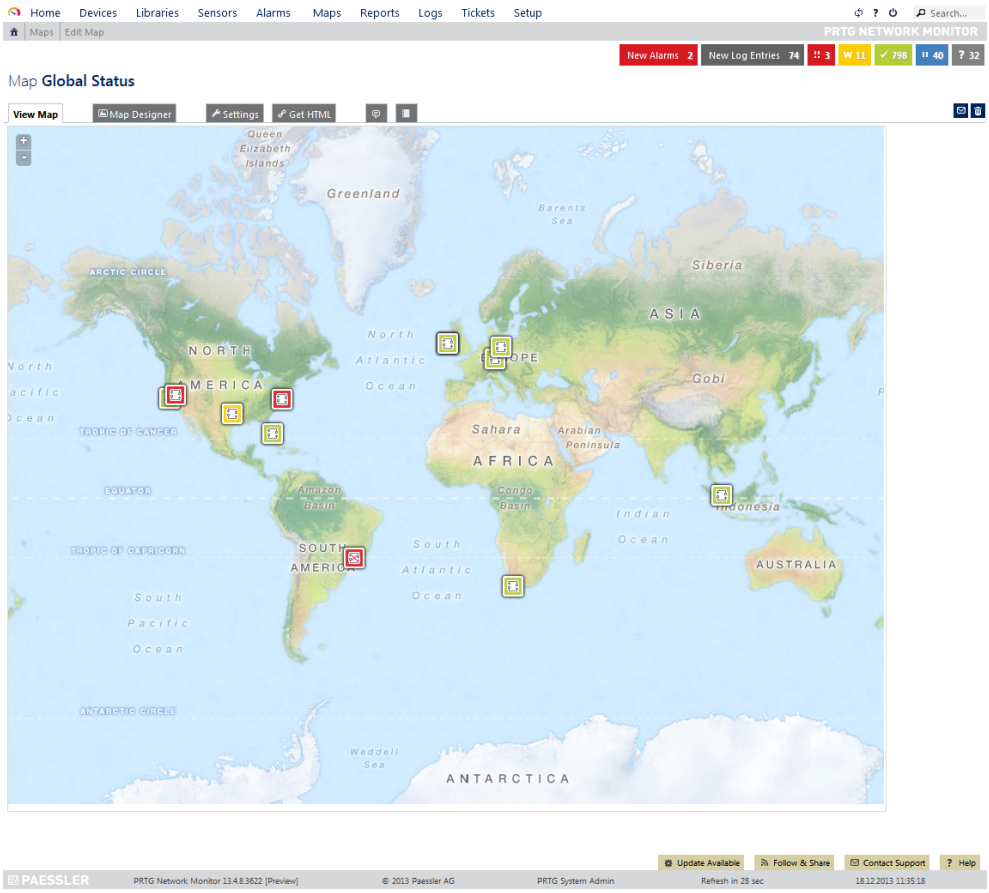
7.7 Geo Maps

With the PRTG Geo Maps feature you can visualize geographical information about your monitored objects. You can display the location of probes, groups, and devices in a graphical map on the details page of an object, or on PRTG **Maps** 2810. This feature is especially useful when you monitor networks which are spread over different locations, for example, in various cities of a country or all over the globe.

For each probe, group, or device, you can enter **Location** information. PRTG will use the first line of this information to query a geographical map which shows your objects. Your location specification will be resolved to global geographical coordinates by the PRTG core server with the help of an external map service provider.

PRTG will connect to the specified maps provider to get map tiles. These are used to set up the graphical map. Then PRTG marks the defined locations with the corresponding object icons and their status 2756 on the map. You can select your favorite map tiles provider in **System Administration—User Interface** 2861 (setting **Geo Maps**).

You can display geographical maps on the device tree. PRTG adjusts the zoom of a map automatically so that it can show all locations of a selected object. You can also add geographical maps to PRTG **Maps** 2810. To do so, open the PRTG **Map Designer** 2816 (either in an existing map or create a new one) and choose the entry **Geo Maps** from the properties menu on the right.



The Global Status of a Network in a Geo Map

Using Geo Maps

To use geographical maps within the PRTG web interface 108 or **Enterprise Console** 2938, please ensure the following:

1. In the system administration in the PRTG web interface, select the maps provider and type you want to view. There, you will also find an option to disable geo maps integration if you do not want to use it. See section **System Administration—User Interface** 2861 (setting **Geo Maps**) for detailed information.

2. In the settings of a monitoring object 159 (probe, group, device), add a city name, or address, or coordinates in the first line of the **Location** field. When you view the details of this object, PRTG will show a geographical map. PRTG uses the **Location** information also when you view objects in the **Enterprise Console** 2938 or add **Geo Maps** objects to PRTG **Maps** 2810.

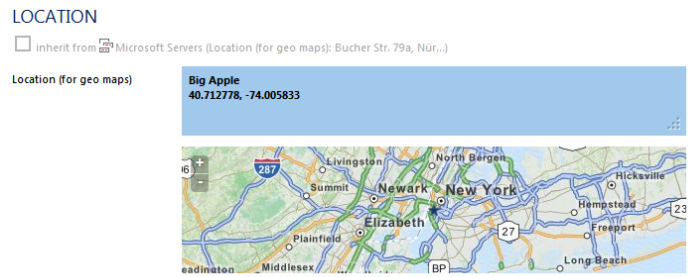
3. Make sure your PRTG core server has access to the internet to obtain map tiles. If a proxy is mandatory in your network, configure proxy settings accordingly. For details, please see **System Administration—Core & Probes** 2883. For details about tile server domains, please see the **More** 2758 section below.

Labeling Locations

You can define your own labels for locations of objects. To do so, enter the desired label in the first line of the **Location** settings and provide the geo coordinates of the location in the second line. This object will appear with the defined label in PRTG geo maps.

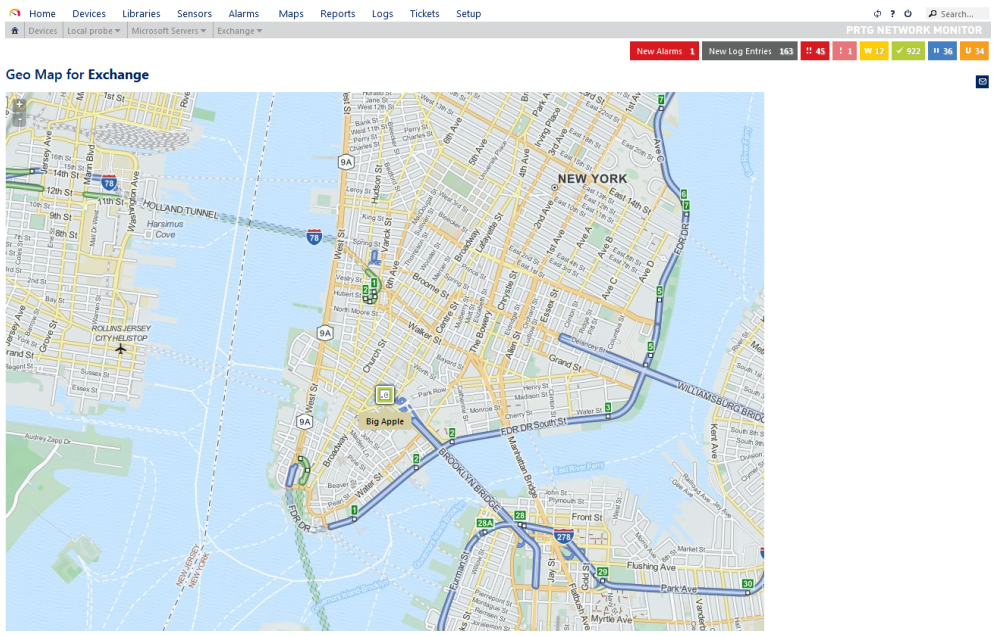
For example, add the following to the location field:

```
Big Apple
40.712778,-74.005833
```



Defining Location New York City with Geo Coordinates and Label Big Apple

The location New York City appears the with the label Big Apple:



Location New York City with Label Big Apple

It is also possible to define the same label for different locations. For example, imagine your company's headquarter is spread over several different locations. For each object representing a dedicated headquarter in the PRTG device tree, enter its coordinates in the second line of the respective **Location** settings and the label "Headquarter" in the first line. All corresponding objects will be displayed as "Headquarter". This way, you can easily find your desired objects on the map.

Map Icon Colors

On the geographical maps the different location icons show the overall status at this location by using a color code. Following, you can see all possible location states in order of their hierarchy:

Flag	Flag Color	Location Status	Meaning
	Red	**Down**	At least one sensor at this location shows a red **Down** status. Hover the circle with the letter symbol in the legend to view the total number of alarms at this location.
	Bright-Red	**Down (Acknowledged)**	At least one sensor at this location is **Down** and a PRTG user acknowledged this status with the **Acknowledge Alarm** function. The **Down** states of all sensors at this location must be acknowledged—if at least one sensor is unacknowledged down, this location will be displayed as **Down**.
	Yellow	**Warning**	At least one sensor at this location shows a yellow **Warning** status. There is no sensor in a **Down** or **Down (Acknowledged)** status at this location.
	Orange	**Unusual**	At least one sensor at this location shows an orange **Unusual** status. There is no sensor in a **Down**, **Down (Acknowledged)**, or **Warning** status at this location.
	Green	**Up**	All sensors at this location are in a green **Up** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Paused**, or **Unusual** status at this location.
	Blue	**Paused**	All sensors at this location show a blue **Paused** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, or **Up** status at this location.
	Black (Grey)	**Unknown**	All sensors at this location have an **Unknown** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, **Paused**, or **Up** status at this location.

Note: For detailed information about sensor states, please see the section **Sensor States** 135.

Geo Tracking of Your Mobile Device

It is possible to show the location of an Android device and track its movements on PRTG Geo Maps. PRTG can draw the route a device has taken directly into geo maps. For this feature, you need the PRTG Mobile Probe for Android. See section **More** 2758 for details.

7.8 Notifications

PRTG uses notifications to send you alerts whenever PRTG discovers a defined status, such as slow or failing sensors, or when sensor channels breach threshold values. You can define an unlimited number of notifications allowing to use one, or more, of several communication channels like email 2841, text messaging 2843, push notifications 2842 to Android and iOS devices, and many more 2840. PRTG sends notifications to the desired user's **Notification Contacts** 2852 that you can define for each user account of your PRTG installation.

For video instructions, please see the **More** 2761 section below.

Overview

PRTG sends a notification when a defined event evokes it. The following events can trigger notifications:

- **Sensor status changes**
  For example, when a sensor changes status to **Down** or **Warning**, if responses are slow, or sensors show an **Unusual** status.
- **Sensor value threshold breaches**
  For example, when a sensor shows a request time higher than 1,000 ms for more than 30 minutes, or when free disk space is below 10%.
- **Speed threshold breaches**
  For example, when a traffic sensor shows more than 1 Mbit/s for more than 5 minutes.
- **Volume threshold breaches**
  For example, when a traffic sensor shows more than 1 Gbyte transferred in 24 hours.
- **Sensor value changes**
  For some sensors you can trigger a notification whenever the value changes, for example, when monitoring files on a hard disk drive.

A notification can be one of these actions:

- **Send Email** 2841
- **Send Push Notification** 2842
- **Send SMS/Pager Message** 2843
- **Add Entry to Event Log** 2845
- **Send Syslog Message** 2845
- **Send SNMP Trap** 2846
- **Execute HTTP Action** 2847
- **Execute Program** 2848
- **Send Amazon Simple Notification Service (SNS) Message** 2848
- **Assign Ticket** 2849

For details, see section **Account Settings—Notifications** 2840.

Note: Usually there are three successive attempts to deliver a notification. If all of these attempts fail, the notification is lost. To never miss a notification, we recommend that you always add two different ways to get a notification. For example, use the latency setting of a state trigger 2721 to choose a notification with another delivery method than in the first trigger condition, or set up a second trigger with another notification for the corresponding object.

Notifications can contain valuable sensor information, such as:

- Last error message
- Last good/failed request
- Total downtime
- Total uptime
- Recent sensor history
- A direct link to the web interface

See **More** 2761 for available placeholders.

Notifications Setup

Overall, you have to go through four steps to use notifications with PRTG. Please go through all of them for a first setup:

1. Check and set up the **Notification Delivery** settings. This tells PRTG how to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2877.

2. Check and set up Notification Contacts for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2852.

3. Check and set up several **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2836.

4. Check and set up **Notification Triggers** for objects. These provoke the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2719.

Note: We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2841 and one SMS notification 2843. If delivery via email fails (due to a email server outage or for other reasons), PRTG can still notify you via your smartphone in this case as a fallback. You can achieve this, for example, by using the latency setting in a state trigger 2721 and selecting a notification with another delivery method than for the first trigger condition.

Please see section **Setting Up Notifications Based on Sensor Limits: Example** 2762 for a step-by-step guide that describes a potential notifications setup.

7.8.1 Setting Up Notifications Based on Sensor Limits: Example

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

This section shows you exemplarily how to set up a notification for exceeded disk free limits. We provide the approach for this specific use case step by step so you can adapt it to define limits and corresponding notifications for other sensor types.

You have to take several steps to set up notifications based on limits:

- Step 1: 2762 Provide necessary information about the delivery of notifications (SMTP and SMS).
- Step 2: 2762 Specify recipients for notifications for each user account of your PRTG installation.
- Step 3: 2763 Create notifications, specifying the type of notification and its content.
- Step 4: 2764 Define thresholds that change a sensor's status (this is not necessary for every kind of notification).
- Step 5: 2766 Add suitable triggers to objects which evoke notifications if something is going wrong in your network.
- Step 6: 2767 Test if the created notification is triggered and delivered correctly.

Note: When you set up your own notifications, you do not necessarily need to go through all the steps we describe here. In this section, our main goal is to give you a general idea of the notifications concept.

Step 1: Setting up the Notification Delivery

Before creating your actual notifications, you first have to define how those notifications are delivered to your email account, mobile phone, or pager. To do so, choose **Setup | System Administration | Notification Delivery** from the PRTG main menu bar. Specify the mechanism of SMTP delivery, sender email and name, as well as the HELO ident. For SMS delivery, select your service provider and provide the corresponding credentials.

You can find details about notification delivery in section **System Administration—Notification Delivery** 2877.

Step 2: Setting up Notification Contacts

Create notification contacts to define where you want receive notifications. Recipients can be email addresses, phone numbers, or push devices (Android or iOS devices, or Windows Phone, with the corresponding PRTG smartphone app 2995). You can define as many recipients for each user account in your PRTG installation as you want. By default, the recipient "Primary Email Address" is available—this is the email address you provide in your account settings 2830. This is sufficient for a first setup of notifications. Later on, when you see how it works, you can define more contacts. When you add a notification to a device, you just have to select a user or user group as recipient then and PRTG uses the according contacts you define here.

For details, see section **Account Settings—Notification Contacts** 2852.

Step 3: Setting up the Notification's Content

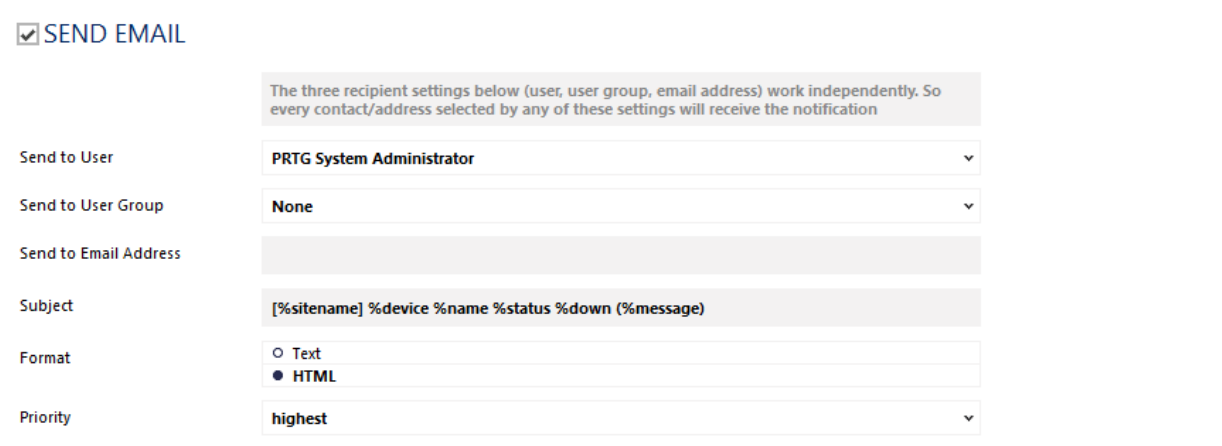
To get an informative message when a disk is running out of capacity, create a corresponding notification. Choose **Setup | Account Settings | Notifications** from PRTG's main menu bar and click on the button **Add New Notification**. Give the notification an explanatory name; in our case you could use Disk Free Limit Notification. However, if you want to trigger this notification on a global level (for example, for a probe or group) such that it would not only apply to breached disk free limits, a general name would be more suitable (like the predefined notification "Email to Admin"). If you leave the default text of the newly created notification, it already contains all necessary information, for example:

- which sensor is affected,
- since when the sensor is affected,
- last value of this sensor.

See section **More** 2767 for the other options you have here.

After providing this basic information, select the delivery method. In our case, we choose **Send Email** for this notification by marking the corresponding checkbox. Specify who will receive the notification (select a specific user, for example, and PRTG sends the notification to all contacts of this user you specified in step 2 2762), its subject, the format, and its priority. By default, the email notification contains several information parameters about the evoking sensor: its name, status, time, message, location in the device tree, etc.

You can choose any other notification method, of course. Please see **Account Settings—Notifications** 2840.



Creating an Email Notification

Once you set up the notification completely, click **Save**. PRTG opens the notifications overview page again. You can now use this notification for every trigger on every object in your device tree.

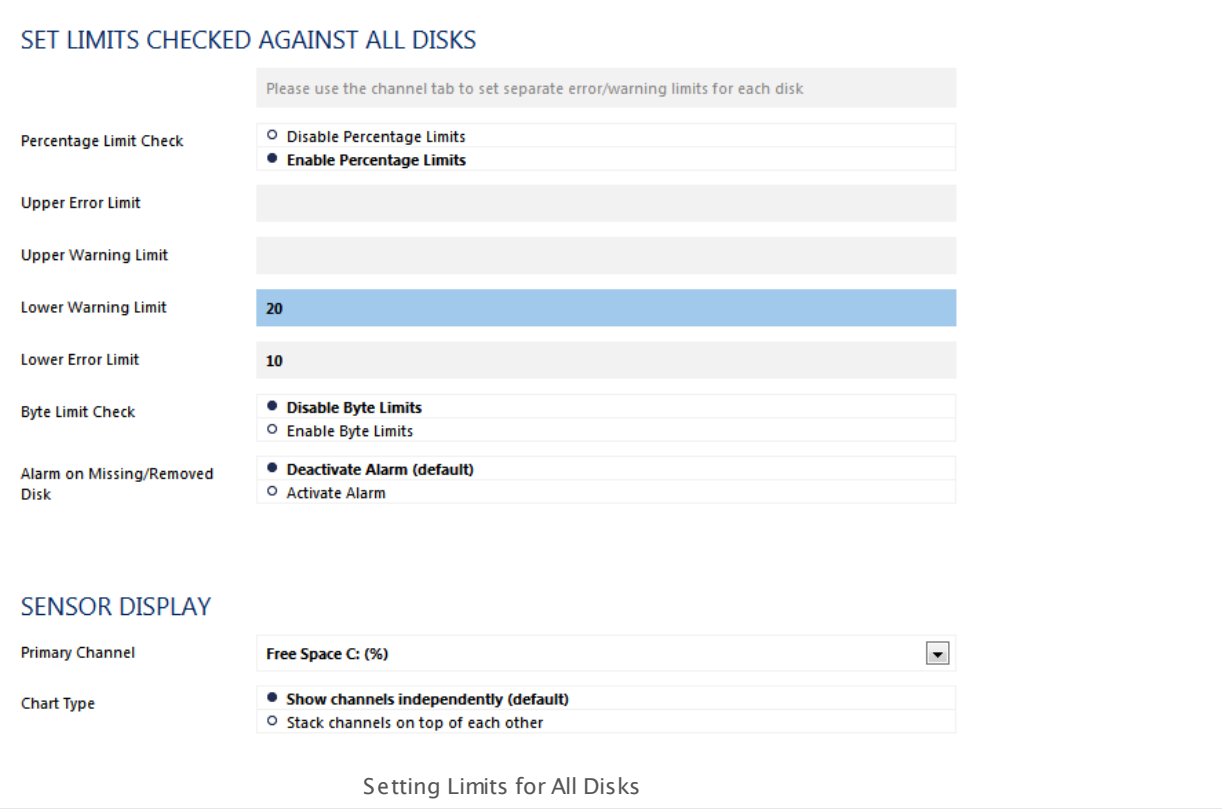
Step 4: Define Limits

Before creating triggers that evoke notifications, first specify the limits which you want to apply to your disks. For example, if you want to get a notification when a disk has exceeded 80% of its capacity, force the sensor into a **Warning** status at this utilization. You have several options to set limits for disk free sensors:

- Set limits checked against all disks in the settings of multi-drive sensors: **WMI Free Disk Space** 2509, **SNMP Linux Disk Free** 1857, **SSH Disk Free** 2109
- Enable limits in **Sensor Channels Settings** 2711 of single sensors.
- You can achieve both with **Multi-Edit** 2742.

Step 4.1: Define Limits in Sensor Settings (Multi-Disk Free Sensors Only)

You can set limits for sensors monitoring multiple disks directly via the **Settings** tab on a sensor's details page. **Multi-Edit** 2744 for existing sensors is also possible. Open the settings of the selected sensor(s) and go to section **Set limits checked against ALL disks**. There, for example, enable **Percentage Limit Check**. In the field **Lower Warning Limit**, enter the percentage suitable to your needs. In our example, this would be **20**. Alternatively, you can use bytes to define a limit. However, we recommend using percentage values for more flexibility. This limit applies to all channels of this sensor that represent disks.



Setting Limits for All Disks

Note: This sensor setting is only available for multi-drive sensors. You can omit Step 4.1 for all sensors that are not from the type "disk free".

Step 4.2: Define Limits for Sensor Channels

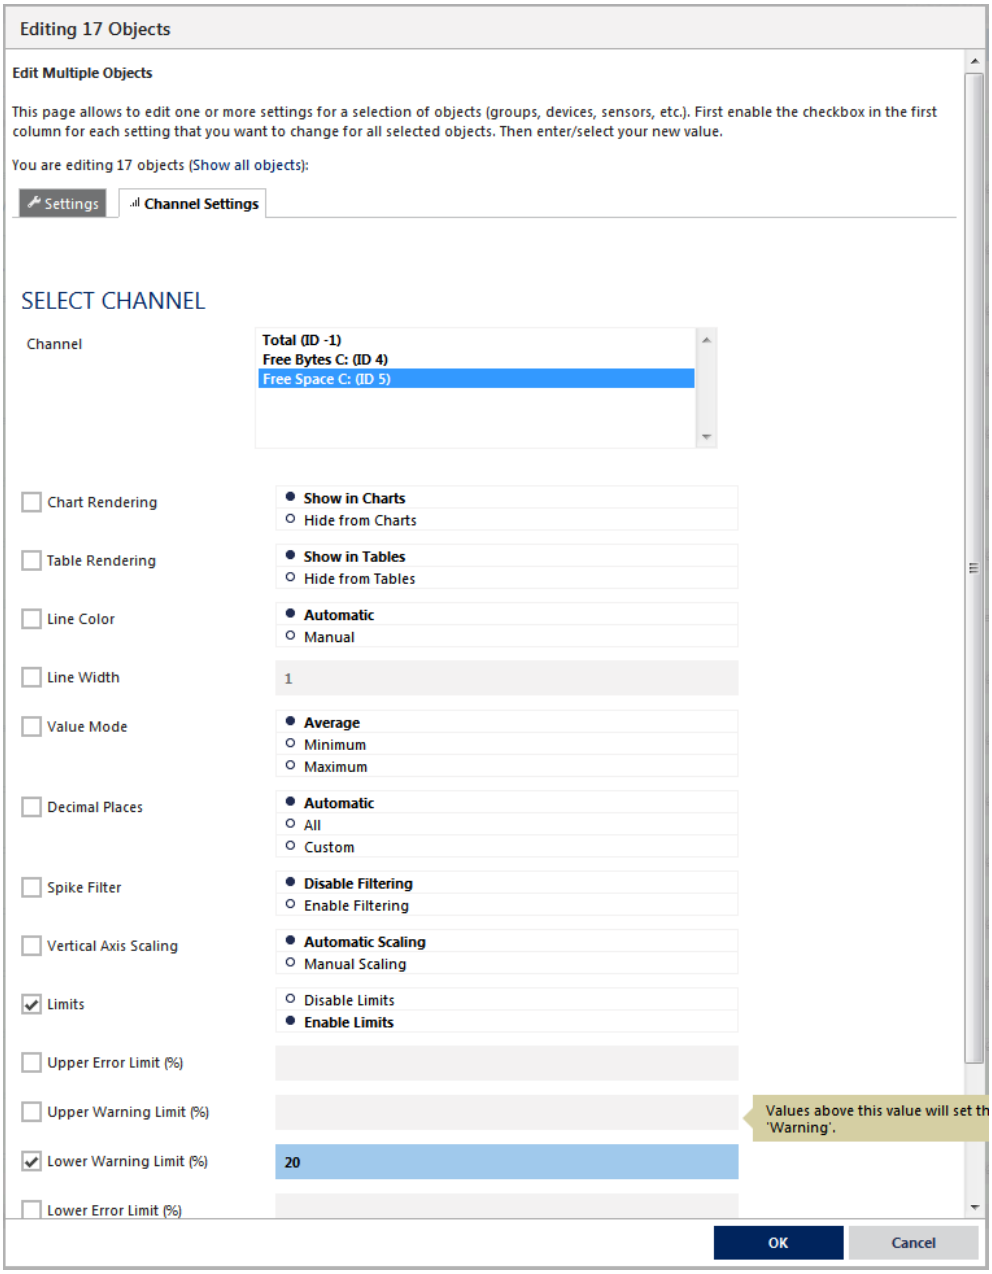
To set specific limits for single disks, use the sensor's **Channel** settings. You can open channel settings via the gear icon in the respective channel gauge or in the channels table. **Enable Limits** at the bottom of the channel settings dialog and specify your desired limits in the **Lower Warning Limit** field. This limit only applies to the respective channel.

Note: If you define channel limits when using the sensor's limit setting in the sensor's **Settings** tab at the same time, the first limit that applies will be considered. This way, you can individually define harder limits for single disks in a multi-disk sensor. All defined limits are valid side-by-side.

You have to take the approach via channel settings for sensor types that monitor only one (logical) disk, for example, the **SNMP Disk Free Sensor** 1685. For these sensor types, you can use **Multi-Edit** 2745 if you want to apply the same limits for each of these sensors automatically.

- To see all sensors of this type at a glance, just filter for it: From PRTG's main menu bar, choose **Sensors | By Type | SNMP Disk Free**.
- Mark the checkboxes of the sensors you want to add a limit for.
- Click the wrench symbol in the multi-edit bar.
- Open the **Channel Settings** tab.
- Select the channel you want to add a limit for; in this case it would be most likely the channel **Free Space**.
- Then **Enable Limits** at the bottom of the dialog and enter the number in the correct field as described above.

When you are done, save these settings—the new limit applies to all channels with this name of the multi-edited sensors.



Setting Limits for Channels with Multi-Edit

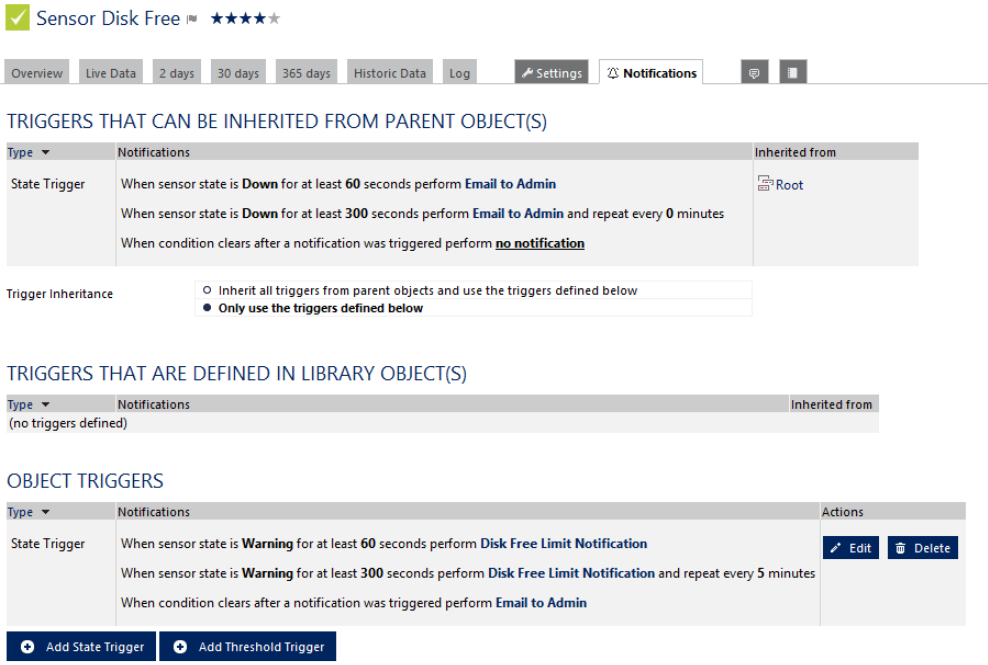
Step 5: Setting up the Notification Trigger

You specified limits to define when a sensor will go into a **Warning** (or **Error**) status. Now you can create the according triggers. The trigger we use in this example is the **State Trigger**. For details about other possible notification triggers, see section More 2767.

- You can set up a **State Trigger** on any level in your device tree. For example, open a group containing the device(s) representing your disks.
- Open the **Notifications** tab.

- Click **Add State Trigger**.
- Set the trigger to "When sensor is Warning" and choose the notification you created before ("Disk Free Limit Notification" or a more general one) from the drop down list.
- Adjust the other notification settings to your needs and save this new object trigger.

Now you receive a notification immediately when the capacity of one of your disks falls below the defined limit, in this case 20% free disk space.



Setting a Trigger for Disk Free Limit Notification

Step 6: Testing the Notification

Finally, test the notification that you created. You can trigger this notification for test purposes immediately:

- From the main menu bar 200, choose **Setup | Account Settings | Notifications**.
- For the respective notification, click on the corresponding **Test** button.

Then, check if the notification was triggered and delivered correctly, depending on the delivery method you defined before. If you do not get a notification (or a defined action is not executed) at all, check the notification logs: From the main menu bar, choose **Logs | System Events | Notifications**. Look for the triggered notification in the table list (verifying that the notification delivery is set up correctly in general) and consider the corresponding message. See section **Logs** 169 for more information.

More

This section provides information about additional options you have when working with notifications.

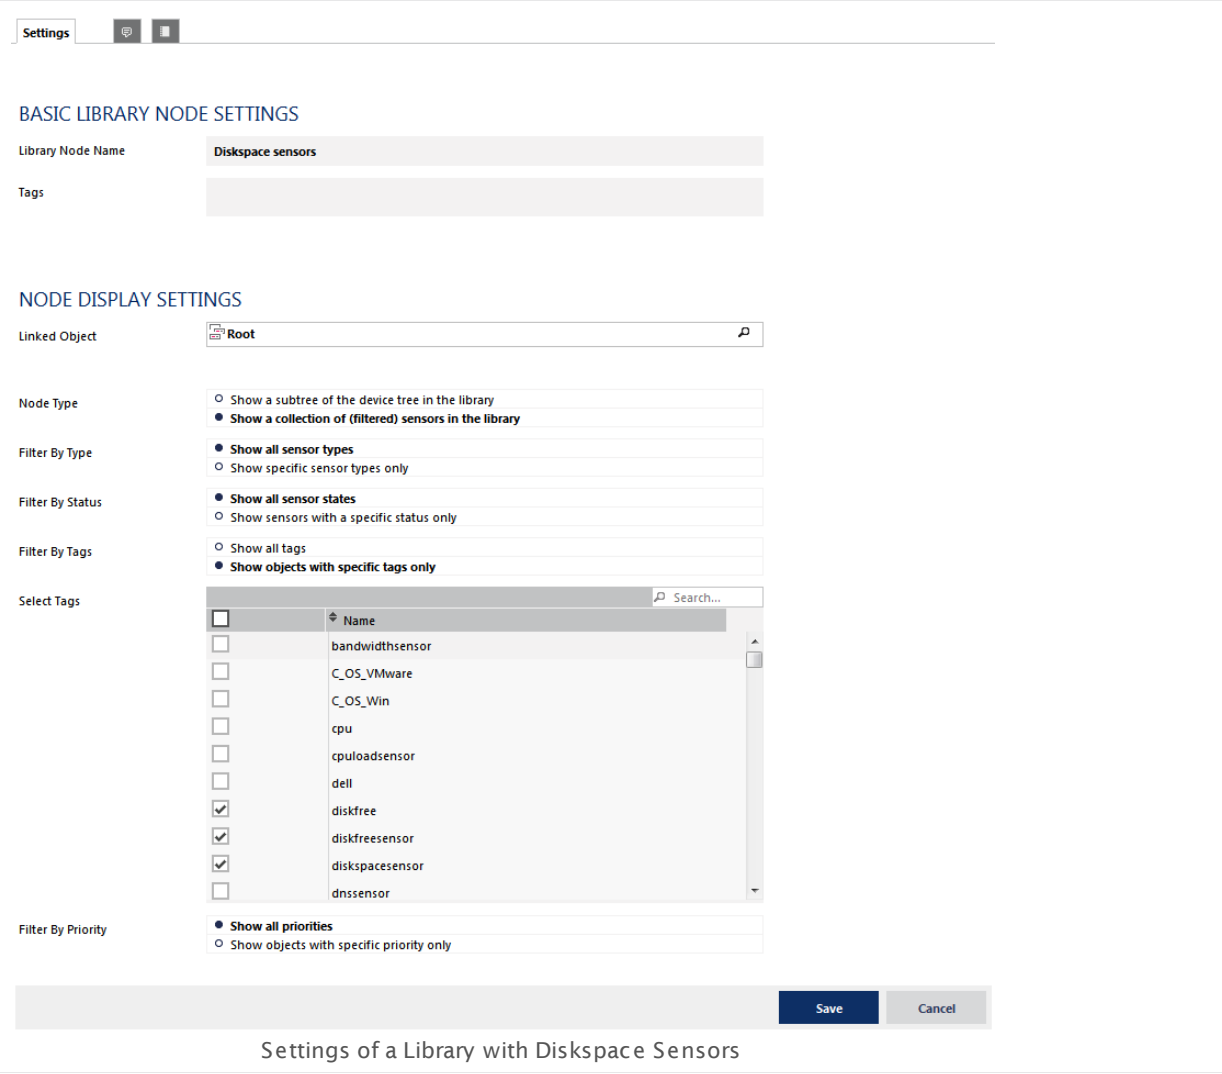
- **Notification Settings:**
  You can create schedules to activate notifications only at specific times, for example, only on weekdays. In section **Notification Summarization** you can choose between various options to avoid message floodings. Furthermore, define which user groups will have access to edit this notification. For details about notification settings, refer to section **Account Settings—Notifications** 2836.

- **Content of Emails:**
  You can individually adjust the subject, header, and footer of emails to your needs. See section **Account Settings—Notifications** 2840 for details about editing the subject. The article **How can I include my own logo into HTML emails?** in the Knowledge Base explains how to edit the header and footer of emails: http://kb.paessler.com/en/topic/65782

- **Other Triggers:**
  An alternative to the state trigger would be to add a **Threshold Trigger**; then you would not need to set up limits explicitly, though, this trigger type would only be suitable for disk free sensors when using the trigger for single sensors, one by one. Free disk sensors have free space in percent as primary by default, other sensors have primary channels with the units bytes or seconds. However, threshold triggers only apply to the primary or total channel. General notification triggering by threshold might not work as expected for sensors of the "percentage" type. You can find all available triggers in section **Notifications** 2759.

- Add a **Threshold Trigger** to a sensor directly:
  Go on a sensor's detail page and select the **Notifications** tab. Click on **Add Threshold Trigger**, select the desired channel, and provide the condition when this notification will be sent. In this example for free disk space, the setting would be "When Free Bytes C: (%) channel is Below 20 for at least 60 seconds perform Disk Free Limit Notification".

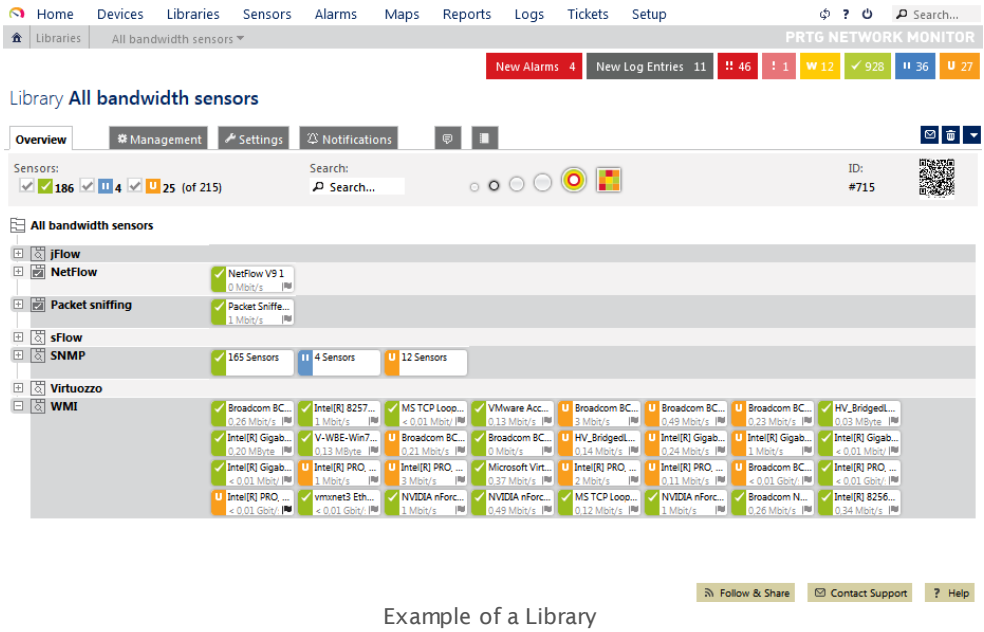
- **Notifications with Libraries:**
  If your disk devices are spread over many groups, we recommend that you use a PRTG library 2770 for your disks. Choose **Libraries | All diskspace sensors** from the main menu bar, go on the **Notifications** tab, and add a state trigger as described above.
  Note: Not all disk free sensor types might appear. You can add them to this library in the settings of the library node. There you can filter by type or tag 2779 and add missing sensors this way. You can also filter by priority and other sensor properties.



Settings of a Library with Diskspace Sensors

7.9 Libraries

With PRTG's **Libraries** feature you can create special views of your device tree with up-to-the-minute monitoring status information, arranged the way you want it.



Example of a Library

In this section:

- Introduction 2770
- Start Libraries 2771
- Libraries List 2771
- Working with Libraries 2772

Introduction

Libraries are a powerful feature that enables you to create additional views of your device tree. These views are updated with the same scanning interval as your device tree, showing the same monitoring data, but arranged in a way you want it. This is interesting if you want to display data in different ways, e.g. depending on target groups or a specific use case. For example, you can create a library which contains an overview of all your bandwidth monitoring sensors, regardless of which device they're running on.

The Library features include:

- Create Libraries containing nodes with monitoring objects from all over your configuration.
- Show data from different PRTG probes in one library.
- Show different branches of your device tree right next to each other.
- Arrange sensors in a tree-like view regardless of which device they are running on.

- Filter your entire tree (or parts of it) for sensor type, state, or tag, showing only matching sensors.

You can create libraries easily, using drag&drop.

PRTG comes with several pre-configured standard libraries, which you can use right away. You can also change or delete them, if you like. The following libraries are automatically created when you install PRTG for the first time (visible for the PRTG Administrator user). Some of them will initially be empty, but as you add more sensors, they will be filled automatically according to the filter settings defined for the nodes of the libraries:

- All bandwidth sensors
- All CPU load sensors
- All diskspace sensors
- All memory sensors
- All VMware sensors
- Sensors grouped by priority
- Sensors grouped by state

Note: Sensors which are added to libraries are not counted against the maximum number of sensors of your license.

Start Libraries

Click the **Libraries** entry from the main menu 204 to view or add custom views of your network's status and monitoring data. Hover over **Start Libraries** to show other menu items. Choose between:

LIBRARIES	
All	Open the Libraries overview list where you can view or add custom device tree views of your network status and monitoring data.
Add Library	Open an assistant to directly create 2773 a new library.
Select Library	Open an existing library. Hover over **Select Library** to show other menu items. Follow the menu path (it is specific to your setup) to select a library and open it.

Libraries List

In the **All** view, you see a list of all existing libraries. Using the links next to a library name, you can perform the following actions.

- **Edit**: Open this library and change the settings 2779 of the library and its nodes

- **Clone**: Create a clone 2740 of this library.
- **Delete**: Delete this library.
- **Used by**: Show which other monitoring objects use this library.
- Click the **Add Library** button to add a new library.

Please also see **Working with Table Lists** 178. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2742 section.

Working with Libraries

For detailed information on how to create and edit libraries please see the following sections.

- **Libraries Step By Step** 2773
- **Management** 2777
- **Libraries and Node Settings** 2779
- **Context Menus** 2785

7.9.1 Libraries Step By Step

In order to create a new library, follow the steps in this section. In the web interface, click on the **Libraries** entry in the main menu to show the libraries main screen.

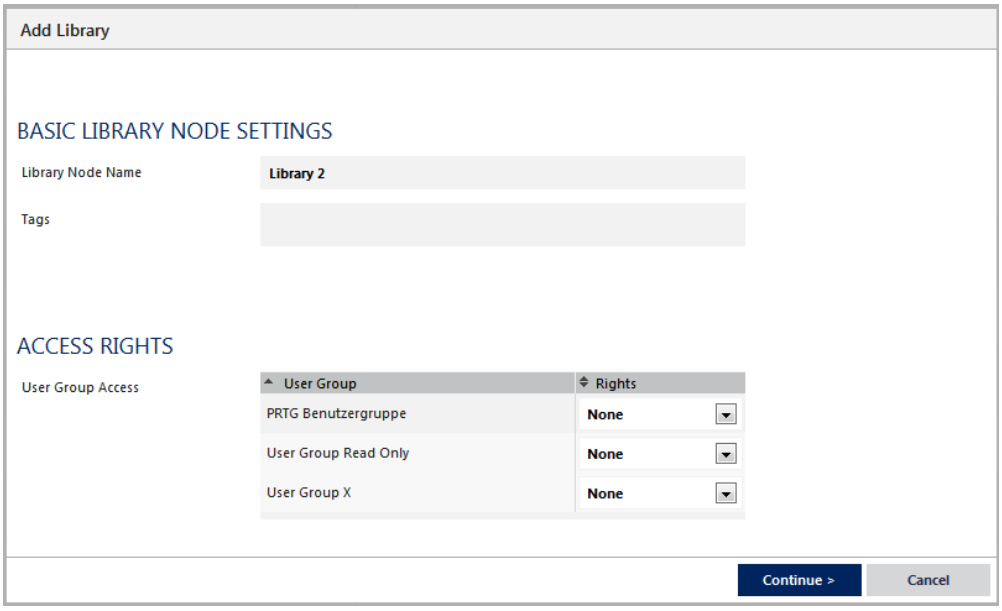
Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

In this section:

Step 1: Add Library

Click on the **Add Library** button. An assistant is shown. Enter a **Library Name**, and define **Tags** and **Access Rights**, if you like. Click on **Continue**.

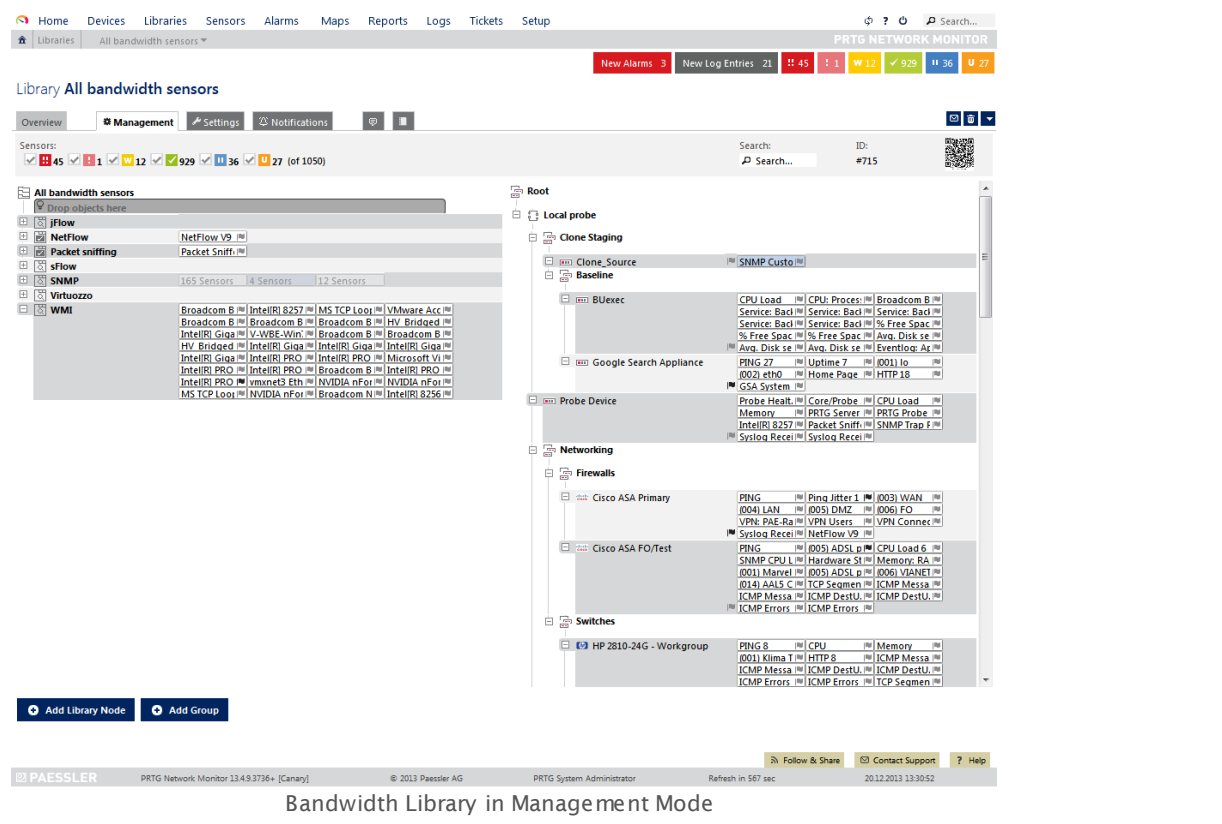
For detailed information, see Libraries Settings 2779 section.



Add Library Assistant Step 1

Step 2: Add Library Nodes

Click to the **Management** tab. You will see a split screen: On the left side, your library is shown (empty in the beginning), and on the right side, you see a less colorful view of your device tree, as known from the device tree's Management 258 tab.



Bandwidth Library in Management Mode

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new Library Node. Repeat this procedure as often as you wish until you have added all desired items to the library.

Note: When adding single sensors to the library, there can only be one sensor in one library node.

Note: Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one.

Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

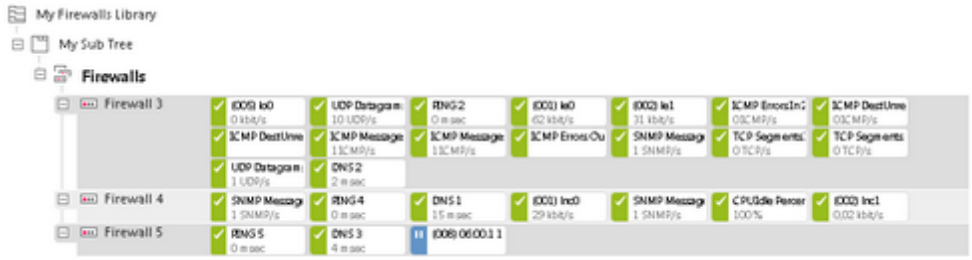
Step 3: Set Library Node Display Settings

You are still in the library **Management** tab.

Right-click the name of a Library Node and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screen shot below for the library node names "My Sub Tree".



Library with one Node Showing a Branch of the Device Tree

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screen shot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

Library with one Node Showing a Collection of Bandwidth Sensors Only

For detailed information, see **Libraries and Node Settings** 2779 (Overview—Library Node Display Settings) section.

Step 4: View

Click on the **Overview** tab to see the final appearance of your library. You have the following options:

- Hover over an object to view a popup window with recent monitoring and status data.
- Use the sensor state selection bar to select which sensors you want to see for the library: Simply remove check marks for sensor states you want to hide. Note: This function is the same you know from the device tree's Sensor Status Bar 126. The setting is reset the next time you open the library.
- Use the **Device Tree View** selection in the page header bar 126 to change the size of the library display. Note: This function is the same you know from the device tree 129.

- Use the **Search** box in the page header bar 126 to search the library for a string in object names. Matching objects will be shown full-colored, all others will be grayed out while the filter is active. Click on the small **x** symbol in the search field to reset the filter. Note: This function is the same you know from the device tree 126.

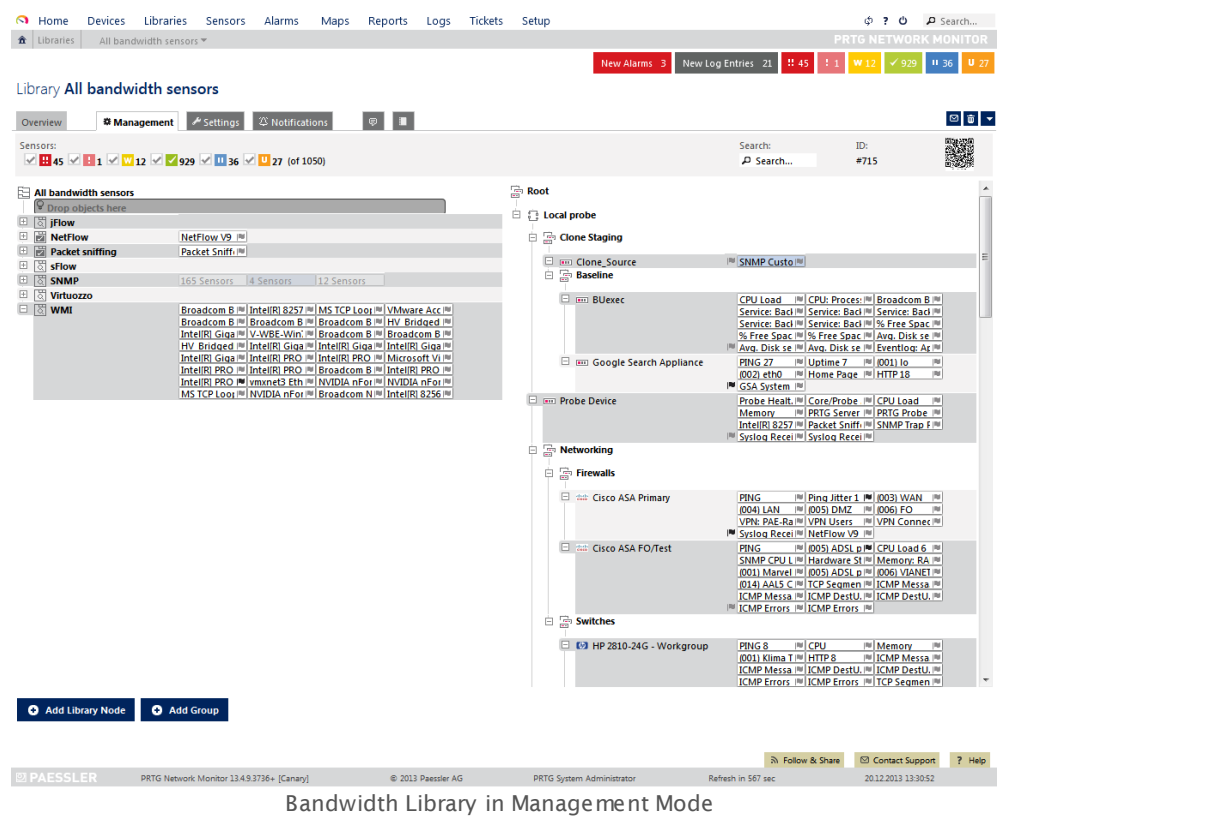
It depends on the library's access rights and the currently logged in user account if it will be visible to other PRTG users. Also, clicking on objects (for example, on sensors) will lead to more detailed information about the object or to an error message indicating insufficient access rights—depending on user account and access rights.

In libraries, you can right-click objects to access their **Context Menus** 2785.

7.9.2 Management

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Click to the **Management** tab. You will see a split screen: On the left side, your library is shown (empty in the beginning), and on the right side, you see a less colorful view of your device tree, as known from the device tree's Management 258 tab.



Bandwidth Library in Management Mode

Add and Change Library Nodes

From the device tree on the right side, drag objects and drop them on the library on the left side. Each dropped object will be added immediately as a new Library Node. Repeat this procedure as often as you wish until you have added all desired items to the library.

Note: When adding single sensors to the library, there can only be one sensor in one library node.

Note: Library nodes can contain up to 1,000 sensors.

You can also create nested library nodes by adding a new node underneath an existing one.

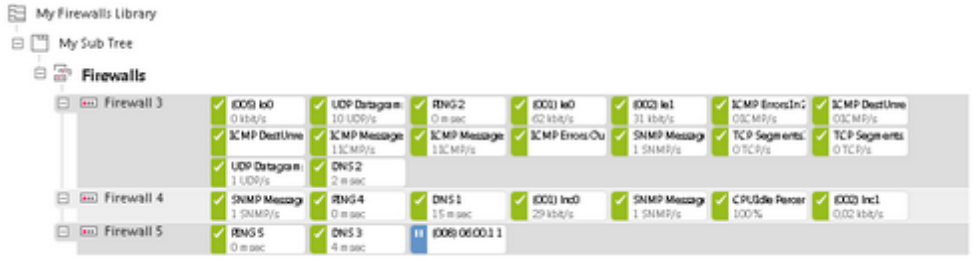
Drag and drop nodes within the library to change their position. If you want to change the monitoring object that is associated with a library node, you can change the **Linked Object** in the node's settings.

Set Library Node Display Settings

Right-click the name of a Library Node and from the context menu, select **Edit | Settings...** to change the **Node Display Settings**. In this dialog, you can change the name of the library and its tags, as well as the linked object, node type, and filters.

These settings are available for each library node. You can choose to either show the **Linked Object** as a sub-tree of your device tree, or to view a collection of all sensors underneath the **Linked Object**.

When selecting the sub-tree view, the library node will just look like a branch in your device tree, as shown in the screen shot below for the library node names "My Sub Tree".



Library with one Node Showing a Branch of the Device Tree

When selecting a sensor collection view, only the sensors underneath the **Linked Object** are shown, omitting probes, groups, and devices. You can additionally filter by certain sensor **Type**, **Status**, and **Tags**. Only matching sensors will be shown. The screen shot below shows the same **Linked Object** as above, but in sensor collection view, additionally filtered for sensors with a **bandwidthsensor** tag.

Library with one Node Showing a Collection of Bandwidth Sensors Only

For detailed information, see Libraries and Node Settings 2779 (Overview—Library Node Display Settings) section.

Context Menus

On right-click, there are different context menus available—in the **Management** as well as in the **Overview** tab.

For detailed information, please see Context Menus 2785 section.

7.9.3 Libraries and Node Settings

Using the libraries tabs you can access all functionalities and settings for a library.

Library Tabs

Overview

Click on the **Overview** tab any time to show the current state of your library.

Library Node Display Settings

While in the **Overview** tab, click on a library node's name to change its settings. Or, while in the **Management** tab, right-click a library node's name and select **Edit | Settings...** from the context menu. In both cases, the following settings are shown. Note: You can only change the settings of a node if it contains monitoring objects already, e.g., groups, devices, or sensors.

BASIC LIBRARY NODE SETTINGS

Library Node Name	Enter a meaningful name for the library node.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags are not case sensitive.

NODE DISPLAY SETTINGS

Linked Object	Click on the reading-class symbol to change the object which is linked with this library node. A popup window will appear, showing the **Object Selector** 181.
Node Type	Select what you want to view for this library node. Choose between: ▪ **Show a subtree of the device tree in the library**: View all objects underneath the linked object as a device tree. ▪ **Show a collection of filtered sensors in the library (max. 1000)**: View all sensors underneath the linked object (only sensors are shown). You can combine several filters with each other (see below). Note: The node can show up to 1,000 sensors, surplus sensors are discarded.

NODE DISPLAY SETTINGS

Filter By Type

This option is visible only if collection of sensors is enabled above. Select if you want to filter the sensor list by a certain type. Choose between:

- **Show all sensor types**: Do not filter for a sensor type.
- **Show specific sensor types only**: Filter the sensor list of the linked object for certain sensor type(s).

Note: This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Select Sensor Types

This option is visible only if filtering by type is enabled above. A list of all sensor types is shown, currently available sensor types are shown in bold letters for your convenience. Set a check mark in front of each sensor type you want to include in the library node view. You can also select and deselect all items by using the check box in the table head.

Note: This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Note: You cannot filter for sensor types that are defined in PRTG mini probes.

Filter By Status

This option is visible only if collection of sensors is enabled above. Choose between:

- **Show all sensor states**: Do not filter for a sensor status.
- **Show sensors with a specific status only**: Filter the sensor list of the linked object for sensors in certain states.

Select Sensor States

This option is visible only if filtering by sensor state is enabled above. A list of sensor states is shown. Set a check mark in front of each status you want to include in the library node view. Choose from:

- **Unknown**
- **Up**
- **Warning**
- **Down**
- **Paused**
- **Unusual**
- **Down (Acknowledged)**
- **Down (Partial)**

NODE DISPLAY SETTINGS

	You can also select and deselect all items by using the check box in the table head. Note: This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.
Filter By Tags	This option is visible only if collection of sensors is enabled above. Choose between: ▪ **Show all sensor tags**: Do not filter for a tag. ▪ **Show objects with specific tags only**: Filter the sensor list of the linked object for sensors with a certain tag. See section **Tags** 96 for details. Note: The tag of a sensor can also be inherited 94 by a parent object.
Select Tags	This option is visible only if collection of sensors is enabled above. Enter one or more tags of sensors that you want to include in the library node view. You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi). See section **Tags** 96 for details. Note: This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.
Filter By Priority	This option is visible only if collection of sensors is enabled above. Choose between: ▪ **Show all priorities**: Do not filter for the priority setting 182 of a sensor. ▪ **Show objects with specific priority only**: Filter the sensor list of the linked object for sensors with specific priority. Note: The priority setting of a group, device, or sensor is ignored here; only the priority setting of the sensor itself is regarded.
Select Priority	This option is visible only if collection of sensors is enabled above. Define which priority setting sensors must have to appear in this collection. Set a check mark in front of each priority you want to include in the library node view. Choose from: ▪ ***** **(highest)** ▪ **** ▪ *** ▪ **

NODE DISPLAY SETTINGS

- *** (lowest)**

  Note: This filter is applied in real-time. If the configuration underneath the linked object changes, the library node will show matching sensors accordingly.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Note: After applying filters it might take several seconds for the changes to become visible. This is due to internal filter processes running in the background.

Management

Click on the **Management** tab to edit the contents of your library, for example, to add items to the library using drag&drop. For detailed descriptions, please see **Management** 2777 section.

Settings

Click on the **Settings** tab to open a library's general settings.

BASIC LIBRARY SETTINGS

Library Name	Enter a meaningful name for the library.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the library. Tags entered here are inherited 94 to all library nodes underneath. Tags are not case sensitive.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Note: When giving access rights to a user group, all members of this user group will be able to see the objects in the library just as seen by the user who originally created the library.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

You can define notification triggers for any kind of object libraries. This is even possible for dynamic libraries which can change with every scanning interval, for example, when you filter a library for the sensor status or priority. For details about how to use notifications, please see section **Notifications** 2759.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Delete

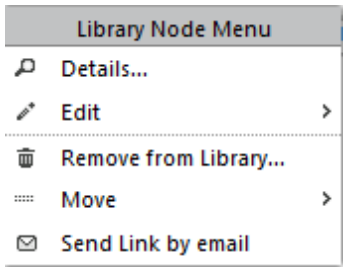
You can delete the entire library any time by clicking on the trash symbol on the right.

7.9.4 Context Menus

On right-click, there are different context menus available.

Library Node Menu

While in the **Overview** or the **Management** tab, right-click on any library node to show its context menu.



Library Node Menu

- Select either **Details...** or **Edit | Settings...** to get to the Libraries and Node Settings 2779. Note: While in the **Overview** tab, these settings are also accessible via left-click on the node's name.
- **Edit | Rename...** will give you an option to rename the library node quickly.
- **Remove from Library...** will remove this library node from the current library. Note: This will not delete any objects in your device tree.
- The **Move | ...** options will move the library node up and down within the library.
- Click on the **Send Link by email** entry to open a new email using your system's standard email client. It will contain a direct link to the page you're currently viewing.

Monitoring Objects Menus

In libraries there are the same Context Menus 186 available you already know from the device tree. With one exception: While accessing these menus within libraries, the **Move** and **Delete** options are disabled to avoid accidental changes to your device tree.

7.10 Reports

You can use reports to analyze historic monitoring results over a specified time such as one or more days, one month, or an entire year, and for your system configuration. You can create reports for all or only for certain sensors.

Introduction

PRTG includes a powerful reporting engine for the ad-hoc as well as scheduled report generation in HTML, PDF, CSV, and XML format. This means that you can run reports on demand or on a regular basis (for example, once a day or once a month). Furthermore, you can create reports for a single sensor or for a whole range of sensors. It is also possible to create HTML reports of your system configuration 2789.

The content and layout of the report is controlled by the report template of your choice and is the same for all sensors in a report. The report time that is shown in data tables and data graph legends depends on the system time of your PRTG core server, not on the timezone settings 2893 of the current user account.

Report Sample

The sample report above shows the report data for devices on a local probe. You can see graphs for the preceding week, plus data tables with numeric results.

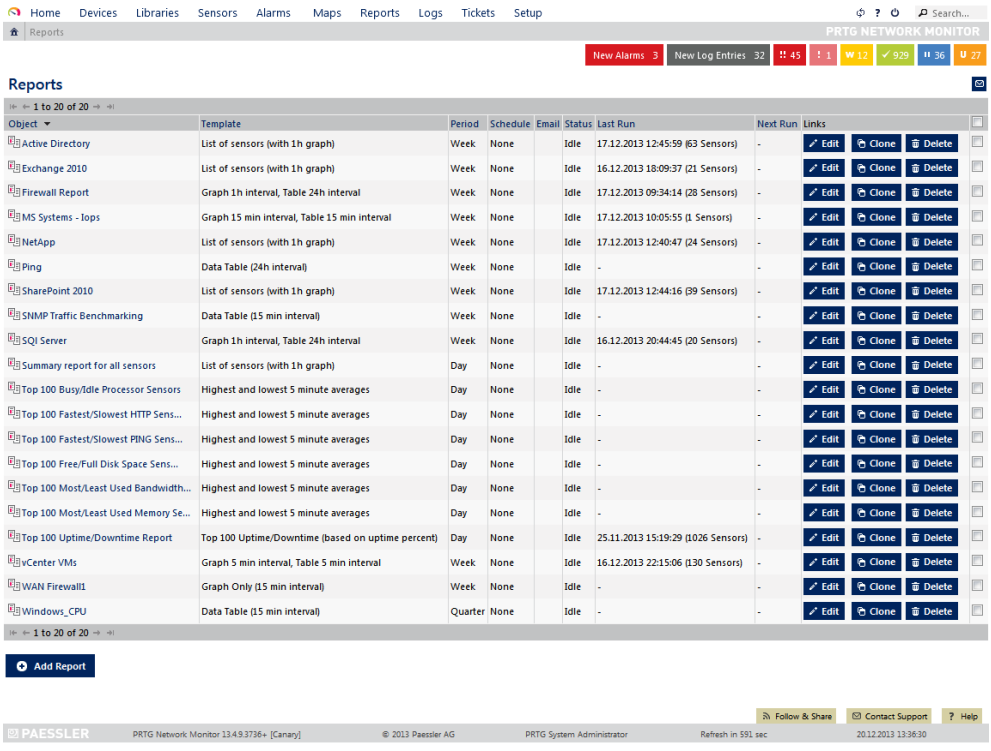
Start Reports

Click the **Reports** entry in the main menu 209 to view or add reports of your monitoring data. Point on **Reports** to show other menu items. Choose between:

REPORTS

All	Open the Reports overview page where you can view or add reports of your monitoring data.
Add Report	Open an assistant to directly add 2790 a new report.
Select Report ›	Open an existing report. Point on **Select Report** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.
Configuration Reports ›	Create reports for maps, reports, users & user groups, and system configuration to document changes to the configuration. Point on **Reports	Configuration Reports** to see the available configuration reports 2789.

Reports Overview



List of Reports

In the **All** view, you see a list of all existing reports for monitoring data. Every line shows information about one report:

- **Object**: Shows the name of the report.

- **Template**: Shows the name of the template that this report uses.
- **Security Context**: Shows the user account that PRTG uses to run the report.
- **Period**: Shows the time span that the report covers.
- **Schedule**: Shows if you set a schedule to regularly execute the report automatically.
- **Email**: If you set a schedule and an email address in the report settings, this shows the email address to which PRTG sends the report automatically.
- **Status**: Shows the current status of the report.
- **Next Run**: If you set a schedule in the report settings, this shows when PRTG runs the report the next time.
- **Last Run**: If you set a schedule in the report settings, this shows when PRTG ran the report the last time.
- **Number of Sensors in Last Run**: Shows about how many sensors the report includes data.

Using the buttons at the end of a row, you can **Edit**, **Clone**, and **Delete** a report.

Please also see **Working with Table Lists** 178. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2742 section.

Click the **Add Report** button to add a new report, or click the name of an existing report to view and edit its settings. You can also run a pre-configured report easily by clicking its name and then using the options in the **Run Now** tab. For both options, please see the **Reports Step By Step** 2790 section.

Note: You can run configuration reports 2786 only via the main menu.

Working With Reports

For detailed information on how to create, edit, and schedule reports, please see the following sections:

- **Reports Step By Step** 2790
- **View and Run Reports** 2794
- **Report Settings** 2798

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

TIME SPAN IN REPORT	MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

A report for a time span of more than 500 days is not possible. If you try to set a larger time span, it will be reduced to 365 days automatically.

Configuration Reports

Configuration reports are a special type of reports and show the current PRTG configuration. They are available for **Maps**, **Reports**, **Users & User Groups**, and **System Configuration**. PRTG generates configuration reports and displays them in a new browser window as an HTML page in the common PRTG report style (like, for example, Historic Data Reports 146 of sensors). You can use configuration reports, for example, to file and document changes to the configuration of your PRTG installation.

Configuration reports contain the same information as you can see on the overview pages of Maps 2810, Reports 2786, as well as on the system administration tabs User Accounts 2890 and User Groups 2896. The configuration report **System Configuration** includes the current system administration settings of the tabs User Interface 2860, Monitoring 2871, Notification Delivery 2877, Core & Probes 2883, and Cluster 2905. Configuration reports are interactive so you can click on available links to go to the corresponding webpage in the PRTG web interface.

7.10.1 Reports Step By Step

To create a new report or to run an existing one, follow the steps in this section. In the PRTG web interface, click on the **Reports** entry in the main menu to show the reports main screen.

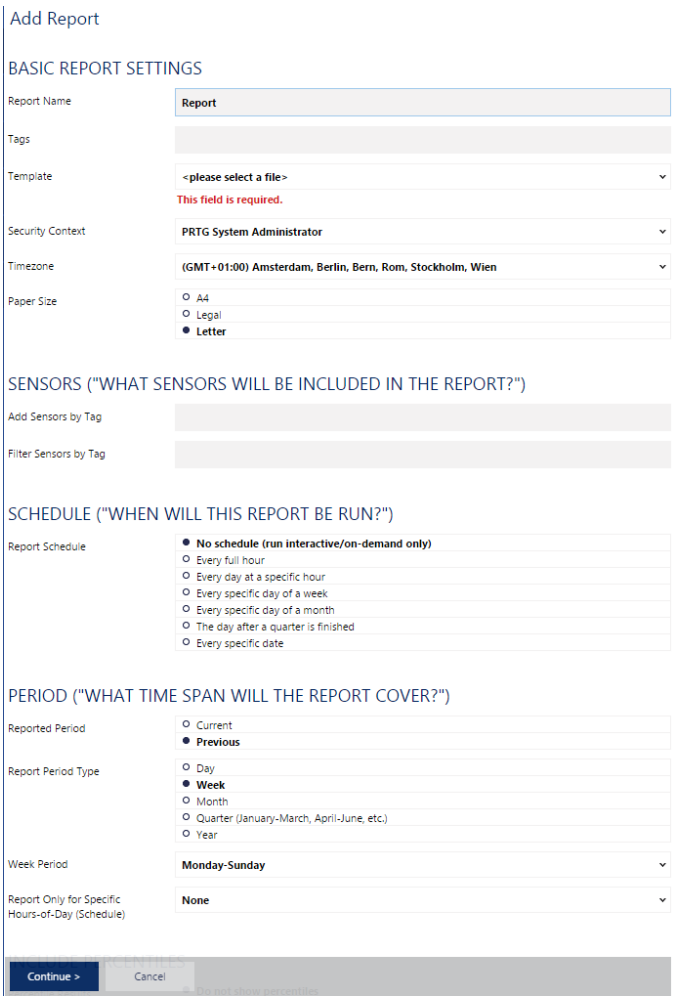
Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Quick Start: Run an Existing Report

PRTG is delivered with several pre-configured reports. To use one of them, click a report's name in the reports main screen and select the **Settings** tab. The next steps are the same as for completely new reports. Although some settings are already given, we recommend that you check them. For example, check the sensors that are included in the report. For some reports that come with PRTG, there are no sensors added yet. Continue with **Step 3: Define Additional Options** 2791 in this section.

Step 1: Add Report

Click the **Add Report** button to add a new report. An assistant appears where you can define various settings. First, enter a meaningful **Report Name**.



Add Report Assistant

Click here to enlarge: http://media.paessler.com/prtg-screenshots/add_report.png

Step 2: Select a Template

In the **Template** option, select one of the report templates from the list. This defines the overall look of your report and how detailed (regarding the intervals) monitoring data is included. For a detailed description of the available template options, please see the **Report Settings** 2798 section. If you are not sure yet, try a template that appears most suitable to you. You can still change all settings later.

Step 3: Define Additional Options

Select a **Security Context** (best choose **PRTG System Administrator**, if available), your **Timezone**, and the **Paper Size** for PDF generation. For detailed information, please see the **Report Settings** 2798 section.

Step 4: Select Nodes and Sensors

Choose the sensors you want to include in the report. When running a cluster 87, define the **Cluster Node** the monitoring data is taken from first. Select a specific node from the list. If you select **All nodes**, PRTG creates a report with data from all of your cluster nodes, but only the primary channel of every sensor appears in the report.

Every report shows monitoring results based on sensor data. There are two ways to include sensors in a report: You can either add sensors manually or by tag. In the **Add Sensors by Tag** field, enter one or more tags that match the sensor range you want a report for.

For example, enter the tag bandwidthsensor to include all sensors that measure bandwidth (or select it from the list of tags which PRTG suggests). PRTG provides this tag by default when you add any bandwidth sensor, so the tag typically gathers all bandwidth sensors, unless you configured your system differently. You can enter several tags. Hit the enter key, or insert comma or space after each tag and enter the next one. Use the **Filter Sensors by Tag** field to explicitly filter sensors with certain tags from the bulk of tags or manually selected sensors defined above.

Tagging is a great option to group sensors or other objects. For more information, see the **Tags** 96 section. You can also leave the tag fields empty and only choose specific sensors manually later.

Step 5: Decide on a Schedule and Additional Settings

In the **Report Schedule** section, choose if you want to run the report on a regular basis or on demand only. Also define which time **Period** will be covered by the report, and if you want to show percentiles, or add report comments or special access rights. For detailed information, please see the **Report Settings** 2798 section.

Note: Scheduled reports are not executed on failover nodes 3122 by default.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Step 6: Check and Adjust the Sensors Included

After saving the settings, switch to the **Sensors Selected by Tag** tab to see a list of all sensors that you added with the tag(s) you defined in step 4. To change tags, go back to the **Settings** tab. You can additionally add sensors manually. To do so, switch to the **Select Sensors Manually** tab. See the **Report Settings** 2807 section for detailed information. The final report shows sensors from both manual and by tag selection.

Step 7: Run Report

Switch to the **Run Now** tab, select a period, and in the **Processing Options** select **View Report as HTML**. Click the **Run Report** button. PRTG generates the report in a new browser window or tab immediately. Depending on the number of selected sensors and the used template, it may take a few minutes until you see the report. If you do not want to wait, close the newly opened browser window or tab and select a PDF option in the **Processing Options**. Click on the **Run Report** button again. The report is then generated in the background and you get a **ToDo ticket** or email once it is finished.

Note: For large PDF reports, PRTG automatically splits the output into separate files to avoid huge PDF files. You can change the number of sensors which PRTG includes into each PDF file by editing the report templates manually. See the **More** 2809 section of Report Settings 2798.

7.10.2 View and Run Reports

In the web interface, click the **Reports** entry in the main menu to show the reports main screen. Click a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click the **Go to all reports** button at the bottom of the page to return to the list of **Reports**.

Report Tabs

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings configured.

RUN REPORT "[Name]"

Report for	Define the time span covered by the report. Choose between: ▪ **Current Period**: Use monitoring data of the current period. The actual time span depends on the report period type defined in the report's settings 2798. It can be today, this week, this month, or this year. ▪ **Previous Period**: Use monitoring data of the last period. The actual time span depends on the report period type defined in the report's settings 2798. It can be yesterday, last week, last month, or last year. ▪ **Select a Period**: Use monitoring data of a period other than current or previous. Select below. ▪ **Select Date Range Manually**: Define a custom time span for the monitoring data that will be used. Set start and end date below.
Date Range	This selection is only visible if you enable the period option above. From the list, select a data range for which PRTG will generate the report. The shown time spans depend on the available monitoring data and on the report period type defined in the report's settings 2798. It can be days, weeks, months, or years.
Start Date	This selection is only visible if you enable the date range option above. Define the begin of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.

RUN REPORT "[Name]"

End Date	This selection is only visible if you enable the date range option above. Define the end of the time span for which PRTG will generate the report. Use the date time picker to enter the date and time. Make sure you define a valid period.
Quick Range	This selection is only visible if you enable the date range option above. Choose between different pre-defined ranges by simply clicking the desired range. Each click changes the **Start** and **End Date** fields above accordingly.

PROCESSING OPTIONS

File Format and Delivery

Define how you want to view the report. Choose between:

- **View Report as HTML**: Directly view the report in your web browser. PRTG loads it in a new browser window or tab.
- **Create and store PDF and data files (available for templates with data tables)**: Create a PDF file and, depending on the **Data Files** settings of the report, CSV and XML files of the report and store them. Once finished, you will find it in the **Stored Reports** tab and a ToDo ticket 172 will be created. By default, PRTG sends out a notification email to the administrator in this case.
  Note: CSV and XML data files are only generated for report templates that include data tables.
- **Create PDF and data files (available for templates with data tables), store them, and send by email**: Create a PDF file and CSV and XML files of the report, store the files, and send them via email once finished.
  Note: CSV and XML data files are only generated for report templates that include data tables.

Note: For large PDF reports, PRTG will automatically split the output into separate files to avoid huge PDF files. You can change the number of sensors included into each PDF file by editing the report templates manually. See **More** 2797 section below.

Note: To create PDF files, ensure the print spooler service is running on the system with your PRTG server.

Data Files

This option is only visible if you select the send by email option above. Define if you want to generate and send CSV and XML files for data tables in the report in addition to the PDF. Choose between:

- **Do not include data files**: PRTG will not generate CSV or XML files for the report and only send the PDF file.

PROCESSING OPTIONS

	▪ **Include CSV files only (available for templates with data tables)**: PRTG will generate and send CSV files in addition to the PDF. CSV data files are only generated if the report uses a template with data tables. ▪ **Include XML files only (available for templates with data tables)**: PRTG will generate and send XML files in addition to the PDF. XML data files are only generated if the report uses a template with data tables. ▪ **Include all data files (available for templates with data tables)**: PRTG will generate and send CSV and XML files in addition to the PDF. CSV and XML data files are only generated if the report uses a template with data tables. Note: The **Data Files** option you select in the settings of this report does not apply if you send the report via email.
Target Email Address	This option is only visible if you select the send by email option above. Enter a valid email address to which PRTG will send the report. Note: You can change the configuration for outgoing emails in the System Administration—Notification Delivery 2877 settings.
Compression	This option is only visible if you select the send by email option above. Define if you want to compress the attached report files before sending. Choose between: ▪ **Send files uncompressed**: PRTG will not compress the report files before they are sent by email but send the files in their original size. ▪ **Send all in one ZIP file**: PRTG will compress the report files to a ZIP file before they are sent by email.

Click the **Run Report** button to start report generation. Depending on the number of selected sensors, this may take a while. If you experience a long waiting time when generating HTML reports for immediate view, please consider using one of the PDF options. You can then view the report as soon as it has finished.

Note: Any sensor graph in your report will only show the channels that are enabled via the **Show in Graphs** option in the Sensor Graph Settings 2711 of the corresponding sensor.

Note: Reports cannot show uptime or downtime data for the Sensor Factory Sensor 1374.

Stored Reports

In the **Stored Reports** tab you can view all PDF reports and data files created in the past. Click a name to open the report. Reports are stored until they are deleted according to the data purging settings of your PRTG configuration. You can set data purging limits for reports in the **System Administration—Core & Probes** 2887 settings.

Other Tabs

For all other tabs, please see the **Report Settings** 2798 section.

7.10.3 Report Settings

In the web interface, click the **Reports** entry in the main menu to show the reports main screen. Click a report's name to select it. Using the reports tabs you can access all functionalities and settings for this report. Click the **Go to all reports** button at the bottom of the page to return to the list of **Reports**.

Report Tabs

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Run Now

On the **Run Now** tab you can execute a report immediately with the settings that you configured before. Please see **View and Run Reports** 2794 section for details.

Stored Reports

On the **Stored Reports** tab you can view reports created in the past. Please see **View and Run Reports** 2797 section for details.

Settings

Click the **Settings** tab to open the settings of a report.

BASIC REPORT SETTINGS

Report Name	Enter a meaningful name to identify this report. The name of the report is used in reports lists 209 and as headline of generated reports.
Tags	Enter one or more tags, separated by space or comma. For example, you can use tags later to search for the report. Tags are not case sensitive.
Template	Select a template for the report. The template defines the overall look of your report and in which detail (interval) the report shows monitoring data. PRTG includes several report templates out of the box. You can choose from templates in the following categories:

BASIC REPORT SETTINGS

- **Data Table Only**: Create a report with data tables only. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **Graph Only**: Create a report with graphs only. Choose from several intervals. Reports with this template cannot generate data files (neither CSV nor XML).
- **Graph with Data Table**: Create a report with graphs and data table. Choose from several intervals. Reports with this template also generate data files (CSV and XML) if set in the **Data Files** section of the report.
- **List of Sensors**: Create a report in a compact sensor list style. This is available with and without graphs. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 10 Uptime/Downtime**: Create a report with up to 10 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Highest and Lowest**: Create a report with up to 100 objects with the highest and lowest average values. Choose from different intervals. Reports with this template cannot generate data files (neither CSV nor XML)
- **Top 100 Uptime/Downtime**: Create a report with up to 100 objects with the highest uptime and downtime each. You can choose between data in percent and hours. Reports with this template cannot generate data files (neither CSV nor XML)

Monitoring data within an interval is averaged. See also the comment on data averaging in the **Reports** 2788 (Automatic Averaging) section. For information on how to modify templates, please see the **More** 2809 section below.

Security Context	Define the user account 2890 that you want to use for access to your monitoring data. The report only contains objects which the selected user 101 is allowed to view. Choose a PRTG user from the list. The available users depend on your configuration. By default, this is the user that created the report. PRTG System Administrator users can change this setting.
Timezone	Define the time zone to use for all date-specific settings in this report (see below). Choose a time zone from the list.
Paper Size	Define the paper size in which PDF reports are created. Choose between:

BASIC REPORT SETTINGS

- **None**: Do not specify a paper format. The size is set automatically.
- **A4**: Use German DIN A4 format.
- **A3**: Use DIN A3 format.
- **A2**: Use DIN A2 format.
- **Legal**: Use North American legal paper format.
- **Letter**: Use North American letter paper format.
- **Ledger**: Use North American ledger paper format.

Orientation

Define the page orientation for the data in PDF reports. Choose between:

- **Portrait**: Use portrait mode for the page orientation.
- **Landscape**: Use landscape mode for the page orientation. The landscape format is designed to properly show data tables of sensors with many channels. Other parts of the report will remain in portrait mode and do not re-size to the landscape format.

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

Cluster Node

This field is only visible when you run PRTG in **Clustering** 87 mode. Define the cluster node from which the report takes monitoring data. Choose a cluster node from the list. The available options are specific to your configuration. Select **All nodes** to create a report with data from all of your cluster nodes.

Note: A report for all nodes includes data of the primary sensor channels only, not for other sensor channels.

Note: If you select a failover node, report and data files will not show data from the local probe or from a remote probe and might be empty or show "0" values.

Note: You can generate CSV and XML data files only for a single failover node. If you choose the option **All nodes**, the report will not create data files!

SENSORS ("WHAT SENSORS WILL BE INCLUDED IN THE REPORT?")

Add Sensors Manually	If you want to manually choose the sensors included in this report, please save settings and switch to the **Select Sensors Manually** 2807 tab.
Add Sensors by Tag	Define the sensors included in this report by tag 96. Enter one or more tags. The report covers all sensors that have at least one of the tags. Please enter a string or leave the field empty. You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi). See the section **Tags** 96 for details. Note: Tags are inherited 96 automatically. So, for example, if you enter the tag of a group 90 here, the report will include all sensors within this group. For detailed information, see the **Inheritance of Settings** 94 section. For sensors you add by tag, the report includes all sensor channels automatically, except if you run a PRTG cluster 87 and select **All nodes** in the **Cluster Node** selection above.
Filter Sensors by Tag	Filter the included sensors further. This option works best in combination with manually added groups and devices. From the sensors that are implicitly added because of their parent objects, the report includes only the ones with the tags you enter here. Enter one or more tags to include sensors in the report. Confirm a tag with enter, space, or comma key. Please enter a string or leave the field empty. You can also use plus (must have) and minus (must not have) signs to categorize tags, for example, +snmp;-wmi (must have the tag snmp and must not have the tag wmi). See the section **Tags** 96 for details.

SCHEDULE

Report Schedule	Define at which time you want to run the report. Choose between: ▪ **No schedule (run interactive/on-demand only)**: Only use the options on the **Run Now** tab to start generating this report manually. ▪ **Every full hour**: Run this report every 60 minutes. ▪ **Every day at a specific hour**: Run this report every 24 hours.

SCHEDULE

	▪ **Every specific day of a week**: Run this report every 7 days. Specify the day below. ▪ **Every specific day of a month**: Run this report on a specific day every month. Specify below. ▪ **The day after a quarter is finished (i.e. at 1. April for the 1. January - 31. March Quarter)**: Run this report for every quarter of the year. ▪ **Every specific date**: Run this report on a specific date every year. Specify below.
Specify Hour	This setting is only visible if you select a specific hour above. From the list, select the hour you want to run the report at. PRTG automatically chooses a suitable time within this hour, usually at the beginning of it.
Specify Day	This setting is only visible if you select the day of week or day of month option above. From the list, select a day of week or a date of the month you want to run the report. If you select **Last**, the report will always run on the last day of the month, regardless of how many days the month has. If you select a date that does not exist in every month, for example, February 31st , PRTG will automatically run the report on the last day of this month.
Specify Date	This setting is only visible if you select the specific date option above. Enter a valid date in the format **DD.MM.**, for example, 31.12. The report runs annually on this date.
Scheduled Processing	This setting is only visible if you select one of the schedule options above. Define what to do with a finished report. Choose between: ▪ **Save report to disk and send it by email**: Create a PDF file and, depending on the **Data Files** 2806 setting, data files of the report, store it, and send it via email. You find the report in your emails and on the **Stored Reports** tab. Define an email address below. ▪ **Save report to disk only**: Create a PDF file and, depending on the **Data Files** 2806 setting, data files of the report and store it. Once finished, you find them on the **Stored Reports** tab. You receive also a ToDo ticket 172 from PRTG. By default, PRTG sends out a notification email to the administrator in this case. ▪ **Send report by email only**: Create a PDF file and, depending on the **Data Files** 2806 setting, data files of the report and send them via email once finished. With this option the report is not permanently stored in PRTG. Define an email address below.

SCHEDULE

Note: For large PDF reports, PRTG automatically splits the PDF into separate files to avoid huge PDF files. You can change the number of sensors included into each PDF file by editing the report templates manually. See the **More** 2809 section below.

Email Address

This setting is only visible if you select a send by email option above. Enter a valid email address to which PRTG sends the report. To enter more addresses, separate them by comma. PRTG sends a message with all recipients in the "To" field of the email.

Note: You can change the configuration for outgoing emails in the **System Administration—Notification Delivery** 2877 settings.

Send to User Group

This setting is only visible if you select a send by email option above. From the list, choose a user group to send an email with the report to all members of this group. You can edit user groups in **System Administration—User Groups** 2896.

Note: If you define individual email addresses (see field above) and a user group, PRTG will send the report to the individual email addresses as well as to the members of the selected user group. In both cases, PRTG will send one message with all recipients in the "To" field of the email.

Compression

This setting is only visible if you select a send by email option above. Define if PRTG will compress the attached report files before sending them out. Choose between:

- **Send files uncompressed (default)**: PRTG sends the report files by email in their original size.
- **Send all in one ZIP file**: PRTG will compress the report files to a ZIP file before they are sent by email.

PERIOD

Reported Period

Define the time span the report covers. Choose between:

- **Current**: Use monitoring data of the current period. Define the period type below.
- **Previous**: Use monitoring data of the last period. Define the period type below.

PERIOD

Report Period Type	Define the type of period you want to create a report for. Choose between: ▪ **Day** ▪ **Week** ▪ **Month** ▪ **Quarter (January-March, April-June, etc.)** ▪ **Year** Depending on your selection, different period selections are shown below.
Day Period	This setting is only visible if you select day period type above. Define the hours when a day starts and ends. Choose from the list of hours. Default setting is **0:00-23:59**.
Week Period	This setting is only visible if you select week period type above. Define when the week starts and ends. Choose between: ▪ **Monday-Sunday**: A reported week starts on Monday. ▪ **Saturday-Friday**: A reported week starts on Saturday. ▪ **Sunday-Saturday**: A reported week starts on Sunday.
Month Period	This setting is only visible if you select month period type above. Define when the month starts and ends. Choose between: ▪ **1.-last day**: A reported month starts on the first and ends on last of the month. ▪ **15.-14.**: A reported month starts on 15th and ends on 14th of the month.
Year Period	This setting is only visible if you select year period type above. Define when the year starts and ends. Choose between: ▪ **1/1-12/31**: A reported year starts on January 1st. ▪ **7/1-6/30**: A reported year starts on July 1st.
Report only for specific hours-of-day (Schedule)	Include certain time spans within the defined period only. If a schedule is selected, the report will include only monitoring data for specified hours or weekdays within the defined period. Select **None** to include all available monitoring data in the report, or choose a schedule.

PERIOD

For example, select the schedule **Weekdays** to exclude all weekends from the report. The available schedules depend on your configuration. For more information, please see the **Account Settings—Schedules** 2856 section.

INCLUDE PERCENTILES

Percentile Results

Define if you want to include an additional percentile calculation 3107 of your data in the report. Choose between:

- **Do not show percentiles:** PRTG does not use a percentile formula to calculate your monitoring results. It will show only the standard values.
- **Show percentiles**: PRTG adds a column to the result data tables, which shows percentiles for every sensor channel.

Note: Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting.

Likewise, percentiles are not available if in a cluster setup you choose the option **All Nodes** in the Cluster setting in the sensor section above.

Percentile Type

This setting is only visible if you select **Show percentiles** above. Enter the percentile type you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded.

Please enter an integer value.

Percentile Average Interval

This setting is only visible if you select **Show percentiles** above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 (seconds), which is equivalent to 5 minutes. This means that PRTG takes 5 minute averages as basic values for the percentile calculation. Please enter an integer value.

Percentile Mode

This setting is only visible if you select **Show percentiles** above. Choose the mode for percentile calculation:

- **Discrete**: PRTG takes discrete values to calculate percentile results.

INCLUDE PERCENTILES

- **Continuous**: PRTG interpolates between discrete values and bases the calculation on interpolated values.

DATA FILES

CSV / XML Files

Define if you want to generate CSV and XML files for data tables in the report in addition to the PDF. Choose between:

- **Do not include data files**: PRTG will not generate CSV or XML files for the report but only a PDF file.
- **Include CSV files only (available for templates with data tables)**: PRTG will generate and store CSV files in addition to the PDF. CSV data files are only generated if the report uses a template with data tables.
- **Include XML files only (available for templates with data tables)**: PRTG will generate and store XML files in addition to the PDF. XML data files are only generated if the report uses a template with data tables.
- **Include all data files (available for templates with data tables)**: PRTG will generate and store CSV and XML files in addition to the PDF. CSV and XML data files are only generated if the report uses a template with data tables.

Note: The option you select here does not apply if you send the report via email on demand from the **Run Now** tab. You can define there if you want to send data files along with the PDF.

Note: If you run PRTG in a cluster, the report will not generate data files if you select **All nodes** in the sensors selection 2800 above. Please specify a single failover node to get data files.

REPORT COMMENTS

Introduction

Enter a custom text that will show up on the first page of the report. Please enter a string or leave the field empty.

Footer Comments

Enter a custom text that will show up at the end of the report. Please enter a string or leave the field empty.

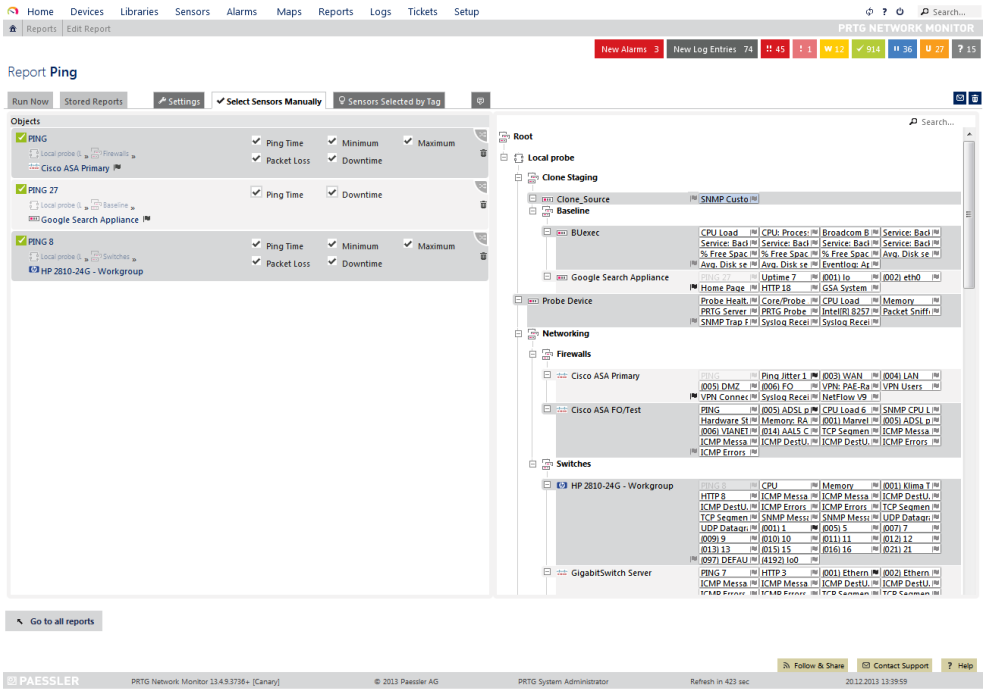
ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2896 settings.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Select Sensors Manually

Click the **Select Sensors Manually** tab to manually choose sensors that you want to include in the report. You see a split screen: On the left side, there is a list of objects that the report already contains (empty in the beginning), and on the right side, you see a less colorful view of your device tree, like on the Management 258 tab in the device tree. You can add objects to the report using drag and drop.



Manual Selection for Reports

- **Add Items**
  From the device tree on the right side, drag objects and drop them on the list on the left side. This can be entire probes, groups, devices, or single sensors. Each dropped object is added immediately as a new list item. Repeat this procedure as often as you wish until you have added all desired items to the report.
  Note: The objects you drop on the left side are always added to the end of the list, you cannot add objects directly in another order.

- **Select Sensor Channels**
  If you add a sensor to the selection, you can specify the sensor channels that the report will include. By default, all channels are selected. To exclude a channel from the report, remove the check mark in front of a channel name.
  Note: If you run a PRTG cluster 87, you can only choose between single channels if you select one specific **Cluster Node** in the report settings. If you select **All nodes** the report's **Cluster Node** setting, the channel selection is not available and the report contains only the primary channel of each sensor.

- **Change Order**
  You can change the order of manually selected objects on the left side with drag and drop. Each item you add appears at the end of the list by default. To change the order, point to the drag and drop symbol (two arrows) in the upper right corner of a selected item, drag it to the desired position, and drop it there.

- **Remove**
  To remove any objects from the report, click the trash can symbol next the respective list item, or select several list items while holding down the Ctrl key and click on the green trash symbol appearing at the top of the list.

Your selection is saved automatically, and there is no undo function.

Note: The final report will include both sensors selected manually and those selected by tag.

Sensors Selected by Tag

Click the **Sensors Selected by Tag** tab to view all sensors that are added to the report depending on the **Add Sensors by Tag** setting of the report. In the table list 178, you see all sensors that you added to the report by their respective tags. This is for your information only, you cannot change sensors here. However, you can switch to the **Settings** tab of the report and change the tags that the report uses to include sensors. Additionally, you can also exclude sensors with certain tags there. The final report will include both sensors selected manually and those selected by tag.

For sensors that you add by tag, all sensor channels are included in the report automatically, except you use a PRTG cluster 87 and select **All nodes** in the **Cluster Node** selection of the report. In this case, the report includes only the primary channel of each sensor.

Note: The final report will include both sensors selected manually and those selected by tag.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

7.11 Maps

With PRTG's **Maps** feature (some people might call this 'dashboards') you can create web pages with up-to-the-minute monitoring status information in a customizable layout. Using this unique concept, you can also make your overview pages of live data publicly available, if you like.

Example of a PRTG Map

In this section:

- Introduction 2810
- Start Maps 2811
- Maps Overview 2812
- Maps Rotation 2812
- Working with Maps 2812

Introduction

There are countless possibilities for the implementation of maps. For example, you can use this feature to:

- Create network maps with status icons for each device on the map.
- Create quick views of your network that can be shown on network operations center screens.

- Create a quick network overview for publishing on the Intranet, allowing at-a-glance information for management of other employees.
- Create a custom view of the most important sensors in your monitoring setup.
- Create Top 10 lists of the sensors of a specific group or device.

Technically, a map is a usual HTML web page. You can build a schema of your network by choosing from hundreds of device icons and connect them with lines. A map can consist of the following elements:

- A set of map items, which can include device icons, sensor status icons, graphs, data tables, lists of sensors, connection lines, geographical maps, or custom HTML code.
- An optional background image (a JPG, PNG, or GIF file, for example, your company logo, or a graphical view of your network).

You can also specify the size of the map. Using the AJAX-based map editor, you can place the items anywhere on the map, and you can also change their size. Each map has a unique URL which you can use to link to the map. Users who want to access the map either need an account in your PRTG installation, or can access a public URL of the map if you allow the **Public Access** feature. Public maps contain a unique **Map ID** access key in the URL to block unwanted visitors.

PRTG comes with several pre-configured standard maps which you can use right away. You can also change or delete them, if you like. The following maps are automatically created when you install PRTG for the first time (visible for the PRTG System Administrator 101 user):

- **Sample Dashboard**: By default, this map shows a graphical structure of your device tree, the sunburst view 129 of your device tree, a list of alarms 161, a geo map 2753, and more. This sample map has a 5***** priority 182 so you can also open it under **Home** in the main menu 200. To not show it in the main menu, define a lower priority.
- **Magic Map**: By default, this map shows the sunburst view 129 of your device tree with several graphics that demonstrate customization capabilities of the maps feature.

Start Maps

Click the **Maps** entry from the main menu 209 to view or add custom views of your network's status and monitoring data. Hover over **Maps** to show other menu items. Choose between:

MAPS	
All	Open the Maps overview page where you can view or add custom views of your network's status and monitoring data.
Add Map	Open an assistant to directly add 2814 a new map.
Select Map ›	Open an existing map. Hover over **Select Map** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

Maps Overview

In the **All** view, you see a list of all existing maps. Using the links next to a map name, you can perform the following actions.

- Click the name of a map to view it.
- Click the **Edit** button to adjust the settings of this map.
- Click the **Clone** button to create an exact copy of this map. As soon as you click, the map is cloned and the cloned map's settings are shown.
- Click the **Delete** button to remove this map.
- Click the **Add Map** button to add a new map.
- Define the priority 182 of a map. Maps with a 5***** priority appear in the main menu bar 200 under **Home** for direct selection (up to 10 entries).

Please also see **Working with Table Lists** 178. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2742 section.

Map Rotation

To show several maps in a rotation, mark the desired maps using multi-edit 2742 and then select **Map Rotation** from the multi-edit menu. PRTG shows the selected maps in rotation on a new page then. This requires login credentials for PRTG.

It is also possible to set up a **public map rotation** without login:

- Allow public access in the settings 2823 of the desired maps.
- Use the corresponding map IDs with its secret keys to build a URL that calls a public map rotation.
- The URL must have this format: the address of your PRTG server, followed by /public/mapshow.htm?ids=.
- Then list the IDs of the desired maps, each separated by a comma.
- Each map ID has to be connected with its secret key using a colon: **http://**yourprtgserver**/public/mapshow.htm?ids=**mapid1:secretkey1,mapid2:secretkey2,mapid3:secretkey3
- While PRTG shows a map rotation, you can change the refresh interval any time when hovering over the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now.

Working with Maps

For detailed information on how to create and edit maps, and to learn how to make them accessible to others, please see the following sections.

- **Maps Step By Step** 2814
- **Map Designer** 2816

- Maps Other Settings 2823

7.11.1 Maps Step By Step

To create a new map, follow the steps in this section. In the web interface, click **Maps** in the main menu bar 200 to show the maps main screen.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

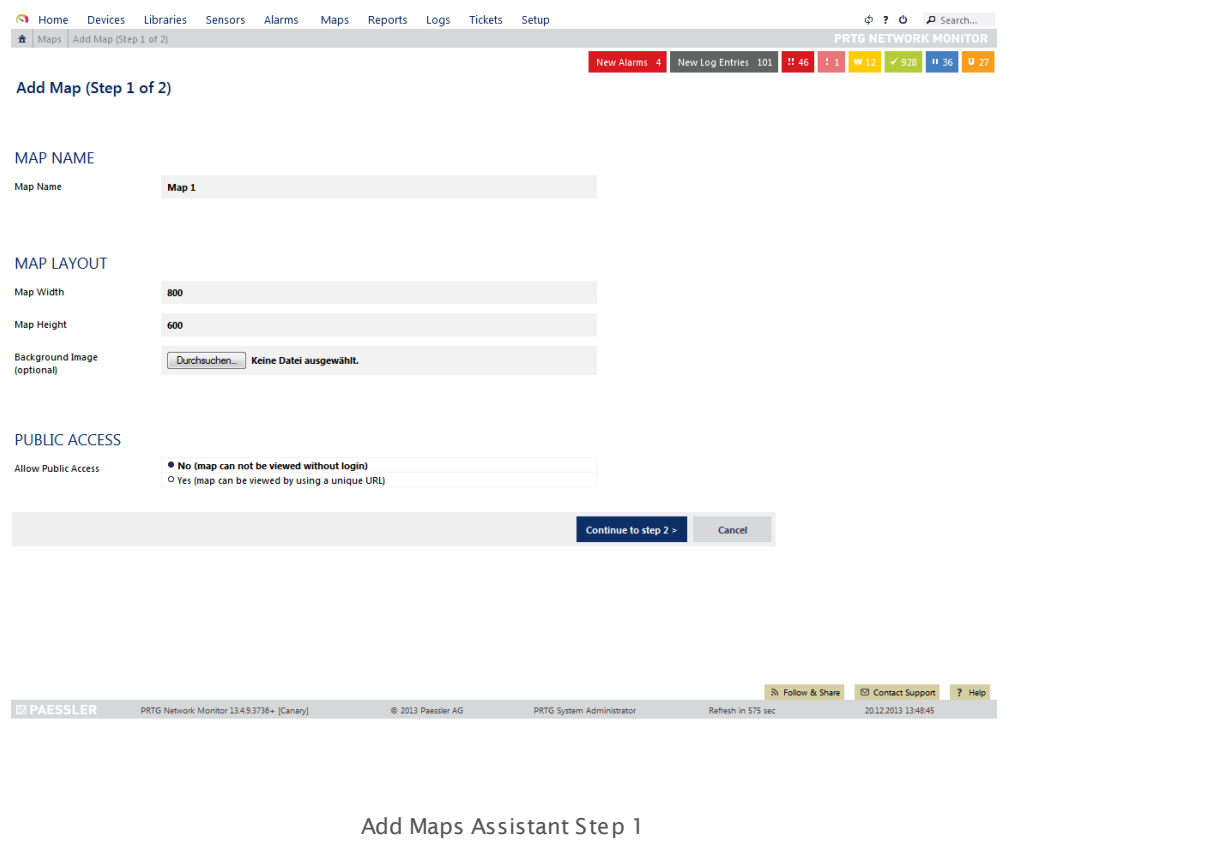
In this section:

- **Step 1: Add Map** 2814
- **Step 2: Add Map Items** 2815
- **Step 3: View and Share** 2815

Step 1: Add Map

Click the **Add Map** button. An assistant appears. Enter a **Map Name** and define **Map Layout** settings (size and optionally a background image). in the **Public Access** section, define the accessibility to your map without login.

For detailed information, see **Maps Other Settings** 2823 section (Settings).



Add Maps Assistant Step 1

Step 2: Add Map Items

Click the **Continue to step 2** button to open the **Map Designer**. Select an object from the device tree on the left, drag&drop an object from the items list on the right side, define further properties of the item (mark it in the main window of the Map Designer and see section **Properties** on the right), and confirm. The item appears on the map immediately. Repeat this procedure as often as you wish until you have added all desired items to the map. Drag items to change their position. Additionally, you can also draw connection lines between items or edit existing items.

For detailed information, see **Map Designer** 2816 section.

Step 3: View and Share

Click the **View Map** tab to see your map. Later, PRTG will show it the way you see it there. If available for an object, you can click most object names as well as all sensors. It depends on the access rights of the object and the currently logged in user account if you can get more detailed information about the object or an error message indicating insufficient access rights.

Click the **Get HTML** tab to get the direct URL of your map that you can share with others. For detailed information, see **Maps Other Settings** 2826 section.

While showing a map, the single map items refresh in the refresh interval you define for this map.

7.11.2 Map Designer

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

In this section:

Use the Proper Browser

Due to the map designer's extensive scripting capability, it is important that you use a compatible browser when editing maps. We recommend that you use Google Chrome 49 or later (recommended) or Mozilla Firefox 45 or later. You can use Microsoft Internet Explorer 11 as well. The map designer is not fully compatible with earlier versions of Internet Explorer or Opera browsers.

Basic Design Concept

Click the **Map Designer** tab to open the editor. It might take a few moments to load (for unresponsive script warnings, please see the More 2822 section below). Here, you can create your map by adding or changing items. The designer screen consists of three main parts: The **Device Tree** on the left side, the current **Map** in the middle, and the **Properties** on the right side.

Map Designer

Each map item takes attributes from both selections.

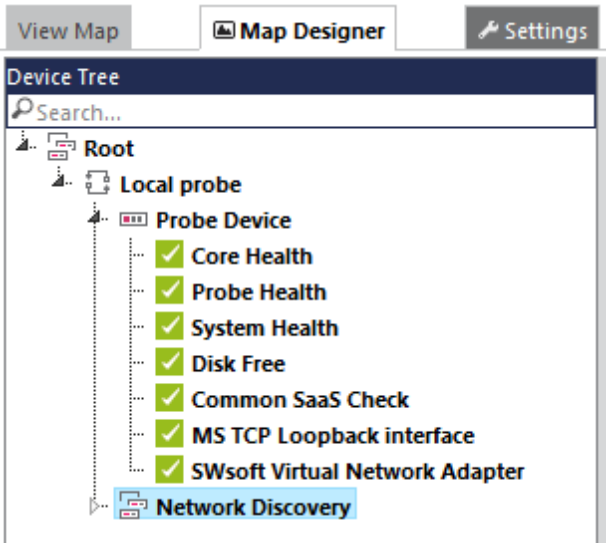
- **Device Tree** (left): Select the monitored object whose data you want to show on the map.
- **Properties** (right): Define how to show the map item.

Simply drag and drop any object from either side onto the map, or double-click on an object. You will always see all changes immediately.

Device Tree Selection

Use the **Device Tree** to select the monitored object whose data you want to show on the map (this can be a probe, a group, a device, or a single sensor). To find the desired object you have the following options:

- Use the arrow symbols at the beginning of each line to open nodes in the device tree and show objects below probes, groups, and devices.
- Enter a few characters into the **Search** box in the upper left corner to search for names (or part of names) of objects in your configuration. You will see the search results immediately. Click the red **x** icon to clear your search.



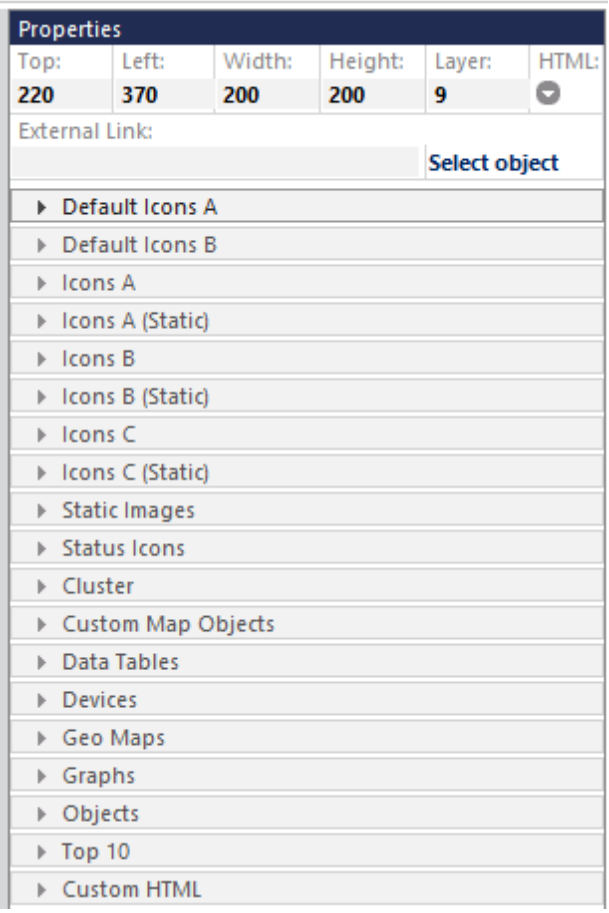
Device Tree Selection in the Map Designer

- No matter which method you choose to find the desired object, you can always drag any object from the **Device Tree** onto a free area of the map to create a new map item.
- If you drag it onto an existing map item, it replaces the existing item while **Properties** and size stay the same.
- You can also select a map item and double click a **Device Tree** object to replace the map item. If no item is selected, double clicking an object adds a new map item.
- To gain more space for map editing, reduce the size of the **Device Tree** box by dragging its right border to the left. Drag it to the right to enlarge it again.

Properties Selection

Use the **Properties** selection to define how to show the map item (for example, as an icon, a map, a table, or a graph). Select the appearance in different categories. Hover over a property object to get a live preview of it (in most cases).

Note: If a certain **Properties** object is not available for the selected **Device Tree** object, you will see a corresponding text note.



Properties Selection in the Map Designer

There are many different property object types available. Simply click one of the categories to show all available types.

- **Default Icons A, Default Icons B**
  These categories offer a variety of iconic symbols of typical network devices in the current PRTG style. Category A comes with object data which category B does not include.
- **Icons A, Icons B, Icons C**
  These three categories offer a variety of iconic symbols of typical network devices. Below each icon you can see the object name and a sensor overview for the object. This shows how many sensors are in which status 135. For some sensors, a mini graph is shown as well.
- **Icons A (Static), Icons B (Static), Icons C (Static)**
  These three categories offer the same variety of iconic symbols of typical network devices as the category described above. Here, no object data is displayed but only the icon.
- **Static Images**
  This category offers free or public domain geographical maps from different sources. For additional geographical maps, please see the **More** 2822 section below. Use properties section Geo Maps if you want to show PRTG **Geo Maps** 2753 in the map.
  Note: The items in this section are independent from the selected **Device Tree** objects.

- **Status Icons**
  This category offers options to insert status 135 icons in different styles. These show the object name and an overview of how many sensors there are and their status. For example, you can add "traffic lights" or the QR code of a monitoring object to your map. There is also an object available for audible alert which will play a sound when the number of alarms of the monitored object are > 0. Note that your browser must support playing embedded sounds (see the **More** 2822 section below for further information) for this icon.
- **Cluster**
  If you use the PRTG **Clustering** 87 feature, you can add icons that show the status of your cluster to your map.
- **Data Tables**
  Choose from several table lists 178 that show sensor lists for the currently selected object. You can also choose from several lists that show sensors in a certain status only.
- **Devices**
  Add several views of your device tree 129 to the map, including sensor gauges 137 for the select object.
- **Geo Maps**
  In this category you can choose between a globe and a geographical map. You can see the location of the currently selected object in the **Device Tree** on the map. To use this feature, you must enable Geo Maps integration and you have to enter a **Location** in the settings of the monitoring object you want to use this with. For more information, please see the **Geo Maps** 2753 section.
  Note: If Geo Maps integration is disabled, you will only see white boxes instead of map previews.
- **Graphs**
  This category offers different graph styles in several dimensions and detail. You can also select graphs including a legend or sensor states.
- **Objects**
  Add some simple geometric shapes to your map. The items in this section do not depend on the selected object in the **Device Tree**.
- **Top 10**
  Choose from several tables that show the top 10 sensors in certain categories, such as least used CPUs, highest bandwidth usage, best availability, or slowest websites.
- **Custom HTML**
  You can use this property, for example, to add external images or applets to your map. To actually add custom HTML code to your map, add the item, and mark it to edit 2821. You can then copy your custom code into the **HTML Before** and **HTML After** fields in the **Properties** box on the right side.

No matter which object you choose, you can always drag any object from the **Properties** box onto a free area of the map to create a new map item. If you drag it onto an existing map item, it replaces this item, while its **Device Tree** object attributes and size stay the same. You can also select a map item and double click an object in the **Properties** box to replace the map item. If no item is selected, double clicking an object will add a new map item.

To gain more space for map editing, reduce the size of the **Properties** box by dragging its left border to the right. Drag it to the left to enlarge it again.

Edit Existing Map Items—Properties Box

Click a map item to select it. You can then edit its attributes using the fields in the upper part of the **Properties** box on the right side:

- **Top**, **Left**, **Width**, and **Height** fields
  Enter position and size values for direct positioning. Click the **Save** button to save your settings. Alternative: Use the mouse to move and resize a map item.

- **Layer** field
  The layer number defines if an item appears on top of or behind another item if they overlap. The item with the higher number appears on top. Enter a positive integer value and click the **Save** button to save your settings. Alternative: Use the arrow symbols in the context menu of a map item to **Bring to front** or **Send to back** an item one layer (see below).

- **External Link**
  PRTG maps are interactive. You can define an address to any website here. If you click the map item when viewing the map, PRTG open this page in a browser window. Enter the whole URL to an external website (for example, https://www.paessler.com) or the address of a subpage of your PRTG installation (for example, devices.htm).

- **HTML**
  Click the arrow symbol underneath to show the **HTML Before** and **HTML After** fields. Any HTML code you enter in these fields is added before or respectively after the map item. Enter your custom HTML code that embeds an object and click the **Save** button. Your HTML object is inserted into the map. For example, you can enter the code <img src="http://media.paessler.com/common/img/logoclaim_r1.gif"> to insert an image of a Paessler logo.

Edit Existing Map Items—Hover Icons

Hover over a map item to show the edit icons for it.

- **Bring to front (arrow up symbol)**
  Move this item one layer to the front. This is useful when adding several items to a map that overlap each other.

- **Send to back (arrow down symbol)**
  Move this item one layer to the back. This is useful when adding several items to a map that overlap each other.

- **Delete (trash symbol)**
  Delete this item.
  Note: Be careful! The item will be deleted immediately without notice and you cannot undo this. Alternative: Select the item and press the Del button on your keyboard.

- **Drop Connections (scissors symbol)**
  If there are connection lines between two items, you can delete all lines starting from this item. Connection lines will be dropped immediately.

Edit Existing Map Items—Using Cursor Keys

While an object is selected, use the cursor keys to move it one pixel at a time. Hold the Shift key in combination with the cursor keys to move the object 10 pixels at a time.

Draw Connection Lines Between Items

You can draw connection lines between any map items via drag and drop. Click the gray handles next to an item and drag a line to the item you want to draw a connection to. A line between these items appears immediately. This can be useful to indicate network connections or logical coherence between two items. To delete connection lines, click the scissors symbol in the item's edit icons  .

Lines between objects are colored dynamically. They are red as long as one of the object's icons shows a red **Down** status. This only affects half of the line, at the end where the red sensor is shown. If both objects connected show a red sensor, this results in a continuous red line.

Snap to Grid

Select whether to use **Snap To Grid** or **Don't Snap**, using the buttons below the **Device Tree** box. This affects how map items are positioned when adding or moving them via drag and drop. The setting is active immediately. With snap to grid enabled, you can place items aligned with the grid only.

7.11.3 Maps Settings

Using the Map tabs you can access all functionalities and settings for a map.

Map Tabs

View Map

Click on the **View Map** tab any time to show a preview of your map.

Map Designer

Click on the Map Designer tab to edit the contents of your map. Please see **Map Designer** 2816 section.

Settings

Click on the **Settings** tab to open a map's general settings. Note: When using the **Add Map** dialog, not all of these settings are available. You can change them later by clicking on the **Settings** tab.

BASIC MAP SETTINGS

Map Name	Enter a meaningful name for the map.
Security Context	Define the user account that will be used for access to monitoring data. The map will only contain objects which the selected user 101 is allowed to view. Please choose a user from the list. The available users depend on your configuration. By default, this is the user that created the map. PRTG Administrator users can change this setting.
Timezone	Define the time zone that will be used for all date-specific options in this map. Select a time zone from the list.
Tag Filter	This setting affects table maps objects. Enter one or more tags separated by space or comma to include sensors in tables. Only sensors with one of the tags entered here will appear in this map's data tables—including sensors which inherit 94 tags from parent objects. Please enter a string or leave the field empty. Note: Use with care! This setting will affect all tables of the current map!

MAP LAYOUT

Map Width	Define the width of the map in pixels. Please enter an integer value.
Map Height	Define the height of the map in pixels. Please enter an integer value.
Automatic Scaling	Define if you want the map to automatically adapt to your screen size. Choose between: ▪ **Scale map view to fit browser size**: The size of the map adapts automatically to the size of your screen. Choose this method if the map is shown on various screens with different resolutions so that it uses the available place in the browser window the best possible way. ▪ **Do not auto-scale map view**: The map uses always the size that you define above. Note: When showing a map 2826 with enabled automatic scaling (/mapshow.htm), you can disable the automatic scaling in this view by adding the parameter **&noautoscale** to the URL.
Background Picture	Define if you want to use a background picture for the map. Choose between: ▪ **Use an image in the background of the map**: Use a custom background image that you define below. ▪ **Do not use a background image**: Do not use a background image.
Background Image	This option is only visible if you enable a background picture above. Click on the **Choose File** button and select an image from your computer or network. Note: Only images in the format JPG, PNG, and GIF are supported. The file size must be smaller than 2 MB. If you try to upload other images, you get an error message. In a cluster, background images are not automatically deployed to the other nodes! In order to view maps on other nodes, copy the background pictures manually to \webroot\mapbackground of the program directory on every node. For detailed information on how to find this path, please see **Data Storage** 3135 section.
Background Color	Select a background color for this Map. Either enter a hex color code or choose a color from the color selector. The hex color code field will always display the currently defined color.

PUBLIC ACCESS

Public Access	Define if others can see the map. Choose between: ▪ **No Public Access**: Do not allow public access to the map. Only users with both a login to the PRTG web interface and sufficient access rights can see the map. ▪ **Allow Public Access**: Allow access to the map using a unique address. The URL contains a key that you can change below.
Secret Key	This field is only visible if public access is enabled above. The key is automatically generated. It is part of the public URL for the map. You can also enter a customized string. We recommend that you use the default value. For more information on public access, please see the **Get HTML** 2826 section. Note: The characters comma "," and colon ":" are not allowed in the secret key field!

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2896 settings.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Get HTML

Your PRTG map is like a standalone HTML page. You can make it accessible to others, if you like. Depending on the **Public Access** setting 2823 of your map, a visitor needs to provide PRTG user account login data to view the map, or sees the map immediately using a URL containing a secret key. When using this unique key, you can also include your map on another webpage, embedding it via <iframe>.

- **Option 1: Link to a web page with the map that requires login credentials**
  The shown URL requires login credentials in order to display the map. PRTG asks the user trying to view the map via this URL for login credentials.
  Note: In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.
- **Option 2: Link to a web page that displays the map without a login**
  To get the shown URL working for public access without a login, enable **Allow Public Access** in the settings tab 2823 of your map.
  Note: In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.
- **Option 3: Show a map inside other web pages using an IFRAME**
  For your convenience, this shows source code for adding an iframe to another webpage. It includes a URL for direct access. Just copy the code and paste it into your webpage code. Also enable **Allow Public Access** in the settings tab 2823.
  Note: In the URL, usually the IP address is given via which the page is available. Maybe a NAT translation is set in your firewall, or you may want to use a domain name or a name from a dynamic DNS service for public access. Please customize URL you use for access to your needs.

While a map is shown via these URLs, you can change the refresh interval any time by hovering over the arrows symbol in the lower right corner. Choose between **10**, **30**, or **60** seconds, **10** minutes or **Refresh** now. The map adapts automatically to the size of the browser window if you enable the auto-scaling setting 2823.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Delete

You can delete the entire map any time by clicking on the trash symbol on the right.

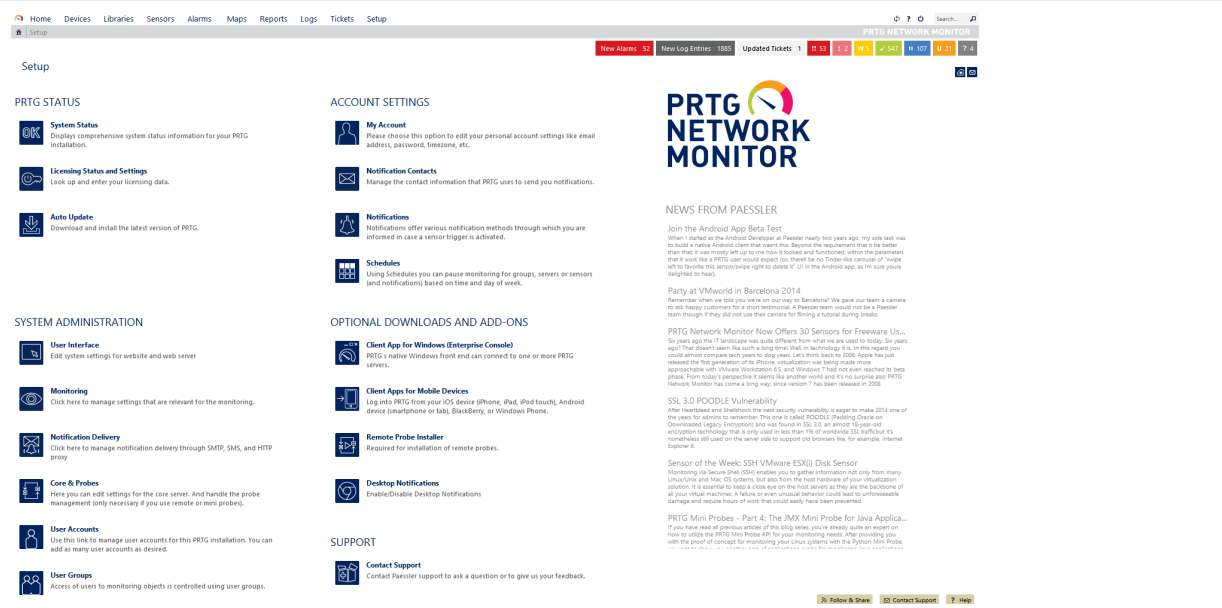
7.12 Setup

In the setup settings of the PRTG web interface, you can define almost all system settings for PRTG. However, some of the machine-oriented settings are defined using two Windows administration tools (see Others 2829 section below).

In the main menu, click on **Setup** to show the available options.



Setup Overview Page

PRTG Status

- PRTG Status—System Status 2907
- PRTG Status—Cluster Status 2923
- PRTG Status—Licensing Status and Settings 2925
- PRTG Status—Auto-Update 2918

Account Settings

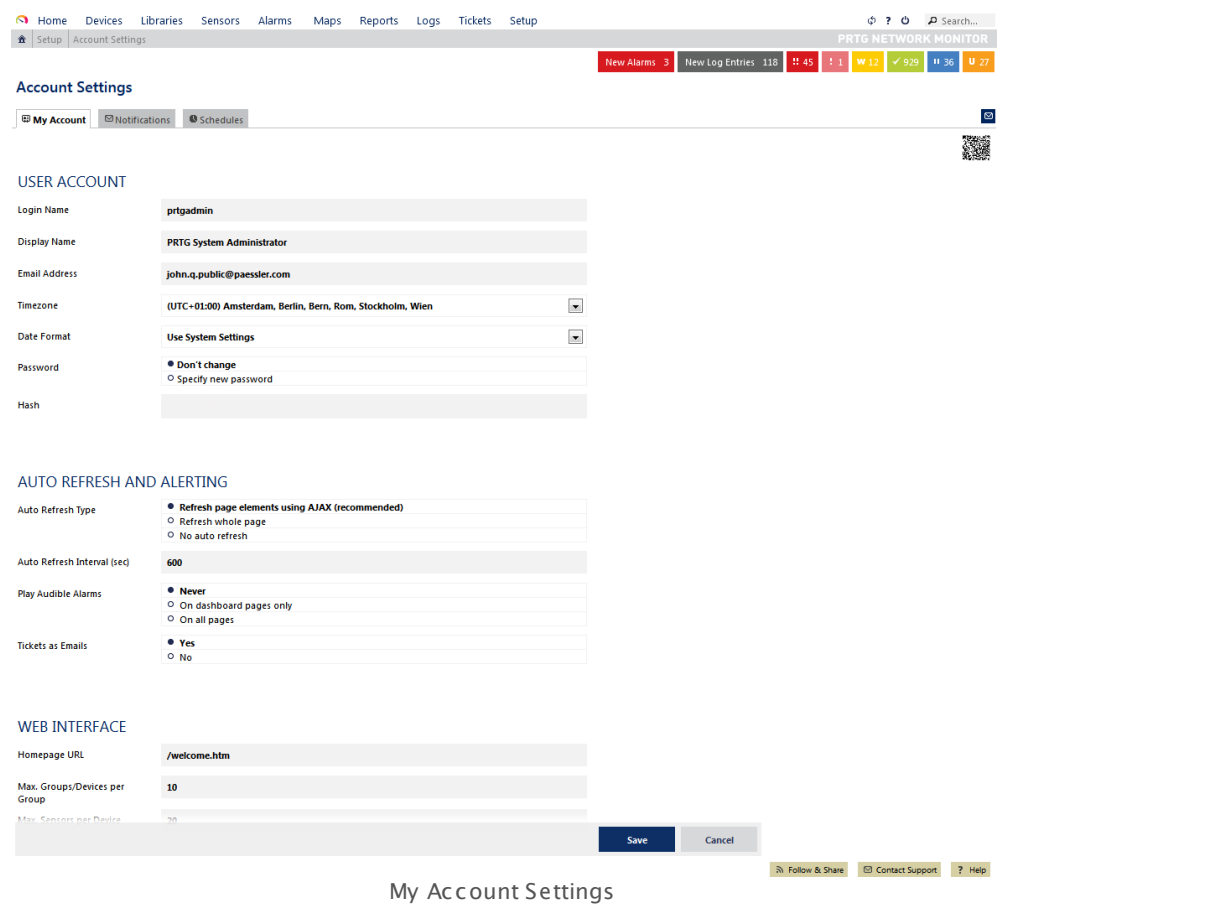
Others

There are some settings that you have to make in the PRTG Administration Tool 3046, running as Windows application. For more details, please see sections PRTG Administration Tool on Core Server System 3047 and PRTG Administration Tool on Remote Probe System 3073.

7.12.1 Account Settings—My Account

In the **My Account** settings you can define values regarding your (currently logged in) PRTG user. All settings in this section are user-specific. Some account options may not available, but restricted to the administrator.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.



My Account Settings

My Account Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

USER ACCOUNT

Login Name	Enter the login name for the user.
Display Name	Enter a name that the user recognizes. It will not be used for login purposes.
Primary Email Address	Enter the user's email address.
Password	Define the user password. For security reasons, the account settings page does not contain the password. Choose between: ▪ **Don't change** ▪ **Specify new password** If you choose to specify a new password, enter the old password and then the new password twice. Note: The new password must be at least 8 characters long. It must contain a number and a capital letter. The password of a PRTG Administrator user can only be changed by this PRTG Administrator user himself.
Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API) 3086. This setting is shown for your information only and cannot be changed here.

ACCOUNT CONTROL

Account Type	This setting is only visible to administrator users. However, it will not shown if the user who's account you want to modify is a member of a group with administrative rights. Define the account type for the current user. Choose between: ▪ **Read/Write User**: You can change settings. ▪ **Read Only User**: You can not edit any settings except your own password. This is a good choice for public or semi-public logins. Note: This setting cannot be changed for the default administrator user.

ACCOUNT CONTROL

Allow Acknowledge Alarms	This setting is only visible if read only user is enabled above. Acknowledging an alarm is an action which requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms 162. Choose between: ▪ **Allow**: Allow acknowledging alarms for this user. ▪ **Deny**: The user will not be able to acknowledge alarms.
Password Changes	Decide if you want the user to be able to change his account's password or not. If you allow the user to change the password, this option will be available in the **My Account** 2830 settings of the respective user. Choose between: ▪ **User may change his account's password** ▪ **Deny the right to change the password** (default) Note: This field is only visible if you edit this option for read-only users as an administrator.
Primary Group	This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups. Note: You cannot change the primary group of Active Directory users. Users which you added with **Active Directory Integration** 3083 can only have this AD group as their primary group. If you need to change this, please delete this user account and add it anew.
Status	This setting is only shown for administrator users. Define the status of the current user. Choose between: ▪ **Active**: The current user can login to the account. ▪ **Inactive**: The current user's login is disabled. Use this option to temporarily deny access for this user. Note: This setting cannot be changed for the default administrator user.
Last Login	Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

USER GROUPS

Member of	Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

AUTO REFRESH AND ALERTING

Auto Refresh	Define if you want PRTG to reload web pages automatically for the current user. Choose between: ▪ **Refresh pages (recommended)**: Automatically refresh the single page elements on the web pages in PRTG. ▪ **No automatic refresh**: Do not automatically refresh web pages.
Auto Refresh Interval (Sec.)	This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use **30** seconds or more. Minimum value is 20 seconds. Note: Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG maps 2810), please set a higher interval.
Play Audible Alarms	Define when an audible alarm will be played for the current user on web pages whenever there are alarms 161 in PRTG. Choose between: ▪ **Never**: Do not play sound files on any web pages. ▪ **On dashboard pages only**: When there are alarms, play a predefined sound on dashboard 200 pages only. The sound snipped will be played again with every refresh of the dashboard page. ▪ **On all pages**: When there are alarms, play a predefined sound on all web pages. The sound will be replayed with every page refresh. For more information about audible notifications and supported browsers, see the **More** 2835 section below.

WEB INTERFACE

Homepage URL	Define the user's default page, which is loaded after logging in or clicking on the Home button in main menu.
Max. Groups/Devices per Group	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for groups and devices here. We recommend values between **10** and **30**.
Max. Sensors per Device	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for sensors per devices here. We recommend values between **10** and **30**.
Timezone	Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends. Note: PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.
Date Format	Define the format of dates for the current user. Note: This setting will take effect after the next login.

TICKET SYSTEM

Email Notifications	Define if you want to get emails from the ticket system. Choose between: ▪ **I want to receive an email whenever a ticket changes**: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket which is assigned to you or your user group is changed. Note: If you edit tickets which are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email. ▪ **I do not want to receive any emails from the ticket system**: You will not get any emails about tickets.

Notification Contacts

In the **Notification Contacts** 2852 tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS, Android and Windows Phone devices with the corresponding PRTG smartphone app 2995).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

More

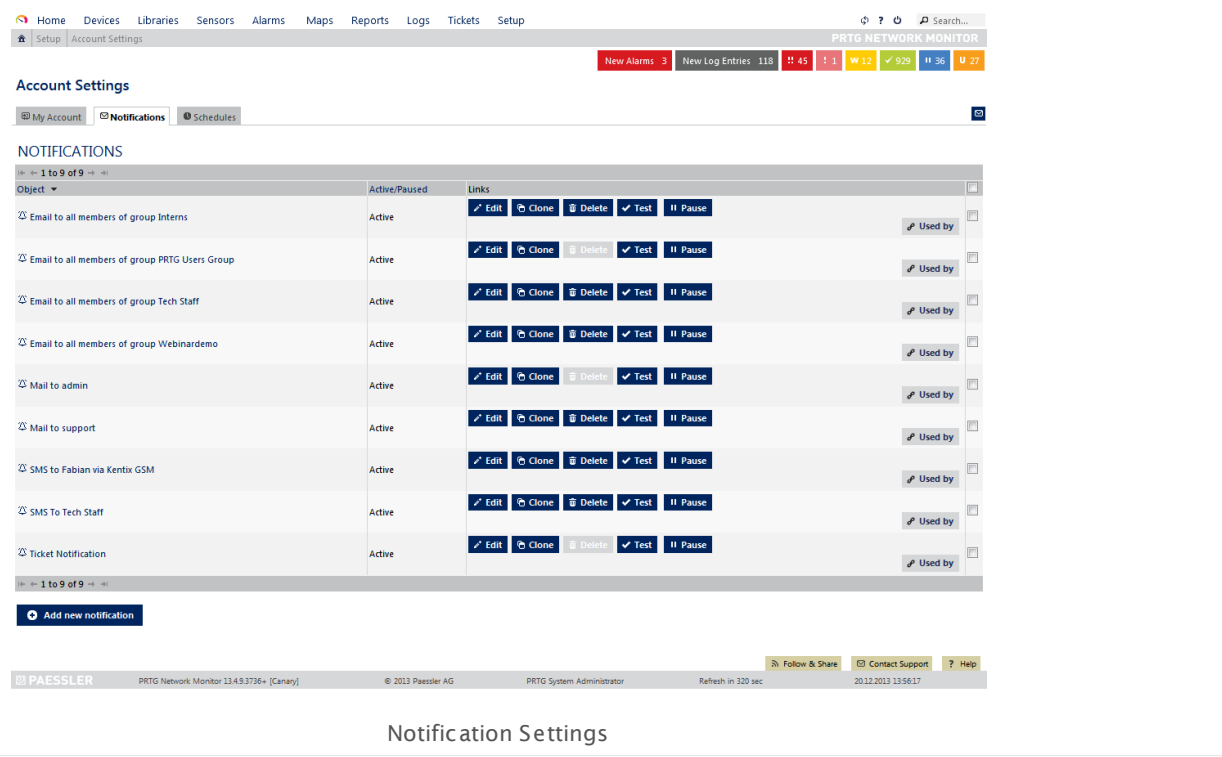
Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- http://kb.paessler.com/en/topic/26303

7.12.2 Account Settings—Notifications

In the notification settings you can define and change notifications for the current PRTG user. Notifications can be triggered for specific sensor states and values.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.



Notification Settings

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see System Administration—Notification Delivery 2877.
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see Account Settings—Notification Contacts 2852.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see Account Settings—Notifications 2836.
4. Checking and setting up **Notification Triggers** for objects. These provokes the defined notifications.
   For detailed information, see Sensor Notifications Settings 2719.

Note: We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2841 and one SMS notification 2843. If delivery via email fails (due to a email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2721 and a notification via a delivery method other than the one for the first trigger. Or by sett up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2759 section.

Notifications Overview

Click the **Notifications** tab to show a list of existing notifications. Using the buttons in the column **Links**, perform the following actions to set up a notification:

- **Test**: Trigger this notification immediately for testing purposes.
  Note: When testing notifications, PRTG will not resolve the placeholders, but rather send the original variables instead.
- **Pause**: Pause this notification. If a notification is paused 185, PRTG will not send messages when this notification is triggered.
- **Edit**: Open the settings of a notification 2837 to edit them.
- **Clone**: Create an exact copy of this notification. The clone 2740 is added to the notifications list as Clone of [...]
- **Delete**: Delete this notification (not possible for predefined notifications).
- **Used by**: Show all objects which trigger this notification.

Please also see **Working with Table Lists** 178. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2742 section.

Notifications Settings

Click the **Add new notification** button to add a new notification, or click the name of an existing notification to edit it.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

BASIC NOTIFICATION SETTINGS

Notification Name	Enter a meaningful name for the notification, for example, SMS to service team or similar.

BASIC NOTIFICATION SETTINGS

Tags	Enter one or more tags 96. Confirm each tag with space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags will be automatically inherited 96.
Status	Select the status of the notification. Choose between: ▪ **Started**: This notification is active. PRTG executes this notification when it is triggered. ▪ **Paused**: Pause this notification. If a notification is paused, PRTG does not execute this notification when it is triggered.
Schedule	Define for which intervals you want notifications to pause. You might want the notifications to pause for scheduled maintenance periods or regular server reboots at certain intervals. For continuous notification select **None.** This selection will make your notifications be active 24/7 without pause. You can also choose one of the suggested schedules from the list. Usually schedules define when this notification will be active. Schedules defined as period list set this notification to inactive at the corresponding time spans. The available options depend on your setup. To add or change existing schedules, please see **Account Settings—Schedules** 2856.
Postpone	Define if PRTG should send you notifications that were triggered during the **Paused** status later on, when the notification function is in **Started** status again. ▪ **No**: Discard all notifications that are triggered while the notification is paused. ▪ **Yes**: Collect all notifications that are triggered while the notification is paused. Send out all these notifications once the **Paused** status ends.

NOTIFICATION SUMMARIZATION

Method	Define if and how PRTG summarizes notifications. Define if several notification triggers are to be collected over a specified time period and then sent as a single summarized notification. Choose between:

NOTIFICATION SUMMARIZATION

	▪ **Always notify ASAP**: Always send out one notification for each received notification trigger as soon as possible (i.e. immediately). ▪ **Send first DOWN message ASAP, summarize others**: When receiving several **Down** triggers, send the first notification immediately, but summarize other notifications into one message. ▪ **Send first DOWN and UP message ASAP, summarize others**: When receiving several **Down** or **Up** triggers, send each first notification immediately, but summarize other notifications into one message. ▪ **Send all DOWN messages ASAP, summarize others**: When receiving several **Down** triggers, send out one notification for each trigger received, but summarize notifications for all other triggers into one message. ▪ **Send all DOWN and UP messages ASAP, summarize others**: When receiving several **Down** or **Up** triggers, send out one notification for each trigger received, but summarize notifications for all other triggers into one message. ▪ **Always summarize notifications**: When receiving several notification triggers, summarize all notifications into one message, regardless of the kind of trigger received. Note: Regardless of the option you choose, PRTG executes notifications of the types **Execute HTTP Action** and **Execute Program** always ASAP. They can never be summarized. Note: The maximum length of entries in summarized email notifications is 1,000 characters per entry.
Subject for Summarized Messages	Define a subject that PRTG will include when sending summarized notifications. You can use the placeholder %SUMMARYCOUNT for the number of messages which are summarized. Note: The subject you define is only used for Send Email and Amazon Simple Notification Service Message notifications.
Gather Notifications For (Minutes)	Define a time span in minutes to define how long PRTG collects notifications for summarization. Please enter an integer value. Note: If you enter a long timespan, for example, **60** minutes, PRTG will collect notifications for one hour until sending them out summarized in a single message.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2896 settings.

Notifications Settings—Choose Notification Methods

With the following settings, you can add one or more methods how PRTG sends out a notification message. You can choose only one method or combine several methods from the list. Whenever the notification is triggered, PRTG sends out messages or performs actions for all configured methods at a time.

To choose a method, mark the check box in front of the corresponding notification type. You can then see and set the options as described below. The following notification methods are available:

- Email 2841
- Push Notification 2842
- SMS/Pager Message 2843
- Add Entry to Event Log 2845
- Syslog Message 2845
- SNMP Trap Message 2846
- Execute HTTP Action 2847
- Execute Program 2848
- Amazon SNS Message 2848
- Ticket 2849

Note: In your message, you can use various placeholders. Some of them are already filled in by default. For a complete list of available placeholders, see the **More** 2761 section below.

SEND EMAIL

Note: This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts** 2853.

Note: The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification email to the active email contacts of the user you select, to the active email contacts of all members of the user group you select, and to all email addresses you enter into the "Send to Email Address" field.

Note: You can include custom email headers and footers into PRTG's HTML emails. For details, please see section **More** 2850.

Note: The predefined default notifications (Email and push notification to admin, Email to all members of group PRTG User Group) will revert to their default users or user groups (PRTG System Administrator or PRTG Users Group) and be reset to "active" state after restarting the PRTG core server.

Send to User	Select a user of your PRTG installation to send the notification email to. PRTG sends this notification to each email contact of this user account. You can add and edit email contacts of a user in **Account Settings—Notification Contacts** 2853. Choose **None** to not use this feature.
Send to User Group	Select a user group to send an email with the notification to all members of this group. PRTG sends this notification to the email contact of every group member. You can edit user groups under **System Administration—User Groups** 2896 and email contacts under **Account Settings—Notification Contacts** 2853. Choose **None** to not use this feature. Note: If you select a user group and a specific member of this group as recipients, the user will only receive a single email. This also applies if you enter an individual email address below that is already defined as an email contact of the selected user. Note: If you define individual email addresses (see below), to a specific user (see above), and a user group, PRTG sends the message to the individual email addresses, to the individual user, as well as to the members of the selected user group. In all cases, PRTG sends one message with all recipients in the "To" field of the email.

SEND EMAIL

Send to Email Address	Enter one or more recipient email addresses to which PRTG sends the notification email. If you enter more than one address, separate them by comma. Leave this field empty to send this notification only to the email contacts of the user or members of the user group you choose above. We recommend that you use the options "Send to User" and/or "Send to User Group" instead because you can manage the notification contacts of users more easily this way.
Subject	Enter the subject of the email notification. Several placeholders (variables) are used here by default: [%sitename] %device %name %status %down (%message)
Format	Define the kind of email that PRTG sends when the notification is triggered. Choose between: ▪ **HTML**: PRTG uses the default HTML email template for the message part of the email. ▪ **Text**: PRTG uses the default plain text email template for the message part of the email. ▪ **Text with custom content**: PRTG uses custom plain text for the message part of the email. You can enter your individual text below.
Custom Content	This field is only visible if you select the custom text option above. Enter the desired message for this email notification in plain text format. You can use placeholders here.
Priority	Define the priority that PRTG sets for the email. Most email clients can show this priority flag. Choose between: ▪ **highest** ▪ **high** ▪ **normal** ▪ **low** ▪ **lowest**

SEND PUSH NOTIFICATION

Note: Push notifications work only with the apps **PRTG for Android** 2995, **PRTG for iOS** 2995, and **PRTG for Windows Phone** 2996. You have to activate push notifications in the settings of your app first. Please see section **More** 2850 for details about the setup and further information.

Note: This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts** 2853.

Note: The PRTG server needs to communicate on port 443 to the PRTG Cloud to send push notifications, which is **https://api.prtgcloud.com:443** (and the same as for the **Cloud HTTP Sensor** 523, the **Cloud Ping Sensor** 533 and support tickets 2932).

Note: The two options for recipients below (user, user group) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active push contacts of the user you select and to the active push contacts of all members of the user group you select.

Send to User	Select a user of your PRTG installation to send the push notification to. PRTG sends this notification to each push contact of this user account. You can edit push contacts of a user in **Account Settings—Notification Contacts** 2853 and add push contacts by activating push notifications in the Android or iOS app with this user. Choose **None** to not use this feature. Note: The predefined default notification (Email and push notification to admin) will revert to the default user (PRTG System Administrator) and be reset to "active" state after restarting the PRTG core server.
Send to User Group	Select a user group to send the push notification to all members of this group. PRTG sends this notification to each push contact of every member of this group. You can edit user groups under **System Administration—User Groups** 2896 and push contacts under **Account Settings—Notification Contacts** 2853. Choose **None** to not use this feature. Note: If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders 2850 (variables) are used here: [%sitename] %device %name %status %down (%message) You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SMS/PAGER MESSAGE

Note: You have to set up this notification method in the **System Administration—Notification Delivery** 2877 settings first.

Note: This notification method uses the central proxy settings that you define for your PRTG core server. For details, please see **System Administration—Core & Probes** 2883 (section **Proxy Configuration**).

Note: This notification method uses notification contacts to deliver the messages. Please set up and check them for the desired user accounts in advance under **Account Settings—Notification Contacts** 2853.

Note: The three options for recipients below (user, user group, email address) work simultaneously. Because of this, you can define more than one user as recipient of this notification. PRTG sends the notification to the active SMS contacts of the user you select, to the active SMS contacts of all members of the user group you select, and to every phone number you enter into the "Send to Number" field.

Send to User	Select a user of your PRTG installation to send the notification to. PRTG sends this notification to each SMS contact of this user account. You can add and edit SMS contacts of a user in **Account Settings—Notification Contacts** 2853. Choose **None** to not use this feature.
Send to User Group	Select a user group to send a text message with the notification to all members of this group. PRTG sends this notification to each SMS contact of every member of this group. You can edit user groups under **System Administration—User Groups** 2896 and SMS contacts under **Account Settings—Notification Contacts** 2853. Choose **None** to not use this feature. Note: If you select a user group and a specific member of this group as recipients at the same time, this user receives the text message only one time. This also counts if you enter an individual phone number below that is already defined as an SMS contact of the selected user.
Recipient Number	Define the number to which PRTG sends the text message. The format depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345. If you enter more than one number, separate them by comma. Leave this field empty to send this notification only to the SMS contacts of the user or members of the user group you choose above. We recommend that you use the options "Send to User" and/or "Send to User Group" instead because you can manage the notification contacts of users more easily this way.

SEND SMS/PAGER MESSAGE

Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here: [%sitename] %device %name %status %down (%message) You can change the message to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

ADD ENTRY TO EVENT LOG

Logfile	Define the log file into which PRTG writes the message. Choose between: ▪ **Application**: Use the Windows application log file in the event log. ▪ **PRTG Network Monitor**: Write messages to the PRTG Network Monitor log file in the Windows event log.
Event Source	This setting is only relevant when using the **Application** log file. Enter the source for the event. Usually, this is the name of the application.
Event Type	Select the type of the event. Choose between: ▪ **Error** ▪ **Warning** ▪ **Information**
Event Log Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SYSLOG MESSAGE

Host/IP	Define the IP address or DNS name of the computer running the syslog server.

SEND SYSLOG MESSAGE

Note: You can receive and analyze syslog messages with the **Syslog Receiver Sensor** 2245.

Syslog Port	Enter the port number on which syslog messages are sent. By default, this is port number **514**. Note: Only User Datagram Protocol (UDP) is supported.
Facility	Define the facility information. There are several options available from the list.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders 2850 (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else).

SEND SYSLOG MESSAGE—SYSLOG MESSAGE SEVERITY STATUS

Depending on the status of the sensor that triggers the syslog notification, PRTG sets the **Severity** level of the message automatically.

OK	Severity level: Notice (5)
Warning	Severity level: Warning (4)
Error	Severity level: Error (3)

SEND SNMP TRAP

For information about the OIDs that are used in the contents of the traps which PRTG sends, please see the SNMP Trap documentation in the **More** 2850 section below.

Host/IP	Define the IP address or DNS name of the computer running the trap receiver. Note: You can receive and analyze trap messages with the **SNMP Trap Receiver Sensor** 2082.

SEND SNMP TRAP

SNMP Port	Enter the port number on which trap messages are sent. By default, this is port number **162**.
Community String	Enter the community string of the device. By default, this is set to **public**. Please enter a string or leave the field empty.
Specific Trap Code	Enter a code that can help you identify the purpose of the trap. Default value is **0**. Please enter an integer value.
Message ID	This ID helps you identify the origin of the trap. For example, enter 1.3.6.1.4.1.32446.1.1.1
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders (2850) (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol ***** (and nothing else).
Agent IP	Define the IP address of the agent. Leave this field empty to use the IP address of your PRTG web server.

EXECUTE HTTP ACTION

Note: Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute HTTP Action** always as soon as possible (ASAP). They are never summarized.

Note: This notification method uses the central proxy settings that you define for your PRTG core server. For details, please see **System Administration—Core & Probes** (2883) (section **Proxy Configuration**).

Note: For more details, please see the PRTG **Application Programming Interface (API) Definition** (3086) in your PRTG web interface.

URL	Enter the URL to which PRTG sends the request. Note: HTTP notifications work with and without SSL, also with servers which do not use SSLv3.
Postdata	Enter postdata if you want to send this data to the URL. You can use placeholders (2850) here. Line breaks are supported.

EXECUTE PROGRAM

Note: Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Execute Program** always as soon as possible (ASAP). They are never summarized.

Note: For more details, please see the **Application Programming Interface (API) Definition** 3086 in your PRTG web interface.

Program File	Select an executable file from the list. PRTG runs it every time the notification is triggered. In this list, you see the files which are in the corresponding **/Notifications/EXE** sub-directory of your PRTG core server system. To appear in this list, store the files as BAT, CMD, DLL, EXE, PS1, or VBS. To find this path, please see section **Data Storage** 3135. Note: In a cluster setup, copy your files to every cluster node installation manually. This makes sure PRTG can execute the notification even when the master node fails. If your custom notification executes an external program, install it on all cluster nodes as well. Please see also **Application Programming Interface (API) Definition** 3086 for detailed information.
Parameter	Enter parameters with which the program file will be started. You can use placeholders 2850 here. For example, is you use a batch file that contains a %1 variable, you can provide a value for this variable here.
Domain or Computer Name	Enter a Windows authority if you want to use another security context for the program than the security context of the PRTG probe service.
Username	Enter the username for Windows access.
Password	Enter the password for Windows access.
Timeout	Enter a timeout in seconds. After this time has passed, PRTG stops the process if it has not terminated yet. Please enter an integer value.

SEND AMAZON SIMPLE NOTIFICATION SERVICE MESSAGE

AWS Access Key ID	Enter your access key as shown in your login area at aws.amazon.com. Please enter a string.
AWS Secret Access Key	Enter your secret access key as shown in your login area at aws.amazon.com. Please enter a string.
Location	Define the location of your Amazon service. Choose one of the shown locations: ▪ US-East (Northern Virginia) ▪ US-West (Northern California) ▪ EU West (Ireland) ▪ US West (Oregon) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ South America (Sao Paulo) ▪ EU Central (Frankfurt)
ARN	Enter the Amazon resource name. Please enter a string.
Subject	Enter the subject of the message. Please enter a string.
Message	Define the message. A message with information about the sensor status is already predefined. Several placeholders 2850 (variables) are used here. You can change it to your liking. To reset this field to its default value, enter a single star symbol * (and nothing else). Note: The message part is only sent if you use email based notifications delivered by Amazon SNS. For SMS delivery, only the subject is sent while the message part is ignored because of SMS size restrictions.

ASSIGN TICKET

Note: Regardless of the **Notification Summarization** method chosen above, PRTG sends notifications of the type **Assign Ticket** always as soon as possible (ASAP). They are never summarized.

ASSIGN TICKET

For details about the ticket system, please see section **Tickets** 171.

Assign to User or User Group	Specify whether to assign the notification ticket to a user group or to a single user. Choose between: ▪ **To User Group**: Select a user group below to which PRTG assigns this ticket. ▪ **To User**: Select the dedicated user below to whom PRTG assigns this ticket. Note: The predefined default notification (Ticket Notification) will revert to the default user group (PRTG Administrators) and be reset to "active" state after restarting the PRTG core server.
Assign Ticket to this User Group / User	Select the user resp. user group to which PRTG assigns the notification ticket.
Subject	Enter the subject of the ticket. Several placeholders (variables) are used here by default. You can change it to your liking.
Content	Define the message in the ticket. A message with information about the sensor status is already predefined. Several placeholders 2850 (variables) are used here. You may change it as you wish.
When Condition Clears	Specify if PRTG closes the ticket automatically when the defined trigger condition clears. Choose between: ▪ **Close ticket automatically (recommended)**: PRTG closes the ticket automatically if the trigger condition is not met anymore. ▪ **Leave ticket open**: PRTG does not close the ticket after the condition has cleared.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Others

For information about the comments and history tabs, please see **Object Settings** 159 section.

7.12.3 Account Settings—Notification Contacts

In the notification contacts settings you can define and change notification contacts for the currently logged in PRTG user. Notifications contacts contain information about how and where to PRTG will send you notifications [2759]. They are unique for each user account. Recipients of notifications can be email addresses, phone numbers, and push devices (these are Android [2995] or iOS [2995] devices or a Windows Phone [2996] with the corresponding PRTG app). This way, every user with a PRTG installation can individually define how and where to receive messages from PRTG.

When you set up one of the notification methods [2840] "Send Email", "Send SMS/Pager Message", or "Send Push Notification", you can choose a PRTG user to send a notifications to all **active** notification contacts of this user. If you select a user group, PRTG sends the notification to all contacts of all users that this group contains. A user can also pause one or more of the contacts to temporarily not receive any messages with this recipient.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** [2877].
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** [2852].
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** [2836].
4. Checking and setting up **Notification Triggers** for objects. These provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** [2719].

Note: We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification [2841] and one SMS notification [2843]. If delivery via email fails (due to a email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger [2721] and a notification via a delivery method other than the one for the first trigger. Or by sett up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** [2759] section.

Notification Contacts Overview

Click on the **Notification Contacts** tab to show a list of all existing notification contacts of the currently logged in PRTG user. Using the buttons in the particular contact rows, you can perform the following actions:

- **Pause**: Pause this notification contact. If a notification contact is paused 185, PRTG does not send any messages to this contact when a notification for this user is triggered.
- **Edit**: Open the settings of this notification contact 2853 and change its description and recipient.
  Note: This is not possible for predefined notification contacts, for example, the primary email address. You can change the primary email address under **Account Settings—My Account** 2830.
- **Delete**: Delete this notification contact.
  Note: This is not possible for predefined notification contacts, for example, the primary email address.

Notification Contacts Settings

Click **Add Email Contact** or **Add SMS Contact** button to add a new notification contact, or click the **Edit** button of an existing notification contact to edit it. A dialog box appears where you can enter the contact settings.

Note: PRTG adds push contacts automatically for the corresponding user when you install a PRTG mobile app on your smartphone or tablet, connect to the PRTG server, and activate push notifications. You cannot add push contacts manually. If your mobile device rejects push notifications actively for an existing push contact, for example, because you deactivated push on the target device or reset it, the PRTG server will pause this contact automatically. The affected PRTG user account will receive a ToDo ticket 172 in this case.

ADD NEW / EDIT NOTIFICATION CONTACT

Description	Enter a meaningful name for the notification contact, for example, SMS to Admin Mobile or similar.
Recipient	Enter a valid email address for the contact type **Email** or a valid phone number for the contact type **SMS**. The format of the phone number depends on the SMS provider. Usually, you use a plus sign "+", followed by country code and number. For example, enter +1555012345 For the contact type **Push**, this field shows a unique token that you cannot change here. This token is needed to send push notifications through the cloud. For details, see the **More** 2854 section.
Contact Type	Shows the type of contact, either **Email**, **SMS**, or **Push**. This setting is shown for your information only and cannot be changed here.

ADD NEW / EDIT NOTIFICATION CONTACT

If you want to use another contact type, create a new contact with **Add Email Contact** or **Add SMS Contact**, or activate push notifications in your PRTG for iOS, Android, or Windows Phone app.

Click on the **Save** or **Add** button to store your settings, or click on **Cancel** to close the dialog box without changes to your configuration.

A cloud contact is added automatically when you install the PRTG app on your smartphone, connect to the PRTG server, and enable push notifications.

Others

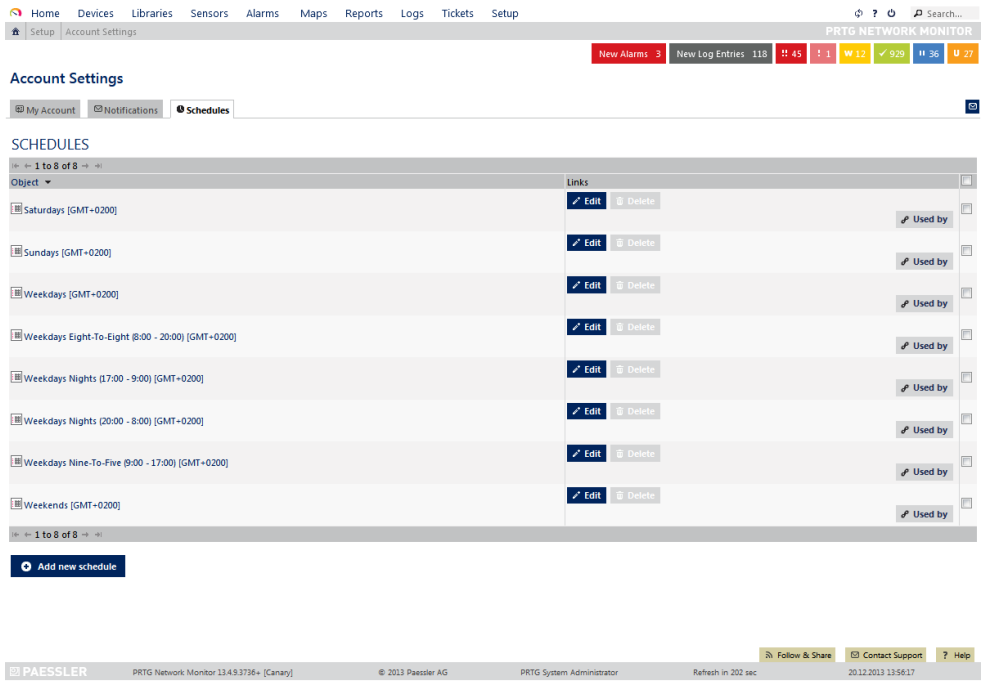
There are some settings that you must make in the PRTG Administration Tool 3046, available as native Windows application. For more details, please see the sections:

- PRTG Administration Tool on Core Server System 3047
- PRTG Administration Tool on Remote Probe System 3073

7.12.4 Account Settings—Schedules

In the schedule settings you can define or change schedules for the currently logged in user. You can use schedules to pause 185 monitoring/notification at for certain time periods with the period lists option. Also you can activate it at certain times with the time table option. You can also use schedules to define the time periods that are to be covered when creating reports 2786 .

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.



Schedules Settings

Schedules Settings

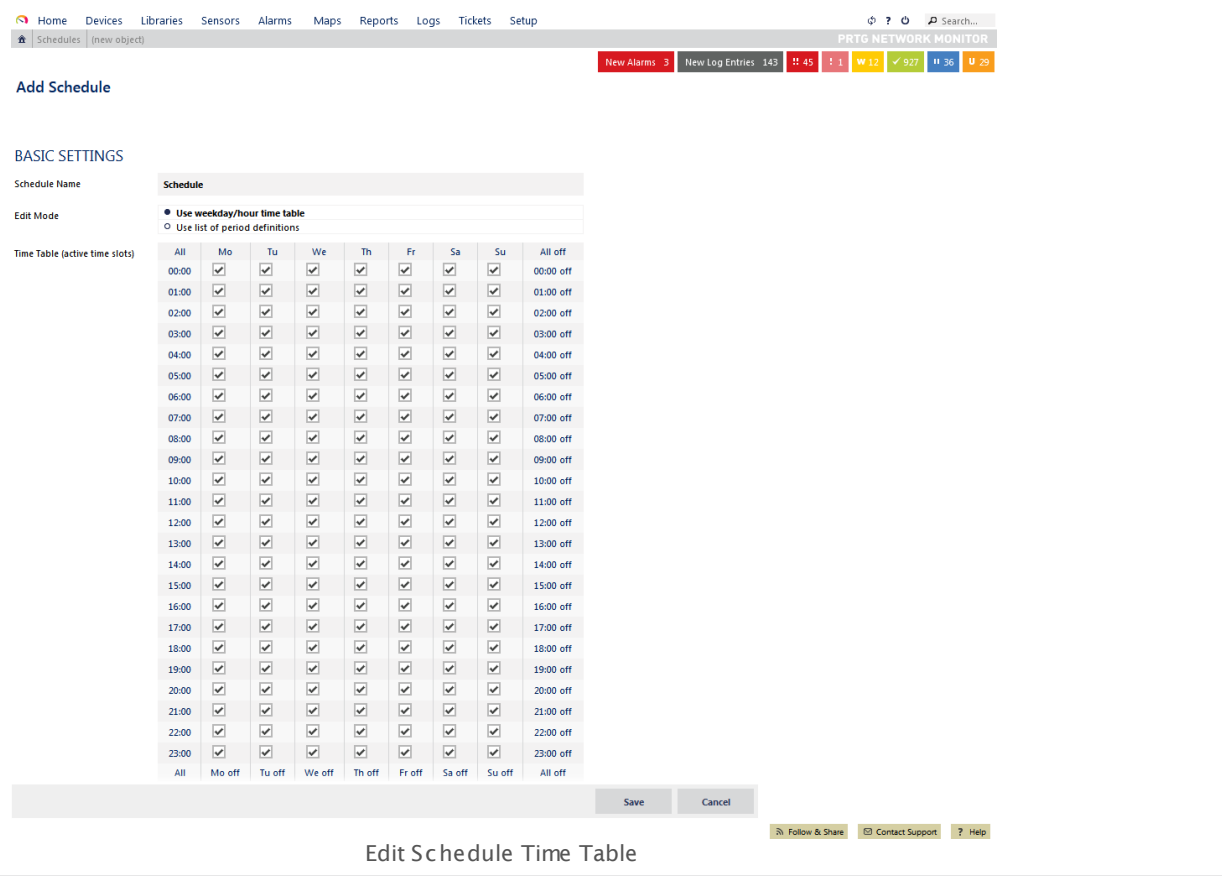
Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Click on the **Schedules** tab to show a list of all existing schedules. By following the links next to the notification name, you can perform the following actions:

- **Delete**: Delete this notification (not possible for predefined notifications)
- **Used by**: Show a list of objects using this notification.

Please also see **Working with Table Lists** 178. Additionally, the multi-edit functionality is available. This enables you to change properties of several objects simultaneously via bulk changes. For more details, see the **Multi-Edit Lists** 2742 section.

Click on the **Add new schedule** button or click on the name of an existing notification to edit.



Edit Schedule Time Table

BASIC SETTINGS

Schedule Name	Enter a meaningful name for the schedule that describes the defined time span(s) or their purpose.
Edit Mode	Select how you want to define a schedule. Choose between: ▪ **Use weekday/hour time table**: Define a schedule by adding check marks to available checkboxes. The lowest possible increment is one hour. Note: This time table **positively** defines which time slots are active.

BASIC SETTINGS

- **Use list of period definitions**: Define a schedule by entering text lines using a specific syntax (see below). Note: This time table **negatively** defines which time slots are inactive.

Time Table

This selection is only visible if the time table option has been enabled above. Define the schedule. It will be used for monitoring objects, reporting, and notifications. You can set time spans with a precision of one full hour by adding check marks. If a box is checked, it means the object is active during this hour, if unchecked, the object will be paused during this hour. You can set check marks individually, or change complete ranges for certain days of the week or time spans.

- To add ranges of check marks, use the buttons **All**, **Mo**, **Tu**, **We**, **Th**, **Fr**, **Sa**, and **Su**, as well as the time buttons on the left side.
- To remove ranges of check marks, use the buttons **All Off**, **Mo Off**, **Tu Off**, **We Off**, **Th Off**, **Fr Off**, **Sa Off**, and **Su Off**, as well as the time **Off** buttons on the right side.

Period List

This field is only visible if period definitions are enabled above. Define the date/time ranges in which the objects using this schedule will be inactive (i.e., paused). During other times, the objects will be active. Enter the ranges in the format ww:hh:mm-ww:hh:mm. For details and examples, see Schedules Settings—Period Definition Syntax 2859 below.

Note: Schedules use the timezone of the computer on which your PRTG core server is running. This may diverge to other time displays in PRTG which are saved in UTC. If you define a schedule with the **Time Table** option in the schedule settings 2857, the time to which the schedule applies is converted to the timezone of your PRTG user account 2833. This means that the schedule is executed according to the time that your user account shows. If you use the **Period List** option, PRTG will not adjust the schedule to the timezone of your user account! The schedule will apply according to the time on your PRTG server in this case. Because of this, you will encounter time shifts for schedules if there are changes to the timezone on the server or in case of different daylight saving and standard time changes.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object does not show up in lists.

ACCESS RIGHTS

- **Read**: Users in this group can see the object and review its settings.
- **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings.
- **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights.

You can create new user groups in the **System Administration—User Groups** 2896 settings.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Schedules Settings—Period Definition Syntax

Define one or more periods of time during which the object using this schedule will be inactive. In each line, enter one range in the format ww:hh:mm-ww:hh:mm: weekday, hour, minute.

- **Possible values for** ww: mo, tu, we, th, fr, sa, su.
- **Possible values for** hh: Enter the hour in 24 hours format (no AM/PM allowed), i.e. a number between 00 and 23.
- **Possible values for** mm: Enter the minute, i.e. a number between 00 and 59.

Example

In the following, find an example for a schedule that pauses an object during the weekend as well as on Wednesday evenings.

```
fr:19:30-mo:06:05
we:18:45-we:23:00
```

Any object using this schedule will be paused from Friday, 7:30 p.m. to Monday, 6:05 a.m. as well as on Wednesday from 6:45 p.m. to 11 p.m. It will be active during the other times.

Others

For information about the comments and history tabs, see the **Object Settings** 159 section.

7.12.5 System Administration—User Interface

In the user interface settings you can define global values regarding the PRTG web site appearance, PRTG web server settings and performance, geo maps, and graph settings.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

User Interface Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

WEBSITE

PRTG Site Name	When using the web interface, the site name is shown in the title bar of your browser window. It is also used by default in notification emails. Please enter a string.
DNS Name	If your PRTG web interface is (additionally) reachable via a DNS name, please enter it here. It is e.g. used by default in notification emails to generate links. Please enter a string.
Website Language	Choose the system language from the drop down list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the Ajax web interface 108, as well as of the **PRTG Administration Tool** 3046. Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.
Graph Type	Select how graphs will be displayed throughout the web interface and in reports 2786. ▪ **Use area graphs (recommended)**: Display filled graphs. ▪ **Use line graphs**: Display graphs using single lines only.

WEBSITE

	We recommend using area charts, as they're better to read. Note: Graphs containing data from more than one cluster node will always be displayed with line graphs automatically.
Automatic Logout	Define if a user who is inactive for a certain period of time will be logged out from the PRTG interface automatically for security reasons. Choose between: ▪ **Keep user logged in, even for a longer period of inactivity.** ▪ **Logout user automatically after a certain period of inactivity.**
Automatic Logout after Minutes	This field is only visible if you selected the logout option above. Specify in minutes after which time of inactivity a user will be logged out automatically. Please enter an integer value. PRTG will redirect to the login page once this time has expired. Note: The countdown will start with one minute delay.
Google Analytics Tracking ID	You can track the usage of PRTG web pages with Google Analytics by entering your Google Universal Analytics Tracking ID into this field. You need a Google Analytics account for this feature. Create a tracking ID within the Google Analytics portal and provide it here. PRTG will then dynamically integrate it into the website. Please enter a string or leave the field empty. The string will look like this: **UA-xxxxxx-xx** For details, please see section **More**.

GEO MAPS

Map Service Provider	Select if and how you want to integrate the Geo Maps feature into the web interface. If enabled, PRTG uses the first line of the location setting of an object 159 to show it on a geographical map. Please choose a map provider: ▪ **Do not show maps (disables Geo Maps integration)**: Disable Geo Maps integration and do not show geographical maps in the web interface. ▪ **MapQuest**: Use MapQuest to show geographical maps. This is the recommended option. ▪ **Nokia Maps**: Use Nokia Maps to show geographical maps.

GEO MAPS

	▪ **CloudMade (API key required)**: Use CloudMade to show geographical maps. Please sign up for an API key on their developer website to use this service. ▪ **Google Static Maps (API key required)**: Use Google Static Maps to show geographical maps. Please sign up for a Google Maps **API v3 key** to use this service as of PRTG version 13! For more information about the different map providers, please see the **More** 2869 section below.
Map Type	This setting is only visible for some map providers. Depending on the chosen provider, several options are shown. Each will show map tiles in a different appearance. Please choose a map type from the list.
API Key (required)	This field is only visible if you selected a provider that requires an API key. Please obtain your personal key and paste it here. For more information on how to get an API key, please see the **More** 2869 section below. Please enter an alphanumeric string.

WEB SERVER

Performance Strategy	Select if you want to enable performance improvements for the web interface. ▪ **All Features: Show all features and live data (recommended)**: Provide full functionality and show all menu items. ▪ **More Speed: Limit features and delay display (experimental)**: Improve reaction time and speed of the web interface by delaying display of monitoring data and hiding some features. For more information on how to speed up the web interface, please see the **More** 2869 section below.
IP Address for Web Server	PRTG is running a web server in order to provide access via the web and Windows interface. Please specify which IP address this web server will run on. Note: Later, you can log in to PRTG by simply pointing your browser to the specified IP address. Choose between:

WEB SERVER

- **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers)**: Use 127.0.0.1 only. PRTG's web and Windows interface will only be accessible from the computer PRTG is installed on.
  Note: Either the selected port or at least one port in the range from **8080** to **8089** has to be available on 127.0.0.1.

Note: If you run PRTG on localhost, please do not use the DNS name http://localhost to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or http://127.0.0.1 instead.

- **All IPs available on this computer**: Use all IP addresses available on this computer and enable access to the web server for all of these addresses. Note: The TCP port selected below must be free on every available IP address.
- **Specify IPs**: Select specific IP addresses on which the PRTG Web server will run on. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header.
  Note: Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address.

Note: Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports.

Note: If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the Enterprise Console 2938, or of Smartphone Apps 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

TCP Port for Web Server	PRTG is running a web server in order to provide the web and Windows interface. Please specify on which port this web server will run. Choose between:

WEB SERVER

- **Secure HTTPS server (recommended, mandatory for internet access)**: This is the recommended setting and needed to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443.
  Note: Although the connection is secure, you will see an **SSL Certificate Warning** 113 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** 3137.
  Note: If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior using a registry setting.
  Note: If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket 171 that shows you the currently used port number and will switch back to 443 as soon as it is available again.
- **Insecure HTTP server (standard port 80, not recommended)**: Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections.
  Note: If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.
- **Expert configuration**: This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below.

Note: If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

Web Server Port	This setting is only visible if the expert configuration is selected above. Enter the desired TCP port number you want the PRTG web server to run on. Please enter an integer value.

WEB SERVER

Note: If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to the custom port via HTTPS. You can change this behavior using a registry setting.

Note: If port the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket 171 that shows you the currently used port number and will switch back to the original port as soon as it is available again.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

Web Server Security

This setting is only visible if the expert configuration is selected above. Specify if you want to use an SSL encryption. Choose between:

- **Use SSL encryption (HTTPS)**: Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above. Note: Although the connection is secure, you will see an **SSL Certificate Warning** 113 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** 3137.
- **Don't use encryption (not recommended)**: This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above. Note: If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

SSL Security

Specify the security level which will be used for SSL connections from and to the PRTG web server. Choose between:

WEB SERVER

- **High security (recommended)**: The web server will only accept high security connections from clients like web browsers, apps 2995, the Enterprise Console 2938, or API clients. These clients must be able to support modern ciphers which support authentication and encryption of 128 bits or stronger and forward secrecy. All modern web browsers do this.
- **Weakened security (necessary for old web browser and old client software)**: If you have clients which do not support the high security setting, you can choose this 'normal security level' setting in order to connect (for example, older browsers, browsers running on Windows XP, some default browsers on Android systems). However, we strongly recommend that you update your clients in this case. For details about how to do this with the Enterprise Console, see the section More 2869 below.

Currently Active IP Address/Port Combination(s)	Shows all currently active combinations of IP addresses and ports on which the PRTG server listens for web requests. This setting is shown for your information only and cannot be changed here. Note: PRTG internally uses port 8085 for report generation.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

PRTG shows several graphs in the objects' detail pages 137 in the web interface. These are kept in RAM memory for fast display without causing extra CPU load or disk usage. The longer the time frames and the shorter the intervals are, the more memory will be used for this. You can adapt the details for all four graphs. This setting will also change the caption of the objects' tabs in the web interface 108 and Enterprise Console 2938.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the Enterprise Console 2938, or of Smartphone Apps 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Live Graph

The live graph is available for sensors only. For the live graph, no fixed time span is given, but you can define how many values will be displayed. The actual time span covered by the live graph depends on the scanning interval set for the sensor you're viewing and is calculated automatically. By default, **120 Values** is set, which results in a graph covering a time span of two hours, if a scanning interval of 60 seconds is set for the sensor. Other scanning intervals will result in graphs covering different time spans. Choose between:

- **60 Values**: This corresponds to a live graph covering a time span of one hour if a 1 minute scanning interval is set. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
- **120 Values**: This corresponds to a live graph covering a time span of two hours if a 1 minute scanning interval is set.
- **240 Values**: This corresponds to a live graph covering a time span of four hours if a 1 minute scanning interval is set.
- **480 Values**: This corresponds to a live graph covering a time span of eight hours if a 1 minute scanning interval is set.
- **960 Values**: This corresponds to a live graph covering a time span of 16 hours if a 1 minute scanning interval is set. Uses most RAM memory.

Graph 1

By default, this is the **2 days** graph in the web interface. You can change it to more or less detail by choosing a time span and a monitoring interval average associated with it. Monitoring results will be averaged regardless of the actual scanning interval set for the sensors. Choose between:

- **1 day with 1 minute averages**: Results in 1440 values.
- **1 day with 5 minutes averages**: Results in 288 values.
- **1 day with 15 minutes averages**: Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.
- **2 days with 1 minute averages**: Results in 2880 values. Uses most RAM memory.
- **2 days with 5 minutes averages**: Results in 576 values.
- **2 days with 15 minutes averages**: Results in 192 values.
- **4 days with 1 hour averages**: Results in 96 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more.

GRAPH SETTINGS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Graph 2	By default, this is the **30 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between: ▪ **10 days with 1 hour averages**: Results in 240 values. ▪ **20 days with 1 hour averages**: Results in 480 values. ▪ **30 days with 1 hour averages**: Results in 720 values. ▪ **30 days with 6 hour averages**: Results in 120 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **40 days with 1 hour averages**: Results in 960 values. ▪ **40 days with 6 hour averages**: Results in 160 values. ▪ **60 days with 1 hour averages**: Results in 1440 values. Uses most RAM memory. ▪ **60 days with 6 hour averages**: Results in 240 values.
Graph 3	By default, this is the **365 days** graph in the web interface. You can change it to more or less detail by choosing a time span covered and a monitoring interval average associated with it. Choose between: ▪ **100 days with 1 day averages**: Results in 100 values. Uses least RAM memory. We recommend this setting for installations with 10,000 sensors or more. ▪ **200 days with 1 day averages**: Results in 200 values. ▪ **365 days with 1 day averages**: Results in 365 values. ▪ **400 days with 1 day averages**: Results in 400 values. ▪ **750 days with 1 day averages**: Results in 750 values. Uses most RAM memory.

REPORT COMMENTS

Introduction	Define a custom text that will show up on the first page of the report. Please enter a string or leave the field empty.

REPORT COMMENTS	
Footer Comments	Define a custom text that will show up on the last page of the report. Please enter a string or leave the field empty.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

7.12.6 System Administration—Monitoring

In the monitoring settings you can define global values regarding scanning intervals, unusual and similar sensors detection, auto-discovery, and uptime threshold.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Monitoring Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

SCANNING INTERVALS

Available Intervals

Define the intervals available in the drop down list of every object's settings 159. In the text field, enter one value in each line. Use **s**, **m**, **h**, and **d** for defining seconds, minutes, hours, and days. By default, there are the following scanning intervals defined:

30s: 30 seconds

1m: 1 minute

5m: 5 minutes

10m: 10 minutes

15m: 15 minutes

30m: 30 minutes

1h: 1 hour

4h: 4 hours

6h: 6 hours

12h: 12 hours

1d: 1 day

Note: We recommend that you do not use intervals shorter than 10 seconds to prevent system overload. Intervals below 10 seconds are not officially supported! The maximum supported scanning interval is 10 days.

SCANNING INTERVALS

You can also define specific points in time to indicate when PRTG executes scanning actions. Enter up to 50 concrete UTC points in time according to the formula

@ UTC hh:mm, hh:mm

Note: Your local time may be different from the UTC time! For more information on how to set specific points in time as a scanning time for sensors, see the **More** 2876 section below.

UNUSUAL DETECTION

The unusual detection can set sensors to an **Unusual** status 135 when there are values that are untypical for the time span in which they are measured. PRTG compares the current average values to the historic monitoring results for this purpose. If the current values show a big difference to the values that are normally retrieved by a sensor, this sensor will indicate this with the unusual status. You can define the granularity of the detection here (this means, how big the difference must be to cause an unusual status). If you disable the unusual detection (both settings to **Never**), sensors will never show an unusual status.

Note: You can enable and disable unusual detection for specific devices, entire groups, and probes in the respective **Object Settings** 159.

Show Unusual When

Define when a sensor shows the unusual status, comparing the weekday. If you enable the detection here, the average of the values which were measured on the day before is compared to the average of the same weekday in previous weeks. Choose between:

- **Never**: Disable unusual detection for weekday average.
- **24h average is <80% or >120% of weekday average**: The average of the values measured on the day before is either lower than 80% or higher than 120% than usually on the same weekday.
- **24h average is <50% or >200% of weekday average**: The average of the values measured on the day before is either lower than 50% or higher than 200% than usually on the same weekday.
- **24h average is <20% or >500% of weekday average (recommended)**: The average of the values measured on the day before is either lower than 20% or higher than 500% than usually on the same weekday.

UNUSUAL DETECTION

- **24h average is <10% or >1,000% of weekday average**: The average of the values measured on the day before is either lower than 10% or higher than 1,000% than usually on the same weekday.
- **24h average is <1% or >10,000% of weekday average**: The average of the values measured on the day before is either lower than 1% or higher than 10,000% than usually on the same weekday.

For example, consider a traffic sensor that usually measures 100 MB average traffic on a weekday. If you choose the first option, it would show an unusual status if the average from the day before is below 80 MB or above 120 MB.

Show Unusual When

Define when a sensor shows the unusual status, comparing the hour-of-day. If you enable the detection here, the average of the values which were measured in the hour before is compared to the average of the same hour on the same weekday in previous weeks. Choose between:

- **Never**: Disable unusual detection for hour-of-day average.
- **Hourly average is <80% or >120% of hour-of-day average**: The average of the values measured in the hour before is either lower than 80% or higher than 120% than usually in this hour of this weekday.
- **Hourly average is <50% or >200% of hour-of-day average**: The average of the values measured in the hour before is either lower than 50% or higher than 200% than usually in this hour of this weekday.
- **Hourly average is <20% or >500% of hour-of-day average (recommended)**: The average of the values measured in the hour before is either lower than 20% or higher than 500% than usually in this hour of this weekday.
- **Hourly average is <10% or >1,000% of hour-of-day average**: The average of the values measured in the hour before is either lower than 10% or higher than 1,000% than usually in this hour of this weekday.
- **Hourly average is <1% or >10,000% of hour-of-day average**: The average of the values measured in the hour before is either lower than 1% or higher than 10,000% than usually in this hour of this weekday.

Consider a traffic sensor that usually measures 10 MB average traffic within an hour. If you choose the first option, it would show an unusual status if the average from the hour before is below 8 MB or above 12 MB.

UNUSUAL DETECTION

Logging	Define if unusual events will be written to the log file. Choose between: ▪ **Do not log unusual events** ▪ **Write unusual events into the log**

SIMILAR SENSORS DETECTION

Similar sensors detection enables PRTG to analyze sensor data for similarities. The detection will run in the background with low priority. The recommended setting for similar sensors detection is to let PRTG automatically decide how many channels will be analyzed. However, you can also override this setting.

Note: When similar sensors analysis is turned off or you have exceeded 1,000 sensors and have chosen the automatic analysis depth option, the similar sensors entry will not be shown in the main menu bar.

Analysis Depth	Define the number of channels PRTG will analyze to detect similarities between sensors or turn the analysis off. Choose between: ▪ **Manage automatically based on sensor count (recommended)**: The analysis depth depends on the total number of sensors you have configured. PRTG will analyze all channels for up to 500 sensors, and only the primary sensor channels for up to 1,000 sensors. If exceeding 1,000 sensors, the analysis will be turned off. ▪ **Analyze primary channels only**: Only the primary channels of sensors are analyzed. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 1,000 sensors. ▪ **Analyze all channels (higher CPU load)**: Similarity detection is applied to all channels. Be aware of potentially high CPU load of PRTG when choosing this setting for more than 500 sensors. ▪ **Turn analysis off**: No similarity detection takes place. Choose this option if you are not interested in the analysis results or you want to keep PRTG's CPU load at a minimum.

RECOMMENDED SENSORS DETECTION

With the sensor recommendation engine, PRTG can analyze devices in your network and suggest you sensors that are still missing for a complete monitoring. The analysis runs with low priority in the background when you add a new device, when the last analysis was executed more than 30 days ago, or when you manually start 156 it.

See the manual section **Recommended Sensors** 155 for more information, for example, on SNMP settings 156, on the results 156 you get and on how you add the suggested sensors 157.

Detection Engine	Define if you want PRTG to analyze your devices to recommend useful sensor types. Choose between: ▪ **Manage automatically based on sensor count (recommended)**: PRTG runs the detection engine for installations with up to 5,000 sensors by default. If you exceed this threshold, PRTG disables the detection engine for performance reasons. We recommend that you set this option so you do not miss any important monitoring data about your network, without risking to run into performance issues. ▪ **Always show recommendations**: PRTG always analyzes your devices even if your installation exceeds 5,000 sensors and you will never miss any suggestion to complete your monitoring. But if you enable this option, please keep in mind this setting in case you encounter performance issues. ▪ **Turn recommendations off**: PRTG never recommends sensors. Select this option if you have performance issues with PRTG or if you do not want to see this information on device overview tabs 137. Moreover, you will not find the option **Recommend Now** in device context menus 192 or on overview tabs anymore.

AUTO-DISCOVERY

Run Discovery at	Define the time when PRTG automatically runs an **Auto-Discovery** 219 in your network if you configured a daily or weekly **Discovery Schedule** in the auto-discovery group settings 221. Choose a full hour between **0:00** and **23:00**. We recommend that you choose a time when there is little user activity in your network, because auto-discoveries can produce a certain amount of load.

UPTIME THRESHOLD

Desired Minimum Uptime	Define which uptime in percent PRTG regards as 100 percent. This setting affects the colors shown next to the sensor icons in reports. Select one of the predefined values between **90 %** and **99.999 %**.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

7.12.7 System Administration—Notification Delivery

In the notification delivery settings you can define global settings for notification delivery. If you do not want to use a specific notification method, just leave the respective fields empty.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Note

This section describes one of four steps to set up the notification system in PRTG. A complete notification setup involves:

1. Checking and setting up the **Notification Delivery** settings. This tells PRTG how and where to send messages.
   For detailed information, see **System Administration—Notification Delivery** 2877.
2. Checking and setting up **Notification Contacts** for the users of your PRTG installation. This defines where to send notifications.
   For detailed information, see **Account Settings—Notification Contacts** 2852.
3. Checking and setting up **Notifications**. This defines the kind of message and its content.
   For detailed information, see **Account Settings—Notifications** 2836.
4. Checking and setting up **Notification Triggers** for objects. These provokes the defined notifications.
   For detailed information, see **Sensor Notifications Settings** 2719.

Note: We recommend that you always set up at least two notifications with different delivery methods for a notification trigger, for example, one email notification 2841 and one SMS notification 2843. If delivery via email fails (due to a email server failure or other reasons), PRTG can still notify you via your smartphone. Simply set your latency setting to a state trigger 2721 and a notification via a delivery method other than the one for the first trigger. Or by sett up a second trigger with another notification for the corresponding object.

For background information, please see the **Notifications** 2759 section.

Notification Delivery Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

SMTP DELIVERY

SMTP Delivery Mechanism	Define how PRTG sends emails using Simple Mail Transfer Protocol (SMTP). Choose between: ▪ **Direct delivery using built-in email relay server (default)**: Use the SMTP relay server built into PRTG. This server manages its own email queue. For each email, it looks up the target SMTP server via the MX record of the target domain, and send the email. ▪ **Use SMTP relay server (recommended inside LANs/NATs)**: Set up your own SMTP relay server to send emails. Enter data below. ▪ **Use two SMTP relay servers (primary and fallback server)**: Set up two own SMTP relay servers—one primary and one as fallback server. Enter data below. Note: When monitoring inside your NAT or LAN, it is often a good idea to use your own LAN-based relay server to deliver notification emails quicker.
Sender Email	Enter an email address to use as sender of all emails. This setting is global and can only be changed centrally here.
Sender Name	Enter a name to use as sender of all emails. This setting is global and can only be changed centrally here.
HELO Ident	Enter the HELO Ident for SMTP. This must be a unique name, preferably the DNS name of the machine running PRTG. See SMTP RFC 2821: The sender-SMTP must ensure that the domain parameter in a HELO command is a valid principal host domain name for the client host.
SMTP Relay Server	This field is only visible if you enable SMTP relay server above. Enter the IP address or DNS name of the SMTP relay server.
SMTP Relay SMTP Port	This field is only visible if you enable SMTP relay server above. Enter the port number the SMTP relay server is running on. Standard value is **25**.
SMTP Relay Authentication	This field is only visible if you enable SMTP relay server above. Select the kind of authentication required for the SMTP server. Choose between: ▪ **No authentication is required**: Use SMTP without authentication. ▪ **Use standard SMTP authentication**: Use standard authentication.

SMTP DELIVERY

	▪ **SASL authentication is required**: Use secure authentication via Simple Authentication and Security Layer (SASL).
SMTP Relay User	This field is only visible if you enable SMTP authentication above. Enter a valid username.
SMTP Relay Password	This field is only visible if you enable SMTP authentication above. Enter a valid password.
Use Encrypted Connection	This field is only visible if you enable SMTP relay server above. Enter the security level for SMTP connections. Choose between: ▪ **Never:** Use insecure connection with plain text transfer. ▪ **If supported by server:** Use a secure connection (default).
SSL Method	This setting is only visible if you enable SMTP relay server and encryption above. It is only relevant for secure connections. Select the SSL or TLS version that your SMTP device supports. We recommend that you use the default value. If you do not get a connection, try with another setting. Choose between: ▪ **SSL V2** ▪ **SSL V2 or V3** ▪ **SSL V3** ▪ **TLS V1**
SMTP Relay Server (Fallback)	
SMTP Relay SMTP Port (Fallback)	
SMTP Relay Authentication (Fallback)	These fields are only visible if you enable the option for two SMTP relay servers above. Please see also the settings that you made for your primary SMTP relay server.
Use Encrypted Connection (Fallback)	
SSL Method (Fallback)	
SMTP Relay User (Fallback)	

SMTP DELIVERY

SSL Method (Fallback)

SMTP Relay User (Fallback)

SMTP Relay Password (Fallback)

Security (Fallback)

SMS DELIVERY

Note: Although PRTG has built-in support for the Application Programming Interface (API) of some SMS providers, we cannot officially provide support regarding these SMS service providers. If you have technical questions about SMS delivery beyond PRTG, please contact your SMS provider directly.

Note: Instead of using a pre-configured provider you can always use a custom URL, enabling you to use extended parameters (this is also an alternative when using providers for which we offer pre-configured options).

You need an internet connection to send text messages via the HTTP API. For information about sending SMS via separate hardware using third party software, please see the **More** 2881 section below.

Configuration Mode	Define how you want to select an SMS provider. Choose between: ▪ **Select an SMS provider from a list of providers**: Select a provider from a list below. ▪ **Enter a custom URL for a provider not listed**: Use another provider and enter the service URL manually below.
Service Provider	This field is only visible if the provider list is enabled above. Choose a service provider from the list. PRTG offers a small incomplete list of providers. Note: Some providers might require a port configuration in your firewall. See **More** 2881 section below for more information.
User	This field is only visible if the provider list is enabled above. Enter a username for the service provider account.

SMS DELIVERY

Password	This field is only visible if the provider list is enabled above. Enter a password for the service provider account.
API ID / Account	This field is only visible if the provider list is enabled above. Some providers need an additional API ID or account information. If provided, enter it here. Please enter a string or leave the field empty.
Custom URL	This field is only visible if the custom provider option is enabled above. From the documentation of your SMS provider, please enter the service URL that is used to send SMS messages. Use the following placeholders for the recipient phone number and the text message: **%SMSNUMBER**, **%SMSTEXT**.
Maximum Length of Text	Some SMS providers will not allow SMS messages exceeding a certain amount of characters. PRTG will restrict the number of characters according to the length specified in this field. A value of **0** means the SMS is sent at its full length.

Note: The notification 2836 methods "Send SMS/Pager Message" and "Execute HTTP Action" will use the central proxy settings defined for your PRTG core server. For details, please see **System Administration—Core & Probes** 2883 (section **Proxy Configuration**).

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

7.12.8 System Administration—Core & Probes

In the core and probe management settings you can define settings for the core server, as well as the settings for probe connections if you use remote or mini probes.

Note: If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, ensure you provide the correct access type for your domain in section Active Directory Integration 2887! For example, change from "local user" to **Use explicit credentials** and provide correct credentials for the domain. Please note that PRTG automatically sets the access type "local system" by default, so you might need to change this.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Core and Probes Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

PROXY CONFIGURATION

Use Proxy Server	We recommend using PRTG with a direct internet connection. However, if you need to use a proxy, you can configure the relevant settings here. Choose between: ▪ **No, use direct connection to the Internet (default)**: Do not use a proxy. Use this setting if there is a direct internet connection available to the server running the PRTG core server. ▪ **Yes, in our network a proxy is mandatory**: Define proxy settings below. Note: Proxy settings are valid for Auto-Update 2918, Activate the Product 65, obtaining Geo Maps 2753 tiles, and for sending out HTTP, push, and SMS text message Notifications 2840. The sensor types Cloud HTTP 523 and Cloud Ping 533 use these proxy settings as well.
Proxy Server	This setting is only visible if proxy usage is enabled above. Enter the address of the proxy server that you use for outbound connections. Please enter a valid address.

PROXY CONFIGURATION

Port	This setting is only visible if proxy usage is enabled above. Enter the port number of the proxy server that you use for outbound connections. Please enter an integer value.
Use Proxy Credentials	This setting is only visible if proxy usage is enabled above. Determine whether the proxy server needs credentials or not. Choose between: ▪ **Yes, the proxy server requires credentials**: Define credentials (username and password) below. ▪ **No, there are no credentials necessary**: Do not use credentials for proxy connections.
User	This setting is only visible if proxy credentials are enabled above. Enter a username for proxy authentication. Please enter a string.
Password	This setting is only visible if proxy credentials are enabled above. Enter a password for proxy authentication. Please enter a string.

PROBE CONNECTION SETTINGS

Probe Connections IPs	Define how PRTG handles incoming connections from probes. Choose between the following options: ▪ **Local Probe only, 127.0.0.1 (PRTG will not be accessible for Remote Probes)**: This is the default setting. The PRTG core server 84 only accepts local probe connections. You cannot use remote probes 3108 with this setting enabled. ▪ **All IPs available on this computer**: The PRTG server will always accept incoming connections from remote probes, no matter on which IP address of the core server they come in. ▪ **Specify IPs**:The PRTG server will accept Incoming connections from remote probes 3117 only on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs. You can also change this setting in the **PRTG Administration Tool on Core Server System** 3051.

PROBE CONNECTION SETTINGS

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the Enterprise Console 2938, or of Smartphone Apps 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

Access Keys

Enter a list of access keys, one per line. Every (remote) probe that wants to connect to this PRTG installation has to use one of these keys. For more information on how to set this key for a probe, please see the PRTG Administration Tool 3074 section.

Allow IPs

Enter a list of remote probe IPs that will be accepted when connecting to this PRTG installation; one IP address per line. The local probe (127.0.0.1) is always allowed automatically. Allowed IPs are checked first (before denied IPs). You can use PRTG's syntax for IP address ranges here (for information about the syntax please see the Define IP Ranges 3094 section).

- ***[Empty]***: An empty field does not allow any remote probes (but only the local probe). Please enter IP addresses to allow remote probe connections.
- **any**: Enter the word **any** to automatically allow all remote probe connections. Note: This is recommended for use in Intranets only!

Note: If the IP address of your remote probe changes regularly (e.g. due to an internet provider assigning IP addresses dynamically), please enter the potential IP range for this remote probe or use the **any** option.

Deny IPs

Enter a list of remote probe IPs that will not be accepted when connecting to this PRTG installation; one IP address per line. This is useful to explicitly deny connections from certain remote probes you do not want to include in your setup any more (e.g. for a certain time). Access to IP addresses you allowed above will be denied if you enter them here. This is useful to allow access to an IP range in the field above, but deny access to a single IP address. You can use PRTG's syntax for IP address ranges here (see the Define IP Ranges 3094 section).

PROBE CONNECTION SETTINGS

Deny GIDs	Enter a list of GIDs, one global ID (GID) per line. The access to matching GIDs will be denied. If you remove a remote probe from the device tree or if you deny a remote probe after installation, its global ID (GID) will be automatically entered here. This specific remote probe will not be able to connect anymore. Denying GIDs is more precise than denying IPs, where other remote probes at the same location could be excluded too.
Mini Probes	Define if you want to allow Mini Probe connections to your PRTG server. If you want to use Mini Probes, you need to set up your PRTG web server to accept connections of Mini Probes here and choose the secure HTTPS server option in the web server settings 2862. Choose between: ▪ **No Mini Probes**: Mini Probes cannot connect to your PRTG web server. You are not able to monitor with Mini Probes if you choose this option. ▪ **Allow Mini Probes to connect to the web server**: Mini Probes can connect to your PRTG web server and use the defined TCP port for the web server 2862 for this purpose. The default port for SSL connections is **443**. ▪ **Allow Mini Probes to connect to an extra port**: Mini Probes can connect via a specific port to your PRTG web server. This is useful if you do not want to have your whole PRTG web server reachable from other networks all the time only because of Mini Probes. Note: SSL is always required to be active on the Mini Probe port. Please refer to the PRTG API 3086 for the full Mini Probe documentation. See also the section **More** 2889 below for further information about PRTG Mini Probes. Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.
Mini Probe Port	This field is only visible if you select the extra Mini Probe port option above. Enter the number of the port that you want to use for Mini Probe connections. Ensure that SSL is available on this port.

PROBE CONNECTION SETTINGS

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the Enterprise Console 2938, or of Smartphone Apps 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

ACTIVE DIRECTORY INTEGRATION

Domain Name	To use the Active Directory Integration 3083 enter the name of your local domain. Please enter a string or leave the field empty.
Access Type	Define which user account PRTG will use to configure Active Directory (AD) access. PRTG uses this account to query the AD for existing groups. Choose between: ▪ **Use the PRTG core service account (usually LOCAL SYSTEM)**: Use the same Windows user account configured for the "PRTG Core Server Service". In a default installation, this is the "local system" Windows user account. If this account does not have the right to query all groups of your Active Directory, do not use this option. ▪ **Use explicit credentials:** Define a user account that PRTG will use to authenticate against the Active Directory. This should be a user account with full access to all of your Active Directory groups.
Access User	This field is only visible if you enable the use of explicit credentials above. Enter the Windows user account name that PRTG will use to authenticate for Active Directory configuration.
Access Password	This field is only visible if you enable the use of explicit credentials above. Enter the password for the Windows user account that PRTG will use to authenticate for Active Directory configuration.

HISTORIC DATA PURGING LIMITS: SELECT FOR HOW MANY DAYS HISTORIC DATA REMAINS ACCESSIBLE

Data purging enables you to automatically delete unnecessary data to free up disk space and improve system performance. You can define different time spans for several kinds of data. Select here for how many days historic data remains accessible. For further information on storage locations, please see the **Data Storage** 3135 section.

Logfile Records	Define how long records in the system logfile Log Database.db will be kept. Enter a value in days. All entries older than this value will be deleted from the log file automatically. This also affects the content of the **Logs** 169 tab of monitoring objects like sensors. Keep this value as low as possible to enhance system performance.
Web Server Log Records	PRTG creates one web server log file every day. Define how many web server log files are kept. Enter a value in days. All web server log files files older than this value will be deleted automatically.
Historic Sensor Data	Define for how many days historic sensor data are kept for all sensors. It is used to create reports 2786 of monitoring data. Enter a value in days. Depending on the used intervals and the number of sensors in your setup, the file containing this data can become large. For smaller installations (500 sensors or less) a value of 365 should be fine. Historic sensor data is the basis for reports on monitoring data. If you decrease this value, there will be less historic monitoring data available!
Toplist Records	Define how long toplist records for Flow 3012 and Packet Sniffer 3010 sensors are kept. Enter a value in days. We recommend using 30 days here. However, old toplist data will be purged automatically as soon as a limit of 2 GB is reached. Thereby the oldest data is deleted first from the database.
Closed Tickets	Define how long tickets which are in status closed are kept. Enter a value in days.
Reports	Reports generated in PDF format are stored on disk for later reference. Define the maximum age for these reports. Enter a value in days. All reports older than this value are deleted automatically.
Configuration Auto-Backups	PRTG creates one backup of your configuration every day. Define the maximum age for these backups. Enter a value in days. All configuration backup files older than this value will be deleted automatically.
Full HTTP Sensor Screenshots	Define how long the screenshots of the **HTTP Full Web Page Sensor** 859 (PhantomJS browser engine) are kept. Enter a value in days. PRTG will delete older screenshots with every sensor scan.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Remote Probe Setup

Find more information about setting up remote probes in the **Multiple Probes and Remote Probes** 3108 section.

7.12.9 System Administration—User Accounts

PRTG administrator users can change all users' account settings and add new users.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

User Accounts Overview

- To change a user's settings, select it from the list by clicking on the username. The available setting options are the same as shown in the **My Account** 2830 settings of the currently logged in user (plus some account control options).
- To add a new user, click on the **New User** button. The options are the same as for existing users (with slight differences).
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box appearing, select an existing user group 2896 from the drop down menu and enter or paste a list of email addresses. They can be separated by space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click on the **New User Group** button. The options are the same as for existing groups (with slight differences).
- Access rights in PRTG are given via user groups. Please make sure a user account is member of the correct user group 2896 and give access to this group in your device tree object's settings 159.

Note: Predefined objects cannot be deleted!

User Accounts Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

USER ACCOUNT

Login Name	Enter the login name for the user.
Display Name	Enter a name that the user recognizes. It will not be used for login purposes.

USER ACCOUNT

Primary Email Address	Enter the user's email address.
Password	Define the user password. For security reasons, the account settings page does not contain the password. Choose between: ▪ **Don't change** ▪ **Specify new password** If you choose to specify a new password, enter the old password and then the new password twice. Note: The new password must be at least 8 characters long. It must contain a number and a capital letter. The password of a PRTG Administrator user can only be changed by this PRTG Administrator user himself.
Passhash	Click **Show passhash** to display the passhash for the selected user. You need the passhash of a user if you use the PRTG Application Programming Interface (API) 3086. This setting is shown for your information only and cannot be changed here.

ACCOUNT CONTROL

Account Type	This setting is only visible to administrator users. However, it will not shown if the user who's account you want to modify is a member of a group with administrative rights. Define the account type for the current user. Choose between: ▪ **Read/Write User**: You can change settings. ▪ **Read Only User**: You can not edit any settings except your own password. This is a good choice for public or semi-public logins. Note: This setting cannot be changed for the default administrator user.
Allow Acknowledge Alarms	This setting is only visible if read only user is enabled above. Acknowledging an alarm is an action which requires write access rights. However, you can explicitly allow this action to read-only users. If enabled, they still do not have write access, but may acknowledge alarms 162. Choose between: ▪ **Allow**: Allow acknowledging alarms for this user. ▪ **Deny**: The user will not be able to acknowledge alarms.

ACCOUNT CONTROL

Password Changes	Decide if you want the user to be able to change his account's password or not. If you allow the user to change the password, this option will be available in the **My Account** 2830 settings of the respective user. Choose between: ▪ **User may change his account's password** ▪ **Deny the right to change the password** (default) Note: This field is only visible if you edit this option for read-only users as an administrator.
Primary Group	This setting is available only for administrator users. Select the primary group for the current user. Every user has to be member of a primary group to make sure there is no user without group membership. Membership in other user groups is optional. For user experience there is no difference between the primary and other user groups. Note: You cannot change the primary group of Active Directory users. Users which you added with **Active Directory Integration** 3083 can only have this AD group as their primary group. If you need to change this, please delete this user account and add it anew.
Status	This setting is only shown for administrator users. Define the status of the current user. Choose between: ▪ **Active**: The current user can login to the account. ▪ **Inactive**: The current user's login is disabled. Use this option to temporarily deny access for this user. Note: This setting cannot be changed for the default administrator user.
Last Login	Shows the time stamp of the user's last login. This setting is shown for your information only and cannot be changed here.

USER GROUPS

Member of	Shows the groups the current user is member of. Access rights to the device tree are defined on group level. This setting is shown for your information only and cannot be changed here.

AUTO REFRESH AND ALERTING

Auto Refresh	Define if you want PRTG to reload web pages automatically for the current user. Choose between: ▪ **Refresh pages (recommended)**: Automatically refresh the single page elements on the web pages in PRTG. ▪ **No automatic refresh**: Do not automatically refresh web pages.
Auto Refresh Interval (Sec.)	This setting is only relevant if you enable auto refresh above. Enter the number of seconds that PRTG waits between two refreshes. We recommend that you use **30** seconds or more. Minimum value is 20 seconds. Note: Shorter intervals create more CPU load on the server running PRTG. If you experience load problems while using the web interface (or PRTG maps 2810), please set a higher interval.
Play Audible Alarms	Define when an audible alarm will be played for the current user on web pages whenever there are alarms 161 in PRTG. Choose between: ▪ **Never**: Do not play sound files on any web pages. ▪ **On dashboard pages only**: When there are alarms, play a predefined sound on dashboard 200 pages only. The sound snipped will be played again with every refresh of the dashboard page. ▪ **On all pages**: When there are alarms, play a predefined sound on all web pages. The sound will be replayed with every page refresh. For more information about audible notifications and supported browsers, see the **More** 2835 section below.

WEB INTERFACE

Homepage URL	Define the user's default page, which is loaded after logging in or clicking on the Home 200 button in main menu.
Max. Groups/Devices per Group	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for groups and devices here. We recommend values between **10** and **30**.

WEB INTERFACE

Max. Sensors per Device	In order to provide a fast and smooth user experience, PRTG attempts to reduce page size when displaying the device tree. It automatically collapses groups and devices when reaching a specified number of items. Enter this threshold for sensors per devices here. We recommend values between **10** and **30**.
Timezone	Define the time zone for the current user. Depending on the time zone you select here, PRTG shows the current user's local time zone in all data tables and graph legends. Note: PRTG receives the UTC (Coordinated Universal Time) from the system time set on the PRTG core server for this purpose.
Date Format	Define the format of dates for the current user. Note: This setting will take effect after the next login.

TICKET SYSTEM

Email Notifications	Define if you want to get emails from the ticket system. Choose between: ▪ **I want to receive an email whenever a ticket changes**: You will receive an email each time a ticket is assigned to you or your user group, or if a ticket which is assigned to you or your user group is changed. Note: If you edit tickets which are assigned to you or your user group, or you assign a ticket to yourself or your user group, you will not get an email. ▪ **I do not want to receive any emails from the ticket system**: You will not get any emails about tickets.

Notification Contacts

In the **Notification Contacts** 2852 tab you can define recipients for each user account. Recipients can be email addresses, phone numbers, or push devices (iOS, Android and Windows Phone devices with the corresponding PRTG smartphone app 2995).

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

More

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- http://kb.paessler.com/en/topic/26303

7.12.10 System Administration—User Groups

PRTG administrator users can change existing user groups or add new ones, and define the users that are member of a certain group.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

All the security settings as well as further rights management are conducted via the user groups. This means that group membership controls what a user may do and which objects the user will see when logged in. The actual rights for each object can be defined in an object's settings. There, you can define different rights for each user group.

- To change a user group's settings, select it from the list by clicking on the group name.
- To add a new user, click on the **New User** button. The options are the same as for existing users (with slight differences).
- To batch-add several users at once in a simple way, please click the **Multiple New Users** button. In the dialog box appearing, select an existing user group 2896 from the drop down menu and enter or paste a list of email addresses. They can be separated by space, comma, semicolon, or a new line. Click the **Add** button to confirm. For each address, PRTG will create a new local user account within the selected user group, carrying the email address as value for **Login Name**, **Username**, and **Email Address**. A new password will be generated automatically and sent to the email address.
- To add a new user group, click on the **New User Group** button. The options are the same as for existing groups (with slight differences).
- For each user group you create, PRTG automatically adds a new group 90 with the name [group_name] home to the device tree.
- For each user group you create, PRTG automatically adds a new email notification 2841 to notifications 2759 with read access rights 101 for this user group. It has the name Email to all members of group [group_name].
- By default, there are no access rights 101 on existing objects for a newly created PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree except the automatically created home group (with write access rights). Please edit the object settings 159 in your device tree and set access rights for your newly created user group in the **Inherit Access Rights** section.
  Note: The easiest way is to set these rights in the **Root Group Settings** 260.

Note: The multi-edit option is not available for the standard user groups PRTG Administrators and PRTG Users Group.

Note: Predefined objects cannot be deleted!

Note: If you want to delete an Active Directory group, you have to delete all users that are in this group in PRTG first. This is because users which you add with **Active Directory Integration** 3083 always have this group as their primary group.

User Groups Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

USER GROUP SETTINGS

User Group Name	Enter a name for the user group.
Administrative Rights	Define if the members of this group will be PRTG administrators. If you enable this option, all members of this group will have full access to all monitoring objects, maps, reports, user accounts and user groups, and they can change the PRTG monitoring configuration. Choose between: ▪ **Yes**: Give full PRTG administrator rights to all members of this group. ▪ **No**: Do not make members of this group administrators. Access to monitoring objects for users that are member of this group will be controlled by the **Access Rights** settings defined in the **Object Settings** 159 of Probes, Groups, Devices, or Sensors. Note: This option is especially useful in combination with the Active Directory option below.
Default Homepage	Enter a PRTG internal web page. This will set the default homepage for all new users created with this group. A user will be redirected to this page after logging in. This concerns new users either added by an **Active Directory** login or by the **Add multiple users** feature.
Use Active Directory	Define if this PRTG user group will be connected to a group in your active directory. Choose between: ▪ **Yes**: Connect this group to an AD group. Choose below. For detailed information, please see **Active Directory Integration** 3083. ▪ **No**: Do not use Active Directory integration for this group, but choose local user accounts instead.

USER GROUP SETTINGS

Active Directory Group	If a valid Active Directory Domain is set in the **System Administration—Core & Probes** 2887 settings and Active Directory integration is enabled above, a drop down menu will appear, showing the groups in your Active Directory. Choose the group whose members will be able to log in to PRTG using their Active Directory domain credentials. All of those AD users will be in the security context of the PRTG group you're about to create/edit. For detailed information, please see **Active Directory Integration** 3083. If your Active Directory contains more than 1000 entries in total, PRTG will display an input field instead of a drop down menu. This is done due to performance reasons. In the input field, you can enter the group name only. PRTG will then add the prefix automatically.
New User Type	If Active Directory integration is enabled above, define the default rights for all new users in this user group. If a user logs in for the first time using Active Directory credentials, PRTG will automatically create a new local user account for this user, applying the user type defined here. Choose between: ▪ **Read/Write User**: The user may change settings. ▪ **Read Only User**: The user may not edit any settings except the own password. This is a good choice for public or semi-public logins.
Allowed Sensors	Define if members of this user group will be able to create all available sensor types or only specific ones. Choose between: ▪ **Users may always create all sensor types**: No restrictions for group members are applied. ▪ **Users may create certain sensor types only**: Choose the allowed sensor types below. This option is especially interesting for a Managed Service Provider (MSP).
Users May Create These Sensor Types	This field is only visible if you defined that the users in this group are only allowed to create certain sensor types. A list of all available types is shown with their name. Select the desired types by adding check marks in front of the respective lines. You can also select and deselect all items by using the check box in the table head.
Ticket System Access	Define if the members of this user group will be able to use PRTG's ticket system 171. Choose between: ▪ **Members can use the Ticket System**: No restrictions for group members are applied.

USER GROUP SETTINGS

- **Members can NOT use the Ticket System**: The Tickets 211 option in the main menu bar 211 will not be visible to users in this group.

MEMBERS

Members	This setting is available only if Active Directory integration is disabled above. Define which local user accounts will be a member of this group. To add a user account from the list, add a check mark in front of the username. The user accounts available depend on your setup.

PRIMARY USERS

User List	Shows a list of all user accounts with this group set as primary group. This is shown for information purposes only. You can change it in a user account's settings 2890.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

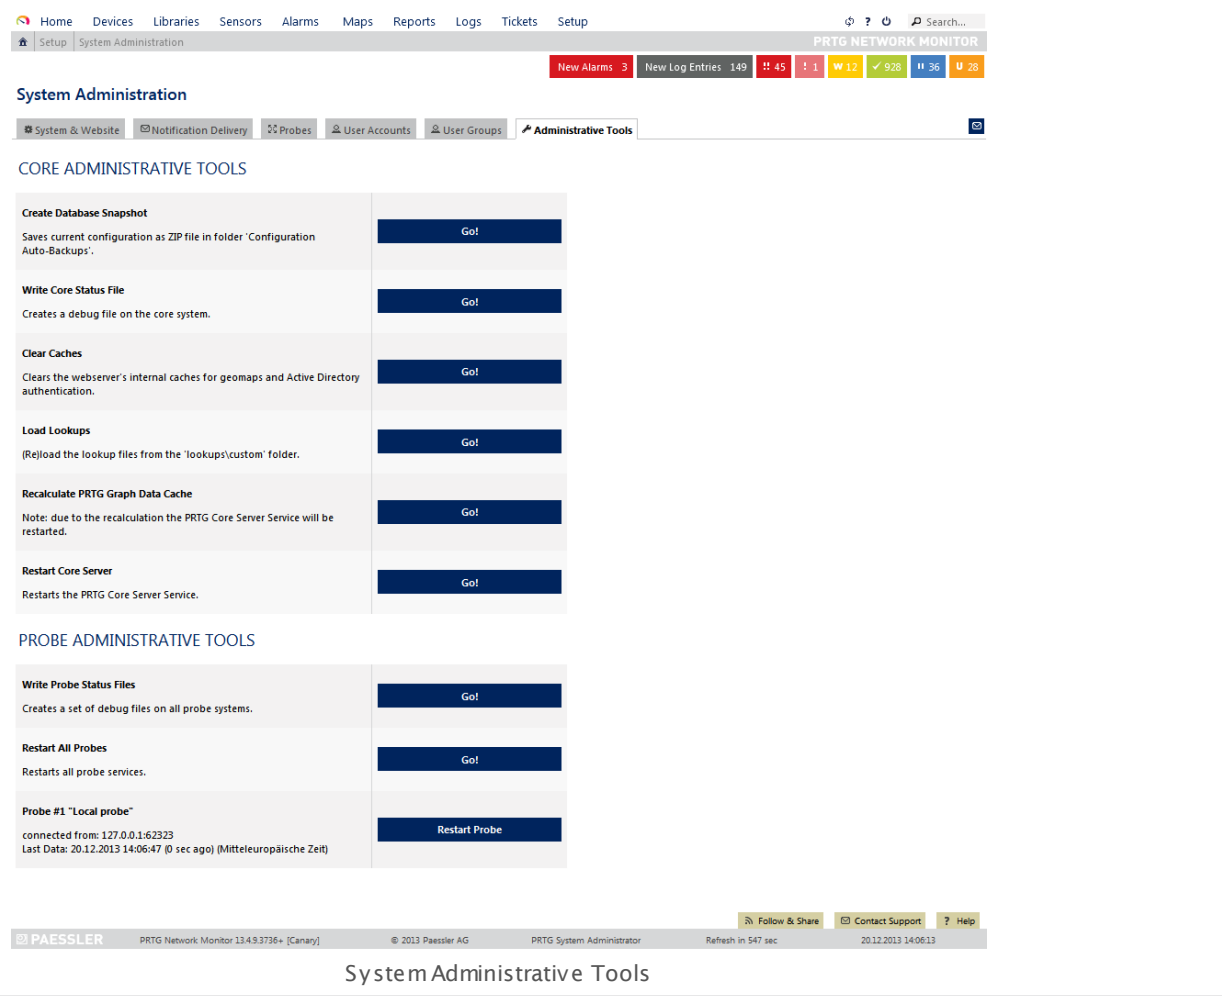
In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

7.12.11 System Administration—Administrative Tools

With the administrative tools you can start system specific processes for debugging purposes. Use them if Paessler's technical support staff advises you to do so. You can start the respective processes by clicking on the **Go!** button on the right.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.



System Administrative Tools

Core Administrative Tools

CORE ADMINISTRATIVE TOOLS

Create Database Snapshot	This will create a snap shot of your PRTG configuration. This action can take up to 100 seconds. Once finished, you will find a ZIP file containing a *.dat file in the **Configuration Auto-Backups** sub folder of your PRTG data directory 3135. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The ZIP file follows the name pattern PRTG Configuration (Snapshot YYYY-MM-DD HH-MM-SS).zip.
Write Core Status File	This will create status files of your PRTG core server. You will find the two text files in the **Logs (System)** sub folder of your PRTG data directory 3135. If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. The files are named Core Status.txt and Core Memory.txt. They are overwritten each time you click this button.
Clear Caches	PRTG caches tiles for **Geo Maps** 2753 and user data for **Active Directory Integration** 3083. Use this button to delete the cache if you encounter broken geo map tiles, or if you changed a user's password in the Active Directory.
Load Lookups	This will (re)load the lookup files 3095 from the **\lookups\custom** folder. In this folder your customized lookup files are stored. If you have created a new lookup file or changed something in an existing lookup file, it might be necessary to load or to reload these files.
Recalculate PRTG Graph Data Cache	PRTG writes monitoring data to the disk constantly and keeps the graphs for your graph tabs in memory. If PRTG is ended unexpectedly, the graph cache may get corrupted. In this case, graphs may be shown empty or show wrong data. If you experience graph display problems, a graph recalculation will fix the problem. Click on **Go!** so that PRTG will delete the data cache file and recalculate it automatically. Note: If you apply recalculation, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Go!** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen. Note: Directly after this action your graphs will be empty. They will be re-filled successively while recalculation in the background progresses. Until recalculation is finished, performance of the PRTG web interface may be affected due to high disk I/O activity.

CORE ADMINISTRATIVE TOOLS

Restart Core Server	You can restart the PRTG core server service manually. Click on the **Go!** button for this purpose. Note: If you restart the core server, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Go!** button, a popup will appear which asks you to confirm the required core server restart. Click on **OK** to trigger the restart and follow the instructions on the screen. Note: If you want to schedule an automatic restart of Windows services for both core server and probe service, you can do this in the corresponding **Probe Settings** 295.

Probe Administrative Tools

PROBE ADMINISTRATIVE TOOLS

Write Probe Status Files	This will create status files of your PRTG probes. Status files will be written for the local probe running on the PRTG core server (if you're running a PRTG cluster, on the cluster node you're currently logged in to) as well as for all remote probes configured (if any). On the respective systems, you will find four text files in the **Logs (System)** sub folder of the PRTG data directories 3135. The files follow the name pattern Probe Memory XX.txt, ProbeState XX.txt, ProbeState AXX.txt, and ProbeState BXX.txt. They are overwritten each time you click this button.
Restart All Probes	This will restart all PRTG probes as well as the local probe Windows service. If there are any remote probes 3106 configured, the probe Windows services on the respective remote systems will be restarted as well. In order to start single probes only, please see below. Note: If you run a PRTG cluster, this action is executed on the cluster node you are currently logged in to. In this case, remote probes are only restarted if you're logged in to the primary master node. The cluster probe Windows service of failover nodes is not restarted if this action is executed on the master node. If you want to restart the cluster probe Windows service of a failover node, please log in to this failover node's web interface and click on the same button there.

PROBE ADMINISTRATIVE TOOLS

Probe [#Number] "[Name]"	Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the "Local probe", the IP will always be IP 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, please click on the **Restart Probe** button. Note: Entries for every single probe are following.

Setup—Topics

Others

There are some settings that you must make in the **PRTG Administration Tool** 3046, available as native Windows application. For more details, please see the sections:

- **PRTG Administration Tool on Core Server System** 3047
- **PRTG Administration Tool on Remote Probe System** 3073

7.12.12 System Administration—Cluster

In the cluster settings you can define the cluster settings. During **Failover Cluster Configuration** 3122, the cluster settings were already pre-defined. See the cluster status 2923 to see if all nodes in your cluster are properly connected.

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Cluster Settings

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

You can set up two, three, four, or five nodes in one cluster. In the table of the cluster settings, the information of each node is written in one line.

CLUSTER NODE SETUP

Node Name	Enter the name of the node (for display purposes).
Node ID	The ID is unique for every node. We recommend that you use the default value.
Node State	You can set the state for every failover node. Choose between: ▪ **Active**: Set the node to be active. ▪ **Inactive**: Set the node to be not active. It will be disabled in the cluster configuration. It will then be not an active part of the cluster and will not appear in the cluster status 2923 any more. This setting is not available for the master node of a cluster. The master is always set to **Active**.
IPs/DNS Names Used for Connections Between Nodes	Define the IP addresses or DNS names that will be used for the connections between the nodes. You can enter different values for every node-node connection. For example, in the field **#2 => #1**, enter the address under which the master node server can be reached from the second cluster member. Usually, this is the IP address or DNS name of the master node. Do this for all available node connections, for example, if you run three nodes, enter the address under which second node can be reached from the third cluster member into the field **#3 => #2**.

CLUSTER NODE SETUP

Please see also section **Failover Cluster Step by Step, Step 4** 3131 and following.

Note: If you use remote probes 3109 outside your local network or outside your Network Address Translation (NAT), ensure the IP addresses or DNS names you enter here are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. These addresses must not be private and have to be reachable from the outside, otherwise your remote probes will not be able to connect.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

For how to set a cluster node into **Maintenance Mode**, please see **PRTG Status—Cluster Status** 2923.

The entire setup process for a cluster requires several different steps. For more information and step-by-step guidance, please see **Failover Cluster Configuration** 3122 section.

7.12.13 PRTG Status—System Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

PRTG Status Tabs

You can view the following aspects of the PRTG status:

- PRTG Status—System Status 2907
- PRTG Status—Cluster Status 2923

System Status

Click on the **System Status** tab to view relevant system information. You might need this data for debugging or when you contact our support team. They ask you in some cases to provide PRTG status information to analyze your issues with PRTG. Furthermore, this page shows interesting usage statistics.

SOFTWARE VERSION AND SERVER INFORMATION

PRTG Version	Shows the exact version of the build your PRTG installation is currently running on.
Auto-Update Status	Shows the latest auto-update message available from Software Auto-Update 2918. For example, the message will indicate any PRTG updates ready to be installed.
Operating System	Shows the exact Windows version build and service packs, the number and kind of CPUs, and the computer name, of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. Note: When running PRTG on virtual systems, not all of the mentioned values may be available.
Server Time	Shows the date and time of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Server CPU Load	Shows the current CPU load of the system the PRTG core server is installed on. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SOFTWARE VERSION AND SERVER INFORMATION

Username	Shows the username 2830 of the PRTG user you're currently logged in as.
Browser	Shows the name and user agent string of the browser you're currently viewing this page with.

LICENSING

Licensee	Shows the name of the license 62 that you use for this installation of PRTG. Licensee (name) and license key together build your license information.
Key	Shows the beginning and the end of the license 62 key that you use for this installation of PRTG. Licensee (name) and license key together build your license information.
Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).
Activation Status	Shows the activation status of this installation of PRTG. Usually, activation is done automatically on first start-up. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see **Activate the Product** 65.
Current Activation Stamp	Shows an internal activation stamp code.
Software Maintenance	Shows the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support, without additional costs.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG sets each new sensor that you add to a **Pause** status 135 automatically. To upgrade your license right now, click the **Need more sensors? Click here to upgrade!** button to visit our web shop.

LICENSING

Editions that allow an **unlimited** number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit 23 is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section **Detailed System Requirements** 23.

SYSTEM STARTUP LOG

Shows the log information created during the last startup of the PRTG core server. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYSTEM WARNINGS

If there are any warnings, PRTG will show them here. Usually, you will see "None" system warnings.

CLUSTER STATUS

This box is only visible if you run a PRTG cluster. This section lists all cluster nodes configured in your monitoring.

Node [Number] — Shows the name of the cluster node as well as the node type (primary/secondary node) and status (current master/failover node). Additionally, all connections from this node to the other cluster nodes are shown, as illustrated on the **PRTG Status—Cluster Status** 2923 page.

LOCAL STATUS

This box is only visible if you run a PRTG cluster. This section lists information about the cluster node you're currently logged in to.

Server State Cluster Messages	Shows internal summary information about the current node and the communication between the nodes. You might be asked about this by Paessler's technical support staff.

CLUSTER CONNECTIONS

This box is only visible if you run a PRTG cluster. This section lists information about the connections between the different cluster nodes.

State of Local Node	Shows Treeversion and size of the Server Volume, both internal system information.
State of Cluster Members	For each cluster node, the name and IP address is shown, as well as a state CRC code, the time stamp of the last "keep alive" signal sent, the current size of the buffer, and the remote IP.
Message State of Cluster Members	For each cluster node, the name, IP address, and unique identifier is shown, as well as the connection state, and statistic information about the cluster message system which is used for the communication between the different nodes.

CORE SYSTEM MEMORY

Shows machine-oriented information regarding the memory usage of the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

THREAD INFORMATION

Shows machine-oriented information regarding the threads running on the core server system. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

ACTIVITY HISTORY

The "Activity History" shows how busy PRTG was for you in the past. The graphs indicate the number of activities on the last 365 days. Right to the graphs, you see statistics about the past day.

Sensor Scans	Shows how often all sensors 92 in this PRTG installation refreshed their data in the past.
Sensor State Changes	Shows how often the **Sensor States** 135 changed in the past.
Notifications Sent	Shows how many **Notifications** 2759 PRTG sent out in the past.
Reports Generated	Shows how many **Reports** 2786 PRTG created in the past.
Page Views	Shows how often pages in the PRTG web interface were opened in the past.
Sensors	Shows how many sensors 92 existed in this PRTG installation in the past.
Devices	Shows how many devices 91 existed in this PRTG installation in the past.
Reports	Shows how many **Reports** 2786 existed in this PRTG installation in the past.
Maps	Shows how many **Maps** 2810 existed in this PRTG installation in the past.

AUTO-DISCOVERY TASKS

Currently Running	Shows the number of auto-discovery tasks that are currently running. A high number of auto-discovery tasks can negatively influence system performance.

BACKGROUND TASKS

Historic Data	Shows if PRTG is re-calculating the historic data cache in the background. If so, you will see the tasks to do until done. Usually, this calculation is done after every core server restart.
Toplist Buffer	When using xFlow 3012 or Packet Sniffer 3010 sensors, PRTG stores Toplist data. The data stream received is buffered and written to the data directory of the core system. Depending on the number and size of the data stream as well as the hard disk and system performance of the core system, the buffer size can rise. When reaching a buffer size of 500, Toplist data is dropped which can lead to incorrect Toplist values for the sensors.
Toplist Upgrade	If you recently updated from an older PRTG version (7 or 8), Toplist data needs to run through a one-time conversion process. While conversion is running you may experience a considerably slow monitoring system. Usually, you will see n/a here.
Similar Sensors Analysis	Shows the current status and the selected setting for the analysis depth of the **Similar Sensors** 151 analysis.
Recommended Sensors Detection	Shows the current status of the detection engine and the current tasks of the **Recommended Sensors Detection** 2874.

DATABASE OBJECTS

Shows statistic information about your monitoring configuration. This information might be necessary when contacting Paessler's technical support staff.

Probes	Shows the total number of probes 278 configured.

DATABASE OBJECTS

Groups	Shows the total number of groups 299 in your configuration.
Devices	Shows the total number of devices 324 in your configuration.
Sensors	Shows the total number of sensors 347 in your configuration.
User Groups	Shows the total number of user groups 2896 in your configuration.
Users	Shows the total number of users 2890 configured.
Notifications	Shows the total number of notifications 2836 configured.
Schedules	Shows the total number of schedules 2856 configured.
Maps	Shows the total number of created maps 2810 in your installation.
Libraries	Shows the total number of created libraries 2770 in your installation.
Reports	Shows the total number of reports 2786 in your installation.
Requests/Second	Shows a value calculated from the total number of sensors and the average scanning interval configured. This number indicates how many monitoring requests per second are sent from the probe(s) to the devices in your network. There are no general guidelines what is a "good" value here. This depends on the sensor types used as well as on your system's performance.
Sensors	Shows a list with numbers and types of sensors used in your configuration. Note: In the list, internal short names are used for sensor types instead of the official designations.

SENSORS BY PERFORMANCE IMPACT

Shows all sensor types used in your configuration ordered by performance impact (from very low to very high). If your PRTG system is very slow, you can see which sensors might cause this issue. Please consider the recommended number of sensors in the respective manual sections 347 for sensors with high and very high performance impact.

SENSORS BY PERFORMANCE IMPACT

Note: In the list, internal short names are used for sensor types instead of the official designations.

SENSORS BY INTERVAL

Shows all sensor types used in your configuration ordered by scanning interval. Please choose reasonable scanning intervals for sensors which can affect the system performance. See the respective manual sections [347] for sensors for more information.

Note: In the list, internal short names are used for sensor types instead of the official designations.

PROBES

This section lists all probes configured in your monitoring. If there are no remote probes configured, only the "Local probe" appears in the list, which runs mandatorily on the PRTG core server.

Note: If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. Remote probes (if any) will only be shown when you are logged in to the primary master node. When logged in to a failover node, the cluster probe running on this node will appear as "Local probe".

Probe [#Number] "[Name]"	Information about the connection status is shown. If the probe is currently connected, the field shows the source IP address and port number used by the probe. For the "Local probe", the IP will always be IP 127.0.0.1. You will also see information about the date when the last data packet was received from the probe. If you want to restart a single probe, please go to the **Administrative Tools Settings** [2900].

SYSTEM SETTINGS

Web Server URL	Shows the URL to access the PRTG web interface 108. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server IPs	Shows all IP addresses the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Ports	Shows the port the PRTG web server is running at. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.
Web Server Port Usage	Shows the number of ports used by the PRTG web server.
Incoming Probe Connection Binding	Shows a combination of the two values below.
Incoming Probe Connection IPs	Shows a list of all IP addresses on which your current PRTG installation listens to incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2883 settings. 0.0.0.0 means that the core server listens on all local network adapter IPs.
Incoming Probe Connection Port	Shows the port number on which your current PRTG installation listens to incoming remote probe connections. The default port is 23560.
Probe Allow IPs	Shows all source IP addresses that will be accepted by the core server for incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2883 settings and can be changed there. any means that all remote probe connections are accepted, regardless of the IP address of the remote probe system.
Probe Deny IPs	Shows all source IP addresses that will be denied by the core server for incoming remote probe connections. This is the same information as shown in the **System Administration—Core & Probes** 2883 settings and can be changed there. Denied IPs are superior to allowed IPs. If this field is empty, there are no denied IPs. Note: PRTG automatically adds the IP address of a remote probe system to this list when you delete a remote probe from your device tree 89.

SYSTEM SETTINGS

DataPath	Shows the path where PRTG stores its configuration, monitoring database, etc. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to. In order to change this setting, please open the PRTG Administration Tool 3047 on the system of the PRTG core server (or of the respective cluster node, if applicable).

WEB SERVER ACTIVITY

Shows statistic information about the web server since last startup. All values are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

Time Since Startup	Shows the time that has passed since the PRTG web server was started.
Page Views	Shows the total number of page views on this core server.
Geo Maps	Shows the total number of geo maps shown on this core server.
HTTP Requests	Shows the total number of HTTP requests to this core server.
HTTP Requests > 500/1000/5000 ms	Shows for how many (percent) of the HTTP requests above the page delivery took longer than 500, 1,000, or 5,000 milliseconds.
Slow Request Ratio	Shows a calculated number of the HTTP request values above. The lower this number, the faster is your installation's web interface.

SYNCHRONIZATION

The core server holds the configuration of the entire monitoring and deploys it to the probes. This section shows statistic information about the synchronization of the core server with the local probe and all connected remote probes (if any), since last startup of the core server. All values shown here are reset when the core server is restarted. If you run a PRTG cluster, this will show information for the system of the cluster node you're currently logged in to.

SYNCHRONIZATION

Note: Only when logged in to the primary master node, you will see synchronization data for remote probe connections.

Last Synchronization with a Probe	Shows the time stamp of the last probe synchronization, and if there is still something to do.
Probe/Core Message Count	Shows the total number of messages sent between core and probe(s), as well as a calculated message speed value.
Raw Buffer Count	Shows the number of raw buffers and a corresponding status indicator.
Sync Cycle Speed	Shows the time necessary for a full synchronization, as well as an evaluation comment of this time (usually, this will be "OK").
Configuration Requests Sent	Shows the total number of configuration requests and the requests that still have to be sent.
Configuration Requests Deleted	Internal debug information. Usually, this value will be 0.
Configuration Requests With Response	Internal debug information. Usually, this value will be 0.

More

Paessler Website: Detailed System Requirements for PRTG Network Monitor

- https://www.paessler.com/prtg/detailed-requirements

Knowledge Base: How can I speed up PRTG—especially for large installations?

- http://kb.paessler.com/en/topic/2733

7.12.14 PRTG Status—Auto-Update

Whenever a new version of the software is available from the Paessler website PRTG will download the setup file automatically if a direct internet connection is available. The **PRTG System Administrator** user will then receive a ToDo ticket 172 with instructions to initiate the update installation.

For customers using a Freeware or Trial Edition 20, automatic software updates are available at any time. Customers using a Commercial Edition 20 need to have an active maintenance contract so updates are available.

Status

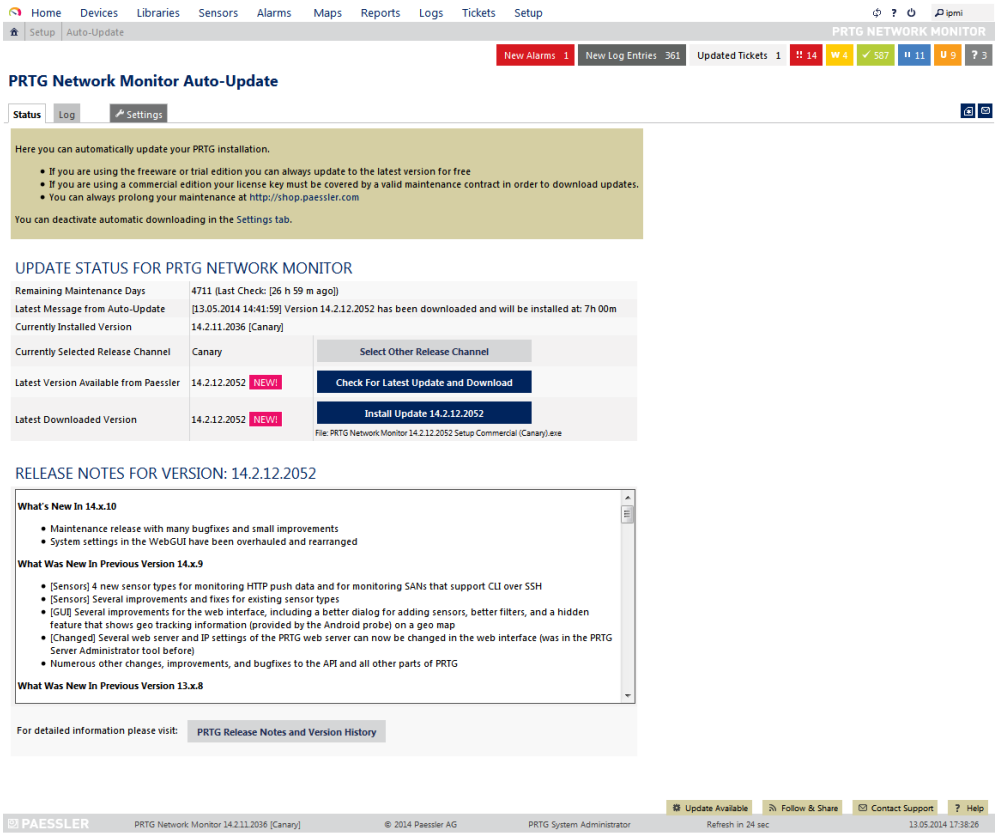
Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

To view the auto-update page of your PRTG installation, select **Setup | Auto-Update** from main menu. On the **Status** tab you can download and perform updates.

Using Auto-Update

If there is a new version available, you will see detailed information about the available version. Please read these notes carefully! You find a summary of current and past release notes below the update section. For detailed release notes, click **PRTG Release Notes and Version History** which will redirect you to the version history page on paessler.com.

To install the latest available version, click **Install Update [version number]**. PRTG will ask you to confirm installation and license—and that's it!



Automatic Software Update Page

Manually Install an Interim Update

Not all available updates from Paessler will be pushed to all customers, but they are still available from the website. Sometimes Paessler support may ask you to update to the latest version.

In this case please click the **Check For Latest Update and Download** button. PRTG will then connect to the Paessler servers and download the setup file, regardless of the status of the update-check. Then **Install Update [version number]**.

Note: To use this function, a direct internet connection is necessary on the computer running the PRTG core server.

Select Other Release Channel

PRTG is available in three different release channels. For details about continuous rollout and release channels, please see the blog article in the **More** 2922 section below.

To change the release channel you receive updates from, please open the auto-update **Settings** 2920 tab and choose the desired release channel in the **Release Channel** section.

Log

Click the **Log** tab to show log information about the update status of PRTG, newest first. In the table list[178] appearing, you can filter the items by using the respective options[178]. For more information, please see the **Logs**[169] section.

Settings

Click the **Settings** tab to configure the PRTG **Software Auto-Update**.

SOFTWARE AUTO-UPDATE

When a New Version is Available	Define what to do when there are software updates available. Choose between: ▪ **Automatically download and install the latest version**: PRTG automatically downloads and installs any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). Note: Without prior notice, the installation of a new version will restart the PRTG Windows services and may also include a server restart. ▪ **Automatically download the latest version and alert the admin**: PRTG automatically downloads any new version as soon as PRTG detects that there is a newer version available (PRTG checks this once per day). After successful download, PRTG will create a ToDo ticket[172] for the PRTG System Administrator user. ▪ **Alert the admin only**: When PRTG detects that there is a newer version available, it will not download updates automatically, but create a ToDo ticket[172] only. You can still download updates manually on the **Auto-Update**[2919] page.
Installation Time	If you select the automatic installation option above, choose the desired time for installation of updates from the drop-down menu.
Release Channel	PRTG updates are delivered in different release channels. You can choose between maximum stability, or most early access to new features. Please choose between: ▪ **Stable: Updated about once per month (most conservative option, recommended)**: These are our best tested versions. Choose this channel for live environments you have to depend on!

SOFTWARE AUTO-UPDATE

- **Preview: Updated about once per week**: Versions in this channel are already thoroughly tested in our labs, but may still contain limitations in certain monitoring configurations. Choose this channel if you are willing to take a little risk for the benefit of getting new features and bug fixes a little earlier. We strongly recommend to not use those versions in live environments you have to depend on!
- **Canary: Updated daily (testing only, should not be used on live systems)**: Updated every night. Use with CAUTION! Software versions in this channel are not tested yet, might contain severe bugs, and are provided for testing purposes only. We strongly recommend to not use those versions in live environments you have to depend on!

For more information about the different release channels, please see the blog article linked in the **More** 2869 section below.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notes

There are a few things we ask you to consider regarding automatic software updates:

- In order for auto-update to work the machine running the PRTG core server needs direct internet access. If a proxy connection is needed, please configure it in the **System Administration—Core & Probes** 2883 settings. For details about the update servers, see the **More** 2922 section below.
- During installation the core server may be restarted without notice.
- PRTG updates existing remote probes automatically, causing short downtimes in monitoring of remote locations. In rare cases a manual update of remote probes is required after you update the core server. In these cases you will be notified in the device tree, and monitoring of remote locations will be interrupted until you perform the manual update 3117 on the system(s) running the remote probe(s). If a server with a probe uses several network connections with different IP addresses, ensure these addresses are included in the list of allowed IPs 2884. Otherwise the remote probe on this machine might be disconnected after an update.
- In a cluster installation the update needs to be installed on one node only. The new version will then be deployed to all other cluster nodes automatically (causing a short downtime for the monitoring on the cluster nodes, one after another).
- If you run several individual PRTG core servers that are not in a cluster, for example, in combination with the **Enterprise Console** 2938, an update has to be initiated and confirmed for each single core server.
- You can disable automatic downloading on the **Auto-Update Settings** 2920 tab. Updates will then only be downloaded on request, when you click on the **Check For Latest Update and Download** button.

- PRTG does not start auto-update downloads if there is less than 500 MB disk space available on the core server system. If this is the case, you can check this on the **Log** 2920 tab.

- https://www.paessler.com/blog/2012/04/25/news/prtg-12-introduces-continuous-rollout

7.12.15 PRTG Status—Cluster Status

To view the status of your PRTG installation, select **Setup | PRTG Status** from main menu. Click on the tabs to change the different settings.

PRTG Status Tabs

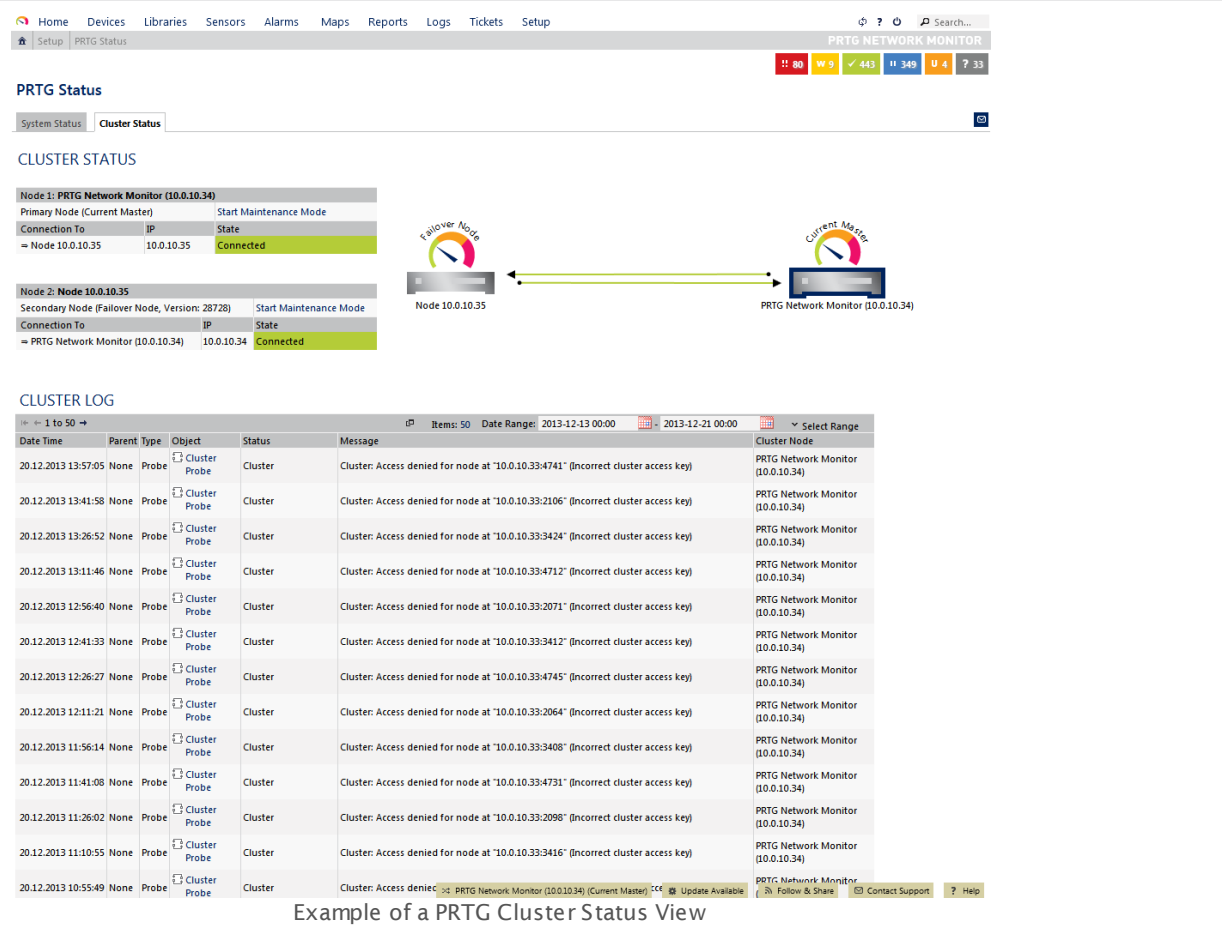
You can view the following aspects of the PRTG status:

- **PRTG Status—System Status** 2907
- **PRTG Status—Cluster Status** 2923

Cluster Status

Click the **Cluster Status** tab to view all nodes connected to the cluster. This tab is only available if you run PRTG in cluster mode 87. The following information is available:

- Cluster Status with all connected nodes as table and graphic
- Cluster Log with all log entries concerning cluster connections



Example of a PRTG Cluster Status View

Click the **Start Maintenance Mode** link to put a cluster node in maintenance mode. A node in this mode is still connected to the cluster, but its monitoring results are discarded until you click the **Stop Maintenance Mode** link. You can use this functionality to explicitly exclude a node from monitoring if you know that the monitoring values will not be accurate, for example, because you reconfigure the failover server. During maintenance, a cluster node is displayed with a transparent color in the overview graphic.

Note: You will not see on this page if your remote probes are connected to failover nodes 3125. Please connect to your failover nodes and check explicitly if remote probes are connected (for example, in the device tree of the PRTG web interface on a cluster node).

For more information about cluster settings, please see System Administration—Cluster 2905 section.

7.12.16 PRTG Status—Licensing Status and Settings

To view information about the license of your PRTG installation and to enter your license key, select **Setup | License | Status** from the main menu. Click the tabs to change the different settings.

PRTG License Tabs

You can view the following aspects of your PRTG license:

- **Your License—Status** 2925
- **Your License—Log** 2926
- **Your License—Enter License Key** 2926

Note: If you open the system administration page from another administration page and 15 minutes (900 seconds) have passed since your last credential-based login, you will be asked to enter your credentials again for security reasons. A dialog box will appear. Simply enter your **Login Name** and **Password** for PRTG in the corresponding fields, confirm and you're done.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

Status

Click on the **Status** tab to view information about your license.

LICENSING	
Licensee	Shows the name of the license 62 that you use for this installation of PRTG. Licensee (name) and license key together build your license information.
Key	Shows the beginning and the end of the license 62 key that you use for this installation of PRTG. Licensee (name) and license key together build your license information.
Edition	Shows the PRTG edition that you use for this installation of PRTG. This determines how many sensors you can use in your monitoring (see below).

LICENSING

Activation Status	Shows the activation status of this installation of PRTG. Usually, activation is done automatically on first start-up. Only if PRTG cannot connect directly to the internet, a manual activation is necessary. For details, please see **Activate the Product** 65.
Current Activation Stamp	Shows an internal activation stamp code.
Software Maintenance	Shows the days remaining for your active maintenance contract. You can buy maintenance for each PRTG license. With an active maintenance contract you may download any available updates and use our premium email support, without additional costs.
Number of Sensors	Shows the number of sensors you can use in your monitoring with your current edition of PRTG (see above). If you reach the limit, PRTG sets each new sensor that you add to a **Pause** status 135 automatically. To upgrade your license right now, click the **Need more sensors? Click here to upgrade!** button to visit our web shop. Editions that allow an **unlimited** number of sensors do not restrict the number of possible sensors by license, so you can create sensors until the performance limit 23 is reached. This means that you can use about 10,000 sensors per core server (depending on your system's performance, sensor types, and scanning intervals). For details, see section **Detailed System Requirements** 23.

Log

Click on the **Log** tag to show a table list of all system log entries with all messages and status changes regarding your license.

Enter License Key

Click on the **Enter License Key** tab to enter name and key for your PRTG Network Monitor license. You can also view your licensed edition. For more details about activation, please see **Activate the Product** 65 section.

SOFTWARE LICENSE

License Name	Enter the license name you have received from Paessler via email. To avoid typing errors, please copy and paste the **License Name** from the email. It must be transferred exactly as shown in the email.
License Key	Enter the license key you have received from Paessler via email. To avoid typing errors, please copy and paste the **License Key** from the email. It must be transferred exactly as shown in the email.
Licensed Edition	Shows the edition of the license that you currently use for this installation of PRTG. This determines how many sensors you can use in your monitoring. If you run a PRTG cluster, this field shows information for the system of the cluster node you are currently logged in to.

7.12.17 Optional Downloads and Tools

To see optional downloads, select **Setup | Downloads** from the main menu. Click a tab to switch between different options.

Downloads Tabs

There are the following downloads available:

- Client App for Windows (Enterprise Console) 2928
- Client Apps for Mobile Devices 2928
- Remote Probe Installer 2928
- PRTG Tools 2928
- Desktop Notifications 2928

Client App for Windows (Enterprise Console)

Download the Windows Graphical User Interface (GUI) Enterprise Console to the current system. If you use the Enterprise Console, you can access the PRTG interface with a native Windows application. The version of the Enterprise Console must match the version of your PRTG server. For more information, please see **Install the Enterprise Console** 72.

Client Apps for Mobile Devices

To monitor your network while on the go, use our free apps for smartphones and tablets. They run on iOS, Android (including BlackBerry devices), and on Windows Phone. For more information on **PRTG for iOS**, **PRTG for Android**, and **PRTG for Windows Phone**, please see the **More** 2929 section below.

Remote Probe Installer

With remote probes you can extend your monitoring to distributed networks that are not directly reachable from your PRTG core installation. The version of the remote probe installer must match your version of PRTG. For more information, please see **Install a PRTG Remote Probe** 67.

PRTG Tools

You can use several freeware tools directly from the Paessler labs which help you to manage your network and to diagnose and test network monitoring issues. Open the **PRTG Tools** tab and click the **More Information and Download** button to navigate to Paessler's freeware tools webpage. There you can find a collection of various tools for PRTG Network Monitor.

Desktop Notifications

This tab is only visible if you access the PRTG web interface with Google Chrome or Firefox browser. For details, please see **Desktop Notifications** 2930 section.

More

Paessler Website: Mobile Network Monitoring with PRTG—Mobile Apps for Smartphones and Tablets

- https://www.paessler.com/apps

Paessler Website: Freeware Network Tools

- https://www.paessler.com/tools

7.12.18 Desktop Notifications

While you are logged in to the PRTG web interface with your Chrome or Firefox browser, PRTG can show notifications on your desktop whenever there are new alarms in your monitoring.

PRTG will show desktop notifications (by default, in the lower right corner of your desktop) whenever there are new alarms after a page refresh in the PRTG web interface. The notification displays the number of new alarms and the current number of each sensor status.

Example of a Chrome Desktop Notification

You have to initially allow those notifications for each installation/profile of Firefox or Google Chrome. In the PRTG web interface, click **Setup** and choose **Desktop Notifications**.

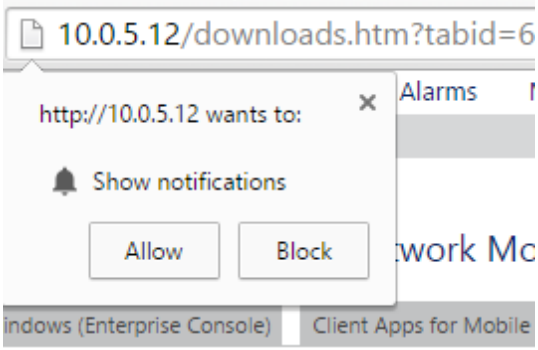
Note: Desktop notifications are not available for Internet Explorer.

Desktop Notifications Settings

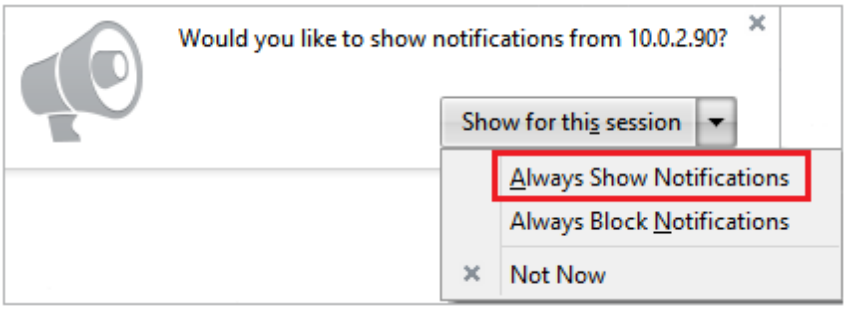
On the settings page, you see one of the following status messages.

Status: Click button below to enable Desktop Notifications

- Click the **Enable Desktop Notifications** button to add your PRTG URL to the list of allowed sites for desktop notifications in Chrome or Firefox.
- On top of your browser window a message appears, asking you to allow desktop notifications.
  - In Chrome, click **Allow** to add the URL of the PRTG web interface to the allowed sites.
  - In Firefox, click **Always Show Notifications** to add the URL of the web interface to the allowed sites.



Click 'Allow' to enable Chrome Desktop Notifications



Click 'Always Show Notifications' to enbale Firefox Desktop Notifications

Status: Sorry, Desktop Notifications cannot be enabled or **Unknown**

- Desktop Notifications are explicitly blocked for the URL of the PRTG web interface in the browser options. Please see section Disabling or Re-Enabling Desktop Notifications 2931 below.

Status: Desktop Notifications enabled

- Desktop Notifications are successfully activated. To disable them, please see Disabling or Re-Enabling Desktop Notifications 2931 below.Microsoft Internet Explorer 11

Disabling or Re-Enabling Desktop Notifications

To disallow or re-allow desktop notifications for the PRTG web interface, edit your browser options:

- In **Google Chrome**: Click the **View site information** symbol in the address bar of the browser. You can block or re-allow notifications for the current URL in section **Permissions**.
- In **Firefox**: In the PRTG web interface, hold the Shift key and right-click to open the browser's context menu. Click on **View Page Info** and select the **Permissions** tab. In section **Notifications**, select the desired option for the PRTG website, for example, block desktop notifications or enable them again.

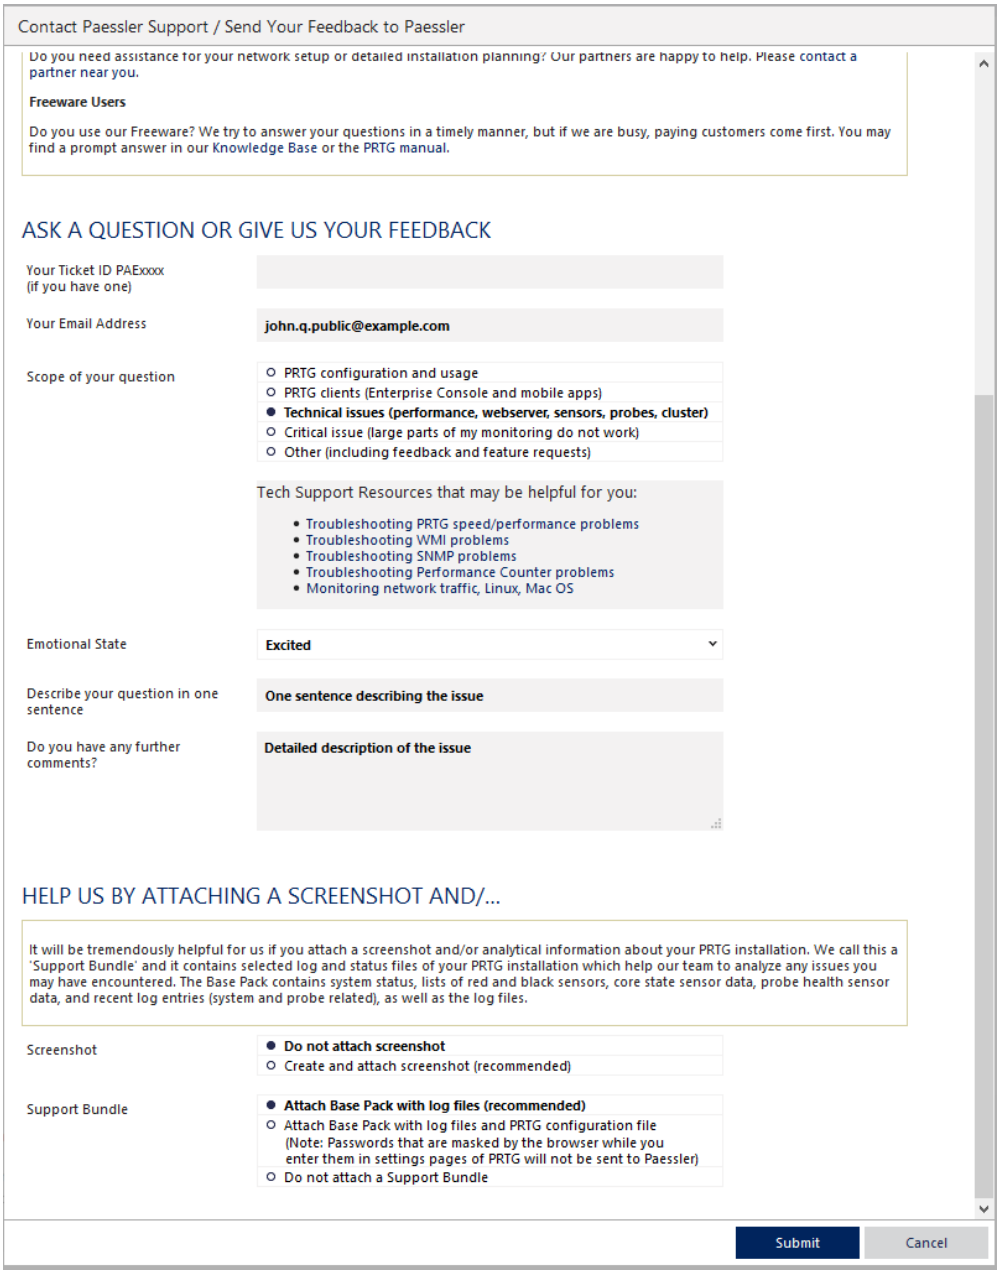
7.12.19 Support—Contact Support

To open the **Contact Paessler Support / Send Your Feedback to Paessler** window in PRTG, choose **Setup | Contact Support** from the main menu. You can open this form also via the footer **Contact Support** on any page in PRTG.

On the one hand, you can adapt this page as feedback form. Help improve PRTG by providing criticism, praise, bug reports, and feature requests. Any comments are welcome! Your feedback will be handled directly by the Paessler support team.

On the other hand, you can use this function to ask for support regarding technical issues. To make the support contact more comfortable, PRTG can automatically attach a screenshot in combination with a Support Bundle which contains several selected PRTG log and status files. This information will help our support team a lot to analyze any issues you may have with PRTG. Please also consider the suggested links to articles regarding the scope of your issue.

Note: PRTG transmits your feedback or support question including the support bundle securely to Paessler via the PRTG Cloud. Please make sure your PRTG server has access to the internet and can reach the URL https://api.prtgcloud.com:443



Contact the Paessler Support or Send Feedback

Ask a Question or Give Us Your Feedback

Provide the following information in this section of the contact form:

- **Your Ticket ID PAExxx**: If you have already opened a new ticket (either directly via email to support@paessler.com, or via the Knowledge Base, or via the support form on paessler.com), enter its ID here. You can find it in your confirmation email regarding the request we received. You can provide the ID with "PAE" in front or just the number. If you leave this field empty, you will create a new ticket when you submit this form.

- **Your Email Address**: Enter your email address here. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account to be able to associate you with your license.
- **Scope of Your Question**: Select a topic regarding your issue and consider the proposed links.
- **Emotional State**: If you want to, you can indicate your current feelings about PRTG.
- **Describe Your Question in One Sentence**: Provide short information that indicates the topic of your issue.
- **Do You Have Any Further Comments?**: Leave your comments here. It can be feedback or support questions. Please describe your issue as detailed as possible!

Attach a Screenshot and/or Support Bundle

To provide as helpful information as possible, you can attach a screenshot of the current page and various support bundles with useful analytical data about your PRTG installation.

In section **Screenshot**, choose between:

- **Do not attach screenshot**: Send the ticket without a screenshot.
  Note: We recommend that you attach a screenshot of the affected PRTG webpage so that we can understand your request easier and faster.
- **Create and attach screenshot (recommended)**: Create a screenshot of the currently displayed page in PRTG to send it with your ticket. You can see a preview below the screenshot section.
  Note: If you encounter issues on a specific page in PRTG, call the contact support form on this page to get a screenshot of it.

In the section **Support Bundle**, you can choose between several packages which differ in coverage of information:

- **Attach Base Pack with log files (recommended)**: Contains log files of your PRTG installation and the following information:
  - System status
  - Lists of sensors regarding their current states
  - Core state data
  - Probe Health sensor data
  - Current log entries
- **Attach Base Pack with log files and PRTG configuration file**: Additionally contains the configuration file.
  Note: Send this package only if our support team told you so! Encrypted passwords in the config.dat file and passwords that your browser masks while you enter them on settings pages will be removed before PRTG sends this package to Paessler Support.
- **Do not attach a Support Bundle**: The ticket will not contain files. Choose this option only when sending feedback.

Click the **Submit** button to send your request directly to our technical support team, or click **Cancel** to return to the page from which you opened the contact form. Usually you will receive an answer by our support team within one or two business days, no matter whether you provide feedback or you have a question.

Note: If you have questions or feedback regarding your license purchase, upgrade, or maintenance extension, please contact our customer service.

Part 8

Enterprise Console

8 Enterprise Console

The Enterprise Console (in old PRTG versions called "Windows GUI") is one alternative interface 83 that you can use to connect to the PRTG core server to configure your setup, view monitoring results, and keep an eye on your network. It is a native Windows application for fast access to data and monitoring management.

The Enterprise Console (EC) provides extended pop-up window functionalities, as well as a seamless link to the Ajax web interface 108 where you can change your monitoring configuration and access further functionalities such as reporting 2961, maps 2959, system setup 2967, tickets 2965, and libraries 2953. The EC shows most of the functions with an embedded webkit browser, for a few options the EC opens an external browser window (using your default browser).

Note: The Enterprise Console runs under all supported Windows versions 23, but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

Note: The Enterprise Console does not support **System Information** 164 and does not show this tab on devices. Please use the PRTG web interface to access system information of a device.

Access Several Core Servers in One Console

As an additional functionality, you can configure access to several PRTG core servers in the Enterprise Console. It can show data of all your independent core server installations at a glance (for example, the device tree 2946 and alarms list 2957), so you can manage your monitoring centrally, also when it is spread across different servers.

Getting Started

Every installation of PRTG Network Monitor includes the Enterprise Console and installs it automatically on the computer running the PRTG core server. If you want to use the Enterprise Console on another computer, please download 2928 and install it there. For details, please see the **Install the Enterprise Console** 72 section.

Note: The Enterprise Console is mainly designed to review and manage an existing installation of PRTG which you already set up. If you just start monitoring, we recommend that you first run through the **Smart Setup** 37 in the PRTG web interface 108 and add your network devices there.

For detailed instructions, please see **Quick Start Guide** 32 section. Once finished, you can seamlessly switch to the Enterprise Console.

Requirements for Connections to PRTG Web Server(s)

To show monitoring data of your PRTG setup, the Enterprise Console must be able to establish a connection to your PRTG web server(s). For this purpose, please ensure the following:

- The following server settings in the Enterprise Console (see section **PRTG Servers** 2970 for details) have to match the following settings in the **PRTG Administration Tool** 3047:

Enterprise Console Server Settings	PRTG Administrator Settings
Server IP / DNS name	**IP address for PRTG's Web Server** on the **Web Server** tab
Port	**TCP Port for PRTG's Web Server** on the **Web Server** tab Note: PRTG switches to port **8080** as a fallback after a restart when port 80 is already used, and to port **8443** if port 443 is not available. PRTG keeps the SSL connection in this case. If this port is also not available, PRTG tries from port 32000 on until it finds an available port. Because the EC cannot recognize these ports (8080, 8443, 32000+) automatically, enter the currently used port manually here in the **Port** setting. If you do not get a connection to the PRTG web server, check the currently used port in the **Web Server** settings under **System Administration—User Interface** 2862 in the PRTG web interface.
Login Name	**Login Name** on the **Administrator** tab
Password	**Password** on the **Administrator** tab

- No local software firewall blocks the connection.
- No local virus protection program blocks the connection.
- The specified port is not used by another application.
- No (hardware) firewall blocks the connection when connecting through a network (LAN or WAN).
- The software versions of the Enterprise Console and the PRTG web server have to match at least in the third number (for example, EC version 2944 15.3.18.3590 can connect to server version 123 15.3.18.3796).

See section **More** 2939 for common issues with the Enterprise Console and their solutions.

The following sections introduce the features and concepts of the Enterprise Console:

Enterprise Console—Topics

- First Start 2941
- General Layout 2942
- Menu Tabs and Page Content 2945
- PRTG Servers 2970
- Options 2973
- Windows Menu Structure 2979
- Context Menus 2986
- Shortcuts Overview 2987

Related Topics

- Ajax Web Interface—Basic Procedures 108
- Ajax Web Interface—Device and Sensor Setup 218
- Ajax Web Interface—Advanced Procedures 2732
- Other User Interfaces 2990

8.1 First Start

This section helps you to start the Enterprise Console for the first time.

Opening the Enterprise Console

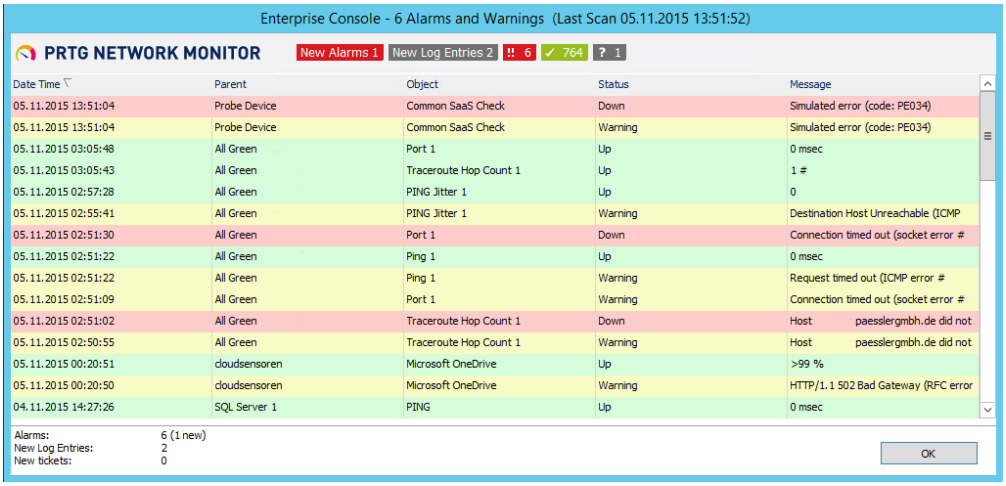
Double click the **PRTG Enterprise Console** icon in the Windows start menu to open it. As soon as it opens, the Enterprise Console tries connecting to your PRTG installation, according to the defined PRTG server connection settings. In a fresh install of PRTG, the settings for the Enterprise Console installed on the computer running the PRTG core server are already predefined, so you can use the Enterprise Console right away. If you get an error message when opening the Enterprise Console, please check the connection settings 2938. For example, adjusting the settings is necessary if you changed the IP address of the server.

For detailed information, please see the **PRTG Servers** 2970 (**PRTG Server Connection**) section.

Note: The Enterprise Console runs under all supported Windows versions 23, but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

Tray Window

By default, the Enterprise Console runs in background and shows a message box whenever there are new alerts, new messages, or new tickets for your monitoring. This window is one of the first things you see after opening the Enterprise Console.

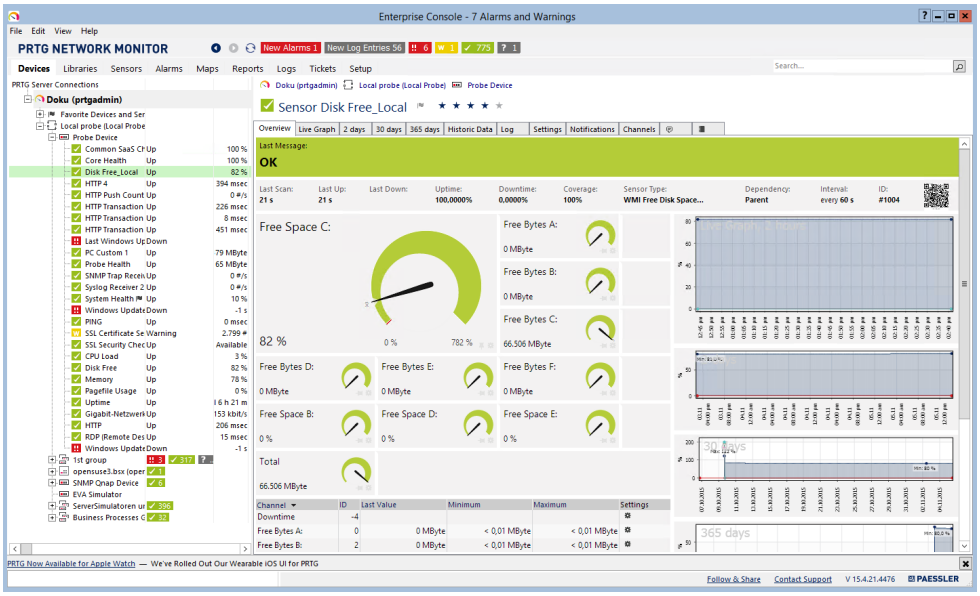


Example of the Tray Window

This window is shown as always on top. Click the **OK** button to close it. You can change the tray behavior in the Enterprise Console settings. For detailed information, please see **Options** 2975 settings (**System—Alerting**).

8.2 General Layout

The main layout of the Enterprise Console (EC in short form) program consists of different elements. See below for details.



PRTG Enterprise Console

From top to bottom, the main layout consists of:

- The Windows menu 2942.
- The page header bar 2943 with the PRTG logo, the viewpoint arrow symbols, the refresh icon, and the sensor states overview.
- The menu tabs bar and page content 2943 underneath.
- The server selection 2943 and search bar 2944 in the upper right corner.
- The news feed 2944 underneath the page content.
- The status bar 2944 at the bottom of the window.

Often, the Enterprise Console displays data and setting directly. Some functionalities and extended setup additionally require a new window of the system's default browser and the web interface 108 shows up. In this case, you are logged in to the web interface automatically via username and hash value 2830. In your browser, it might be necessary to confirm the certificate that is used by the PRTG web server. For more information, please see **SSL Certificate Warning** 113 section. If you configure your Enterprise Console for a connection with more than one PRTG core server, keep an eye on the server selection 2943 bar to choose which server's data you want to access.

Windows Menu

The Windows menu gives access to general configuration and settings. For details, please see section **Windows Menu Structure** 2979.

Page Header Bar

Enterprise Console Page Header Bar

The page header consists of the following parts:

- **PRTG Logo**
  Click the PRTG Network Monitor logo to open the Ajax web interface 108 in the browser which you define in the Enterprise Console **Options** 2973. If you configured several PRTG core servers, the browser loads the web interface of the server that you have currently selected in the **Devices** 2946 tab.

- **Previous Viewpoint / Next Viewpoint (Arrow Symbols)**
  The Enterprise Console stores the different views which you navigate to in the application. Using these arrows (or using the shortcuts Alt+Left and Alt+Right), you can step back and forth in the history, just as you know from your web browser.

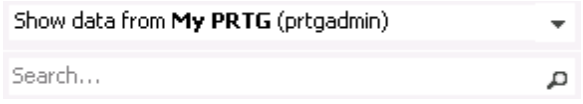
- **Refresh (Arrow Circle Symbol)**
  Click the refresh symbol (F5) any time to refresh the current screen. This immediately queries data for the current screen from all active PRTG core servers just as the automatic refresh does. You can configure the update interval in the **Options** 2973 settings.

- **Global Sensor Status Symbols**
  This area shows the aggregated status of all sensors from all active PRTG core servers, divided into different sensor states. Depending on the particular sensor states, you see colored boxes with numbers which symbolize the sensors. For example, you can see how many sensors are in **Up**, **Down**, **Warning**, **Pause**, **Unusual**, or **Unknown** status. Click a status icon to view a list of all sensors in the respective status. For a detailed description, please see manual section **Sensor States** 135. Next to the global sensor status symbols you can also see the number of new alarms and new log entries, as well as the number of new tickets, if there are any. Click the respective icons to view **Alarms** 161, **Logs** 169, or **Tickets** 171.
  Note: When you view sensor lists, you can show the sensors of only one server at once. So, the global sensor overview shows the total number of sensors in a certain status on all active servers, but viewing a list of all sensors in a certain status from all servers is not possible for performance reasons.

Menu Tabs Bar and Page Content

You can navigate through your setup using the menu tabs bar. Please take a few minutes to familiarize yourself with all menu items. The page content underneath varies depending on the selected menu tab. It shows various information about your monitored objects. For a detailed description of all tabs, please see the **Menu Tabs and Page Content** 2945 section.

Server Selection



Enterprise Console's Server Selection and Search Bar

In the server selection bar you see all active PRTG core server connections which are configured for the current Windows user account (saved in the registry).

The server you select here determines globally which information the EC shows in all **Menu Tabs** (except the **Devices** tab: the server selection does not apply for the devices tab). Depending on your selection, **Libraries**, **Sensors**, **Alarms**, **Maps**, **Reports**, **Logs**, **Tickets**, and **Setup** options are shown for the respective server only. Select **All PRTG Servers** to show consolidated information for all active PRTG core servers which appear in the list.

Note: For technical reasons, you cannot show consolidated information from all servers in the **Sensors**, **Setup**, and **Search Results** tab. To use these tabs, please select one single PRTG core server from the server selection bar.

Select **File | Manage PRTG Server Connections** from the main menu to add or remove **PRTG Servers** from the list, or to edit an existing one.

Search Bar

Select a single PRTG core server from the server selection bar and enter a key word to search the respective server. In the **Search Results** tab, the Enterprise Console displays matching monitoring objects, help topics, and related objects. If you click a monitoring object (for example, a sensor) in the search results, the Enterprise Console opens this object on the **Devices** tab with details in the device tree.

Note: If you have configured a connection in the **PRTG Servers** options that uses a **Root ID** other than 0, the EC ignores this setting while searching. In this case, the EC shows **Search Results** for the entire server (starting at Root ID 0).

News Feed Bar

The news feed bar shows latest news by Paessler. Click the bar to open a window with an overview about recent articles. You can open a specific article in the web browser by clicking the particular header. If you do not want to show the news feed in your Enterprise Console, click the X symbol besides the bar. You can enable it again via **View | Show News Feed** in the main menu (Ctrl+N).

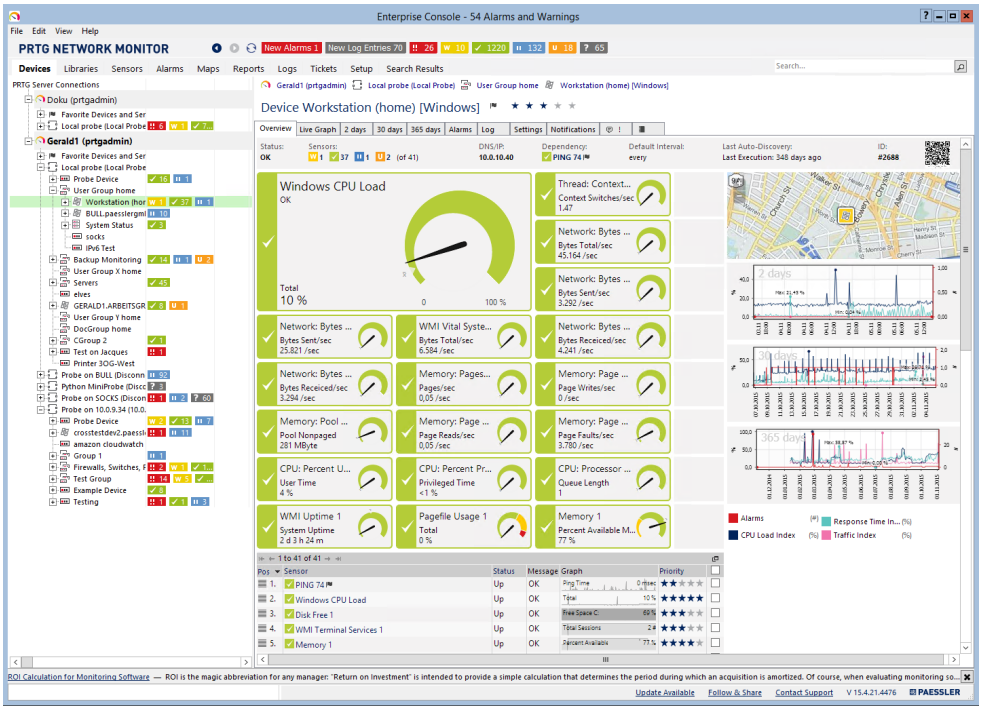
Status Bar

Enterprise Console Status Bar

The status bar shows the version number of your PRTG Enterprise Console and the Paessler logo which leads you to the Paessler website when you click it. Furthermore, the status bar contains a **Contact Support** link which opens a window to leave feedback or to ask for support, and a **Follow & Share** link which opens PRTG's social network contact information in the Ajax web interface. You will also see a note if an update for one of connected servers is available. Click Update Available to open the **Auto-Update** page in the EC.

8.3 Menu Tabs and Page Content

Under the different menu tabs of the Enterprise Console, you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example.



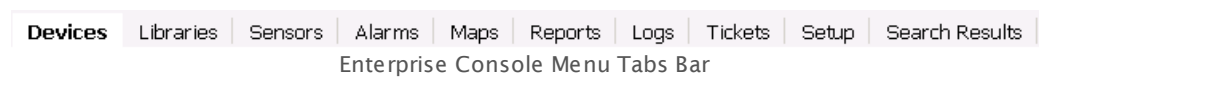
PRTG Enterprise Console — Device Details

The following sections introduce the available options within the different tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

8.3.1 Devices

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Devices Menu Tab

The **Devices** tab is your starting point for everyday use. The page is split into two parts. On the left hand side, it shows the tree-like device view which lists all configured PRTG core servers with their probes, groups, devices, and the sensors on the devices, in a hierarchical order. Next to each object you see an overview of the number of sensors, grouped by their current status.

The first child node of the tree is called **Favorite Devices and Sensors**. It contains all devices and sensors that you marked as favorites. To add an object to the favorites list, right-click on the desired device or sensor and select the **Add to Favorites** entry from the context menu 186. For details, please see Priority and Favorites 182 section.

Note: For more information about the hierarchical order of the different objects in the device tree, please see Object Hierarchy 89 section.

On the right side you see details about the object selected on the left. The information is spread over several tabs.

Over the object's name you see always a path which you can use to navigate through the device tree. It can also help you to orient yourself if you get lost. If you click a breadcrumb item, a drop-down menu opens that shows all available objects on the same level. For example, you can use this to directly access all other sensors or a device, other devices within a group, another group on the same probe, other probes in your root group, or another PRTG server.

Enterprise Console Sensor Sub-Tabs on the Device Tab

Edit Objects in the Device Tree

Use the **Edit** menu (or the object's context menu 2986) to access different important functions of the items you have currently selected in the device tree on the left hand side, such as

- Add devices or sensors to the favorites list (or remove them from the list)
- Sort all sub nodes of an object alphabetically
- Move objects up and down in the tree
- Check now
- Pause monitoring
- Access tools
- and many more

For details about the available options, please see section **Windows Menu Structure** 2979.

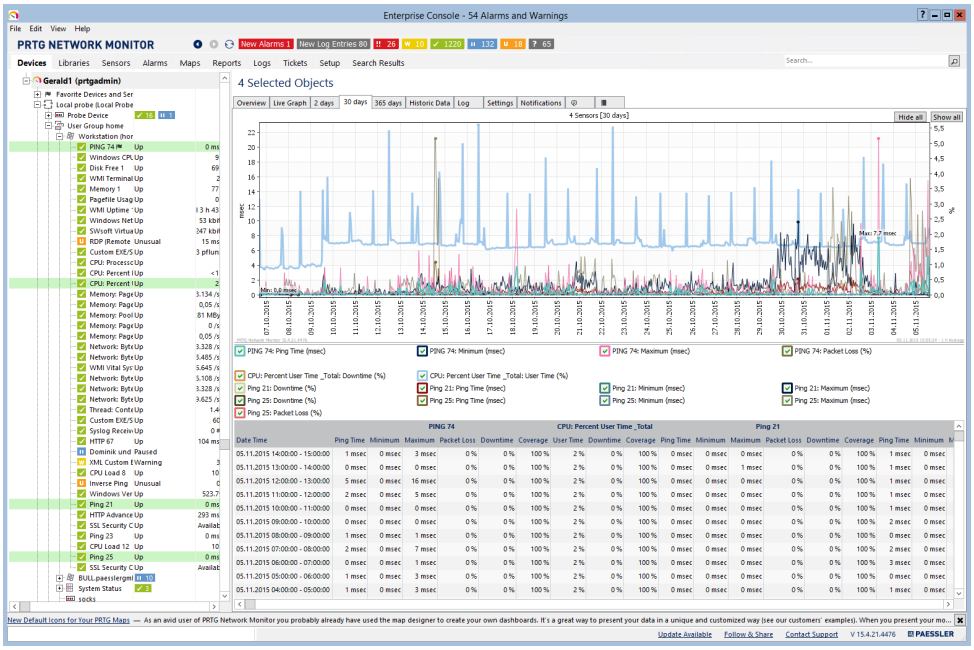
Select Multiple Items in Device Tree

In the device tree shown on the left, you can select one or more objects, even from different PRTG core servers. Hold down the Ctrl key to select more objects simultaneously with your mouse. Usually, you select more than one item to view combined graphs, or to apply a command from the **Windows Menu** 2979 (for example, **Check Now** or **Pause**) to several objects.

When you select multiple items, the sub-tabs on the right side show data for all selected items at a glance. For example, when if you select two sensors, you see their tables next to each other. Graphs will actually appear combined! This is a great way to instantly show one chart containing the graphs of all selected objects. Each sensor channel is represented as one line. This aggregated view works for all kind of objects.

Note: The tab **Live Graph** shows data for sensors only.

Note: Below each graph you see a key. Point to an entry in the key to display the corresponding line in the graph above in **bold**.



Aggregated Graph View in Enterprise Console

Note: You may need to enlarge the Enterprise Console's window to see all tables and graphs.

Devices—Overview

The **Overview** tab shows general information about the selected object. Depending on the selected object selected, you can see different information.

- For servers, probes, and groups the table shows information in the **Name** and **Status** section, such as priority, parent objects and number of sensors on this object. Additionally, the window shows a geographical map, if enabled in your PRTG configuration as well as in the Enterprise Console's **View** 2983 menu, and index graphs 139. For detailed information about geographical maps, please see **Geo Maps** 2753 section.
- For devices, the **Overview** tab shows device details and summary graphs for different time spans, gauges, as well as a list of all sensors on this device, recommended sensors 155, and a geo map.
- For sensors, the **Overview** tab shows sensor details, current status, and the last value of all sensor channels, as well as sensor graphs for different time spans. You can also edit channel settings in this tab by clicking on a channel's gear icon. For details, please see section **Sensor Channels Settings** 2711.

Devices—Live Graph, 2 days, 30 days, 365 days

These tabs are only available if you enable the **Large Single Graph** (Ctrl+L) view in the **Windows Menu** 2983 (**View**). For **Small Multiple Graphs** view please see **Devices—Graph** 2949 section below.

Select one of the tabs to display an object's monitoring results as **Live Graph** (content available for sensors only), or for different time spans in more or less detail (**2 days**, **30 days**, **365 days**). On every tab, you will see graphs as well as data tables.

While you view a sensor graph, you can hide single sensor channels individually. Remove the check mark symbol in front of a channel name underneath the graph, and the line of the according channel disappears. You can also **Show all** or **Hide all** channels by clicking these buttons in the graph. The graph view is reset immediately.

Note: The days mentioned here are the default setting. You can change the detail of the different graphs any time under **System Administration—User Interface** 2866.

Note: Below each graph you see a key. Point to an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Graph

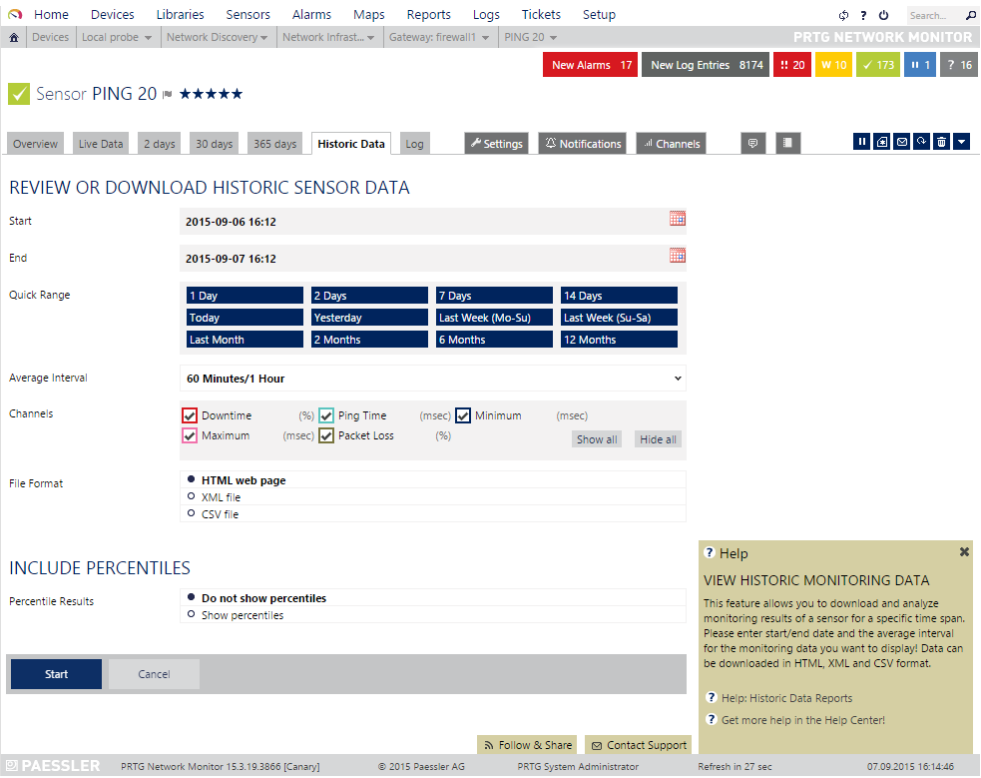
This tab is only available if you enable the **Small Multiple Graphs** (Ctrl+S) view in the **Windows Menu** 2979 (**View**). For **Large Single Graphs** view please see above 2948. This tab shows an overview with single graphs and data tables for live data, 2 days, 30 days, and 365 days. It might be necessary to enlarge the window to display all graphs.

Note: The days mentioned here are the default setting. You can change the detail of the different graphs any time under **System Administration—User Interface** 2866.

Note: Below each graph you see a key. Point to an entry in the key to display the corresponding line in the graph above in **bold**.

Devices—Historic Data

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When you call the historic data reports via this tab, there is no sensor selection available because you already determined which sensor you want to create a report for. If you want to select another sensor for the report, choose **Sensors | View Historic Data** from the main menu in the PRTG web interface.



Historic Data Tab of Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/historic_data_tab_ping_sensor.png

Select the **File Format** for the results:

- **HTML web page**: Opens a new browser window with the historic data report
- **XML file**: Opens a new browser window with the historic data report as XML file.
- **CSV file**: Opens a new browser window with the historic data report as CSV file.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's **Options** 2977 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in the **SSL Certificate Warning** 113 section.

View and functionality are the same as in the web interface. For details about the available **Historic Data** report options, please see the **Historic Data Reports** 146 section of the Ajax Web Interface 108 documentation.

Devices—Log

Click the **Log** tab to show a table list with all log information on this object. This is a subset of the entries available via the **Logs** 2963 menu tab.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Devices—Settings

The **Settings** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. For every type of object and for every sensor, different options are available. For detailed information, please see the following sections (depending on the selected object) in the Ajax Web Interface 108 documentation:

- **Probe Settings** 278
- **Group Settings** 299
- **Device Settings** 324
- **Sensor Settings** 347

Devices—Settings—Multi-Edit

If you select several objects on the left side, the **Settings** tab switches into multi-edit mode 2742. Using multi-edit, you can set a check mark for one or more settings. All changes apply to all selected objects. The multi-edit dialog displays settings which are common among the selected objects only.

If you select only sensors on the left side in the device tree, the **Settings** tab additionally displays a **Channel Settings** tab. Using this tab you can multi-edit the settings of any channels 2711 which are common among the selected sensors, as long as the channels have the same name. Set a check mark for one or more channel settings. All changes apply to all selected sensors.

Note: You cannot use multi-edit for objects on different PRTG core servers.

Devices—Notifications

The **Notifications** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface. You can set different notification triggers.

For detailed information, please see the **Sensor Notifications Settings** 2719 section in the Ajax Web Interface 108 documentation.

Note: You cannot change notification settings for multiple objects at a time. We recommend that you use the **Inheritance of Settings** 94 for easy configuration.

Devices—Comments

The **Comments** tab loads and displays the currently selected object's settings from the web interface. View and functionality are the same as in the web interface.

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Devices—History

The **History** tab shows all changes to the settings of an object with a timestamp, the PRTG user which conducted the change, and a message.

Drag & Drop Sorting in Device Tree

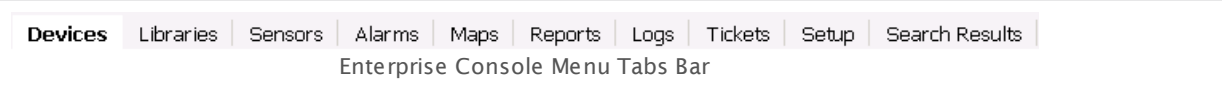
In the device tree, you can also move probes, groups, and devices simply via drag and drop. Activate it in the Windows menu 2979 **Edit | Drag & Drop Sorting** and then drag your objects as you like: You can move devices and groups, or add groups or devices to other groups. You can also move objects via the context menu 2986.

Note: You cannot move objects in the following cases:

- You cannot move any objects from one PRTG core server to another.
- You cannot move sensors from one device to another. To clone sensors to other devices using drag & drop, please use the Ajax Web Interface 108. For detailed information, please see the **Manage Device Tree** 258 section.
- You cannot move devices from one group to another.
- You cannot move groups from one probe to another.
- You cannot move probes from one core server to another.

8.3.2 Libraries

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Using Libraries is a great way to keep an eye on your network status because you can individually select which sensors you would like to see there. For a general introduction to PRTG Libraries, please see Libraries 2770 section.

Libraries Menu Tab

The page is split into two parts. On the left hand side you see all available libraries from one or several servers, on the right hand side the actual libraries.

- Click a library's name to display it. In the tabs above the library, select from Overview 2770, Management 2777, Settings 2779, Notifications 2759, Comments 2783, and History 2784. Each of these tabs loads the respective functionality of the Ajax Web Interface 108. Click the **Save** button to apply changes to your settings. For more details, please see the Libraries 2770 section.
- Underneath the tabs bar, there are different options available to change the current library view: You can set sensor filters (set or remove check marks to include or exclude sensors in a certain status) and change the device tree view. For details about the tree view, please see General Layout—Tree View Layout 123 section.
- Click a library node to edit the node settings 2779 in a new window.
- Double-click a library's name on the left to open the library in the configured external web browser. You can edit it or add new libraries to this PRTG server. For more details, please see the Libraries 2770 section.

- Right-click a library's name to open its context menu 2986. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser** in the libraries overview on the left, **Details...**, **Edit**, **Remove from Library...**, **Add Library Node...**, **Add Group...**, and **Send Link by Email** on the **Overview** tab of a specific library on the right. For more details, please see the **Libraries** 2770 section.
- Use the button **Add Library** to create a new library and the button for object history 210 to view all changes to libraries.

Libraries Menu Tab—Add Library

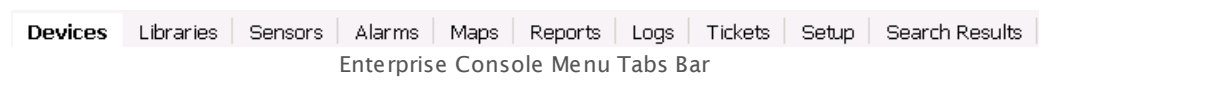
Click the **Add Library** button to add a new library to a PRTG server.

Depending on the current setting shown in the server selection 2943 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a library, please see **Libraries Step By Step** 2773.

8.3.3 Sensors

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Viewing lists of sensors is a great way to keep an eye on your network status because you can select which kind of sensors you want to see. You can filter by various parameters like object or sensor type, for example, and current sensor status.

Sensors Menu Tab

Note: For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

Click the **Sensors** entry in the menu tabs bar to show a table list of all sensors. You can enable a filter to only show certain sensors. To do so, choose from three different drop down menus to build a filter. With each filter you can further decrease the number of shown sensors.

- **By Type**
  The second drop down menu shows all sensor types 348 available in your monitoring setup. Select an entry to only show sensors of this type. The default value is **All Types**.

- **By Status**
  The third drop down menu shows all possible sensor states[135]. Select an entry to only show sensors that currently show this status. Choose between **All States**, **Down**, **Down (Acknowledged)**, **Down (Partial)**, **Warning**, **Up**, **Paused**, **Unusual**, and **Unknown**. The default value is **All States**.
  Note: If you click a sensor symbol in the page header bar[2943], you can directly view a sensor list filtered by the selected sensor status for the selected server.

If you have filtered out all sensors and the list below shows no entries, remove some filters by reverting them to the default values.

Note: In the column **Last Value**, the table shows only the last value of the sensor's **primary channel**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

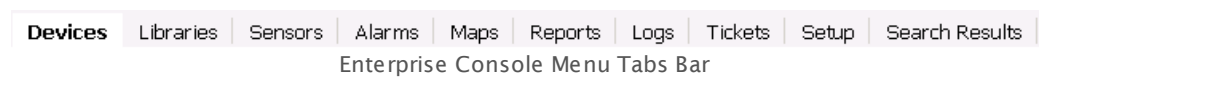
From this list view, you can select multiple items to apply the same action to them, for example, **Edit** | **Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

8.3.4 Alarms

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Alarms Menu Tab

In the **Alarms** tab you can show the alarms of all active PRTG core servers. To do so, select **All PRTG Servers** from the server selection in the upper right corner.

The alarms list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful to keep track of all irregularities in your network.

Using the options **Error**, **Warning**, and **Unusual**, you can hide and show sensors in the respective status by removing and adding a check mark. When choosing **Error**, this includes sensors in the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**.

Click **Show as Gauges** to show the sensors on the **Alarms** tab represented with gauges 137.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

From this list view, you can select multiple items to apply the same action to them, for example, **Edit | Check Now**.

You can select multiple items by the following means (you can also combine them):

- Click and hold your left mouse key while pointing to the lines you want to select
- Hold the Ctrl key while clicking to toggle the selection status of a single line
- Click a line and hold the Shift key while clicking another line to select all lines in between.

Acknowledge Alarm

An acknowledged alarm shows up in the alarms list as "acknowledged" (see **Sensor States** 135) and will not trigger 2719 any more notifications 2759.

Note: If the alarm condition clears, the sensor usually returns into an **Up** status immediately with the next sensor scan.

To acknowledge an alarm, right-click a sensor entry and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the last message value of the sensor. You can choose between: **Acknowledge Indefinitely...**, acknowledge **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**.

If you choose **Until...** a dialog box appears:

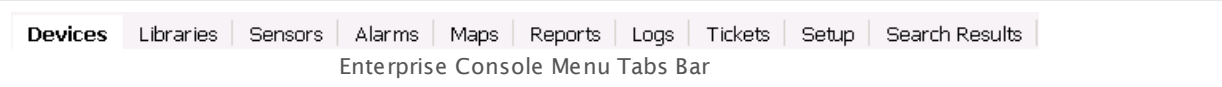
ACKNOWLEDGE ALARM UNTIL

Selected Objects	Shows the sensor(s) for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using multi-edit 2742.
Message	Enter a text, for example, the reason why you acknowledge the alarm. Please enter a string or leave the field empty.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time. Note: If the alarm condition still persists after the specified date, the sensor will show a **Down** status again.

Only users 2890 with write access rights may acknowledge alarms. You can give read-only users the right to acknowledge alarms, too. See section **User Accounts Settings** 2890, section **Account Control**.

8.3.5 Maps

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Maps Menu Tab

The page is split into two parts. On the left hand side you see all available maps from one or several servers, on the right hand side the details of the selected map.

- Click a map's name to display it. In the tabs above the map, select from **View Map**, Map Designer 2816, Settings 2823, Get HTML 2826, Comments 2826, and History 2826. Each of these tabs loads the respective functionality of the Ajax Web Interface 108. Remember to click the **Save** button to apply your settings. For more details, please see the Maps 2810 section.

- Double-click a map's name to open the map in the configured external web browser. You can edit it using the Map Designer 2816, or add new maps to this PRTG server. For more details, please see the Maps 2810 section.

- Right-click a map's name to open a context menu 2986. The following options are available: **Add**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser**.

- Use the button **Add Map** to create a new map and the button for object history 210 to view all changes to maps.

Maps Menu Tab—Add Map

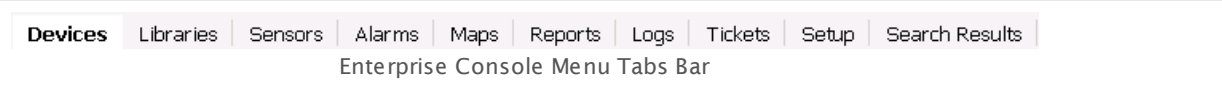
Click the **Add Map** button to add a new map to a PRTG server.

Depending on the current setting shown in the server selection 2943 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a map, please see section **Maps Step By Step** 2814.

8.3.6 Reports

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Reports Menu Tab

On the **Reports** tab you see all available reports from one or several servers in one list.

If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click once or twice on the header of the column you want to sort by.

Choose one report and double click its name to open its details. The page will split into two parts. On the left hand side you see all available reports from one or several servers, on the right hand side the options for the currently selected report.

- Click a report's name in the list on the left to display its options. In the tabs above the report, select from Run Now 2794, Stored Reports 2797, Settings 2798, Select Sensors Manually 2807, Sensors Selected by Tag 2809, and Comments 2809. Each of these tabs loads the respective functionality of the Ajax web interface 108. Remember to click the **Save** button to apply your settings. For details, please see the Reports 2786 section.
- Right-click a report's name to open its context menu 2986. The following options are available: **Add**, **Run Now**, **Edit**, **Delete**, **Clone**, **Send link by email**, and **Open in Web Browser**.
- Use the button **Add Report** to create a new report and the button for object history 210 to view all changes to reports.

Reports Menu Tab—Add Report

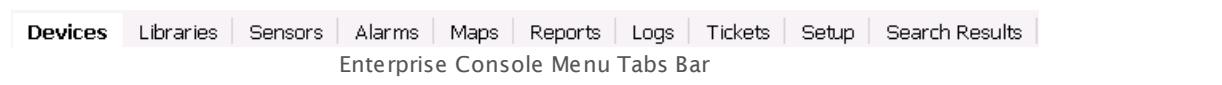
Click the **Add Report** button to add a new report to a PRTG server.

Depending on the current setting shown in the server selection 2943 bar in the upper right corner, an (embedded) window will open (if one specific server is selected), or you will see a selection window that asks you to choose the core server you want to add the new item to. Choose an installation to start.

For details about adding a report, please see **Reports Step By Step** 2790.

8.3.7 Logs

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

The Logs list shows all past activities and events of your PRTG monitoring setup. This is useful to keep track of all important activities and, for example, to check whether messages were sent. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected.

There are two options to call the logs list: Either you click the **Log** tab while you view an object's details on the Devices 2950 menu tab, or you choose the **Logs** entry from the menu tabs bar.

Logs Menu Tab

Click the **Logs** entry in the menu tabs bar to show a list of all log entries of a PRTG core server.

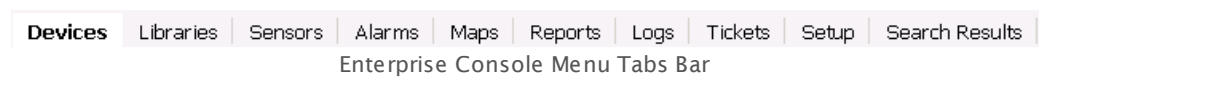
You can either view the entries of one or all servers. If you have configured more than one PRTG core server and you want to view entries from all servers in your PRTG Servers 2970 setup, simply select **All PRTG Servers** from the server selection in the upper right corner.

You can enable a filter to only show log entries of a certain event from the categories **Status Changes**, **System Events**, and **Object History**. Choose a category from the **Show** menu. The second drop down menu shows all possible event types for the selected category. Select an entry to only show events of the respective event type. Choose a sensor status 135 for status changes, **Probe Related**, **Auto Discovery**, **Notifications**, or **Status Messages** for system events, or a system object for object history 169. You can also define the time span for which you want to show logs.Use the date time picker to enter the date and time.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

8.3.8 Tickets

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Tickets Menu Tab

Note: For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

On the **Tickets** tab you can view all tickets on the currently selected PRTG core server.

Note: You can only display tickets from one server at the same time, not from all PRTG servers.

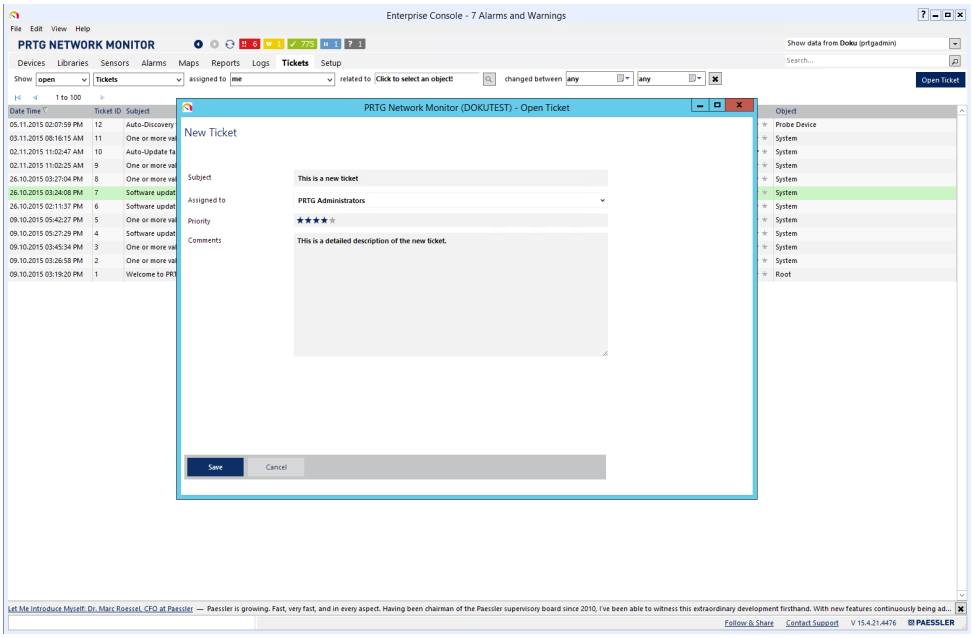
In the header bar of the tickets list, you can choose several filters to find and display certain tickets: by status, type, concerned user or user group, related monitoring objects, and last edit. Click the X symbol to undo the date selection.

Double-click an entry in the tickets list to open a ticket in a new window and to conduct ticket related actions (edit, assign, resolve, close, or reopen). You can also multi-edit tickets via the context menu: mark several tickets by holding Ctrl or Shift and clicking on the corresponding tickets. Right-click a ticket to open the context menu. The following actions are available: **Open Ticket**, **Edit Ticket**, **Assign Ticket**, **Resolve Ticket**, **Reopen Ticket**, **Close Ticket**, **Priority/Favorite**, **Open in Web Browser**.

The list can show up to one hundred entries at a time. Use the arrow symbols above the list to show other items. You can jump to the beginning of the list, or browse through it hundred by hundred. If the list has more than one entry, you can also sort the items by the contents of a certain column. To sort, simply click the header of the column you want to sort by once or twice.

Tickets Menu Tab—Open Ticket

To open a new ticket, click **Open Ticket** in the upper right corner or in the context menu. Select a related object, click **Continue**, and provide **Subject**, **Assigned to**, **Priority**, and **Comments**. Once finished, click **Save** to create the ticket.

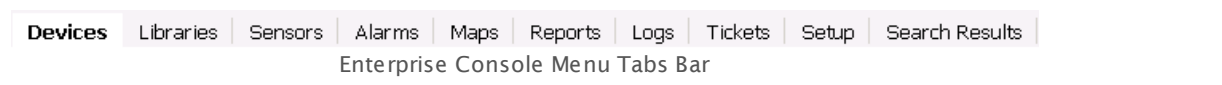


Open Ticket Dialog in PRTG Enterprise Console

For details about working with the PRTG ticket system, please see section Tickets 171 for the PRTG web interface.

8.3.9 Setup

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Setup Menu Tab

Note: For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

In the **Setup** tab you can access all options available in the Setup 2828 menu of the Ajax web interface. You can collapse and expand the sections by clicking the – or + symbol.

For more information, please refer to the respective section in the documentation for the PRTG web interface.

Account Settings:

- My Account 2830
- Notifications 2836
- Notification Contacts 2852
- Schedules 2856

System Administration:

- User Interface 2860

- Monitoring 2871
- Notification Delivery 2877
- Core & Probes 2883
- Administrative Tools 2900
- Cluster 2905 (available in a cluster 87 setup only)

User Accounts:

- You see a list of configured user accounts. Select one to change settings. For details, please see User Accounts 2890 section.

User Groups:

- You see a list of configured user groups. Select one to change settings. For details, please see User Groups 2896 section.

PRTG Status:

- System Status 2907
- Cluster Status 2923 (available in a cluster 87 setup only)
- Licensing Status and Settings 2925
- Auto Update 2918

Optional Downloads and Add-Ons:

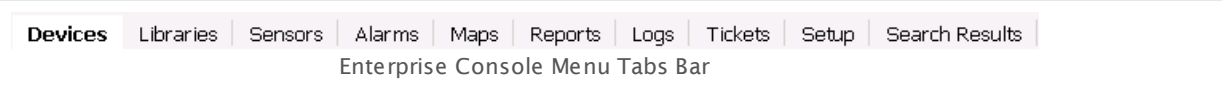
- Client App for Windows (Enterprise Console) 2928
- Client Apps for Mobile Devices 2928
- Remote Probe Installer 2928

Support:

- Contact Support 2932

8.3.10 Search Results

The Enterprise Console has a tab-like interface. Using the tabs you can navigate through various pages with information about your monitored objects, such as your network status and monitoring results, for example, as well as access maps, reports, tickets and settings.



Enterprise Console Menu Tabs Bar

There is documentation available for the following tabs:

- Devices 2946
- Libraries 2953
- Sensors 2955
- Alarms 2957
- Maps 2959
- Reports 2961
- Logs 2963
- Tickets 2965
- Setup 2967
- Search Results 2969

Search Results Menu Tab

Note: For technical reasons, this function is available for one server at a time only. If you have configured more than one PRTG core server, please choose one server from the server list in the upper right corner.

The **Search Results** tab is only visible if you do a search using the search box in the upper right corner. For your search, the Enterprise Console shows all matching objects on one PRTG core server. Click a monitoring object in the results to show it in the Enterprise Console's Devices 2946 tab.

Other objects, for example, manual sections, load in an external browser window.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's Options 2977 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in the SSL Certificate Warning 113 section.

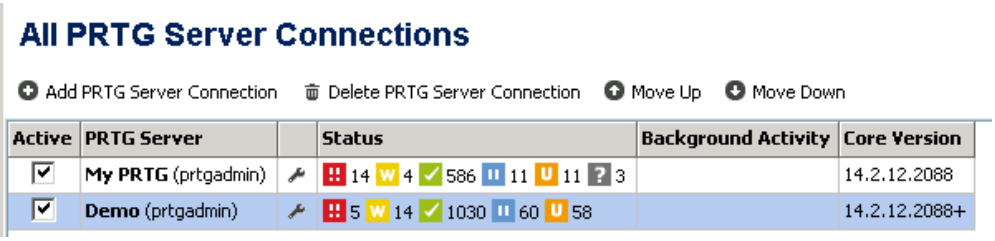
8.4 PRTG Servers

The Enterprise Console connects to the web server API running on every PRTG core server installation. It supports saving the configuration for a connection to one or more PRTG core servers. In a full PRTG installation, there is already a connection predefined.

Note: For a successful connection, the program versions of Enterprise Console and PRTG core server have to match. When connecting to several servers, make sure they all run on the same software version. At least the third number of the whole version number has to be equal. For example, EC version 15.4.**21**.4476 can connect to server version 15.4.**21**.4768.

PRTG Servers List

From the main menu, select **File | Manage PRTG Server Connections** to view a list of all servers configured for the currently logged in Windows user account. You can also access this list by clicking the **PRTG Server Connections** entry above the device tree.



PRTG Servers List in the Enterprise Console

The list shows the server or display name, as well as login information used. In the **Status** column you see an overall sensor status for this server connection. You can also see if there is any **Background Activity** on the respective server (for example, a running **Auto-Discovery** 219), which can potentially affect performance and response times.

In the list, set a check mark for every PRTG server you want to poll with every update interval. If a server is not reachable, the Enterprise Console deactivates it automatically after several unsuccessful connection attempts. When opening the Enterprise Console, it automatically re-establishes the connection to all active servers.

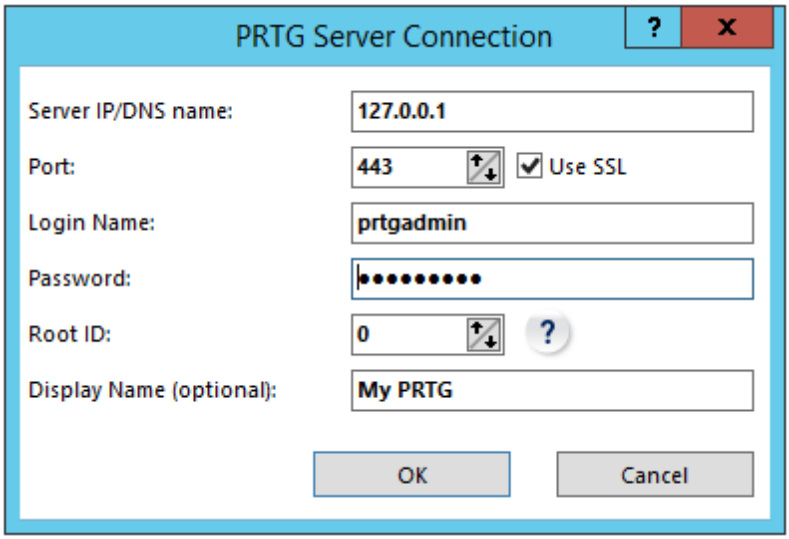
Add or Edit a PRTG Server Connection

In the header bar above the server list, click **Add PRTG Server Connection** to add a new server connection configuration. Use **Delete PRTG Server Connection** to remove an entry from the list. With **Move Up** and **Move Down** you can change the order of the servers on the **Devices** 2946 tab. There is also a context menu 2986 available for each server connection with the options to **Deactivate PRTG Server Connection**, to **Add** a server, to open and edit the **Settings** of the server, to **Delete** the server, to open the server in the Ajax web interface (**Open in Web Browser**), as well as **Move Up** and **Move Down** to change its position on the **Devices** 2946 tab.

To change the settings of an existing server in the list, open its context menu with right-click and click **Settings** or click the respective wrench symbol in the table. You can alternatively use the context menu of a server on the **Devices** 2946 tab: There you can choose between **Edit PRTG Server Connection** (opens the edit dialog), **Deactivate PRTG Server Connection** (the Enterprise Console will not show this server's monitoring data anymore; you can activate it again later in the servers list 2970), or view **Dependencies** 98.

When adding or editing, a dialog box appears to enter connection information.

Note: Connection settings are stored for each Windows user individually in the registry under the following node: HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI



PRTG Server Connection Settings in Enterprise Console

Server IP/DNS name

- Enter the IP address or DNS name of the PRTG server the Enterprise Console connects to.
- This is the same address or name as defined in the web server settings for the core server. For detailed information please see **PRTG Administration Tool** 3048 (**Web Server**) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Port

- Enter the port on which the PRTG server runs.
- This is the same port as defined in the web server settings for the core server. For detailed information please see **PRTG Administration Tool** 3048 (**Web Server**) section. Make sure the values match.
- Make sure the server is reachable (especially when using Network Address Translation (NAT)) and no firewall settings block the connection.

Login Name

- Enter the login name that you use to login to the web server.
- This can be the administrator login or the login of another PRTG user.
- In a new installation, the login name is **prtgadmin** by default.
- For detailed information about user accounts, please see **System Administration—User Accounts** 2890 section.

Password

- Enter the password for the login name entered above.
- In a new installation, the password is **prtgadmin** by default.

Root ID

- Enter the ID of the object that is the root of the device tree 90.
- Default value is **0**, which is the **Root** group of your configuration.
- If you enter an other object's ID here, the device tree will start at this object, only showing all other objects below in the hierarchy.
- This is useful to only view a part of the device tree, which might load much faster.
- You can create several connections that only differ in the **Root ID** value to quickly switch between different views within your configuration, choosing different PRTG core server connections in the Enterprise Console's **Devices** 2946 tab.

Display Name (optional)

- Optionally enter a name that the EC displays in the **PRTG Server Connections** list.
- If you leave this field blank, the Enterprise Console displays the **Server IP/DNS name** setting there.

Click the **OK** button to save your settings or **Cancel** to discard them.

8.5 Options

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the options dialog.

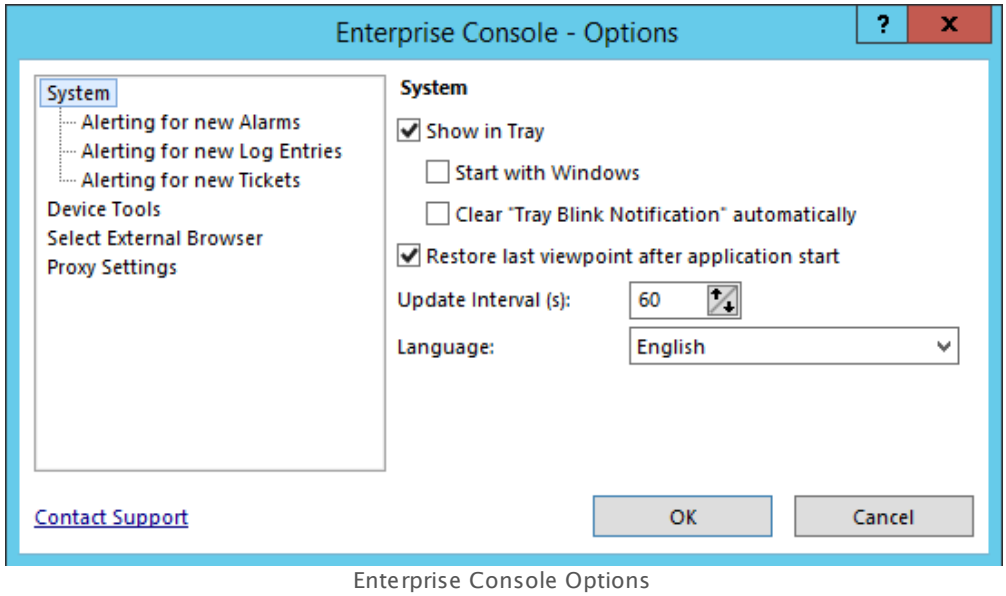
You can choose from these options on the left hand side:

- System 2973
- System—Alerting 2975
- Device Tools 2975
- Select External Browser 2977
- Proxy Settings 2978
- Contact Support 2932

System

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

Change general system settings for the Enterprise Console.



Enterprise Console Options

ENTERPRISE CONSOLE – OPTIONS: SYSTEM

Show in Tray	By default this setting is enabled. With this setting enabled, a PRTG icon appears in the Windows tray 2941. When you point your mouse to it, it will show information with the most important status information about your monitoring. With a right-click you can access a menu with access to the most important functions. To use any alerting functionalities (see **System—Alerting** 2975 section), you must enable this option. If the tray icon is not shown, no alerting from the Enterprise Console is available.
Start with Windows	This setting is only available to change only if you enable the tray option above. By default this setting is enabled. With this setting enabled, the Enterprise Console will start up automatically when Windows starts.
Clear "Tray Blink Notification" automatically	This setting is only available to change only if you enable the tray option above. Whenever there are new entries in the **Alarms** 2957 list, the tray icon will start blinking. If you enable this option, the tray icon will stop blinking automatically as soon as there are no more alarms. With this option disabled, the icon will keep blinking, even if all alarms are cleared meanwhile.
Restore last viewpoint after application start	If this option is enabled, the Enterprise Console saves information about the currently shown view (for example, sensor details, a certain graph, or a map 2810). It is written to the registry 2978 when you close or exit the program. When you open the Enterprise Console again, it will try to restore the same view. Only if the object is not available any more (due to changes on the server, or due to unavailability of a server), the default view loads.
Update Interval (Sec.)	Define the number of seconds that the Enterprise Console waits before the screen refreshes. Please enter an integer value. Default value is **60** seconds. You can use the up and down arrows to go one second up or down.
Language	Choose the language for the Enterprise Console from the drop down menu. Default is **English**. Depending on your installation, you can choose other languages here. This setting influences the language of the Enterprise Console only.

System—Alerting

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

You can define what the Enterprise Console will do in case of new **Alarms**, **Log Entries**, or **Tickets**. The settings are the same for all of these three cases, but you can individually define them for each case. On the left side, select either **Alerting for new Alarms**, **Alerting for new Log Entries**, or **Alerting for new Tickets** and define the settings as follows.

Note: All alerting options only take effect if you enable the **Show in Tray** option in the system 2973 settings above. If the tray icon is disabled, there will be no alerting from the Enterprise Console.

ENTERPRISE CONSOLE – OPTIONS: ALERTING FOR NEW ALARMS

Blink Tray Icon	The tray icon will blink if there are new items to be alerted for. You can additionally set the **Clear Tray Blink Notification automatically** option in the system 2973 settings above.
Balloon Info in Tray	Show a balloon info next to the PRTG tray icon if there are new items to be alerted for.
Popup Message	Show a popup message window if there are new items to be alerted for. Note: The popup window will be always on top until it is closed.
Play Sound	Play an audible notification if there are new items to be alerted for. There is a default sound defined. To change it, please click the folder icon and select any standard WAV file from your hard disk drive. PRTG already comes with a small set of sounds you can choose from. Note: The sound file is played only on the computer running the Enterprise Console.
Open Enterprise Console	Open the Enterprise Console if there are new items to be alerted for.

Device Tools

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

In the **Device Tools** settings you can define commands that will be available in the **Windows Menu** 2979 and context menu 2986 of groups, devices, and sensors. A command to initiate a remote desktop connection is already predefined.

Note: You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.

Click the **Add** button to add a new command, or choose an existing one from the list and click the **Edit** button to change the settings. Use the **Delete** button to remove an entry from the list.

ENTERPRISE CONSOLE – OPTIONS: EDIT TOOL

Name	Enter a custom name for your command. The command will show up with this name in context menus. Please enter a string.
Command	Enter the command you want to execute on the local machine. This can be, for example the name of a program or script, with or without path, according to your system's configuration.
Parameters	Enter the parameters with which you want to execute the command. You can use the placeholders (variables) shown in the window, section **Available placeholders** 2976. Other placeholders are not possible. During runtime, these placeholders are replaced by the respective values set for the monitoring object you select to execute this device tool. For example, the %id placeholder will be replaced by the ID of a group, a device, or a sensor, depending on which object you execute the command for.
Shortcut	Select a key shortcut for the command. Choose an **F**-Key from the list or select **None** to not use a key.

Parameters—Available placeholders

The following placeholders (variables) are available in the Enterprise Console.

Placeholder	Available For Groups	Available For Devices	Available For Sensors	Will Be Resolved To
%id	X	X	X	The object's **ID** as shown in the page header on the object's details page
%name	X	X	X	The object's **Name**
%host	—	X	X	The sensor's or device's **IP Address/DNS Name**
%message	—	—	X	The sensor's **Last Message**
%value	—	—	X	The sensor's **Last Result** value
%type	—	—	X	The sensor's **Type**

If you use a placeholder in combination with an object it is not available for, it will simply not be resolved but the placeholder itself will be returned.

Note: To see the output of all placeholders for different objects you can create a simple test tool that displays the output in a command line window. Just create a tool with the command **cmd** and the following content in the **Parameters** field:

```
/K echo.id: %id && echo.name: %name
       && echo.host: %host && echo.message: %message
       && echo.value: %value && echo.type: %type
```

Right-click an object in the device tree and run the tool from the **Tools** option in the menu (either Windows 2979 or context menu 2986).

Select External Browser

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

With these settings you can define which browser the Enterprise Console will use when you select a command that requires to open an external browser window, for example when you select **View | Open in Web Browser** from the Windows menu of the EC. You can only select browsers installed on the system running the Enterprise Console, other browser options are disabled.

By default, the system's default browser is opened. To change the Enterprise Console's behavior, choose between:

- **Use system default browser (**browser.exe**)**
- **Use IE (Version:** x**)**
  Note: Only Microsoft Internet Explorer 11 is supported by the Ajax web interface! Please do not use it with Internet Explorer 10 or earlier! We recommend that you use Google Chrome 49 or later (recommended) or Mozilla Firefox 45 or later as external browser.
- **Use Firefox (Version:** x**)**
- **Use Chrome (Version:** x**)**
- **Use Safari (Version:** x**)**

Proxy Settings

From the Windows menu 2979 of the Enterprise Console, select **File | Options...** to open the settings dialog. Please select a setting on the left and change the respective values on the right side. Click the **OK** button to save your settings.

If the connection to the PRTG core servers requires a proxy connection, you can set it here.

ENTERPRISE CONSOLE – OPTIONS: PROXY SETTINGS

No Proxy	Use a direct connection to the servers.
Use System Settings	Use your Windows default settings, configured in Internet Explorer. To view these settings, open the Internet Explorer on your system and select **Tools	Internet Options** from the menu. Select the **Connections** tab and click the **LAN settings** button.
Manual Proxy Configuration	Manually enter a proxy configuration. Enter the IP address/DNS name of the proxy, a port number, as well as username and password (if required by the proxy). Note: Only basic authentication is available!

Settings Storage

For each individual Windows user account, the settings of the Enterprise Console are stored in the Windows registry. For details, please see **Data Storage** 3135.

8.6 Windows Menu Structure

The Windows menu of the Enterprise Console has four main menu items:

- File 2979
- Edit 2979
- View 2983
- Help 2984

File

The File menu offers system related options for the Enterprise Console. The particular close and exit options depend on the enabling status of the tray option.

FILE	
Manage PRTG Server Connections	Show a list of all configured PRTG core server connections. For detailed instructions, please see **PRTG Servers** 2970 section.
Options...	Open the **Options** 2973 dialog to set EC system options and to configure one or more PRTG core server connections.
Close or Exit	This menu item appears as either **Close** or **Exit**, depending on whether the tray icon is enabled or disabled in the **Options** 2973 settings. Use **Close** to close the Enterprise Console window. Alerting is still available via the tray icon then. You can also double-click the tray icon to re-open the Enterprise Console. **Exit** shuts down the Enterprise Console completely. This option is only available if the tray icon is not running. Shortcut: Alt+X
Close and Exit	This menu item is only available if the **Show in Tray** option is enabled in the **Options** 2973 settings. It will completely shut down the Enterprise Console and tray icon, so no tray alerts are shown any more. Shortcut: Ctrl+Alt+X

Edit

The content of the **Edit** menu varies, depending on which menu tab 2945 you are and whether and which objects are selected within the **Devices** 2946, **Sensors** 2955, or **Alarms** 2957 tab.

Note: Some of the options open the Ajax web interface when you select them.

When you click one of these items, a new window or tab of the external browser configured in the Enterprise Console's **Options** 2977 will open. PRTG automatically logs in and redirects you to the respective web page. If your browser displays a certificate warning, please find more information in the **SSL Certificate Warning** 113 section.

EDIT

Check Now	Perform an immediate scan for all selected objects (use the Ctrl key to select multiple objects). This option polls all selected devices and queries new data for all sensors on them. If you choose this option for a probe or a group, you query data for all sensors in the object hierarchy 89 underneath. Shortcut: Ctrl+K
Details	Open the overview tab for the selected object (probe, group, device, or sensor).
Edit	Access the pages for editing **Settings...** 159, **Notifications** 159, **Access Rights...** 101, and **Management** 159 (not for sensors) of the selected object. In addition, you can **Rename...** this object. Point on it to see available options.
Dependencies	This option is only available if you select a server (the **Root** group), a probe, or group. This function shows an overview of the dependencies 98 configured for the selected object. If you select a dependencies option, the Enterprise Console opens the respective dependencies overview in a new window. For details, please see section **Show Dependencies** 2751.
Add Group...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding a new group to the selected probe or group. For detailed instructions, please see **Add a Group** 237.
Add Auto-Discovery Group...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding such a group. For detailed instruction, please see section **Auto-Discovery** 219.
Add Device...	This option is only available if you select a probe or group (not the **Root** group). This option opens an assistant in a new window which guides you through adding a new device to the selected probe or group. For detailed instructions, please see **Add a Device** 244.

EDIT

Add Sensor...	This option is only available if you select a device. This option opens an assistant in a new window which guides you through adding a new sensor to the selected device. For detailed instructions, please see **Add a Sensor** 256.
Auto-Discovery	This option is only available if you select a device. Point on it to see available options. You can choose between: ▪ **Run Auto-Discovery**: This option starts an automatic search and adds new sensors to the selected device. The search is running in background. You will see new sensors after a few minutes automatically. For more information, please see **Auto-Discovery** 220 (**Run Auto-Discovery Now**). ▪ **Run Auto-Discovery with Template**: With this option you can run an auto-discovery with a pre-defined device template.
Create Device Template...	This option is only available if you select a device. This option opens an assistant in a new window which guides you through creating a device template. This template is then available for auto-discovery 219. For detailed instructions, please see **Create Device Template** 2747.
Sort Alphabetically	This option is only available if you select a probe, a single group, or a device. This will sort direct children of the selected node such as groups, devices, or sensors in alphabetical order. Caution: The ordering is stored in the monitoring configuration so you cannot revoke it!
Acknowledge Alarm...	This option is only available if you select a sensor in a **Down** or **Down (Partial)** status 135. Point on it to see available options. For details on how to acknowledge an alarm, please see **Alarms** 2958 section.
Delete	Delete the selected object(s). You will be asked for confirmation before anything is actually deleted.
Clone...	This option is only available if you select a single group, device, or sensor. This options opens an assistant in a new window which guides you through cloning the selected object. For detailed instructions, please see **Clone Object** 2740.
Move	Move the selected object(s) of the device tree (use the Ctrl or Shift key to select multiple objects). Point on it to see available options. Choose between **Top**, **Up**, **Down**, and **Bottom** to move the object (s) to the top or bottom of the mother node, or one entry up or down.

EDIT

	You can also move the selected group or device to another group with **To Other Group...** This option opens an assistant in a new window to guide you through the movement. Please see section **Devices** 2952 for details about allowed movements.
Pause	Pause and resume monitoring for the selected objects from the device tree (use the Ctrl key to select multiple objects). Point on it to see available options. Choose between: Pause **Indefinitely**, **Resume** from pause, pause **For 5 Minutes**, **For 15 Minutes**, **For 1 Hour**, **For 3 Hours**, **For 1 Day**, **Pause Until...** The option **Pause Until...** opens an assistant in a new window where you can enter a message and a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date. You can also set up a **One-time maintenance window**: Enter a message and start and end date of the maintenance in the appearing window. Use the date time picker to enter the date and time.
Simulate Error Status	This option is only available if you select a sensor. Set the selected sensor to a simulated error status. As for the pause status, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error state. Note: "Simulate error status" does not work for sensors that run on a PRTG Mini Probe.
Priority/Favorite	Set the priority for the selected object. You can also add devices and sensors to favorites. For details, please see section **Priority and Favorites** 182.
Historic Data	Open the historic data tab of the selected object. Point on it to see available options. You can choose between **Last 2 days...**, **Last 30 days...**, and **Last 365 days...**, or when selected one sensor **Live Data...** and **View Historic Data...**. You can also create a report. For detailed instructions, please see **Historic Data Reports** 147 (**Menu**). When you select one or more sensors (hold the Ctrl or Shift key to select multiple items), you can open the **Compare Sensors** 143 dialog. The graphs of all chosen sensors appear in the comparison dialog automatically. You can add additional sensors in the comparison dialog. For sensors, you can open the **Similar Sensors Overview** 151.

EDIT

Device Tools	Call a tool command. All placeholders (variables) configured in a tool command will be resolved for the currently selected object. Point on it to see all available tools configured in your **Options** 2975 settings (**Device Tools**). By default, a **Remote Desktop** tool is pre-configured which tries to initiate a remote desktop connection to the IP address or DNS name of the selected object (this will usually work for devices, of course). You can also add a device tool directly to the selected object: **Add Device Tool...** will open **Options—Device Tools** 2975. For devices, additional options are available. They allow you to connect to the **Service URL** value defined in the device's settings 2951, or open the **IP address/DNS name** of the device via the protocols HTTP, HTTPS, and FTP. For each of these functions, your system's default programs will be used. Usually, this is your browser. You can also install a remote probe on a device via **Remote Probe Quick Setup** 3112. Note: You may need to run the Enterprise Console as administrator to make the tool function work with your Windows version.
Find Duplicates	This option is only available if you select a device. Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A new window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.
Drag & Drop Sorting	Enable this option to sort all objects in the device tree via drag and drop. By default, this option is disabled to avoid accidental moves of objects. For details, please see section **Devices** 2952.
Send Link by Email	Send the link to the selected object by email. This option opens a new email using your system's standard email client. It contains a direct link to the details page of the selected object.
Open Ticket	Open a ticket that refers to the currently selected object. For details, please see section **Tickets** 2965.

View

The View menu provides settings related to what the Enterprise Console shows.

VIEW

Refresh	Query data for the current screen from the PRTG core server immediately, just as the automatic refresh does. You can configure the auto-refresh in the **Options** 2973 settings. Shortcut: F5
Large Single Graph	Change the view in **Devices** 2946 menu tabs to large single graphs. This option displays live graphs and graphs for three other time spans in different tabs. Shortcut: Ctrl+L
Small Multiple Graphs	Change the view in **Devices** 2946 menu tab to multiple small graphs. This option displays live graphs and graphs for three other time spans in one tab.
Show Geo Maps	Choose if you want to show geographical maps 2753 in the Enterprise Console. Shortcut: Ctrl+G
Show News Feed	Choose if you want to show the news feed in the Enterprise Console. Shortcut: Ctrl+N
Next Viewpoint	Go forward to the next viewpoint (only available if you went back to a previous viewpoint before). This is similar to a browser's function to go forth in history. Shortcut: Alt+Right
Previous Viewpoint	Go backwards to the previous viewpoint. This is similar to a browser's function to go back in history. Shortcut: Alt+Left
Open in Web Browser	Open the currently selected object in the Ajax web interface. This option is not available if multiple objects are selected. You can set the default browser in the **Options** 2977 settings.

Help

This menu provides links to help and information.

HELP

Help Center	Open the **Help and Support Center** in the Ajax web interface.
HTML Manual Enterprise Console...	Open the **Enterprise Console** 2938 sections of this manual in the Ajax web interface.
PRTG Network Monitor Homepage...	Open https://www.paessler.com/prtg in your browser for overall information about PRTG.
Follow & Share	Open PRTG's social network contact information in the Ajax web interface.
Contact Support	Open the **Contact Support** 2932 dialog box to leave feedback or to ask for support by sending a support bundle.
About...	Open an information window about the Enterprise Console application with version number and copyright information.

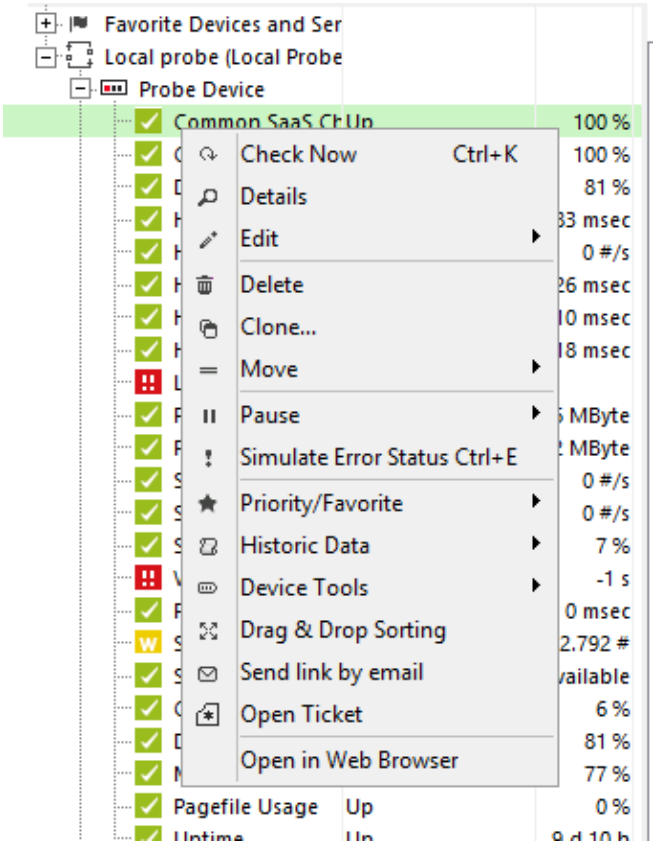
8.7 Context Menus

For every object in the Enterprise Console, there are context menus available which appear when you right-click an object in the device tree. These context menus vary depending on the selected object and always contain a sub-set of the options available in the Windows menu. For detailed explanations, please see Windows Menu Structure 2979.



Context Menu of a Device in the Enterprise Console

8.8 Shortcuts Overview

The following shortcut keys are available in the Enterprise Console:

Alt+X: File | Close or Exit
With the **Show in Tray** option enabled in the **Options** 2973 settings, this is **Close**, otherwise **Exit**.

Ctrl+Alt+X: File | Close and Exit
This menu item is only shown if the **Show in Tray** option is enabled in the **Options** 2973 settings.

Alt+Right: Next Viewpoint

Alt+Left: Previous Viewpoint

Ctrl+K: Edit | Check Now

Ctrl+P: Edit | Pause | Indefinitely

Ctrl+R: Edit | Pause | Resume

Ctrl+E: Edit | Simulate Error Status

Ctrl+L: View | Large Single Graph

Ctrl+S: View | Small Multi Graphs

Ctrl+G: View | Show Geo Maps

Ctrl+N: View | Show News Feed

F5: View | Refresh

F6: [Context Menu] | Tools | Custom tool command, if available

F7: [Context Menu] | Tools | Custom tool command, if available

F8: [Context Menu] | Tools | Custom tool command, if available

F9: [Context Menu] | Tools | Custom tool command (default: **Remote Desktop**)

F10: [Context Menu] | Tools | Custom tool command, if available

F11: [Context Menu] | Tools | Custom tool command, if available

F12: [Context Menu] | Tools | Custom tool command, if available

Part 9

Other User Interfaces

9 Other User Interfaces

This chapter introduces other available user interfaces additional to PRTG's Ajax web interface and Enterprise Console. There are special interfaces optimized for mobile access, including apps for mobile devices. Read more in the following sections.

Other User Interfaces—Topics

Related Topics

9.1 Mobile Web GUI

IMPORTANT NOTICE

The Mobile Web GUI is deprecated. We do not maintain this interface anymore and will completely remove it from PRTG soon. For mobile access to your PRTG server, please use our **PRTG Apps for Mobile Network Monitoring** 2995 instead. For access to the fully featured Ajax web interface 108, please use the current version of a supported browser 27. For more information, please see section **More** 2994.

The Mobile Web GUI is a slim interface to view your monitoring results while on the go. It is optimized for both small screens and low bandwidth usage in order to provide an easy and fast access to your PRTG core server when connecting with mobile devices. You can view sensor lists, data tables, and graphs with live data.

Compared to the **Ajax Web GUI** 108, this interface comes with limited functionality and is primarily provided for quick review of data while on the go. Nevertheless, you can acknowledge alarms, pause or resume monitoring, and interactively view geo maps as well as sensors and other lists.

This interface is based on jQuery Mobile 1.0, supporting all major mobile operating systems and browsers.

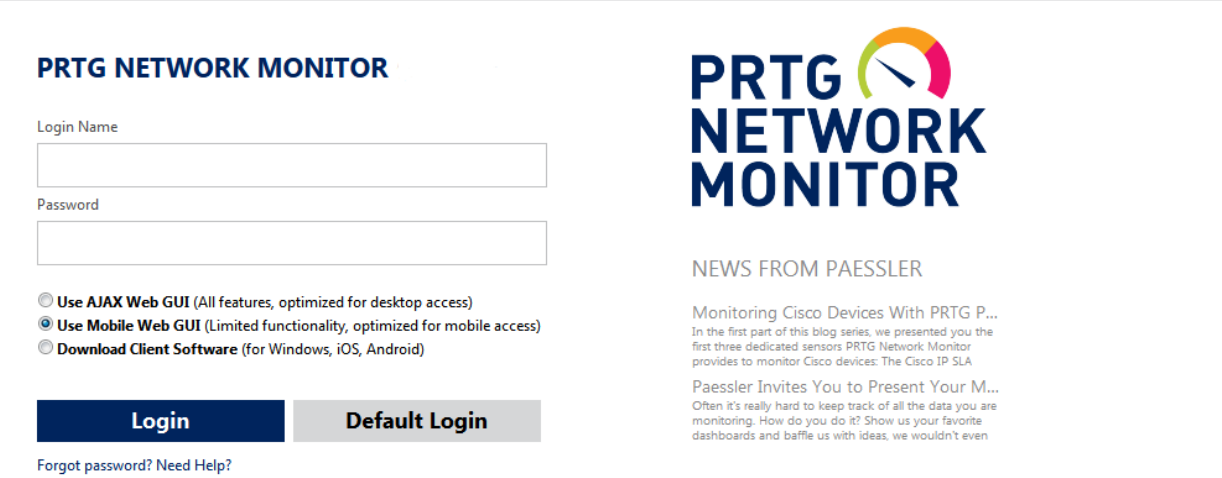
Loading the Web Interface

Make sure your PRTG core installation is accessible via the internet. In your mobile device, enter the IP address or URL of the system PRTG is running on. When using a cluster, you can connect to any node accessible.

If you see a certificate warning in your browser, you can usually just confirm it. For more information please see **SSL Certificate Warning** 113.

Login Screen

After loading the web interface, the login screen is shown.

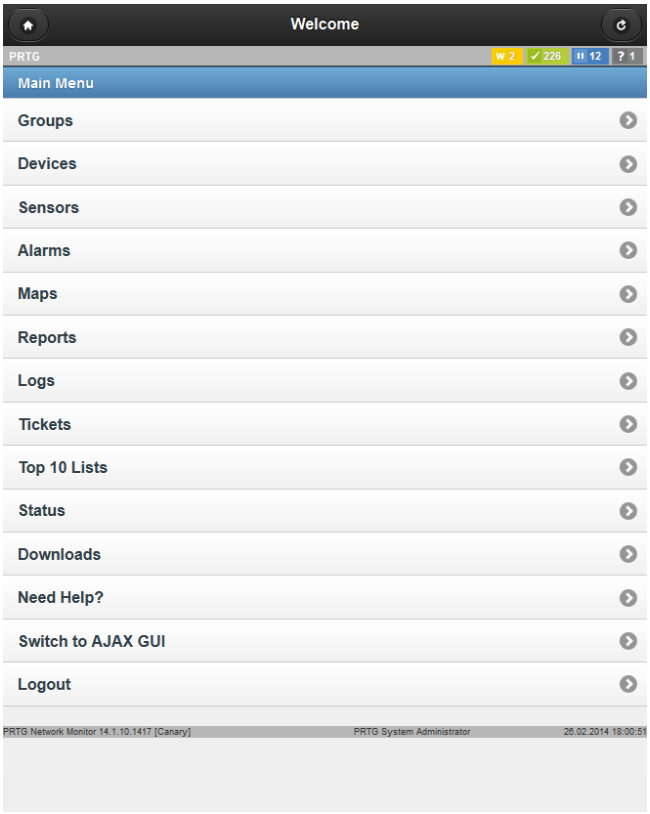


Mobile Web GUI Login

Enter your credentials, choose the **Use Mobile Web GUI (Limited functionality, optimized for mobile access)** option, and click **Login**. For detailed information on different credentials, please see the **Login** 110 section for the Ajax Web GUI.

General Layout

The home screen of the Mobile Web GUI shows the sensor overview as well as all available main menu entries. Click/tab on menu items to get to groups, devices, and sensor data. You will be guided through a sequence of sub and sub-sub screens. Whenever you get lost, click/tab on the house symbol in the upper left corner to get back to the home screen.



PRTG Mobile Web GUI

There are also different sensor top lists available in the **Sensors** menu entry. Note: Most of the functionality is read-only, because this interface is intended for viewing data. In order to change your monitoring configuration or settings, please switch to the Ajax Web Interface 108. If you would like to have more options on your mobile devices, take a look at our Smartphone Apps 2995.

Using the Mobile Web GUI

The device tree and lists of sensors, alarms, logs, and tickets are available as usual, but in a view that is optimized for mobile screens. In addition, you can show monitoring data for all objects. This section will not explain the GUI in detail, because the concepts are the same as throughout the Ajax web interface 108. In the following, find a list with the main differences compared to the full Ajax interface:

- There are no context menus available, but actions such as acknowledge an alarm, scan now, pause, etc. can be initiated directly on an object's details page, using the corresponding buttons.
- Reports and Maps are accessible in a view-only mode.
- You cannot edit system settings.
- To save bandwidth, an automatic page refresh is only activated after confirmation.
- You can switch from the Mobile Web GUI to the Ajax web interface at any time by using the **Switch to AJAX GUI** option.

You will just need a few minutes to become familiar with this interface, because the structure is basically the same as you know it from PRTG's Ajax web interface. Have fun monitoring while on the go!

9.2 PRTG Apps for Mobile Network Monitoring

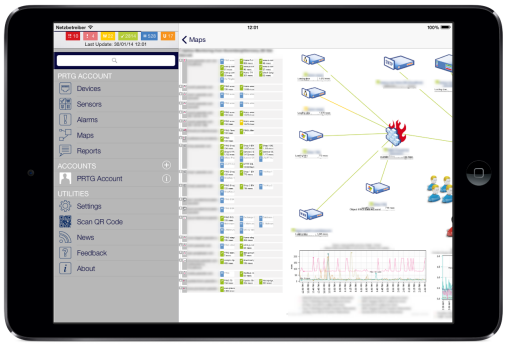
You can access your PRTG installation on your mobile devices with several PRTG apps. We provide apps for iOS devices, Android systems, and Windows Phone. You can download and use these apps for free. PRTG for iOS 2995, PRTG for Android 2995, and PRTG for Windows Phone 2996, and make it possible to monitor your network while on the go.

The basic requirements to use these free apps are a running PRTG core server which is accessible from the network your device is connected to (either directly or via a VPN connection) and a recent operating system version on your mobile device. For details about requirements, see below.

PRTG for iOS

PRTG for iOS is the iOS app for PRTG Network Monitor version 13 or later. You can use it on iPhone, iPad, and iPod touch with iOS version 7 or later. You can also use free push notifications 2842 with this app.

For more information and to download this app, please see our web page **PRTG for iOS**.



Maps on iPad

PRTG for Android

PRTG for Android is the Android app for PRTG Network Monitor version 13.1 or later. Use it on your smartphone or tablet with Android version 4.0 or later, on a BlackBerry device or on a Kindle Fire. For full functionality, we recommend that you use at least PRTG 13.x.4 and Android 4.1. On your BlackBerry device you need version 10.3. Note: You cannot deploy the app via BlackBerry Enterprise Service (BES).

You can also use free push notifications 2842 with the PRTG for Android app.

For more information and to download this app, please see our web page **PRTG for Android**.

Sensor List on PRTG for Android

PRTG for Windows Phone

PRTG for Windows Phone is the Windows Phone app for PRTG Network Monitor 13.3 or later. You can run it on Windows Phone 8.0 or later.

For more information and in order to download this app, please see our web page **PRTG for Windows Phone**.

PRTG for Windows Phone Menu

Note: Push notifications are currently not supported with this app.

Part 10

Sensor Technologies

10 Sensor Technologies

This section introduces different technologies that PRTG uses for monitoring to give you more background information. Please read more in the following sections.

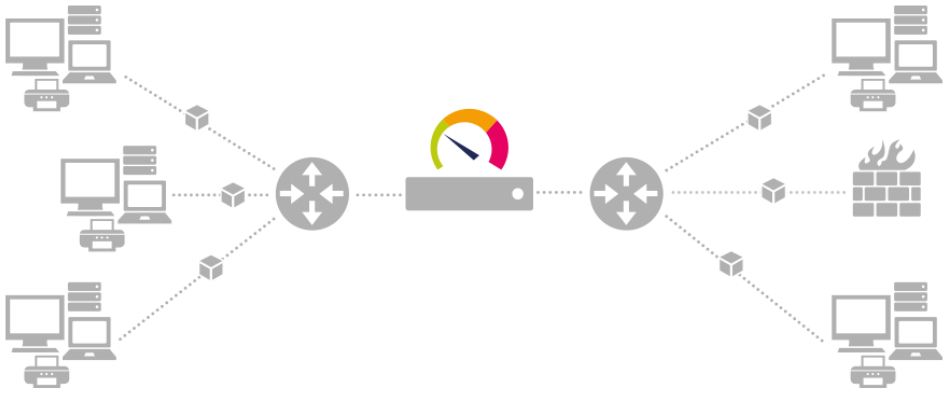
Sensor Technologies—Topics

10.1 Monitoring via SNMP

Monitoring via Simple Network Management Protocol (SNMP) is the most basic method of gathering bandwidth and network usage data.

How SNMP Monitoring Works

You can use SNMP to monitor bandwidth usage of routers and switches on a port-by-port basis, as well as device readings such as memory and CPU load. The queried devices must support SNMP.



Network Monitoring via SNMP

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/network-monitoring-via-snmp.png

When you use a sensor with this technology, PRTG sends small data packets to devices, for example, querying routers, switches, and servers for the traffic counters of each port. These trigger reply packets from the device. Compared to PRTG's other bandwidth monitoring technologies via flows, packet sniffing, or WMI, the SNMP option creates the least CPU and network load.

Reasons to Choose SNMP Monitoring

SNMP is the most commonly used method mainly because it is easy to set up and requires minimal bandwidth and CPU cycles. If your network devices support SNMP and/or if you want to monitor large networks with several hundred or thousands of sensors, we recommend that you start with SNMP. Besides network usage monitoring, another well-known feature of SNMP is the ability to also watch other network parameters such as CPU load, disk usage, temperature, as well as monitoring many other readings, depending on the queried device.

SNMP Network Issues

To use Simple Network Management Protocol (SNMP) for monitoring purposes, it is imperative that UDP packets can travel from the machine running PRTG to the device you want to monitor and back. This is usually the case in LANs and intranets. For connections across the internet, to a Demilitarized Zone (DMZ), or for Wide Area Network (WAN) connections, some changes to the traversed firewalls may be necessary. Keep in mind that SNMP V1 and V2c are not secure protocols so you should not use them across the internet or insecure data connections. Only SNMP version 3 supports encryption.

Understanding SNMP Sensors

To better understand and set up SNMP sensors, you may want to learn more about the principles of Object Identifiers (OID) and Management Information Base (MIB). For more information about this topic, please refer to the Knowledge Base article in the **More** 3004 section below.

For an overview and details about all SNMP sensors, please see the **List of Available Sensor Types** 350 section.

SNMP Versions

PRTG supports three versions of the SNMP protocol: Version 1, version 2c, and version 3.

SNMP Version 1

This is the oldest and most basic version of SNMP.

- Pro: Supported by most SNMP-compatible devices; simple to set up.
- Contra: Limited security because it only uses a simple password (community string) and sends data in clear text (unencrypted). Because of this, you should it only use inside LANs behind firewalls, but not in WANs; version 1 only supports 32-bit counters which is not enough for high-load (gigabits/second) bandwidth monitoring.

SNMP Version 2c

This version adds 64-bit counters.

- Pro: Supports 64-bit counters to monitor bandwidth usage in networks with gigabits/second loads.
- Contra: Limited security (same as with SNMP V1).

SNMP Version 3

This version adds authentication and encryption to SNMP.

- Pro: Offers user accounts and authentication for multiple users and optional data packet encryption, increasing available security; plus all advantages of Version 2c.
- Contra: Difficult to configure. Not suitable for large networks (see below for more information).

It is important to know that if you select an SNMP version that is not supported by the server or device you want to monitor, you receive an error message. Unfortunately, in most cases, these error messages do not explicitly point to the possibility that you use the incorrect SNMP version. These messages provide minimum information only, such as cannot connect or similar. Similar errors occur when community strings, usernames, or passwords do not match.

SNMP Overload and Limitations of the SNMP System

SNMP V1 and V2 scale directly with the performance of the hardware and the speed of the network. In our labs we are able to monitor 30,000 SNMP V1 sensors at a 60 second interval with one PRTG server (core and local probe) plus two remote probes with 10,000 sensors each.

However, SNMP V3 has performance limitations due to the SSL encryption. The main limiting factor is CPU power (as well as the other general limits for PRTG). Because of this limitation, you can monitor only a limited number of sensors per second using SNMP V3. Currently, PRTG is able to handle about 40 requests per second and computer core, depending on your system. This means that, on a common 1.x GHz computer with two cores, you can run about 5,000 SNMP v3 sensors with a 60 seconds scanning interval; on a system with four cores, you can monitor around 10,000 sensors with 60 seconds interval. The CPU load is at about 50% then. We do not recommend more.

Furthermore, the PRTG core server and probes should run on different computers. If you experience increased values in the Interval Delay SNMP or Open Requests channels of the **Probe Health** sensor (values above 0 % indicate that the SNMP requests cannot be performed at the desired interval), you need to distribute the load over multiple probes. SNMP V1 and V2 do not have this limitation.

If you run into SNMP overload problems, you have three options:

- Increase the monitoring interval of the SNMP V3 sensors.
- Distribute the SNMP V3 sensors over two or more probes.
- Switch to SNMP V1 or V2 if you can go without encryption.

What is the SNMP Community String?

The SNMP Community String is similar to a user ID or password that allows access to the statistics of a router or another device. PRTG Network Monitor sends the community string along with all SNMP requests. If the correct community string is provided, the device responds with the requested information. If the community string is incorrect, the device simply discards the request and does not respond.

Note: SNMP community strings are only used by devices that support SNMP V1 and SNMP V2c protocols. SNMP V3 uses safer username/password authentication, along with an encryption key.

By convention, most SNMP V1/V2c equipment ships with a read-only community string set to the value **public**. It is standard practice for network managers to change all the community strings to customized values during device setup.

10.2 Monitoring via WMI

Windows Management Instrumentation (WMI) is Microsoft's base technology for monitoring and managing Windows based systems. PRTG uses this technology to access data of various Windows configuration parameters and status values. However, sensors using the WMI protocol generally have a high impact on the system performance. In addition to strict WMI sensors, there are sensors which use another approach to monitor Windows systems with less influence on the system performance.

Monitoring Windows Systems: Performance Counters

Besides sensors which monitor Windows systems only via WMI, PRTG provides sensor types which use a hybrid approach. These sensors first try to query data via Windows Performance Counters using Remote Registry Service. Querying Performance Counters needs less system resources than monitoring via WMI. These Windows sensors use WMI as a fallback if Performance Counters are not available or cannot be read out. When running in fallback mode, PRTG re-tries to connect to Performance Counters after 24 hours. This is the default approach and can be changed in the **Windows Compatibility Options** in the **Device Settings** 324. Though, it can be the case sometimes that these Performance Counters differ from the direct method.

Note: You can identify these hybrid sensors by looking at their categories, for example, in the add sensor dialog. **Search directly** for "windows" and select "Performance Counters" as **Technology Used**. Among them are various sensors with "Windows" in the name, as well as some Hyper-V sensors.

How WMI Works

WMI allows accessing data of many Windows configuration parameters, as well as current system status values. Access can be local or remote via a network connection. WMI is based on COM and DCOM and is integrated in Windows 2000, XP, 2003, Vista, 2008, Windows 7, and Windows 8 (add-ons are available for Windows 9x and NT4). PRTG officially supports WMI for Windows Vista or later.

In order to monitor remote machines, PRTG's WMI sensor needs Active Directory account credentials to have access to the WMI interface. You can enter these credentials in PRTG for the parent device or group, or in the **Root** 260 group. The sensor will then inherit these settings.

Note: Sensors using the Windows Management Instrumentation (WMI) protocol generally have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For an overview and details about all WMI sensors, please see the **List of Available Sensor Types** 352 section.

Limitations of WMI on Windows Vista and Windows Server 2008 (R1)

You should be aware that performance of WMI based monitoring is drastically limited when the monitoring station or the monitored client runs on Windows Vista or Windows Server 2008 (R1). When it comes to network monitoring via WMI, Windows Server 2008 R2 is many times faster than Windows Server 2008 (R1) or Vista.

Note: These are not limitations of PRTG, but arise from the WMI functionality built into the Windows operating systems mentioned.

The results of our tests are:

- On Windows Server 2008 R2 or Windows 7 you can run about 10,000 WMI sensors with one minute interval under optimal conditions (such as running the core and the target systems exclusively under Windows Server 2008 R2 and being located within the same LAN segment). Actual performance can be significantly less depending on network topology and WMI health of the target systems - we have seen configurations that could not go beyond 500 sensors (and even less).
- On Windows Vista/Windows 2008 R1 you can run about 300 WMI sensors with one minute interval.
- The more Windows Vista/Windows 2008/Windows 7 client systems you have in your network, the more WMI monitoring performance will be affected.
- System performance (CPU, memory etc.) of virtualization does not strongly affect WMI monitoring performance.

If you want to use WMI for network monitoring of more than 20 or 30 systems, please consider the following rules:

- Do not use Windows Vista or Windows 2008 R1 as monitoring stations for WMI-based network monitoring.
- If possible use Windows Server 2008 R2 for WMI based network monitoring (or Windows 7).
- If you cannot run PRTG on Windows Server 2008 R2, consider setting up a remote probe for the WMI monitoring. (You still get far better WMI monitoring performance with a remote probe on a virtual machine running Windows Server 2008 R2 than on any bare metal system running Windows Vista/Windows 2008.)
- Consider switching to SNMP-based monitoring for large networks. Using SNMP you can easily monitor 10 times as many nodes as with WMI (on the same hardware).

10.3 Monitoring via SSH

Monitoring via Secure Shell (SSH) enables you to gather performance and system data from many Linux and Unix distributions, as well as from certain Mac OS X systems. If your system is supported, this monitoring technology will work without any additional software on the target systems.

How Monitoring via SSH Works

To monitor remote machines via SSH, PRTG needs credentials (preferably root access) of the devices. If you use PRTG's SSH sensors, you can enter the necessary credentials in PRTG for the parent device or group, or in the **Root** 260 group, in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section on the **Settings** 159 tab. The sensors then inherit these settings by default.

With each scanning interval, PRTG logs in to your devices and queries data by executing specific commands.

For an overview and details about all SSH sensors, please see the **List of Available Sensor Types** 353.

Limitations When Using SSH Monitoring

Due to the plurality of Linux/Unix derivatives, PRTG's SSH sensors cannot support all distributions on the market. Also, only certain Mac OS systems are supported. For a detailed list please see the **More** 3009 section below.

Authentication via SSH Private Key

PRTG supports authentication via password or via private key.

When you use a private key, please ensure the following:

- Provide the key in OpenSSH RSA format.
- The key may not be encrypted! PRTG does not support password protected keys.
- The key must be provided as RSA key, you cannot use DSA keys with PRTG!

When you provide an unencrypted RSA private key in OpenSSH RSA format, please copy the entire key, including the

```
-----BEGIN RSA PRIVATE KEY-----
```

and

```
-----END RSA PRIVATE KEY-----
```

lines, into the designated text field in PRTG and **Save** your settings. Once you have pasted in and saved the private key, PRTG shows it as

```
**************************
```

Please make sure there exists a corresponding public key on the target device.

For a detailed description how to convert and use an existing SSH key, please see the **More** 3009 section below.

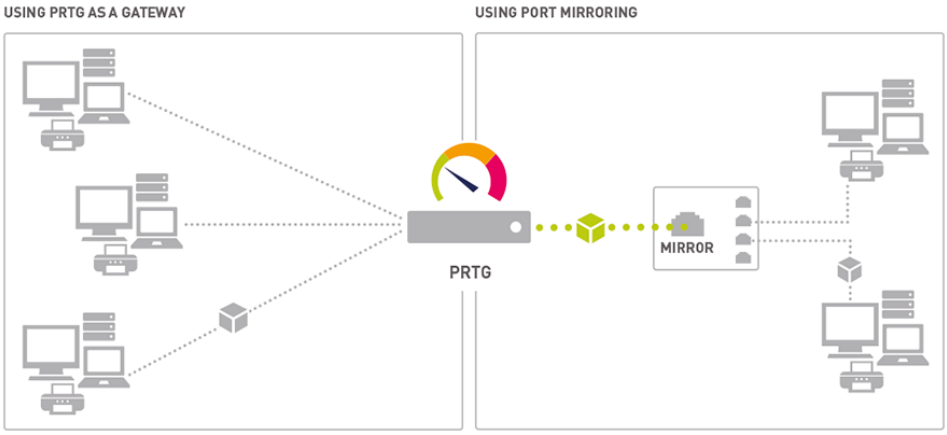
10.4 Monitoring Bandwidth via Packet Sniffing

Packet Sniffing comes into consideration if your network device(s) do not support SNMP or xFlow to measure bandwidth usage and if you need to differentiate the bandwidth usage by network protocol and/or IP addresses.

Note: Packet Sniffer sensors support **Toplists** 2734 (Top Talkers, Top Connections, etc.).

How Packet Sniffing Works

If you need to know what applications or IP addresses cause the traffic in your network, you can use a packet sniffer. A packet sniffer looks at every single data package that travels through your network for accounting purposes.



Monitoring with PRTG via Packet Sniffer Sensors

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/data-acquisition-using-packet-sniffing-lan.png

PRTG can analyze the packets passing the network card of a PC or you can connect it to the monitoring port of a switch. To calculate bandwidth usage, PRTG inspects all network data packets either passing the PC's network card (shown on the left side in the schema above) or the data packages that a monitoring port of a switch (right side) sends with its built-in packet sniffer. Using remote probes, you can set up packet sniffers anywhere in your network (see **Add Remote Probe** 3108 section).

Comparing the four bandwidth monitoring technologies which PRTG provides (SNMP, WMI, xFlow, and packet sniffer) this one creates the most CPU and network load, so you should only use it in small to medium networks, on dedicated computers for larger networks or for individual computers.

Reasons to Choose Packet Sniffing

It is important to understand that the packet sniffer can only access and inspect data packages that actually flow through the network interface(s) of the machine running the PRTG probe software. This is fine if you only want to monitor the traffic of this machine (e.g., your web server). In switched networks, only the traffic for a specific machine is sent to each machine's network card, so PRTG can usually not discern the traffic of the other machines in the network.

If you also want to monitor the traffic of other devices in your network, you must use a switch that offers a monitoring port or port mirroring configuration (Cisco calls it SPAN). In this case, the switch sends a copy to the monitoring port of all data packages traveling through the switch. As soon as you connect one of the PRTG probe system's network cards to the switch's monitoring port, PRTG is able to analyze the complete traffic that passes through the switch.

Another option is to set up the PC running PRTG as the gateway for all other computers in the network.

Set Up Packet Sniffer Sensors

Find details on how to set up the different flow sensors in the following sections:

- **Packet Sniffer Sensor** 1211
- **Packet Sniffer (Custom) Sensor** 1222

Header Based Packet Sniffing

For packet sniffing, PRTG looks at the IP addresses and ports of source and destination to assess the protocol. This is a very fast method which saves system resources.

Note: Sometimes, this method is not fully accurate. For example, it is not possible to identify HTTP traffic on ports other than 80, 8080 and 443 as HTTP. HTTP traffic on non-standard ports would not be accounted as such.

More

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- http://kb.paessler.com/en/topic/60203

10.5 Monitoring Bandwidth via Flows

Using flow protocols, you can monitor the bandwidth usage of all packets going through a device. In PRTG, you can view **Toplists** for all xFlow (NetFlow, IPFIX, sFlow, jFlow) sensors.

How xFlow Monitoring works

You can measure bandwidth usage by IP address or by application in a network, using one of the xFlow (including IPFIX) protocols. They are the best choice especially for networks with high traffic (connections with 100s of megabit or gigabits). For xFlow monitoring, the router gathers bandwidth usage data (flows), aggregates them, and sends information about these flows to PRTG using UDP packets. When you use sampling (mandatory for sFlow), only information about every n-th packet is sent to PRTG which reduces CPU load a lot. Because the switch already performs a pre-aggregation of traffic data, the flow of data to PRTG is much smaller than the monitored traffic. This makes xFlow the ideal option for high traffic networks that need to differentiate the bandwidth usage by network protocol and/or IP addresses.

NetFlow and IPFIX Monitoring

The NetFlow (and IPFIX) protocol is mainly used by Cisco devices. Once configured, the router sends for each data flow a NetFlow or IPFIX packet to the monitoring system running on a PRTG probe. You can be filter and evaluate the data in PRTG. There are different NetFlow and IPFIX sensors available: The basic ones offer predefined channel definitions, the custom variants enable you to define your own channels.

The advantage of using NetFlow or IPFIX:

- Generates little CPU load on the router itself (according to Cisco 10,000 active flows create about 7% additional CPU load; 45,000 active flows account for about 20% additional CPU load).
- Generates less CPU load on the PRTG core system, compared to packet sniffer sensors.

Note: You must enable NetFlow or IPFIX export on the device you want to monitor. The device must send a flow data stream to the IP address of the PRTG probe system on which you set up the NetFlow or IPFIX sensor. You can monitor Juniper **jFlow** with the corresponding sensors as well (basically they are adjusted NetFlow v5 sensors).

sFlow Monitoring

sFlow works similar to NetFlow monitoring. The router sends data flow packets to the monitoring system running on a PRTG probe. The most obvious difference between the two flow protocols: With sFlow, not all of the traffic is analyzed, but only every n-th packet. It is like having a river of traffic and you take a cup of water out of it ever so often and analyze it.

The advantage is clear: There is less data to analyze, there is less CPU load needed, and less monitoring traffic is generated. Nevertheless, you can get a good insight into your network bandwidth usage. Note: Currently, PRTG supports sFlow version 5.

Set Up Flow Sensors

Find details on how to set up the different flow sensors in the following sections:

- NetFlow V5 Sensor 1141
- NetFlow V5 (Custom) Sensor 1153
- NetFlow V9 Sensor 1164
- NetFlow V9 (Custom) Sensor 1176
- IPFIX Sensor 1003
- IPFIX (Custom) Sensor 1015
- sFlow Sensor 1393
- sFlow (Custom) Sensor 1405
- jFlow V5 Sensor 1035
- jFlow V5 (Custom) Sensor 1047

Limitations

On a powerful 2008 PC (Dual Core, 2.5 Ghz), you can process about 100,000 flows per second for one xFlow stream. Using sampling, the number of actual flows can be much higher. When using complex filters, the value can be much lower. For example, with a router sending about 2,000 flows/second (which corresponds to mixed traffic at gigabit/second level without sampling) you can expect to configure up to 50 NetFlow sensors operating properly. PRTG internally monitors its own NetFlow processing. You can see decreased values in the **Health** channels of the Core Health 555 and Probe Health 1311 sensors as soon as NetFlow packets are not processed due to an overload (you find these sensors on the local probe device).

If you experience an overload, please consider using sampling or setting up multiple probes and distribute the NetFlow streams to them. We do not recommend that you add more than 50 NetFlow sensors per PRTG probe.

This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

Note: Flow sensors are not IPv6 compatible.

10.6 Bandwidth Monitoring Comparison

The following table shows the differences between PRTG's four methods available for bandwidth monitoring:

	WMI	SNMP	Packet Sniffer	xFlow (IPFIX, NetFlow, sFlow, jFlow)
Setup	Medium	Easy	Easy to complex (depending on filter rules used)	Can be complex (e.g., the switch must be configured)
Traffic can be filtered	No	No	Yes	Yes
Differentiate bandwidth usage by protocol or IPs	No	No	Yes	Yes
PRTG can show Toplists (Top Talker, Top Connections, Top Protocols, custom)	No	No	Yes	Yes
Filter bandwidth usage by IP	No	No	Yes	Yes
Filter bandwidth usage by MAC address	No	No	Yes	No
Filter bandwidth usage by physical network port	Yes	Yes	No	No

	WMI	SNMP	Packet Sniffer	xFlow (IPFIX, NetFlow, sFlow, jFlow)
Monitor network parameters other than bandwidth usage	Yes	Yes	No	No
CPU load on the machine running PRTG	Low	Low	Higher, depends on the amount of traffic	Higher, depends on the amount of traffic
Excess bandwidth usage of monitoring	Small	Small	None (except when monitoring switch ports are used)	Depends on the traffic

10.7 Monitoring Quality of Service and VoIP

PRTG can monitor the Quality of Service (QoS) in a network with dedicated QoS sensors, as well as Cisco IP Service Level Agreement (SLA) and Cisco Class Based Quality of Service (CBQoS). Slight variations of network parameters like jitter, packet loss, or packet delay variation (PDV) usually have only little effect on TCP based services (for example, HTTP, SMTP). But for UDP based services like Voice over IP (VoIP) and video streaming, a steady stream of data packets is crucial. The sound quality of a VoIP call drops dramatically when UDP packets are not received in a timely fashion, or if packets are lost or out-of-order. As a rule of thumb for good quality of service (in a VoIP perspective), you want low measurements for jitter (less than 20 to 50 ms) and PDV (less than 100 ms), and preferably zero measurements for packet loss, duplicated packets, or packets in wrong order.

For Quality of Service measurements, four sensors are available:

- **QoS (Quality of Service) Sensor** 1329
  Monitors VoIP relevant network parameters by testing network connection quality between two probes.
- **QoS (Quality of Service) Round Trip Sensor** 1338
  Monitors VoIP relevant network parameters by testing network connection quality between a probe and a target device at the endpoint of the connection. Traffic is measured bidirectional.
- **Cisco IP SLA Sensor** 492
  Monitors VoIP relevant network parameters through IP SLA results from Cisco devices (via SNMP).
- **SNMP Cisco CBQoS Sensor** 1515
  Monitors VoIP relevant network parameters by using Cisco's CBQoS (via SNMP).

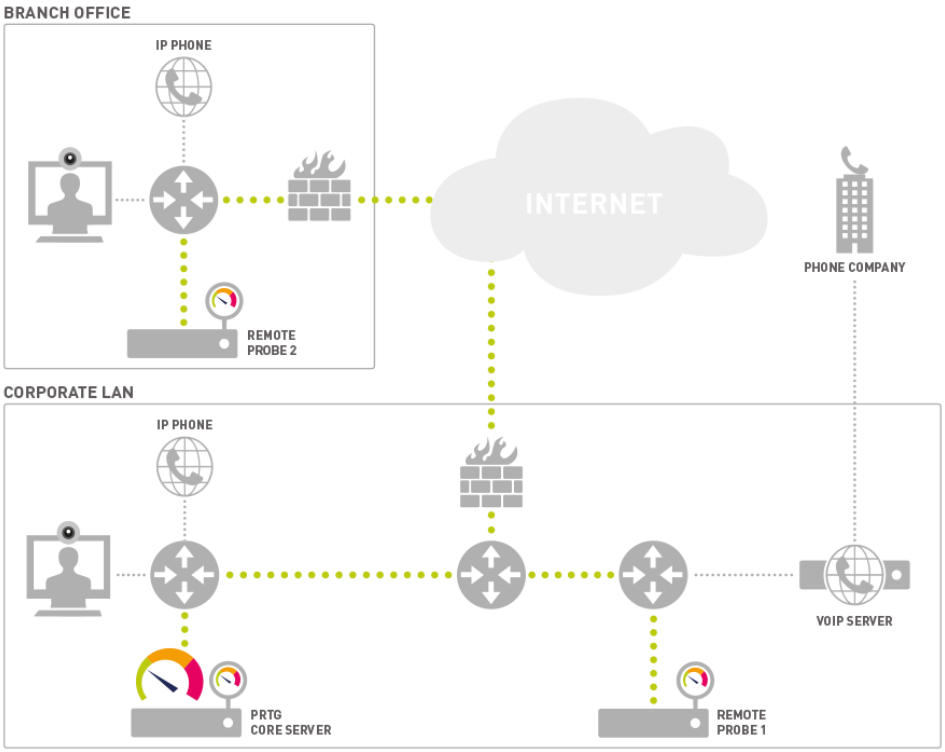
QoS (Quality of Service) Sensors

The QoS Sensors monitor the quality of a network connection by measuring the following parameters:

- Jitter in ms according to RFC 3550
- Packet delay variation (PDV) in ms according to RFC 3393
- Lost packets in %
- Out-of-order packets in %
- Duplicated packets in %

The QoS sensors measure quality of service by sending UDP packets between two probes. This means that you can test any network connection in your network by simply placing a remote probe 3108 on (or near) each 'end' of the connection and measuring the connection quality between them. This is the perfect tool to find network issues that can affect VoIP sound quality or video streaming 'hiccups'.

Note: You can use the QoS Round Trip sensor also without installing a remote probe at the connection endpoint. See section **More** 3021.



Monitoring Quality of Service with PRTG

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/voip-monitoring-1.png

The measurements for QoS monitoring are taken between two probes. So the first step is to place two PCs running a remote probe on (or near) both ends of the connection that you want to monitor. As an alternative, the local probe on the PC running the PRTG core can also be used as one end, or you can use the PRTG QoS Reflector (see section **More** 3021) to bounce the packets when monitoring QoS roundtrips. If any firewalls, packet filters, or Network Address Translation (NAT) systems are en route, you must configure them as necessary so that the UDP packets can reach the target probe.

In PRTG, create a new QoS sensor on a **Probe Device**, or, if you use the roundtrip sensor, on any device. Please find details about settings in the **QoS (Quality of Service) One Way Sensor** 1329 resp. **QoS (Quality of Service) Round Trip Sensor** 1338 section. With the settings for number and for size of the packets, you can configure the test data stream. 1,000 packets of 172 bytes each is a good start, but if your applications use larger packets you may want to enter other values here. Try to configure the test streams with parameters similar to that of the UDP services you are using across this connection.

Cisco IP SLA Sensor

Wikipedia describes IP SLA as a feature included in the Cisco IOS Software that can allow administrators the ability to Analyze IP Service Levels for IP applications and services. IP SLA uses active traffic-monitoring technology to monitor continuous traffic on the network. This is a reliable method in measuring over head network performance. IP-SLA is mostly used to monitor the sound quality of VoIP traffic.

If you haven't done so already, add a device in PRTG for the Cisco device that you want to monitor. Then create a new **Cisco IP SLA** sensor on this device. Please find details about settings in the **Cisco IP SLA Sensor** 492 section.

This feature is only available in the more expensive Cisco devices. If you don't have IP SLA capable routers/switches, you can still get similar information with PRTG's QoS sensor (see above 3017) which does not require any special hardware—just two PCs running Windows. If you own hardware that supports IP SLA, then PRTG brings you probably the least-cost monitoring solution for IP SLA. Most vendors charge extra for IP SLA support (a thousand bucks and more). Following Paessler's long term policy, we simply include this as one of our sensor types. With PRTG you can even use the Freeware Edition to monitor IP SLA!

PRTG monitors the following parameters: Calculated Planning Impairment Factor (ICPIF), Mean Opinion Score (MOS), Average Jitter, Packets Lost, Packets Out Of Sequence, Packets Late, Average Round Trip Time (RTT), DNS RTT, TCP RTT, Transaction RTT. Especially two of these parameters are interesting for VoIP: Mean Opinion Score (MOS) and Calculated Planning Impairment Factor (ICPIF).

SNMP Cisco CBQoS Sensor

Cisco Class Based Quality of Service (CBQoS) provides information about QoS of Cisco network devices which support the Modular QoS command line interface (MQC). With Classed Based QoS, you can obtain monitoring data that includes summary counts and rates by traffic class before and after the enforcement of QoS policies, according to Cisco's CBQoS Management Information Base (MIB) definition. PRTG determines CBQoS data via Simple Network Management Protocol (SNMP). The corresponding sensor type is available out-of-the-box in PRTG version 13.x.5 or later. CBQoS is available in Cisco IOS by default as of version 12.4(4)T.

In order to monitor CBQoS, add a device to PRTG for the Cisco device that you want to monitor. Then create a new SNMP Cisco CBQoS sensor on this device. Please see section **SNMP Cisco CBQoS Sensor** 1515 for more details.

This sensor type supports the following CBQoS classes:

- **Class Map**: statistical data about class maps, such as pre- and post-policy packets and sizes, drop packets and size, as well as no-buffer drop packets
- **Match Statement**: statistical data about match statement specific information, such as pre-policy packets and size
- **Queueing**: statistical data about queuing actions, such as current and maximum queue depth, drop packets, and drop size

You can select the desired CBQoS entries which you want to monitor while creating the sensor in PRTG. The available entries are given with their particular connections, their descriptions, and class types.

Voice over IP

For Mean Opinion Score (MOS) measurements, Cisco conducted a panel test where a wide range of listeners judged the quality of voice samples sent using particular codecs, on a scale of 1 (poor quality) to 5 (excellent quality). The Cisco device calculates the corresponding value for the current network connection based on the network parameter measurements like jitter and packet loss.

Note: The Cisco IP SLA sensor reads out the MOS directly from the Cisco device. For the QoS and the QoS Round Trip sensor, PRTG calculates the MOS by itself. See section **More** 3021 for details.

The values and their meanings are:

MOS	Quality	Expected Quality Impairment
5	Excellent	Imperceptible
4	Good	Perceptible, but not annoying
3	Fair	Slightly annoying
2	Poor	Annoying
1	Bad	Very annoying

The second interesting parameter ICPIF is the sum of measured impairment factors minus a user-defined access Advantage Factor that is intended to represent the user's expectations, based on how the call was placed (for example, a mobile call versus a land-line call) (quoted from Cisco's website).

Upper Limit for ICPIF	VoIP Call Communication Quality
5	Very good
10	Good
20	Adequate
30	Limiting case
45	Exceptional limiting case
55	Customers likely to react strongly (complaints, change of network operator)

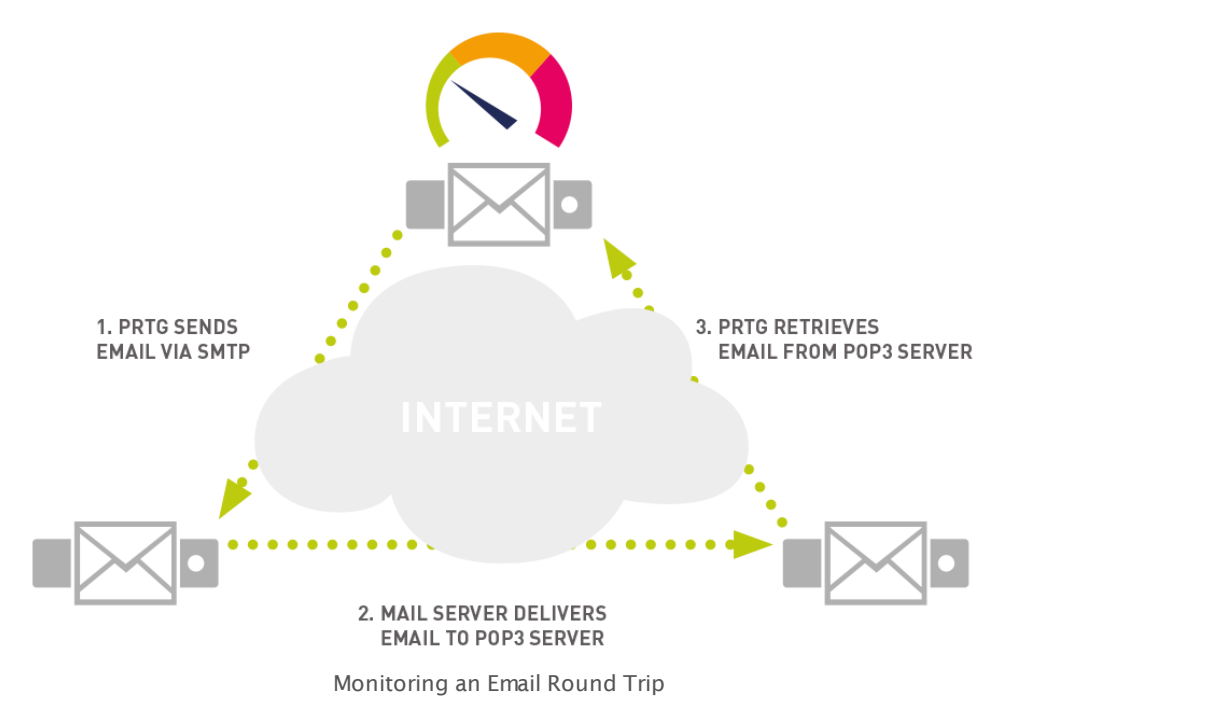
10.8 Monitoring Email Round Trip

Email Round Trip sensors ensure the end-to-end delivery of emails and make it possible to monitor availability and performance of a complete email delivery process. There are two sensor types for this task:

- SMTP&POP3 Round Trip Sensor 1455
- SMTP&IMAP Round Trip Sensor 1443

Both initially deliver an email to a mail server using SMTP. Afterwards the receiving mailbox is scanned using Post Office Protocol version 3 (POP3) or Internet Message Access Protocol (IMAP) until the email arrives. The test email contains a unique code in the topic which is used to identify the email, such as PRTG Roundtrip Mail: {6D136420-5A3E-46CF-871A-1DAF0C4F3D5D}.

When PRTG successfully received an email in this email round trip cycle, it marks the respective message for deletion on the mail server. Usually, a mail server will then delete this email. For best performance, we recommend using a dedicated email accounts for email round trip sensors.



Monitoring an Email Round Trip

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/monitoring-an-email-round-trip.png

In the scenario shown above, there are three steps in the round trip:

- **Step 1**
  PRTG delivers an email via the SMTP protocol to a mail server (just like an email client).

- **Step 2**
  The SMTP server delivers the email to a POP3/IMAP server (which can be located at a remote site, in your local LAN or on the same server as well).
- **Step 3**
  Every few seconds PRTG connects to the POP3/IMAP server until the test email arrives.

Recommended Configuration

Here is a simple concept to check delivery of email out of and into your organization:

1. Create a dedicated email account for this test in your mail system.
2. Set up an external email account (hosted mail server, free mail service, etc.) and configure it to send all emails back to this dedicated email account in your organization (which you created in Step 1).
3. Set up PRTG's round trip sensor to send an email to the external email account (which you created in Step 2) using your LAN's mail server and then check for the email account on your mail system (which you created in Step 1) for arrival of the email.

With this technique you are testing multiple aspects of your email server setup. As long as the sensor shows a green light, this means:

- Your email server accepts emails via SMTP.
- Emails are being sent to the outside world (internet connection works, MX lookups work etc.).
- Emails from external mail server can be delivered into your mail system (this includes aspects like the fact that the MX records for your domain are correct, your mail server can be reached from the outside world, your email filtering is working etc.).
- Emails can be retrieved using POP3 (or IMAP).

Note: Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.

Conclusion

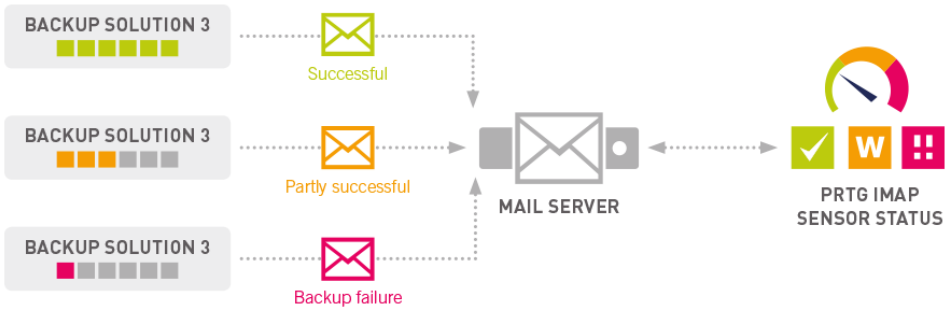
These two sensor types are a great tool to ensure delivery of email from and to your mail servers. Compared to the standard SMTP, POP3 and IMAP sensors - which only check the availability of these services - the two roundtrip sensor types actually monitor the complete transaction from accepting the mail on the first email server to delivery of the mail on the final POP3/IMAP server.

10.9 Monitoring Backups

Monitoring your backup software enables you to be sure that your recent backups succeeded. With PRTG you can check the email notifications of various backup jobs. You only need two things for backup monitoring:

1. Configure your backup software to send emails to a dedicated email account, and
2. configure PRTG's **IMAP Sensor** for backup monitoring.

PRTG will analyze the backup emails for you and set the status of the IMAP sensor accordingly. This way you will see the states of all your backup jobs at a glance.



Backup Monitoring via Email

10.10 Monitoring Virtual Environments

A highly flexible IT infrastructure is a common need nowadays and virtualization has become an important pillar of the IT all over the world. Applications in your network might be distributed over many different servers, networks, and locations. They might also be in the cloud, and your computations can take place in data centers spread over the whole world. So, if your network connection or any other corresponding hardware fails, hundreds of applications might be unavailable—an impact to your daily business processes which should be avoided at any costs.

Because of this, monitoring the physical infrastructure of your data center is still a must in times of virtual environments. With the layer of virtualization in addition to your physical equipment, your logical infrastructure also needs a close treatment. PRTG assists you to deal with these advanced requirements and enables you to react proactively to issues before they affect your whole system. With PRTG you can monitor all layers of your IT infrastructure in a comprehensible way so you will reduce issues related to dynamic IT environments significantly.

Monitoring All Layers of Your IT Infrastructure

In general, you can assume that with the layer of virtualization you have to monitor a total of four layers in your IT infrastructure:

- **Hardware (Server Racks):** Usually you will set up your monitoring in the common way and monitor most of the hardware components in your network with PRTG's SNMP sensors 350. You are able to gain monitoring data about many different device readings such as CPU load, memory, disk space with this monitoring technology 3001, as well as information about network traffic and bandwidth usage of your routers and switches. It is absolutely mandatory for a working IT environment to monitor all hardware components in order to be alerted if something fails or hardware resources are running out. In addition, you can identify potential bottlenecks affecting your virtualized infrastructure. You can set this monitoring up in the usual way.

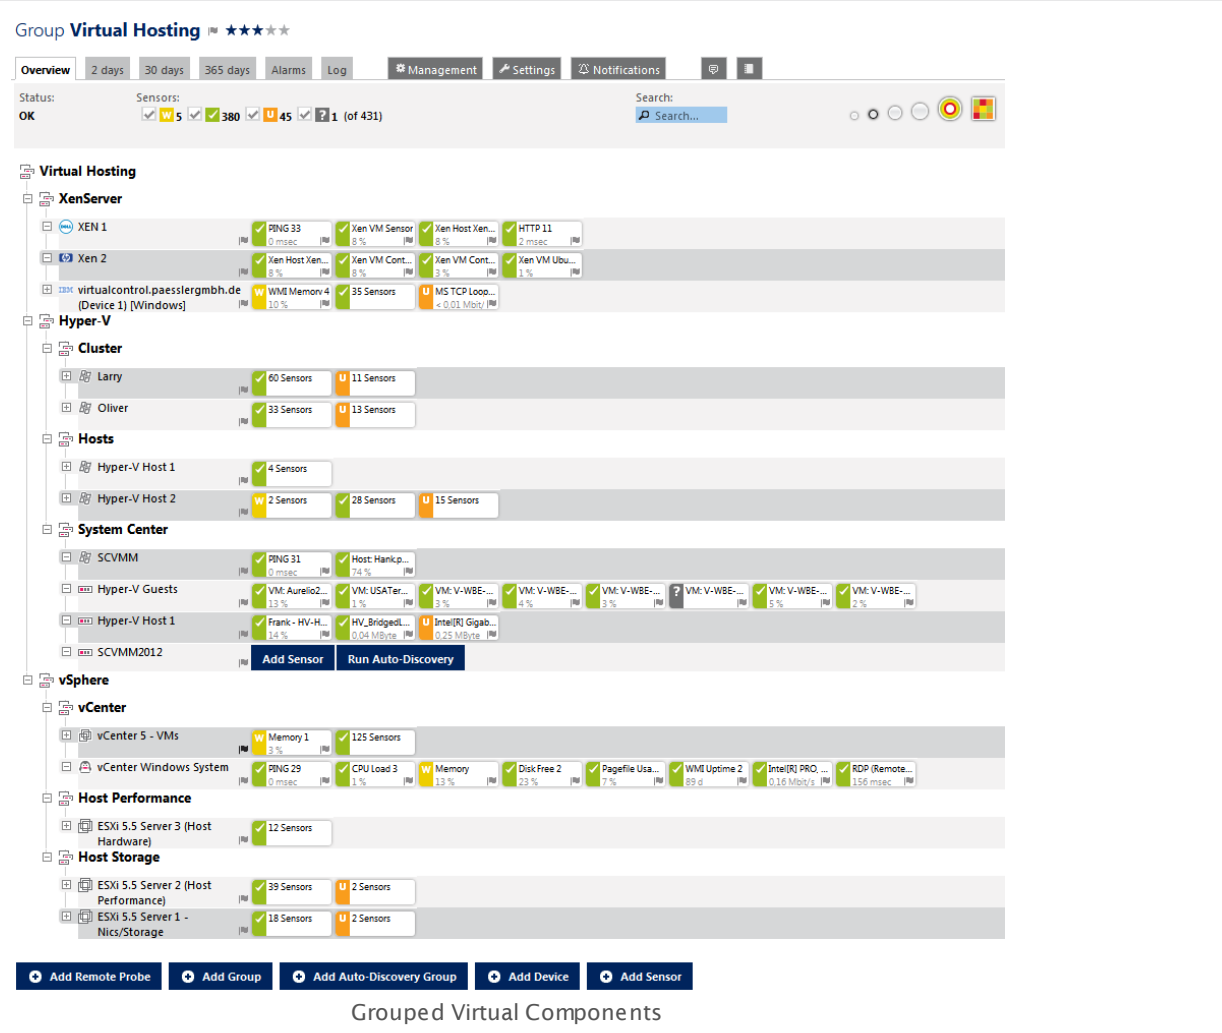
- **Host Server Hardware:** It is essential to explicitly monitor the host hardware of your virtualization solution. If you have issues with your virtual machines (VMs), the origin might be a host hardware failure. You should closely monitor your VM host servers to get alerted if the status is other than "normal". Besides the out of the box hardware sensors, PRTG provides specific sensors for various virtualization host servers; the following monitoring data of your host servers will help you prevent issues in virtualized environments:
  - VMware: current reading and health status (via WBEM), a general status as shown in vSphere (via SOAP), and disk space of a VMware data store (via SOAP)
  - Hyper-V: host health critical values, deposited pages, network traffic, CPU usage of guests, hypervisor, and in total
  - Citrix XenServer: CPU, memory, and network usage, the number of running virtual machines on the host server, and load average

- **VMs from the "Outside":** The virtual machines run on their particular host servers. PRTG can show you the status of single virtual machines and several of their performance counters. It might be helpful to know which resources a single VM uses and needs, but monitoring single VMs is not advisable in every case because it has a noticeable influence on the overall performance. Often it will be sufficient to monitor only VMs which are critical for your network. If a VM reaches its capacity limits, PRTG can alert you and you can conduct the corresponding resolution steps like enhancing this VM's resources. Indicators for a healthy virtual machine which you can monitor with PRTG out of the box are:
  - VMware: CPU and memory usage, disk read and write speed, read and write latency, and network usage
  - Hyper-V: CPU usage, disk read and write speed
  - Citrix XenServer: CPU usage and free memory
  - Virtuozzo: disk space and network usage

- **VMs from the "Inside" (Operating Systems):** You can monitor the Windows operating system of a single VM with PRTG's standard WMI sensors 352, for example. With this technology 3005 you can access data of various Windows parameters. Other operating systems like Linux/MacOS can make data available via SSH 3006 and SNMP 3001. The status of the operating systems on your VMs can indicate potential issues of the same, just like the operating systems on your physical machines which are important for a reliably working IT infrastructure: You can monitor these with the same attention, depending on your application scenario, but be careful due to performance considerations. Especially many WMI sensors can result in load problems, so monitor only really important systems "from the inside". Furthermore, you do not need to monitor every item multiple times. For example, it might be sufficient to monitor free disk space only from the outside of the actual VM.

Monitoring the Virtual Infrastructure

To monitor your IT infrastructure, best practice is to set up the monitoring of the hardware layer of your data center first in PRTG, especially in order to find potential bottlenecks which might have an impact on your virtual servers. Then you can start monitoring your virtual environment itself. If you use several solutions for virtual hosting, it is also a good idea to group related host servers, their virtual machines, and the operating systems together. The screenshot below will give you an idea about how to organize this.



Grouped Virtual Components

The screenshot above shows you the particular group "Virtual Hosting" of an entire PRTG setup. This is an example how monitoring of virtual environments can look like. The sample group contains several subgroups for the virtualization solutions Citrix "XenServer", Microsoft "Hyper-V", and VMware "vSphere". The vSphere group, for example, has three subgroups: we monitor the vCenter VMs and the vCenter Windows system, the performance of the host server, and the storage system of the host.

Devices for Physical Hosts

In PRTG, set up devices which represent the physical hosts of your virtual machines. For example, for your VMware hosts, add devices which represent the ESXi servers, for Hyper-V add devices which represent your Hyper-V host servers, for Citrix add devices which represent your Xen servers.

Then you can add suitable and expressive sensors to the host server devices. Running PRTG's auto-discovery [219], many useful sensors will be created automatically. There are several pre-configured host hardware sensors available out of the box in PRTG:

- VMware Host Hardware (WBEM) Sensor 2290: monitors an ESXi server via Web-Based Enterprise Management (WBEM)
- VMware Host Hardware Status (SOAP) Sensor 2298: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- VMware Host Performance (SOAP) Sensor 2308: monitors a VMware host server via Simple Object Access Protocol (SOAP)
- Hyper-V Host Sensor 940: monitors via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device
- Citrix XenServer Host Sensor 502: monitors via Hypertext Transfer Protocol (HTTP)

These sensor types monitor hardware specific counters to ensure that no hardware issues affect your actual virtual machines. Additional sensor types can monitor the host hardware via SNMP (for example, traffic and custom requests), data storage on ESXi servers via SOAP, as well as there are sensors for network adapters and storage devices which are connected to a Hyper-V host server. You can also monitor Virtuozzo host servers with sensors for network usage and disk space for each container.

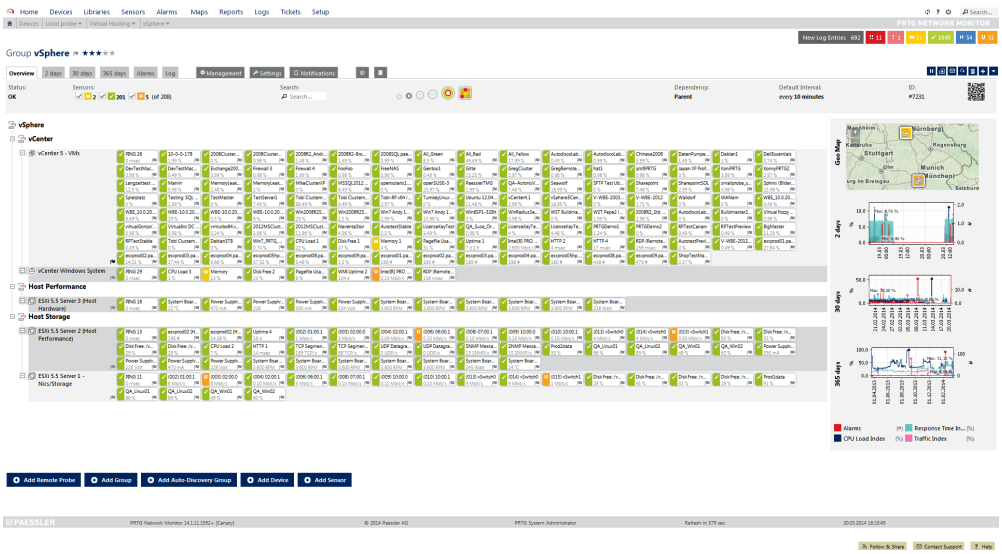
Devices for Virtual Machines

To monitor your actual virtual machines, add them to your host servers in PRTG. For a better overview, you might want to add another device to PRTG which represents your host server and add sensors for your VM to there. The according sensors for virtual machines will show you the performance of single VMs as well as their usage of resources. This will help you identify VMs with poor performance and react proactively before one or more VMs crash. As mentioned above, you can additionally monitor your particular VMs from the inside (which means the operating systems on your VMs) if necessary. See the sections below for details about particular virtualization solutions.

VMware Virtual Machine

PRTG's VMware Virtual Machine (SOAP) Sensor 2318 monitors VMs on a VMware host server via Simple Object Access Protocol (SOAP). With the VMware system, the general idea is to add a vCenter server as a device to PRTG and use the vCenter as parent device where you add the sensors to for your virtual machines. So, in the case of vMotion when your VMs change their host server, PRTG will be able to follow these movements and will never lose the monitored VMs.

For this sensor type, you need the Microsoft .NET Framework with the latest update of version 4.0 running on the probe machine. If you use many VMware sensors, we also recommend adjusting the settings on your VMware host server to accept more incoming connections.

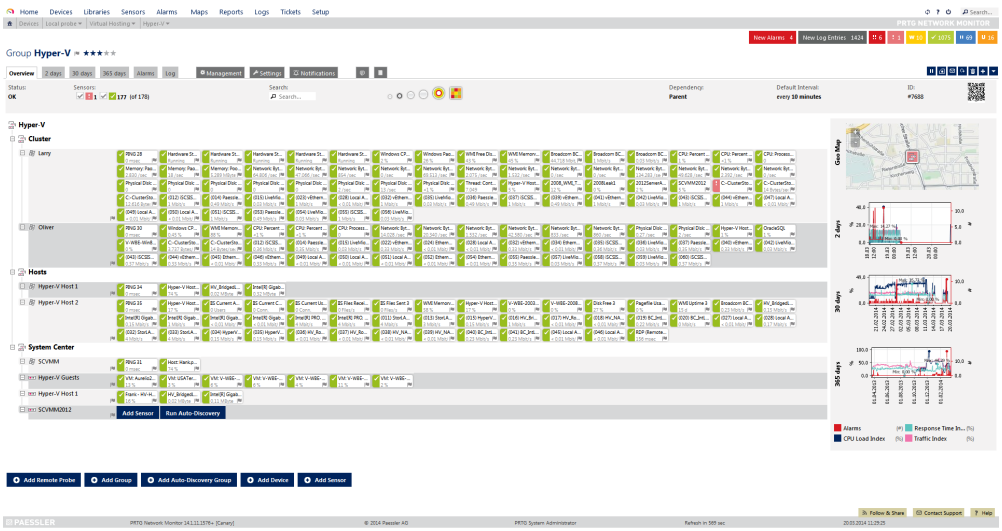


vSphere Group

This screenshot a sample vSphere group in PRTG. As recommended, the VMware virtual machines are added to the vCenter device. There is also a dedicated device for the vCenter Windows operating system with common WMI sensors for CPU, memory, disk, and network usage. The ESXi host servers are organized in their own groups regarding performance and storage. In this example, PRTG monitors the hosts with the standard SNMP hardware sensors as well as with the specific VMware ESXi host sensors.

Microsoft Hyper-V Virtual Machine

PRTG's Hyper-V Virtual Machine Sensor 949 monitors VMs via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. With this hybrid approach, the sensor first tries to query data via performance counters and uses WMI as a fallback if there are no performance counters available. Performance counters in general need less system resources than WMI. We recommend using System Center Virtual Machine Manager (SCVMM) as parent device for this sensor type, because when your VMs change their physical host with Live Migration, this sensor will still be able to continue monitoring. You should also disable User Account Control (UAC) in the Windows operating system of the VM.



Hyper-V Group

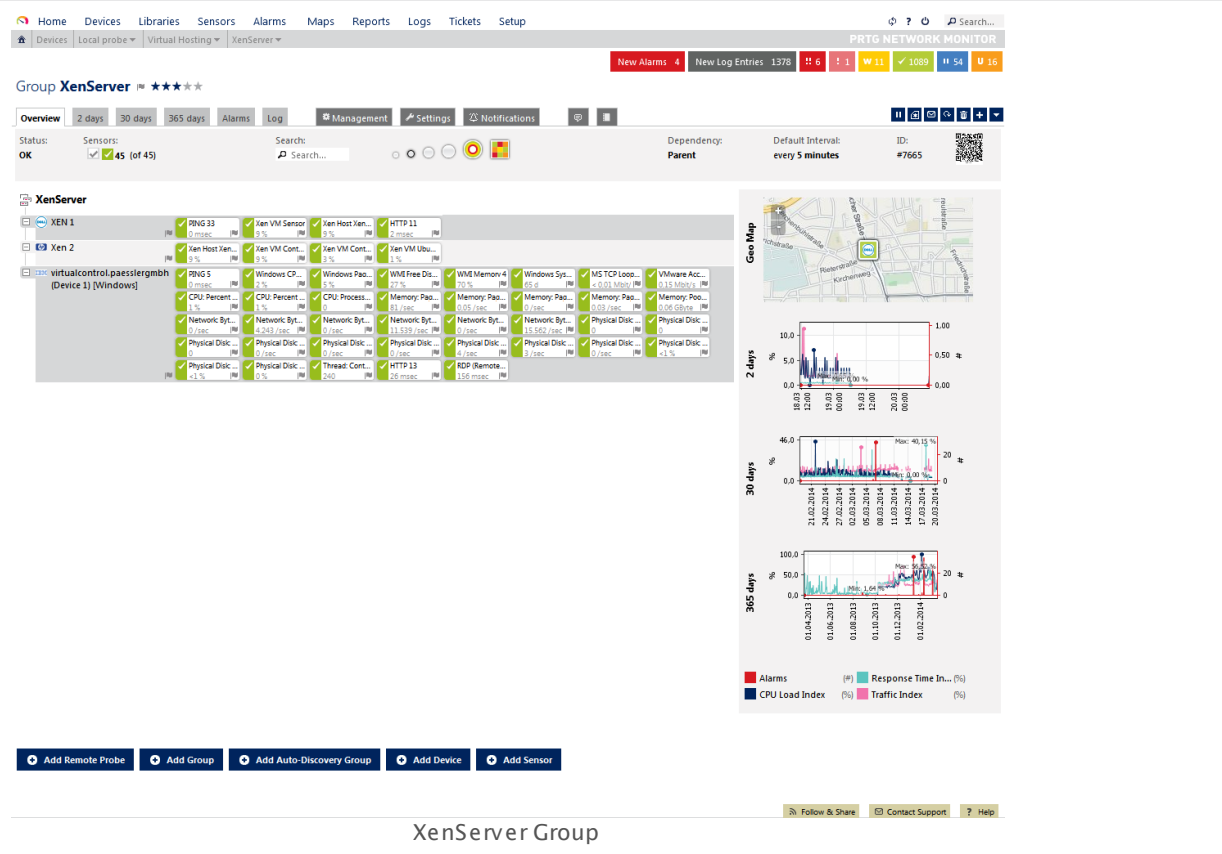
This screenshot shows a sample Hyper-V group in PRTG. There is a dedicated group for failover clustering where two nodes are monitored with several SNMP and WMI sensors, as well as Hyper-V Host Server sensors 940 and sensors for the Hyper-V virtual machines. This ensures that Hyper-V and failover clustering works without any issues. The Hyper-V hosts are monitored the same way, organized in a dedicated group for hosts.

Note that we recommend adding the particular virtual machines to the SCVMM server if possible! We pointed out above that you should add the VMs to an SCVMM server to avoid issues with Live Migration. You can see this in the group "System Center". The particular VMs are added to the dedicated device "Hyper-V Guests".

Citrix XenServer Virtual Machine

PRTG's Citrix XenServer Virtual Machine Sensor 513 monitors VMs via Hypertext Transfer Protocol (HTTP). For this sensor type, you have to add a device to PRTG which represents a Citrix XenServer with version 5.0 or later. Another requirement is the Microsoft .NET Framework: You have to run the latest update of version 4.0 on the probe machine where you add this sensor to.

In a XenServer pool, every host knows each running VM. Because of this, there is no central instance which provides all available data so it does not matter on which host you query your VMs. All queries on any host are automatically forwarded to the pool master which manages the XenServer pool. So it is sufficient to create the desired sensors for your XenServer VMs on a device that represents one host server of your pool. PRTG's XenServer sensors can figure out by themselves which host is running and retrieve the according data.



XenServer Group

This screenshot shows a sample XenServer group in PRTG. There are two devices for XenServer hosts (Xen 1 and Xen 2), each with a Citrix XenServer Host sensor [502] and several Citrix XenServer Virtual Machine sensors [513] for the particular VMs on this host. Furthermore, the Windows operating system is represented as a dedicated device ("virtualcontrol") which is monitored with several WMI sensors regrading CPU, disk, memory, and network usage.

The sensor types described in this section monitor virtual machine specific counters to ensure that all your VMs have enough resources available. If a VM is overloaded, PRTG can notify you immediately and you can proactively take care of issues before a particular VM has an outage or other failures. Additionally, we have shown an idea for a structured virtual monitoring with several recommendations.

You can find all available sensors for virtual servers and the according virtual machines in section **List of Available Sensor Types—Virtual Servers Sensors** [354].

Performance Considerations

For best performance when monitoring virtual environments, we strongly recommend that you use a computer with **Windows Server 2012 R2** to run the PRTG probe with the according sensors. So for example, you can run up to 300 VMware sensors in a 60 seconds scanning interval on Windows 2012 R2, while you can only use 30 VMware sensors with the same interval on Windows 2008 R2.

10.11 Monitoring Databases

Monitoring your databases enables you to ensure that, on the one hand, database queries are processed in time, and, on the other hand, that the database itself performs within the defined parameters. Furthermore, database monitoring with PRTG makes it possible to be alerted via a corresponding sensor status if database queries return an unexpected result value.

PRTG comes with built-in native sensors for the most common databases:

- Microsoft SQL servers
- MySQL servers
- PostgreSQL servers
- Oracle SQL servers

However, it is possible to monitor many other database servers. For this concern, PRTG uses the ActiveX Data Objects (ADO) interface.

There are two types of database sensors:

- **Sensors monitoring databases directly** 3033: Monitor databases from the user perspective. These sensors send a request to the database server and receive corresponding values. You can optionally process data tables and show values in individual channels or monitor transactions.
- **Sensors monitoring database performance** 3036: Monitor databases with a more abstract view on the servers. Usually, these sensors monitor performance counters via Windows Management Instrumentation (WMI).

Sensors Monitoring Databases Directly

PRTG provides several sensors which can "look into" the content of databases. Sensors of this type connect to the database server, execute a defined query, and show the execution time of the whole request and the query. You can use these sensors to process the data table and show requested values in individual channels.

The following sensor types are available for this kind of monitoring:

- **Microsoft SQL v2 Sensor** 1075: Monitor your Microsoft SQL server 2005 or later.
- **MySQL v2 Sensor** 1090: Monitor your MySQL server version 5.0 or later.
- **Oracle SQL v2 Sensor** 1187: Monitor your Oracle database server version 10.2 or later.
- **PostgreSQL Sensor** 1297: Monitor your PostgreSQL database version 7.x or later.

For these sensor types, you can define valid SQL statements that the sensors send to the database server. Define the queries in an SQL script file and store it into the respective **\Custom Sensors\sql** subfolder of your PRTG installation (see section **Data Storage** 3135 for details). You can select this SQL script when you add the sensor to PRTG. With every scanning interval 272, the sensor executes this script with the defined query against the database and the database returns corresponding values in individual channels (see the example 3034 below for sample channel value selections). Use the **Sensor Channels Settings** 2712 to define limits for specific values.

Note: These sensor types need .NET 4.0 or later installed on the computer running the PRTG probe.

Alternatively, you can monitor almost all available database servers with the **ADO SQL v2 Sensor** 378 via an ActiveX Data Objects (ADO) connection.

Example: SQL Channel Value Selection

The SQL (v2) sensors determine their channel values by using column numbers, column names, row numbers, or key value pairs. This section shows which option you can choose to get the desired value from an SQL data table.

Consider the following data table that an SQL query might return from a database:

article_id	articles_available	first_listing	orders
00	12	2001	4
01	345	2005	56
02	678	2008	290
03	90	2012	32

This data table has four columns with the following numbering:

- Column 0 has the name "article_id"
- Column 1 has the name "articles_available"
- Column 2 has the name "first_listing"
- Column 3 has the name "orders"

The numbering of columns starts with 0, as well as the numbering for rows starts with 0. The table has four rows, each row contains the properties of one "article". The "articles" have the IDs 00, 01, 02, 03. This also illustrates the proper row numbering (0, 1, 2, 3).

With the options for channel value selection in SQL sensors, you can read out the following values:

- All values that are in row 0 (here: 00, 12, 2001, 4)
- All values that are in column 0 (here: 00, 01, 02, 03)
- All values that are in column 1 (here: 12, 345, 678, 90)

It is not possible to get values from any other cell in a data table. If you need this, you have to re-construct your data table.

The following samples show possible results for channel value selections regarding this data table:

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Column Number	This channel will show the value in row 0 of the column you specify. Consider you define "1" as column number. Then the sensor channel value is "12" because it is the cell in column 1 and row 0. Possible return values for this option are: ▪ Column number "0" returns "00" ▪ Column number "1" returns "12" ▪ Column number "2" returns "2001" ▪ Column number "3" returns "4"
Channel Value Selection by Column Name	This channel will show the value in row 0 of the column you specify. Consider you define "orders" as column name. Then the channel value is "4" because it is the cell in column "orders" and row 0. Possible return values for this option are: ▪ Column name "article_id" returns "00" ▪ Column name "articles_available" returns "12" ▪ Column name "first_listing" returns "2001" ▪ Column name "orders" returns "4"
Channel Value Selection by Row Number	This channel will show the value in column 0 of the row you specify. Consider you define "1" as row number. Then the sensor channel value is "01" because it is the cell in row 1 and column 0. Possible return values for this option are: ▪ Row number "0" returns "00" ▪ Row number "1" returns "01" ▪ Row number "2" returns "02" ▪ Row number "3" returns "03"

SAMPLE CHANNEL VALUE SELECTIONS

Channel Value Selection by Key Value Pair	This channel will show the value in column 1 of the same row where the key in column 0 was found. Consider you define "02" as key. Then the sensor channel value is "678" because it is the cell in the same row in column 1 as the the key in column 0. Possible return values for this option are: ▪ Key "00" returns "12" ▪ Key "01" returns "345" ▪ Key "02" returns "678" ▪ Key "03" returns "90"

This sample channel value selection illustrates how to choose the correct option to get needed values from an SQL data table and shows which cells the SQL sensors can address.

UDF: Counting Returned Rows

If you execute a UDF (User Defined Function) on the SQL server and want to know how many rows this UDF returns, follow these steps:

- A command to execute your UDF on the SQL server may look like this, for example:

```
exec myUDF
```

- To get the information how many rows this UDF returns, extend the query in your SQL script:

```
exec myUDF;
select @@rowcount as row_count
```

- In the settings of your SQL sensor, choose the option **Select Channel Value by Column name**
  Note: If not done yet, you have to create a new SQL v2 sensor and enable **Data Processing** while sensor creation.
- Enter **row_count** into the **Column Name** field of the channel to show the value from this column in the channel.

Sensors Monitoring Database Performance

Performance sensors for database servers have a more "abstract" view on databases and regard performance "from the outside". They do not read out any values of the database, neither do they send SQL queries to databases. This sensor type is only available for Microsoft SQL and MongoDB servers.

The Microsoft SQL server sensors monitor performance via Windows Management Instrumentation (WMI). You can manually set up different performance counters for your server instances, for example, general statistics, access methods, buffer and memory manager, locks, and SQL statistics.

Microsoft SQL Server performance sensors are available for Microsoft SQL Server 2008, 2012, and 2014:

- **WMI Microsoft SQL Server 2008 Sensor** 2565
- **WMI Microsoft SQL Server 2012 Sensor** 2577
- **WMI Microsoft SQL Server 2014 Sensor** 2589

10.12 Monitoring Syslogs and SNMP Traps

PRTG is utilizable as a full scale syslog server and SNMP trap receiver. Every PRTG installation includes this functionality so no additional software is needed. This manual section describes a sample configuration for PRTG's syslog and SNMP trap receiver and gives you an idea about how to use these features.

Syslog is a well-established standard for computer message logging. Many network devices support sending syslogs to communicate informational, analysis, and debugging messages which are intended for network management and security auditing. SNMP traps are asynchronous notifications from SNMP-enabled devices and can be used to report important incidents and data, just like syslog messages. Devices trigger these messages for various reasons, such as system events, outages, critical conditions, and many more.

PRTG provides two dedicated sensor types which work as full scale syslog resp. SNMP trap receivers:

- **SNMP Trap Receiver Sensor** 2082
- **Syslog Receiver Sensor** 2245

Because both the syslog and the trap receiver are implemented as common sensor types, you do not need to install software in addition to PRTG (for example, you do not need an extra syslog server but only the PRTG web server). You can create the Syslog Receiver as well as the SNMP Trap Receiver sensors in the usual PRTG way via the add sensor 256 dialog. Then configure your syslog- or SNMP trap-enabled device(s) to send messages to PRTG.

Under lab conditions, PRTG could handle about 10,000 syslog and trap messages per second on a quad core desktop machine when using a single sensor without filters. Note: The number of messages PRTG can process actually depends on your configuration and system setup. It might be significantly less messages.

You can filter the incoming messages by various parameters so that PRTG will process only specific messages and purge other data right away. Processed messages are stored in an internal high-performance database on the particular probe machine and are available for reviewing and analyzing via the PRTG web interface. The main limiting factor for storage of syslog and trap messages is the hard disk space on the machine running the PRTG probe with these sensors.

Sample Configuration

Follow the steps below for a sample configuration of Syslog and SNMP Trap Receiver sensors. You can apply these instructions to both the SNMP Trap Receiver as well as the Syslog Receiver because the setup works in a similar way for both.

1. Adding the Receivers 3039
2. Configure the Source Devices 3040
3. Collect Messages 3040
4. Review and Analyze Messages 3041
5. Refine the Filters 3042

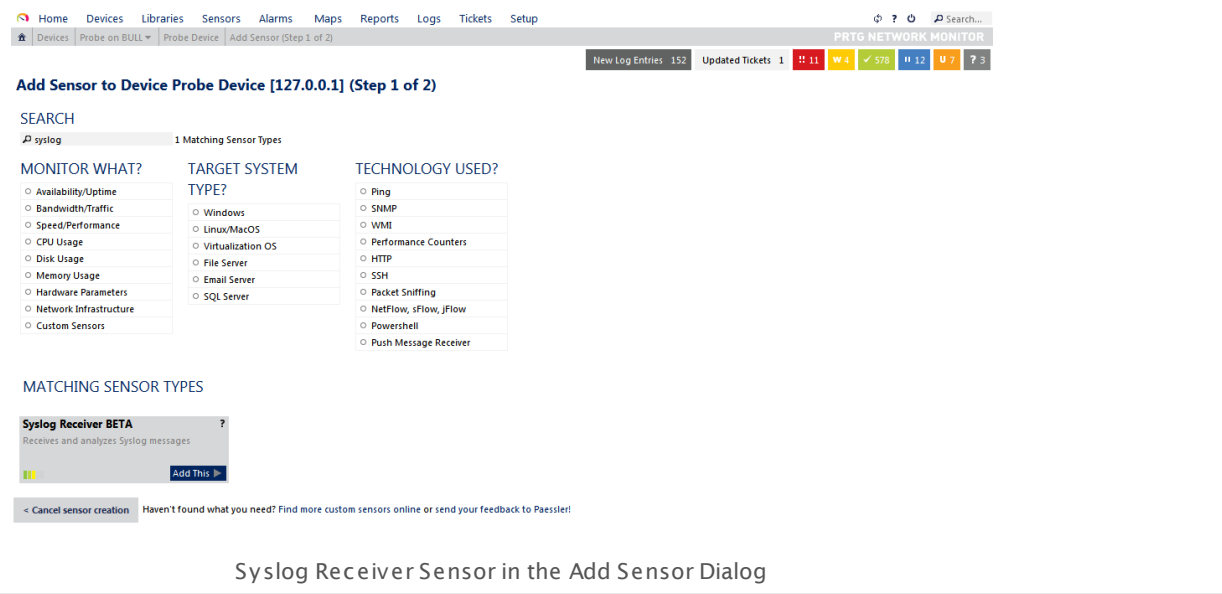
6. Create Notification Triggers 3043

Step 1: Add a Syslog Receiver or SNMP Trap Receiver sensor to PRTG.
Both sensor types inherit an implicit filter by the IP address of the parent device. So, on the one hand, it is possible to add these sensors to a probe device 91. Then you will receive all messages from the system running the probe and can optionally filter for specific sources later. On the other hand, you can add these sensors directly to the source device. Then only messages from this device will be processed.

Add the receiver sensors to the desired device in the common way, for example, via the device's context menu 192. We recommend leaving the sensor's default settings unchanged for the first configuration (port, include and exclude filter, warning and error filter) to see what data actually comes in.

Note: Adding the sensor to a network device directly will increase its speed in comparison to a filter definition in the sensor settings. Distributing Syslog and SNMP Trap Receiver sensors over different probes will make the overall performance scalable and gives you variability for the place of data storage 3135.

Note: If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper sender. For example, if you want to receive syslog or trap messages from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.

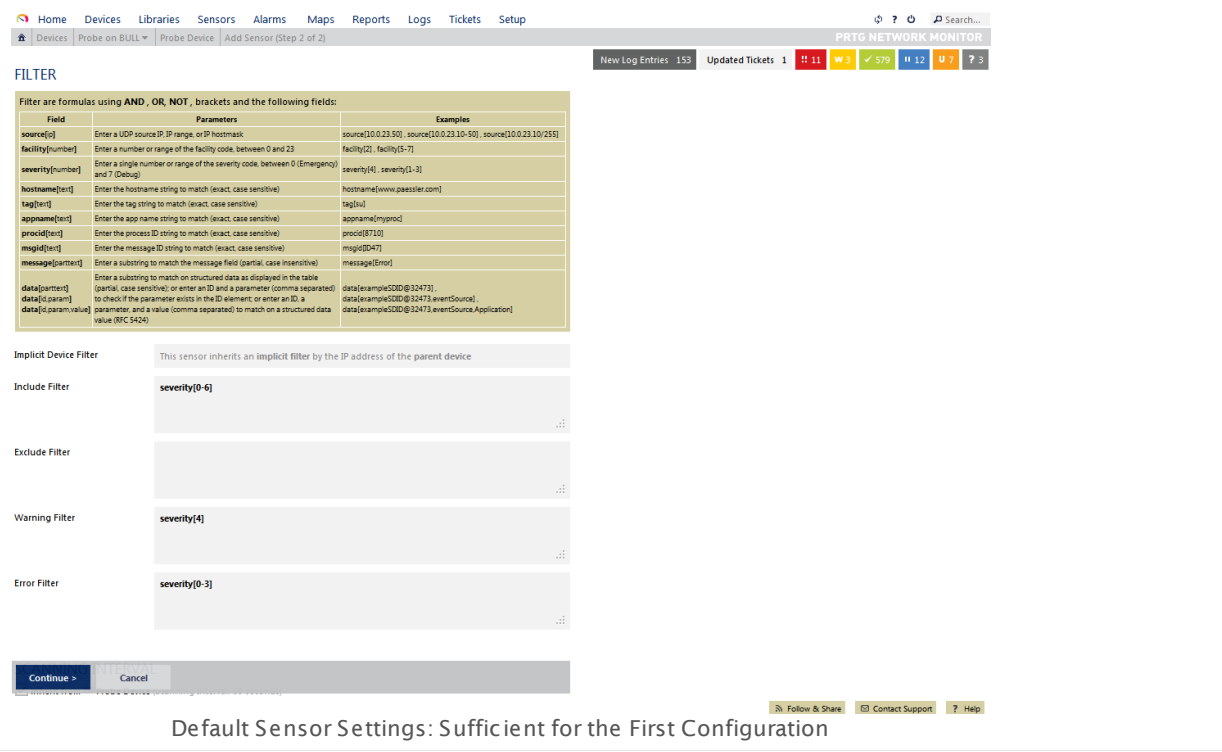


Syslog Receiver Sensor in the Add Sensor Dialog

Step 2: Configure your network device(s) which support sending syslogs or SNMP traps appropriately.
Configure your syslog or SNMP trap ready devices to send syslogs or traps (see documentations of the respective device vendors). They have to address the PRTG probe on which your Syslog or SNMP Trap Receiver sensor runs. So specify the IP address of the machine with the respective PRTG probe. If you keep your syslog or trap receiver's default settings, use the port 514.

Note: The protocol is User Datagram Protocol (UDP).

Note: The SNMP Trap Receiver does not support **SNMP v3** traps. Please use SNMP v1 or v2c instead.

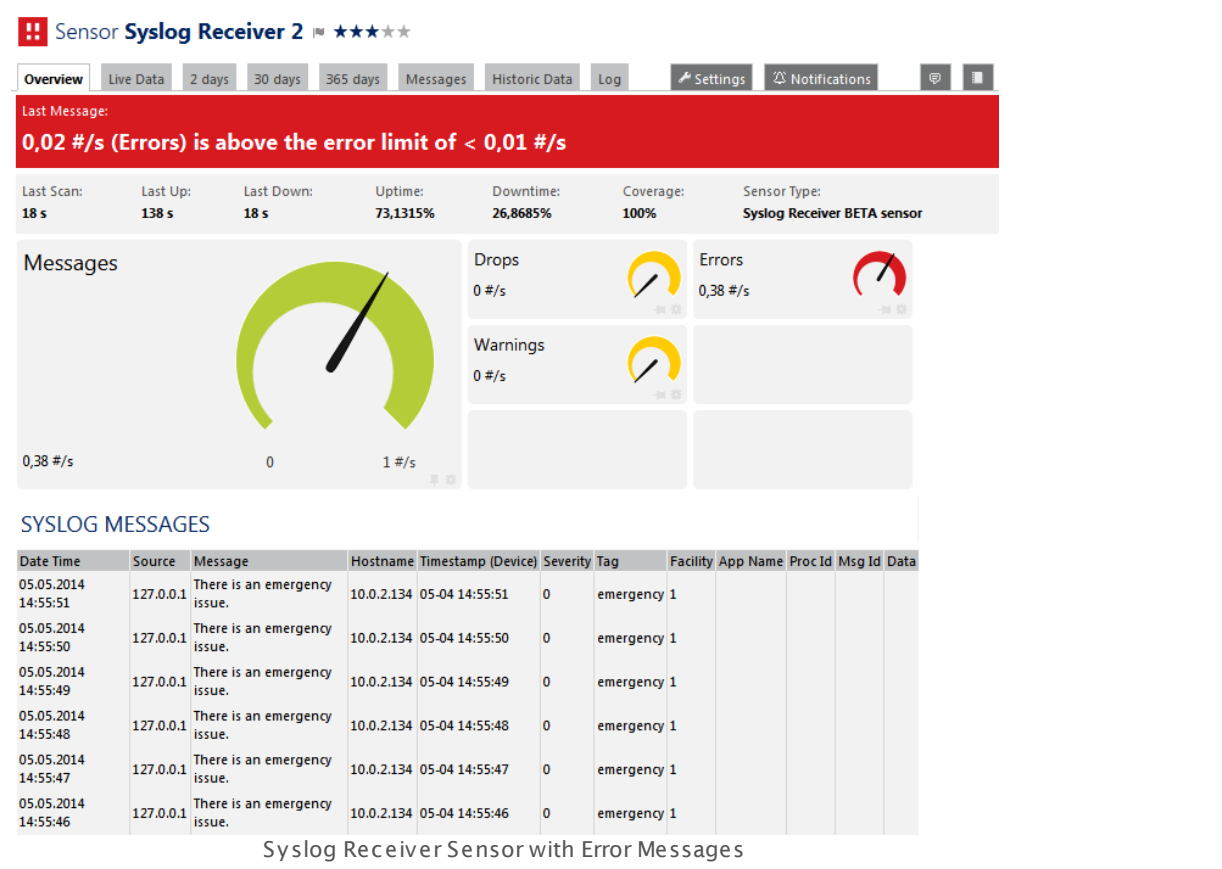


Default Sensor Settings: Sufficient for the First Configuration

Step 3: Start collecting syslog or SNMP trap messages from your devices.
You do not have to accomplish any further configuration steps to use PRTG as a syslog server or SNMP trap receiver. When your device(s) send syslogs or SNMP traps to the specified PRTG probe machine, the messages will appear automatically in PRTG's web interface. After each sensor scan (by default inherited from the parent device), PRTG will count the received syslogs or traps in the according channels (total number of messages during the last interval, error and warning messages, or dropped packets).

Let the syslog receiver or the SNMP trap receiver collect data for a while to see what comes in. By default, the respective sensor will go into a **Warning** status if there was at least one message with severity 4 and into an **Error** status if there was at least one message with severity 3 or lower during the last sensor scan.

Note: Incoming messages are counted per scanning interval, so it might take a few moments to see the received syslogs/traps, depending on the remaining time until the next sensor scan. Of course, you can use **Check Now** via the sensor's context buttons [126] to perform an immediate scan and see corresponding data. The sensor states are also defined per scan. So, for example, a message which is classified as error will count for the error channel only for one scanning interval; if there is no new error message in the following scanning interval, no message is shown in the error channel anymore and the error status will disappear after the next sensor scan. The syslog or trap itself will still be accessible on the **Messages** tab.

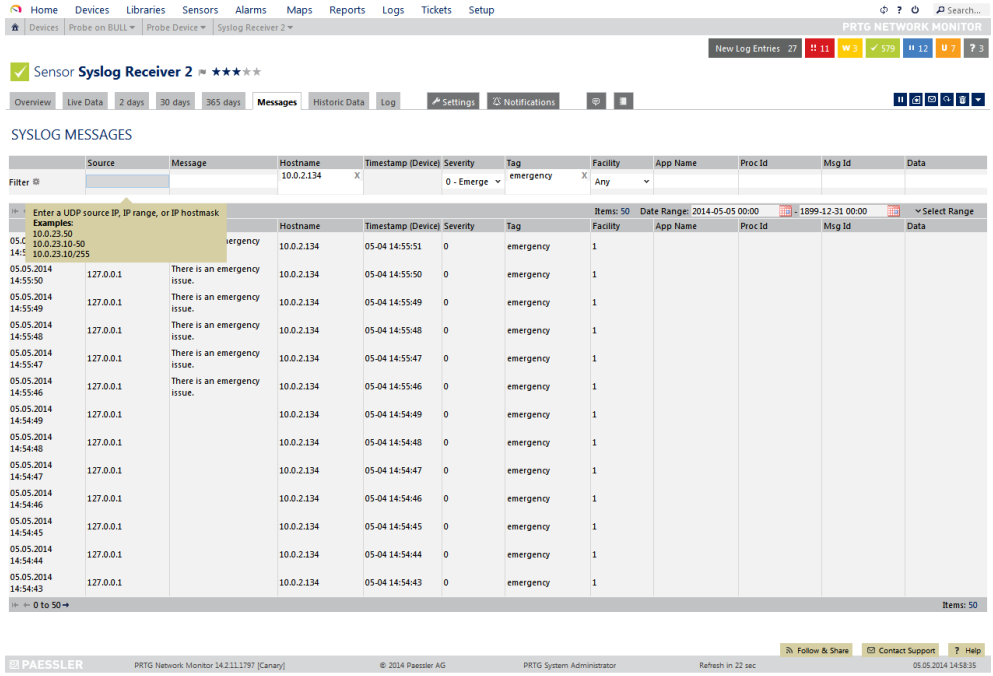


Syslog Receiver Sensor with Error Messages

Step 4: Review and analyze the collected data.
All incoming messages which match the include filter are processed and stored in PRTG's internal high-performance database. Review and analyze the received syslogs and traps via PRTG's web interface. For details, see the respective manual sections of **SNMP Trap Receiver Sensor** [2092] and **Syslog Receiver Sensor** [2255]. Then you can decide about further filtering of the incoming messages.

Note: The received data is also available in PRTG's data folder [3135] as common files. One data file is created per hour.

Note: For the SNMP Trap Receiver sensor, you can add the Management Information Base (MIB) files of your device(s) to the **\MIB** subfolder of PRTG. This will result in Object Identifier (OID) resolution and makes trap messages more comprehensible. For example, instead of the OID 1.3.6.1.4.1.32446.1.1.2 you would see SNMPv2-SMI-v1::enterprises.32446.1.1.2 = 0 (example from the PRTG MIB).



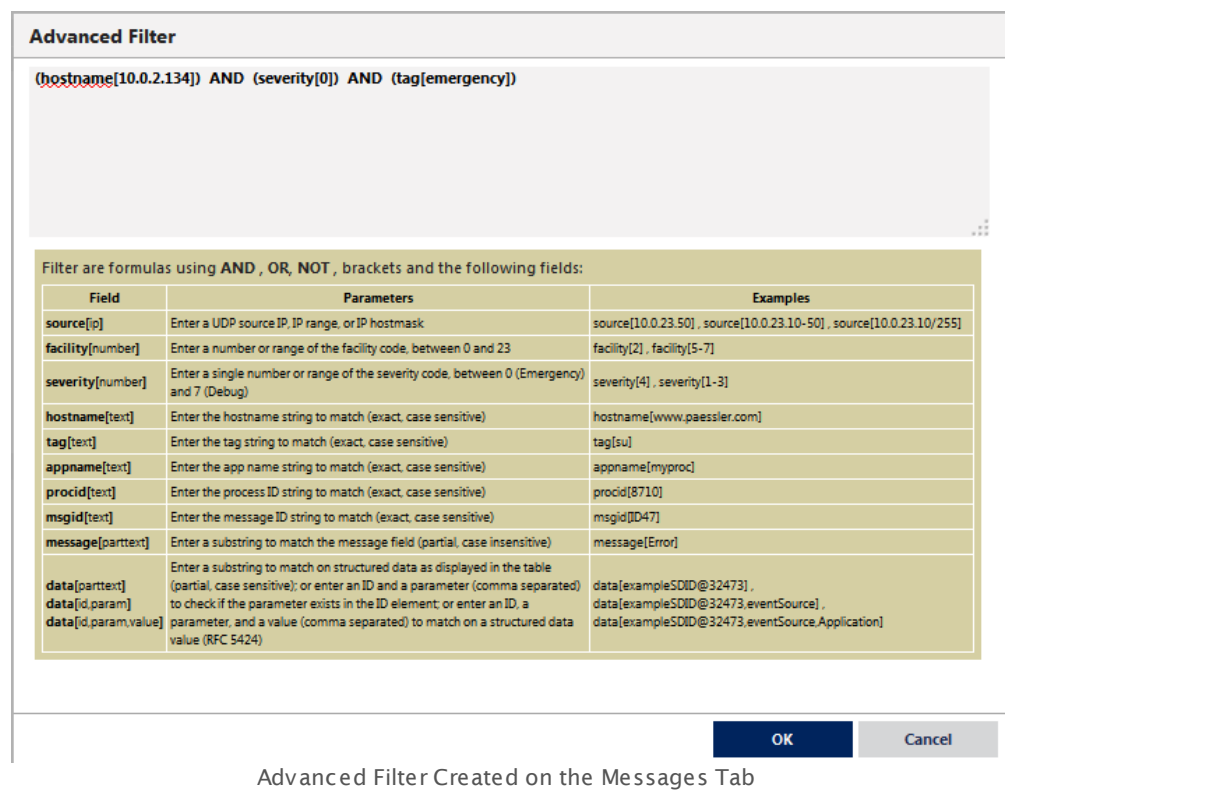
Received Syslogs on the Messages Tab

Step 5: (Optionally) refine the filters.
In order to enhance the productivity with your PRTG syslog servers and trap receivers, you can adjust the default filter settings. PRTG provides you a comprehensible formula system that you can use to describe which kind of messages you want to process and which of them will count as error or warning messages. You can configure the following filters for received messages in the settings of the respective receiver:

- **Include** filter: Process and store specific types of messages only.
- **Exclude** filter: Do not process specific types of messages and discard them.
- **Warning** filter: Define rules to categorize received messages as warnings.
- **Error** filter: Define rules to categorize received messages as errors.

Use the syntax which is provided in the corresponding manual sections to define your individual filter rules: SNMP Trap Receiver Sensor 2091 and Syslog Receiver Sensor 2254.

Note: You can create filter rules with a few mouse clicks using the **Advanced Filter** on the **Messages** tab of a specific sensor and copy these rules into the sensor settings to apply them.

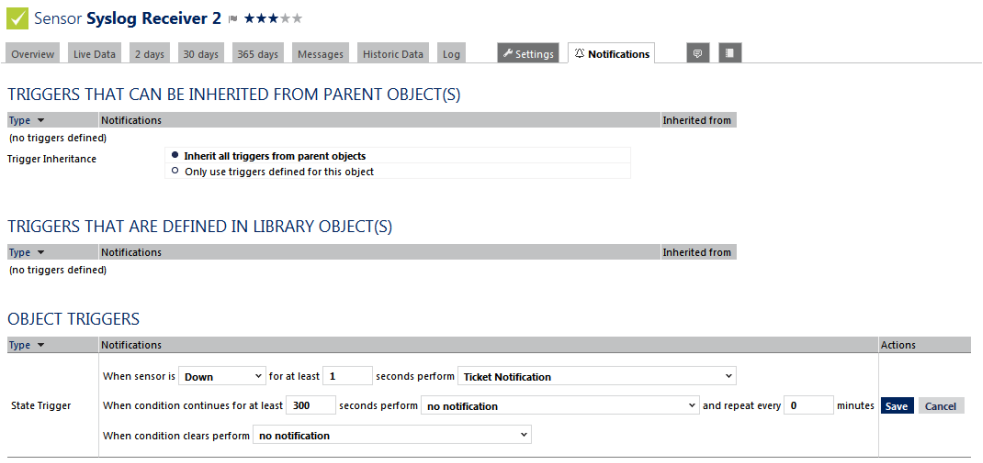


Advanced Filter Created on the Messages Tab

Step 6: (Optionally) create notification triggers.
By default, the warning and error channels of the Syslog and SNMP Trap Receiver sensors have a very low upper warning resp. error limit (0.00000001). The reason for this is that even when only one syslog or trap has been counted in the respective channel during a scanning interval, the overall status of the sensor will show this with the corresponding status. This way, you will always recognize if there is something wrong on the monitored system.

Because of this sensor behavior, best practice would be to add a **State Trigger** on the **Notifications** 2759 tab of the sensor if you want to get a notification 100 when a warning or error message type comes in. Define a very low **Down** or **Warning** time condition to not miss any warnings or errors to not miss any messages, for example 0 seconds. Another option would be a **Speed Trigger** for notifications regarding messages per second.

Note: You can use syslog and trap specific placeholders in notification templates in order to see the messages when you receive a notification. See the **More** 3044 section below for more information.



State Trigger for a Syslog Receiver

Part 11

PRTG Administration Tool

11 PRTG Administration Tool

With the **PRTG Administration Tool** that you can launch from the Windows start menu, you can edit administrative settings that affect your PRTG installation, the local probe running with it, and remote probe installations. All settings will require a restart of the affected PRTG Windows services to apply any changes on the configuration. Please see the following sections for details.

If you start the PRTG Administration Tool on the PRTG core server, you can change settings which affect your whole PRTG installation and your local probe. If you run the PRTG Administration Tool on a system on which a remote probe runs, you can only change settings which are related to this probe.

Note: You can also change many administrative settings via the **Setup** 2828 in the PRTG web interface. For probes, settings are also available on the corresponding tab 295 in the web interface.

Note: You can review the history of all changes to the settings of the PRTG Administration Tool in the **Logs (Debug)** directory. The name of the according log file is **PRTG Administration Tool Changelog.log**. For information on how to find the folder used for storage, please see section **Data Storage** 3135.

11.1 PRTG Administration Tool on Core Server System

With the PRTG Administration tool you can define various system-oriented settings that affect your PRTG installation, as well as restart services and view log information. You can change many of these settings also via the system administration 2828 in the PRTG web interface.

Note: To get familiar with the different components of PRTG, we recommend that you read the **Architecture** 83 section.

Note: All settings you define here are only valid for the local installation running on the computer you open the program on. In order to change settings for another installation, for example, another cluster node installation, please log in to this computer and open the program there.

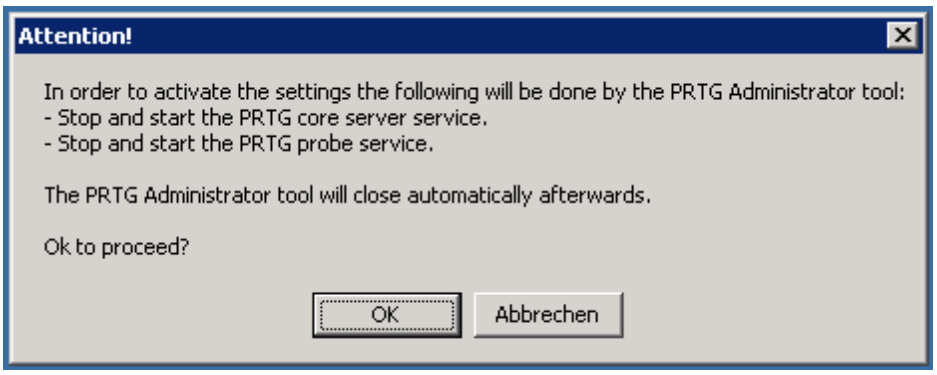
Note: This section describes the available settings in the PRTG Administration Tool when you open the tool on the PRTG core server system (core or web server and local probe related). If you open this program on a remote probe machine, only probe related settings 3073 are available.

If you prefer a video introduction to the **PRTG Administration Tool**, see the **More** 3072 section below for more information.

From the **PRTG Network Monitor** group in Windows start menu, please select **PRTG Administration Tool** to open the application. You can choose from these options in different tabs:

- Web Server 3048
- Core Server 3051
- Cluster 3053
- Administrator 3058
- License 3059
- Probe Settings for Core Connection 3060
- Probe Settings for Monitoring 3062
- Service Start/Stop 3063
- Logs and Infos 3065

When you close the program with the **Ok** button after changing settings, you are asked to restart the core server Windows service and/or probe service in order to save the settings. Please confirm by clicking the **OK** button. Otherwise the changes are ignored.

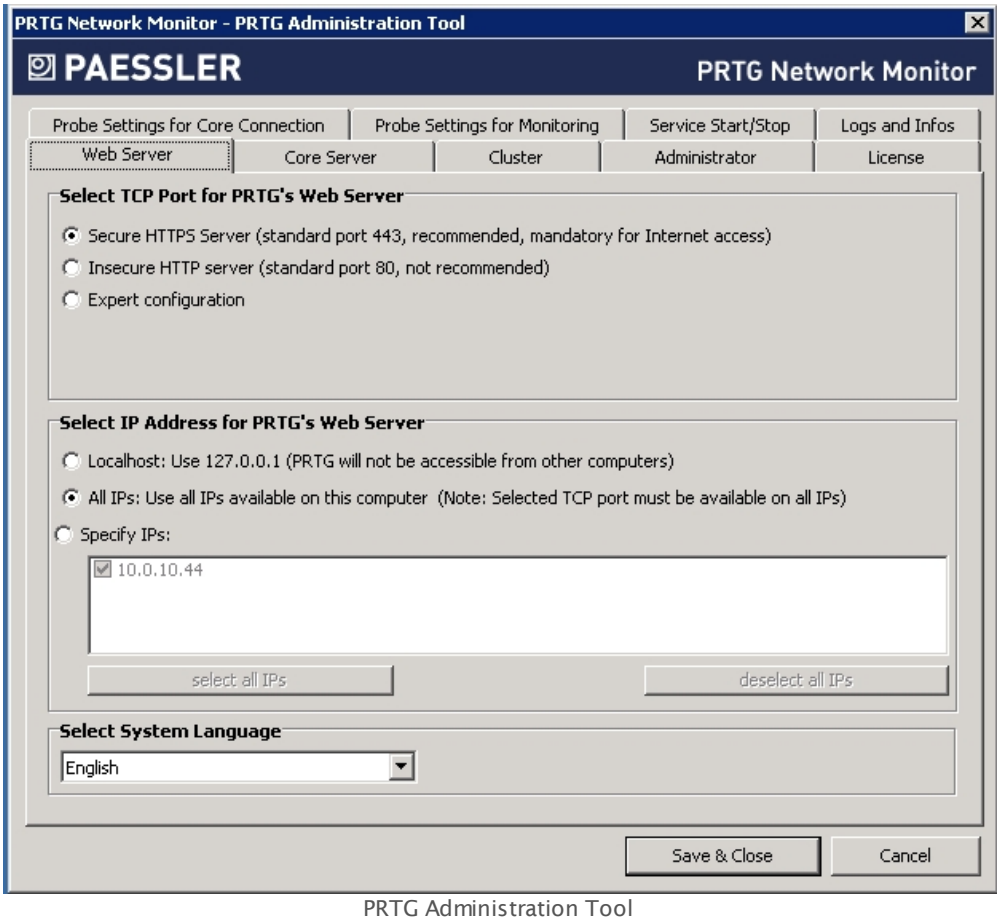


PRTG Administration Tool: Restart Services

Web Server

Edit IPs, ports, access methods, and language for the Ajax web interface 108.

Note: You can change all settings which are on the **Web Server** tab also via the PRTG web interface in the **User Interface** 2860 settings.



PRTG Administration Tool

WEB SERVER

Select TCP Port for PRTG's Web Server	PRTG is running a web server in order to provide the web and Windows interface. Please specify on which port this web server will run. Choose between: ▪ **Secure HTTPS server (recommended, mandatory for internet access)**: This is the recommended setting and needed to access the PRTG server via the internet. Use a secure HTTPS connection that is encrypted via SSL on port 443. Note: Although the connection is secure, you will see an **SSL Certificate Warning** 113 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** 3137. Note: If port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to port 443 via HTTPS. You can change this behavior using a registry setting. Note: If port 443 is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket 171 that shows you the currently used port number and will switch back to 443 as soon as it is available again. ▪ **Insecure HTTP server (standard port 80, not recommended)**: Use a standard web server without SSL encryption on port 80. This setting is not recommended for WAN connections. Note: If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only. ▪ **Expert configuration**: This setting allows you to specify a custom web server port and the security of the connection. This option is intended for systems with an existing web server on the standard port. Define port and encryption below. Note: If PRTG always uses a fallback port after a server restart, check for other programs that use the same port as PRTG. For example, the Microsoft IIS web server also uses the port 80 (443 for SSL) by default and blocks it. Please disable such programs and services on startup.
Expert Configuration: SSL Encryption	This setting is only visible if the expert configuration is selected above. Specify if you want to use an SSL encryption. Choose between:

WEB SERVER

- **Use SSL encryption (HTTPS)**: Use a secure HTTPS connection that is encrypted via SSL on a custom port as defined above. Note: Although the connection is secure, you will see an **SSL Certificate Warning** 113 in your browser when logging in to the PRTG web interface, because the default certificate is unknown to your browser. You can install another SSL certificate for PRTG later. Please see **Using Your Own SSL Certificate** 3137.
- **Don't use encryption (not recommended)**: This setting is not recommended for WAN connections. Use a standard web server without SSL encryption on a custom port as defined above. Note: If used on the internet, attackers could potentially spy on credentials you enter into PRTG. We strongly recommend using this option in a LAN only.

Expert Configuration: Web Server Port

This setting is only visible if the expert configuration is selected above. Enter the desired TCP port number you want the PRTG web server to run on. Please enter an integer value.

Note: If you use a secure connection and port 80 is free, PRTG will reserve it as well. When users try to connect on port 80 via HTTP, they will then be redirected to the custom port via HTTPS. You can change this behavior using a registry setting.

Note: If port the defined port for a secure connection is not available, PRTG will try port 8443 as fallback. If this port is also not available, PRTG searches from port 32000 upwards for a free port. PRTG sends a ticket 171 that shows you the currently used port number and will switch back to the original port as soon as it is available again.

Select IP Address for PRTG's Web Server

PRTG is running a web server in order to provide access via the web and Windows interface. Please specify which IP address this web server will run on. Note: Later, you can log in to PRTG by simply pointing your browser to the specified IP address.

Choose between:

- **Localhost, 127.0.0.1 (PRTG will not be accessible from other computers)**: Use 127.0.0.1 only. PRTG's web and Windows interface will only be accessible from the computer PRTG is installed on.
  Note: Either the selected port or at least one port in the range from **8080** to **8089** has to be available on 127.0.0.1.

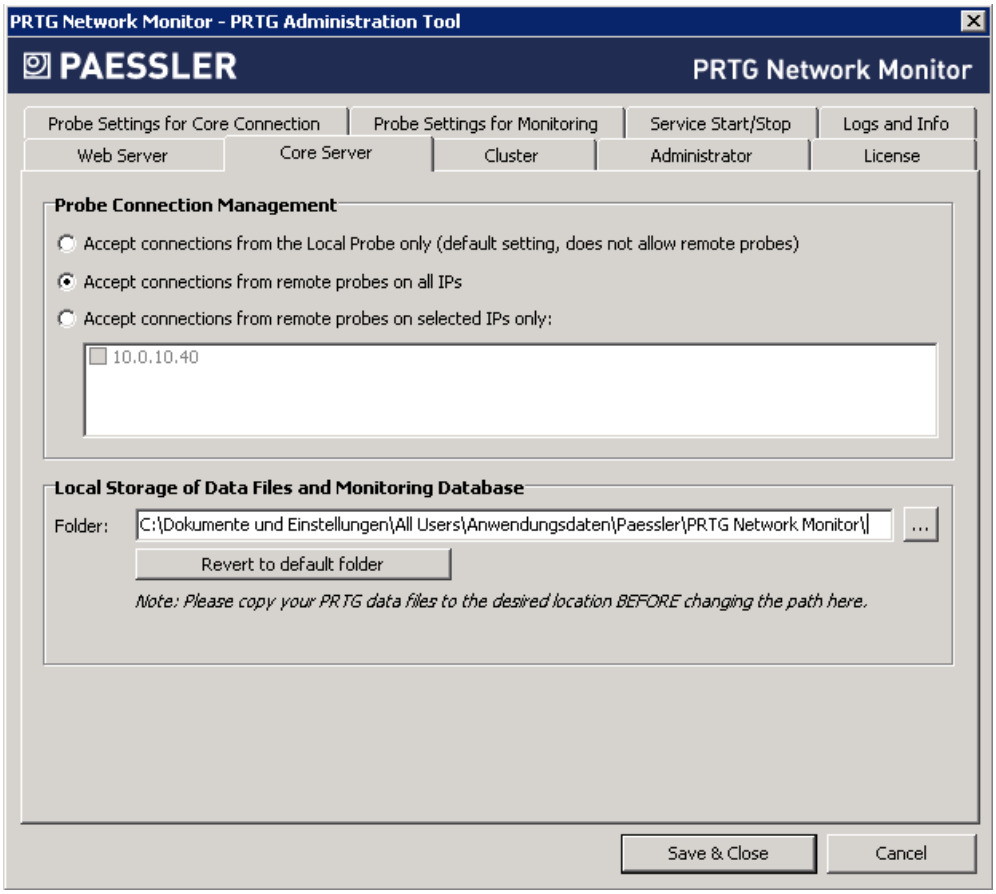
Note: If you run PRTG on localhost, please do not use the DNS name http://localhost to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or http://127.0.0.1 instead.

WEB SERVER

	▪ **All IPs available on this computer**: Use all IP addresses available on this computer and enable access to the web server for all of these addresses. Note: The TCP port selected below must be free on every available IP address. ▪ **Specify IPs**: Select specific IP addresses on which the PRTG Web server will run on. A list specific to your system is shown. Add a check mark in front of every IP address you want the PRTG web server to be available at. You can also select and deselect all addresses by clicking on the check box in the table header. Note: Either the selected port or at least one port in the range from **8080** to **8089** has to be available on the specified IP address. Note: Regardless of the selected setting above, one port in the range from **8080** to **8180** has to be available on the specified IP address so PRTG can create reports. The report engine will try to connect to the core server on one of these ports. Note: If PRTG does not find a network card on startup it will switch the IP setting to **Localhost**. This setting will remain, even if a network card is available later on. If you disabled or removed the network card on the machine running the PRTG core server, please re-check this setting.
Select System Language	Choose the system language from the drop down list. Default is **English**. Depending on your installation, you may be able to choose other languages here. This setting defines the language of the Ajax web interface 108, as well as of the **PRTG Administration Tool** 3046.

Core Server

Define settings for the core server.



PRTG Administration Tool: Core Server

CORE SERVER

Probe Connection Management

Define how PRTG will handle incoming connections from probes. Choose between the following options:

- **Accept connections from the Local Probe only (default setting, does not allow remote probes)**: This is the default setting. Only local probe connections will be accepted by the PRTG core server. You cannot use remote probes 3108 with this setting enabled.
- **Accept connections from remote probes on all IPs**: Incoming connections from remote probes will always be accepted, no matter on which IP address of the core server they come in.
- **Accept connections from remote probes on selected IPs only**: Incoming connections from remote probes 3117 will only be accepted on the selected IP address(es) of the core server. In the list, select the IP addresses by adding a check mark in front of the desired IPs.

CORE SERVER	
	You can also change this setting in the PRTG web interface under System Administration—Core & Probes 2884.
Local Storage of Data Files and Monitoring Database	Define the data folder to which PRTG will store configuration and monitoring data. Click on the **...** button to choose another folder on your system. Note: Before changing the path, make sure you stop both services and copy all data to the new location. Click on the **Revert to default folder** to reset to default.

Cluster

On the **Cluster** tab you can manually change how the current core installation will behave in a cluster. Before changing settings here, please read Failover Cluster Configuration 3122 section.

PRTG Administration Tool: Cluster

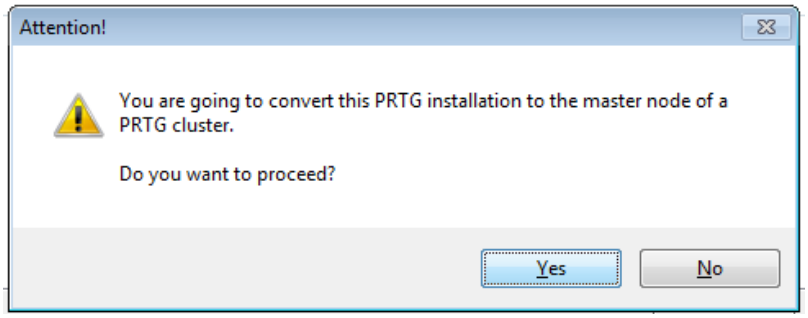
CLUSTER

Cluster Settings	Depending on the current cluster settings you will see different information here. ▪ **Cluster Mode**: Shows which cluster mode the current installation is running. This setting is shown for your information only and cannot be changed here. Possible values are **Standalone** (no cluster mode), **Cluster Mode: Master Node**, or **Cluster Mode: Failover Node**. ▪ **Cluster Port**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here. ▪ **Cluster Access Key**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here. ▪ **Own Node ID**: This field is only shown when PRTG is running in a cluster mode. This setting is shown for your information only and cannot be changed here.
Cluster Mode Actions	Depending on the current cluster settings, you see different active buttons here. For details, see below.

Follow these instructions to create or join a cluster, or to change its settings:

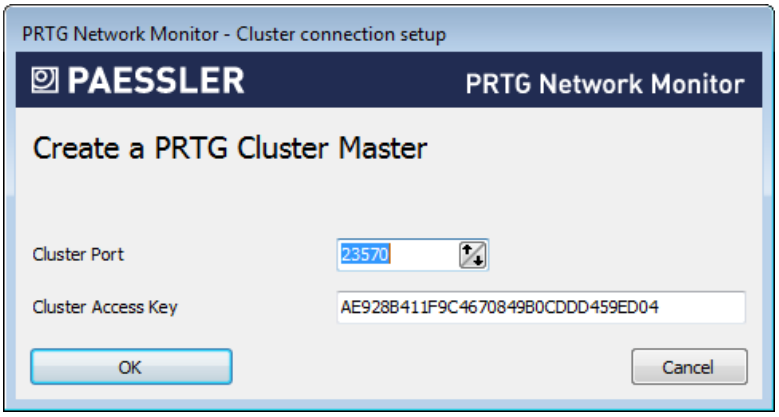
Create a PRTG Cluster...

- Start creating a cluster by clicking this button. The current PRTG core server will then be the **Master Node** of your cluster.
- After you click this button, please confirm converting this installation into a master node by clicking on the **Yes** button.



Converting an Installation into a Cluster Master Node

- A new dialog box will appear.

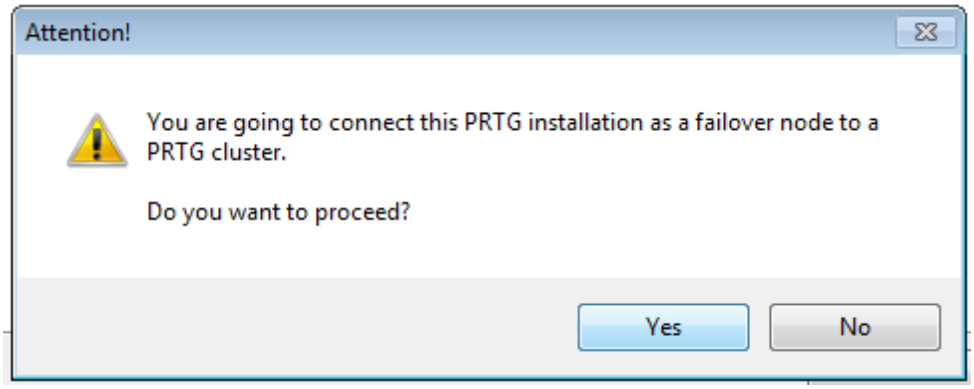


PRTG Administrator: Creating a Cluster Master

- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your Failover Node (s).
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

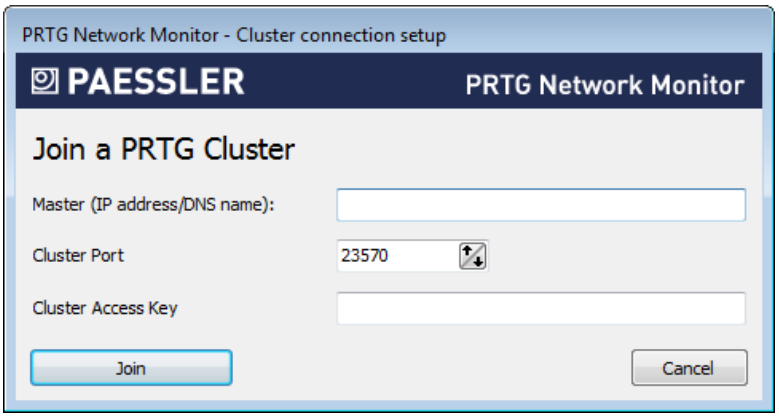
Join a PRTG Cluster...

- Add this installation to an existing cluster which already has a **Master Node**, by clicking this button. The current PRTG core server will then be a **Failover Node** in the cluster.
- Note: This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- After you click this button, confirm converting this installation into a failover node by clicking on the **Yes** button.



Converting an Installation into a Cluster Failover Node

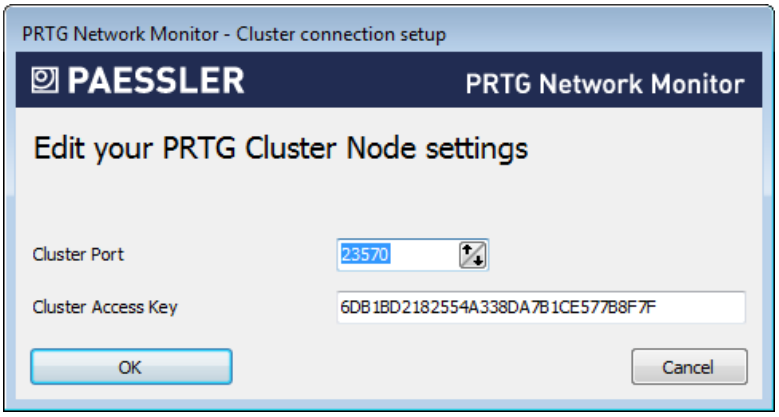
- A dialog box will appear.



PRTG Server Administrator

- Enter the cluster's **Master IP address/DNS name**. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in your **Master Node**'s settings. Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Change PRTG Cluster Settings...



PRTG Server Administrator

- If you are running your PRTG installation in cluster mode, you can change the settings here. A new window will appear.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- Please make sure you use the same settings on all nodes in your cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Revert to Standalone...

- If you are currently running your PRTG installation in cluster mode, you can change it to **Standalone** mode. If you do so, this node will no longer be part of a cluster.
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Master Heartbeat

This section is only visible if you are running your PRTG installation in cluster mode. The current master can execute an external executable file on a regular basis. We call this a "heartbeat".

You can use this, for example, to report the IP address of the current master node to a dynamic DNS provider, so a DNS name is always redirected to the current PRTG master node in case the original master node fails and a failover node (running at a different IP address) takes over the master role.

Choose between:

- **No heartbeat**: Do not execute a file on a regular basis.

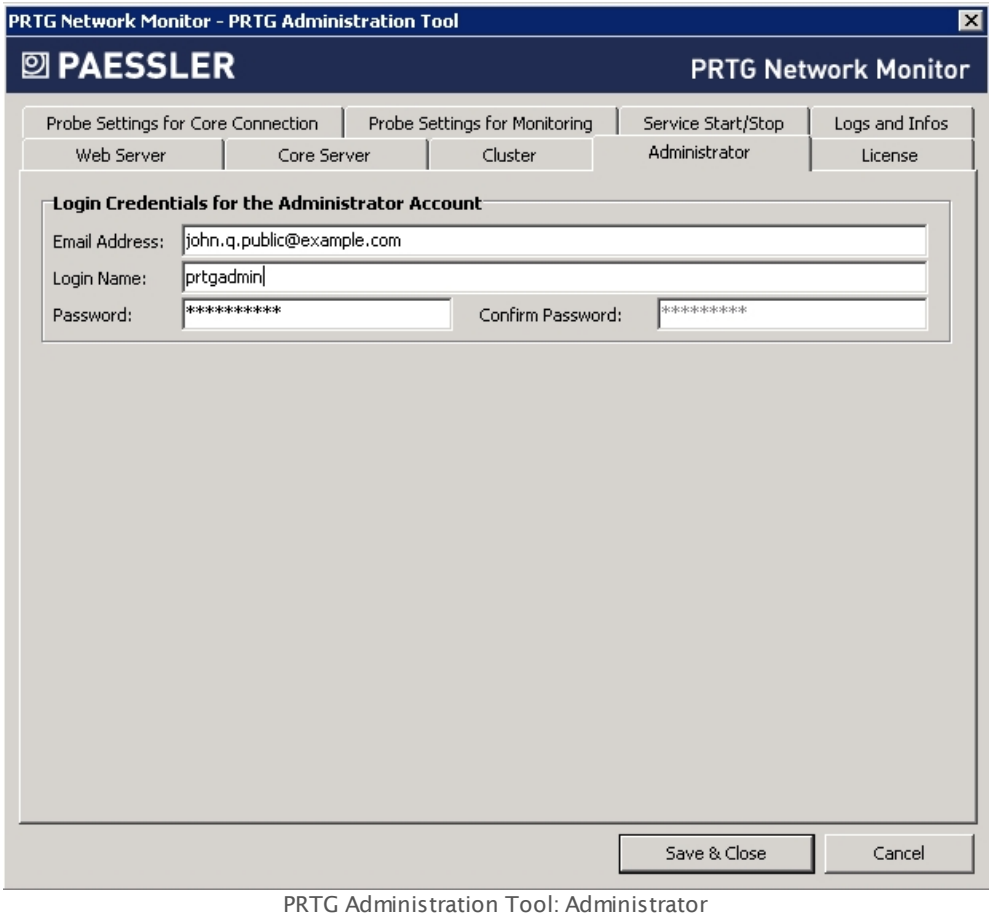
- **Run the following external executable file every 5 minutes**: Click on the **...** button to choose a file you want to execute. This can be, for example, a command line tool, or a batch file. It will be executed on the current master node only, with a fixed interval of five minutes. The interval cannot be changed.

Note: Please make sure the selected file is available under the same (local) path on all failover nodes. In case one of your failover nodes becomes current master, the heartbeat can only be executed reliably if the respective executable file exists on all of your failover nodes.

Administrator

Change PRTG System Administrator specific settings.

Note: You can change these settings also in the account settings of the **PRTG System Administrator** user in the PRTG web interface.



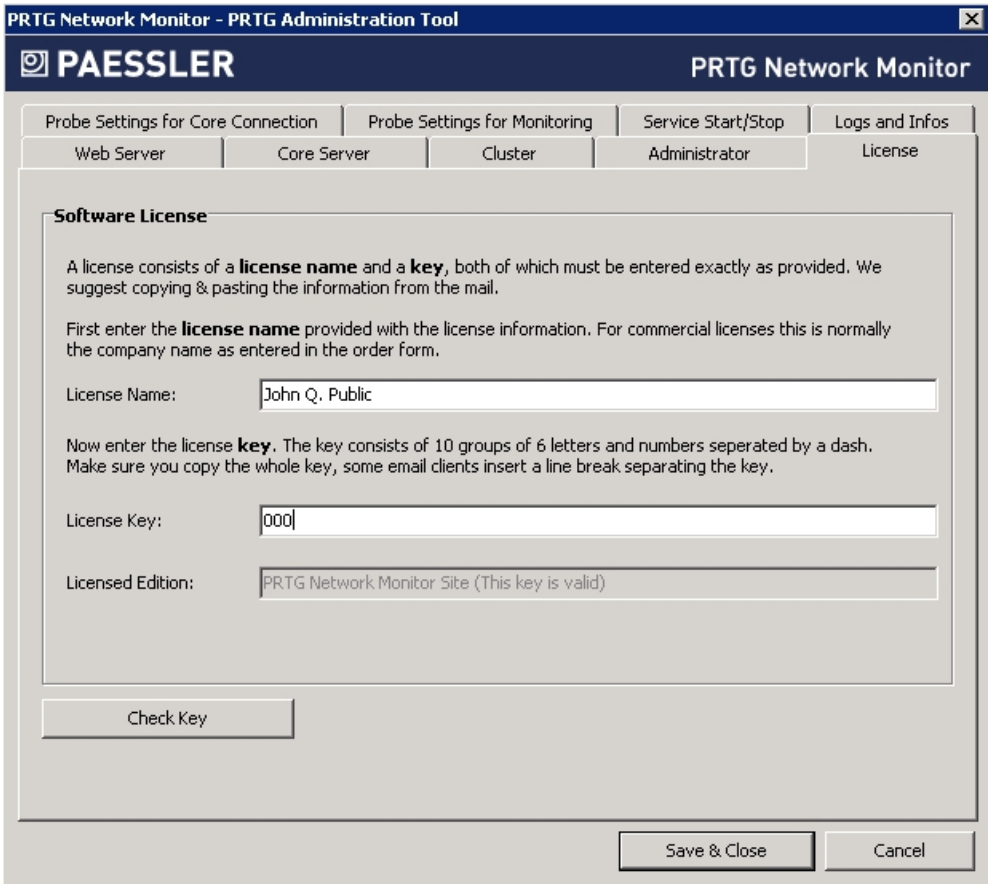
PRTG Administration Tool: Administrator

LOGIN CREDENTIALS FOR THE ADMINISTRATOR ACCOUNT

Email Address	Enter a valid administrator's email address. By default, PRTG will send notifications and important messages to this address.
Login Name	Enter a name for the **PRTG System Administrator** login; this is your default login. You use it when you log in to the PRTG web interface or Windows Enterprise Console. Note: The default login name is **prtgadmin**
Password	Enter a password for the **PRTG System Administrator** login; this is your default login. You use it when you log in to the PRTG Web- or Windows Enterprise Console. Note: The default password is **prtgadmin**
Confirm Password	If you change your password, re-enter the password for the **PRTG System Administrator** login to confirm it.

License

To use a PRTG license with this installation of PRTG, please enter the license information you have received from Paessler via email. To avoid typing errors, please copy and paste both the **License Name** and the **License Key** from the email. Both must be transferred exactly as shown in the email.



PRTG Administration Tool: License

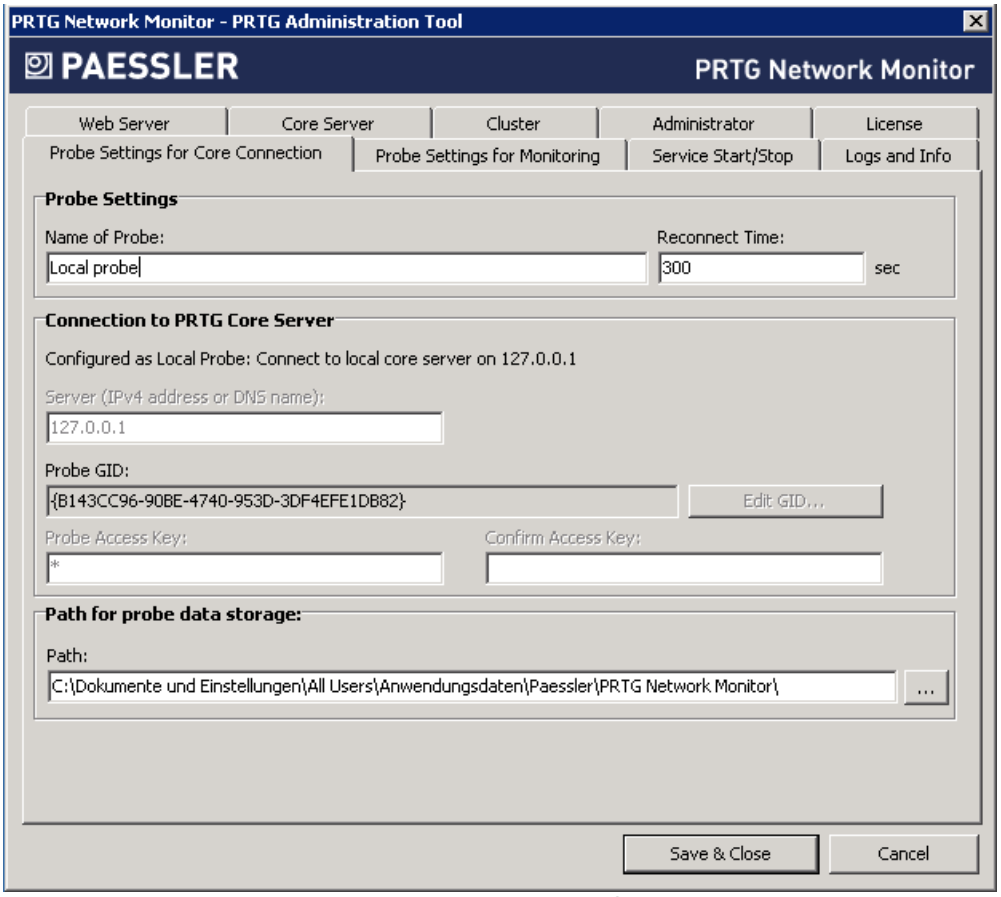
To make sure your key has been entered correctly please click on the **Check Key** button. A popup box will either show success or denial of your license information. License information is also checked if you change tabs.

In the **Licensed Edition** field you will see an accepted license key.

Note: You have to use the right edition for your license key. For example, the installer for trial and Freeware edition does not accept any commercial keys. For more information, please see **Enter a License Key** 62 section.

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.



PRTG Administration Tool: Probe Settings for Core Connection

PROBE SETTINGS

Name of Probe	Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.
Reconnect Time	Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings will affect how the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

CONNECTION TO PRTG CORE SERVER

Server (IPv4 address or DNS name)	If this probe is configured as the **Local Probe** of the PRTG core installation, it will connect to the core via 127.0.0.1 which you cannot change. If this probe is configured as a **Remote Probe**, enter the IP address or DNS name of the core server.
Probe GID	The **Probe GID** is a unique identifier for the probe. We recommend that you do not change it. Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click on the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value. It is not possible to change the GID for a local probe. Note: You can deny GIDs under **System Administration—Core & Probes** 2884 in the PRTG web interface.
Probe Access Key	You do not need an access key for **Local Probe** connections. On a **Remote Probe**, the **Probe Access Key** must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. Please see **System Administration—Core & Probes** 2884 section for more information. Note: Also check allowed and denied IPs there to ensure that the core server accepts the IP address of the remote probe.
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to assure correctness.

PATH FOR PROBE DATA STORAGE

Path	Define the data folder to which PRTG will store configuration and monitoring data. Click on the **...** button to choose another folder on your system. Note: Before changing the path, make sure you stop both services and copy all data to the new location.

Probe Settings for Monitoring

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that will be used for outgoing monitoring requests of certain sensor types.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP. Note: This feature does not support all sensor types for technical reasons.
- This is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

Note: If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see IPv6 105 section.

Service Start/Stop

You can stop and start PRTG Windows service manually. Click the **Stop Core Server** resp. **Stop Probe Service** button to stop a service, and **Start Core Server** resp. **Start Probe Service** to start it again. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and probes via the PRTG web interface under Administrative Tools 2901.

We recommend that you set a schedule for automatic restarts.

SCHEDULED RESTART SETTINGS

Restart Options	For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options:

SCHEDULED RESTART SETTINGS

- **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2900 in the PRTG web interface.
- **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below.
- **Scheduled system reboot (recommended)**: This is the recommended setting, although not set by default. Enter a schedule below. We recommend restarting Windows servers once a month for best performance.

Restart Schedule

This setting is only visible if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server:

- **Once per week**: Select a weekday and time below.
- **Once per month (recommended)**: Select a day of month and time below.

Specify Day

This setting is only visible if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) resp. month (1st to 30th resp. Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has.

Note: If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.

Specify Hour

This setting is only visible if you selected a schedule option above. Select the time of day when PRTG will perform the restart.

Note: A Windows warning message will be displayed 10 minutes before restart to inform a logged in user. The actual restart time can differ up to 30 minutes from the settings you enter below!

Note: You can also define a restart schedule on the **Settings** tab of a probe, section **Administrative Probe Settings** 2951, in the PRTG web interface.

Logs and Info

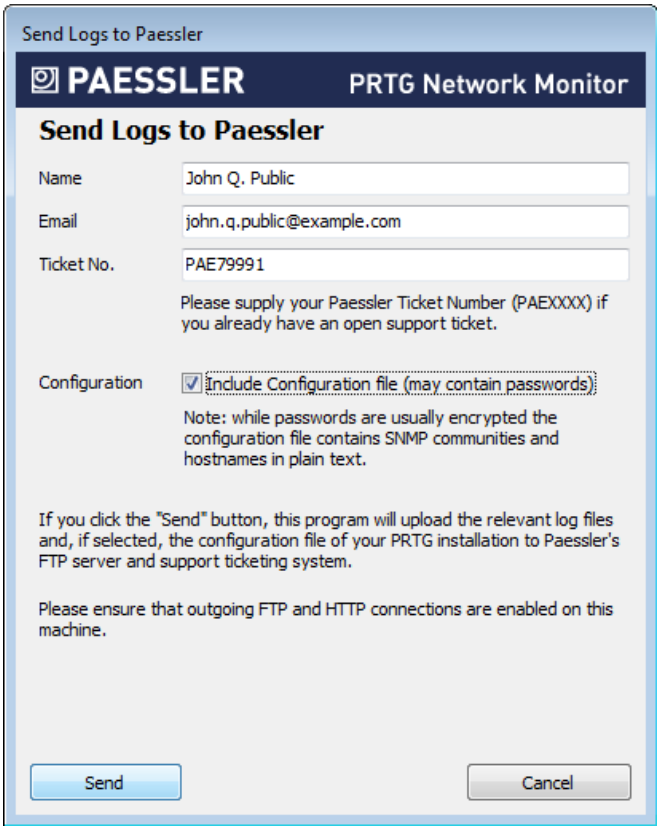
LOG FILES

Open Log Folder...	Open the PRTG Network Monitor data directory on your hard disk drive to access all log files which PRTG creates.
Send Logs to Paessler...	Open an assistant to send log files to the Paessler support team. Please see below for details. Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.
Open Support Ticket...	This will open the support form on Paessler's webpage in a browser window. Note: If you need help, we recommend that you use the **Contact Support** 2934 option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.



Send Logs to Paessler

If you open a support ticket, Paessler support might ask you to send log files for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your log files.

SEND LOGS TO PAESSLER

Name	Enter your name.
Email	Enter your valid email address. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account.
Ticket No.	This field is optional. If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically. Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.

SEND LOGS TO PAESSLER

Configuration	Define if your configuration file will be included in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click on the **Send** button to start data upload. Ensure that FTP and HTTP connections are allowed on this machine.

PROBE SETTINGS

Name of Probe	Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.
Reconnect Time	Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings will affect how the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	If this probe is configured as the **Local Probe** of the PRTG core installation, it will connect to the core via 127.0.0.1 which you cannot change. If this probe is configured as a **Remote Probe**, enter the IP address or DNS name of the core server.
Probe GID	The **Probe GID** is a unique identifier for the probe. We recommend that you do not change it. Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click on the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value. It is not possible to change the GID for a local probe. Note: You can deny GIDs under **System Administration—Core & Probes** 2884 in the PRTG web interface.

CONNECTION TO PRTG CORE SERVER

Probe Access Key	You do not need an access key for **Local Probe** connections. On a **Remote Probe**, the **Probe Access Key** must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. Please see **System Administration—Core & Probes** 2884 section for more information. Note: Also check allowed and denied IPs there to ensure that the core server accepts the IP address of the remote probe.
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to assure correctness.

PATH FOR PROBE DATA STORAGE

Path	Define the data folder to which PRTG will store configuration and monitoring data. Click on the **...** button to choose another folder on your system. Note: Before changing the path, make sure you stop both services and copy all data to the new location.

Probe Settings for Monitoring

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that will be used for outgoing monitoring requests of certain sensor types.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP. Note: This feature does not support all sensor types for technical reasons.
- This is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

Note: If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see **IPv6** 105 section.

Service Start/Stop

You can stop and start PRTG Windows service manually. Click the **Stop Core Server** resp. **Stop Probe Service** button to stop a service, and **Start Core Server** resp. **Start Probe Service** to start it again. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and probes via the PRTG web interface under **Administrative Tools** 2901.

We recommend that you set a schedule for automatic restarts.

SCHEDULED RESTART SETTINGS

Restart Options	For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options: ▪ **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2900 in the PRTG web interface. ▪ **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below. ▪ **Scheduled system reboot (recommended)**: This is the recommended setting, although not set by default. Enter a schedule below. We recommend restarting Windows servers once a month for best performance.

SCHEDULED RESTART SETTINGS

Restart Schedule	This setting is only visible if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server: ▪ **Once per week**: Select a weekday and time below. ▪ **Once per month (recommended)**: Select a day of month and time below.
Specify Day	This setting is only visible if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) resp. month (1st to 30th resp. Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has. Note: If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.
Specify Hour	This setting is only visible if you selected a schedule option above. Select the time of day when PRTG will perform the restart. Note: A Windows warning message will be displayed 10 minutes before restart to inform a logged in user. The actual restart time can differ up to 30 minutes from the settings you enter below!

Note: You can also define a restart schedule on the **Settings** tab of a probe, section **Administrative Probe Settings** 295, in the PRTG web interface.

Logs and Info

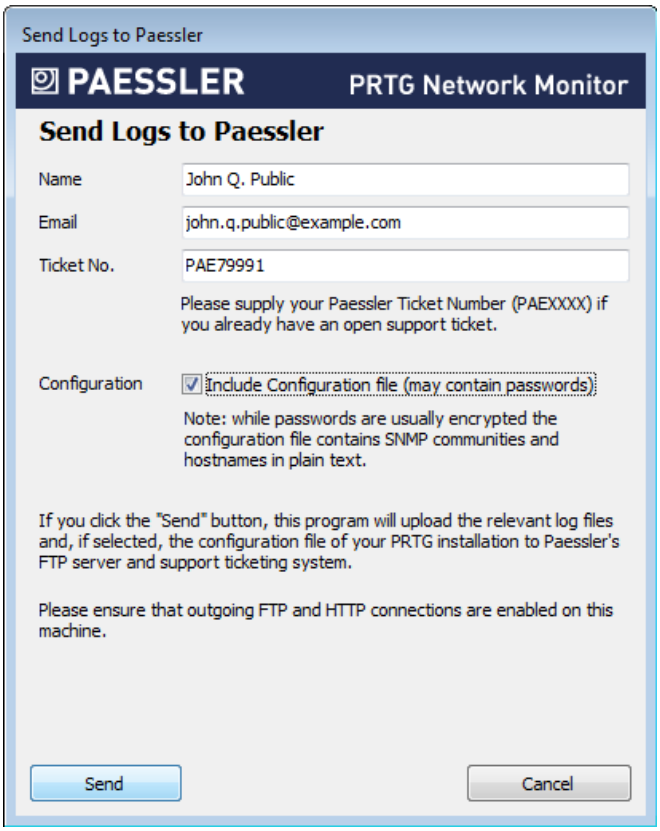
LOG FILES

Open Log Folder...	Open the PRTG Network Monitor data directory on your hard disk drive to access all log files which PRTG creates.
Send Logs to Paessler...	Open an assistant to send log files to the Paessler support team. Please see below for details. Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.
Open Support Ticket...	This will open the support form on Paessler's webpage in a browser window. Note: If you need help, we recommend that you use the **Contact Support** 2934 option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.



Send Logs to Paessler

If you open a support ticket, Paessler support might ask you to send log files for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your log files.

SEND LOGS TO PAESSLER

Name	Enter your name.
Email	Enter your valid email address. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account.

SEND LOGS TO PAESSLER

Ticket No.	This field is optional. If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically. Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.
Configuration	Define if your configuration file will be included in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click on the **Send** button to start data upload. Ensure that FTP and HTTP connections are allowed on this machine.

More

Paessler Website: PRTG Administration Tool (video tutorial)

- https://www.paessler.com/support/videos/prtg-basics/administration-tool

Knowledge Base: Which ports does PRTG use on my system?

- https://kb.paessler.com/en/topic/61462

11.2 PRTG Administration Tool on Remote Probe Systems

If you start the PRTG Administration Tools on a system on which a PRTG **Remote Probe** 3109 runs, you can define various probe related settings, restart services, and view log information. You can change many of these settings also via the system administration 2828 and the probe settings tab 295 in the PRTG web interface.

Note: To get familiar with the different components of PRTG, we recommend that you read the **Architecture** 83 section.

Note: All settings made here are only valid for the local installation running on the computer you open the program on. In order to change settings for another installation, for example, another remote probe installation, please log in to this computer and open the program there.

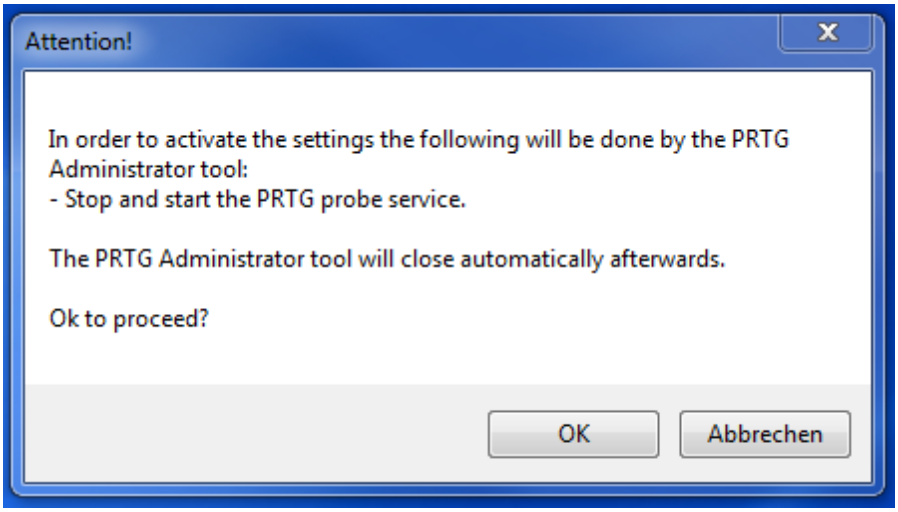
Note: This section describes the available settings in the PRTG Administration Tool when you open the tool on a PRTG remote probe system. If you open this program on the PRTG core server, you have also access to settings regarding your whole PRTG installation.

If you prefer a video introduction to the **PRTG Administration Tool**, see the **More** 3080 section below for more information.

From the **PRTG Network Monitor** group in Windows start menu, please select **PRTG Administration Tool** to open the application. You can choose from these options in different tabs:

- Probe Settings for Core Connection 3074
- Probe Settings for Monitoring 3076
- Service Start/Stop 3077
- Logs and Infos 3078

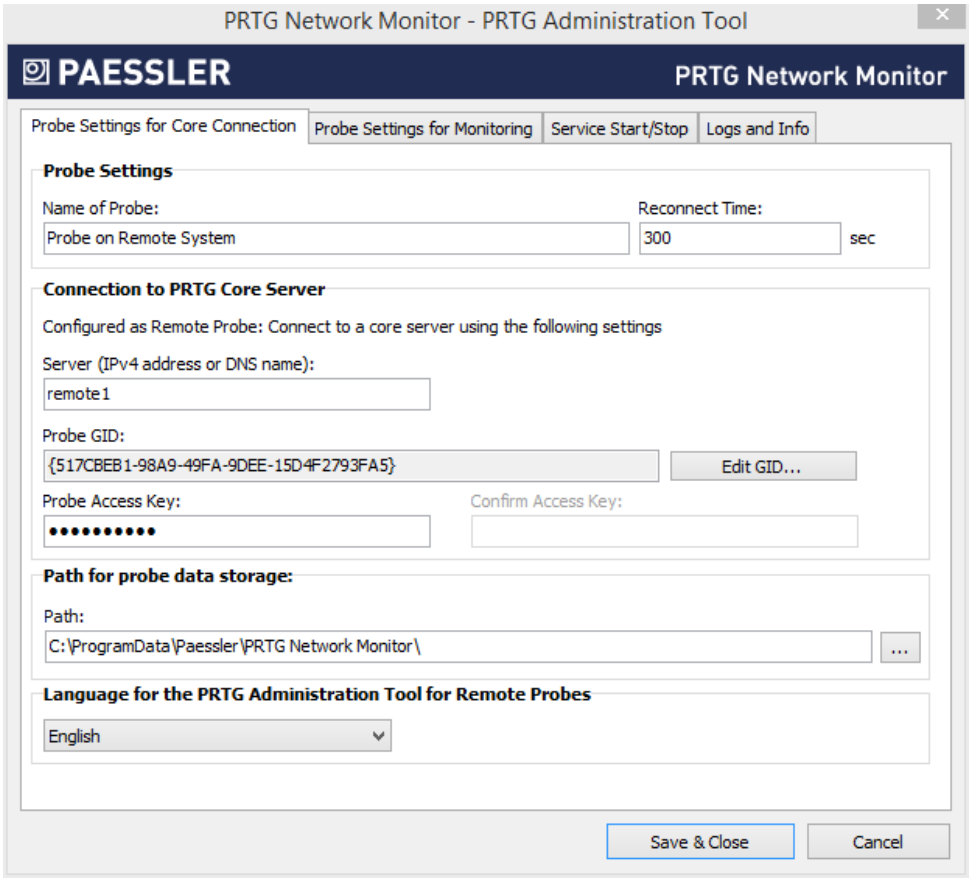
When you close the program with the **Ok** button after changing settings, you are asked to restart the probe service in order to save the settings. Please confirm by clicking the **OK** button. Otherwise the changes are ignored.



PRTG Administrator: Restart Probe Service

Probe Settings for Core Connection

Define general settings regarding the probe and probe connections.



PRTG Administrator: Probe Settings for Core Connection

PROBE SETTINGS

Name of Probe	Enter a meaningful name to identify the probe. PRTG shows this name, for example, in the device tree, and in all alarms by default. Please enter a string.
Reconnect Time	Define the time that PRTG will wait until the probe tries to reconnect to the core server if the connection fails. Please enter an integer value.

CONNECTION TO PRTG CORE SERVER

These settings will affect how the probe will connect to the core server. A probe is either a local probe or a remote probe. PRTG will automatically detect the type of probe and show the correct setting options.

Server (IPv4 address or DNS name)	If this probe is configured as the **Local Probe** of the PRTG core installation, it will connect to the core via 127.0.0.1 which you cannot change. If this probe is configured as a **Remote Probe**, enter the IP address or DNS name of the core server.
Probe GID	The **Probe GID** is a unique identifier for the probe. We recommend that you do not change it. Exception: Only if you substitute an existing remote probe from a different computer, you have to copy the GID from the old probe to the new probe. To do so, click on the **Edit GID...** button and confirm the warning with **Yes**. You can then change the value. It is not possible to change the GID for a local probe. Note: You can deny GIDs under **System Administration—Core & Probes** 2884 in the PRTG web interface.
Probe Access Key	You do not need an access key for **Local Probe** connections. On a **Remote Probe**, the **Probe Access Key** must match one of the access keys configured in your PRTG core server installation. If it does not match, the remote probe will not be able to connect to the core server. Please see **System Administration—Core & Probes** 2884 section for more information. Note: Also check allowed and denied IPs there to ensure that the core server accepts the IP address of the remote probe.
Confirm Access Key	If you enter an access key for a remote probe, enter it in this field again to assure correctness.

PATH FOR PROBE DATA STORAGE

Path	Define the data folder to which PRTG will store configuration and monitoring data. Click on the **...** button to choose another folder on your system. Note: Before changing the path, make sure you stop both services and copy all data to the new location.

Probe Settings for Monitoring

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that will be used for outgoing monitoring requests of certain sensor types.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP. Note: This feature does not support all sensor types for technical reasons.
- This is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

Note: If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see IPv6 105 section.

Service Start/Stop

You can stop and start PRTG Windows service manually. Click the **Stop Core Server** resp. **Stop Probe Service** button to stop a service, and **Start Core Server** resp. **Start Probe Service** to start it again. Both actions usually take from a few seconds up to several minutes to complete. You can also restart the core server and probes via the PRTG web interface under **Administrative Tools** 2901.

We recommend that you set a schedule for automatic restarts.

SCHEDULED RESTART SETTINGS

Restart Options	For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options: ▪ **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2900 in the PRTG web interface. ▪ **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below. ▪ **Scheduled system reboot (recommended)**: This is the recommended setting, although not set by default. Enter a schedule below. We recommend restarting Windows servers once a month for best performance.
Restart Schedule	This setting is only visible if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server: ▪ **Once per week**: Select a weekday and time below. ▪ **Once per month (recommended)**: Select a day of month and time below.
Specify Day	This setting is only visible if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) resp. month (1st to 30th resp. Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has.

SCHEDULED RESTART SETTINGS	
	Note: If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.
Specify Hour	This setting is only visible if you selected a schedule option above. Select the time of day when PRTG will perform the restart. Note: A Windows warning message will be displayed 10 minutes before restart to inform a logged in user. The actual restart time can differ up to 30 minutes from the settings you enter below!

Note: You can also define a restart schedule on the **Settings** tab of a probe, section **Administrative Probe Settings** 295, in the PRTG web interface.

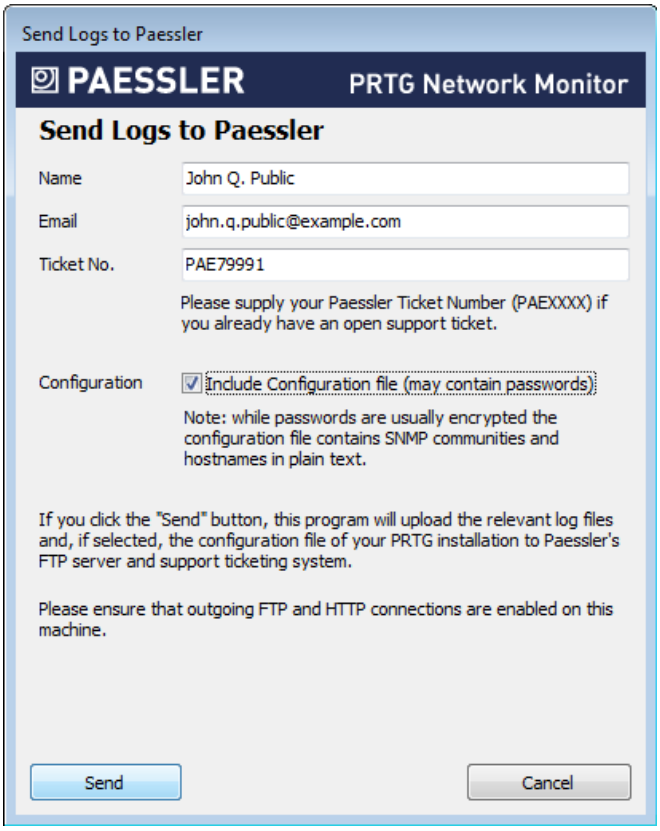
Logs and Info

LOG FILES	
Open Log Folder...	Open the PRTG Network Monitor data directory on your hard disk drive to access all log files which PRTG creates.
Send Logs to Paessler...	Open an assistant to send log files to the Paessler support team. Please see below for details. Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.
Open Support Ticket...	This will open the support form on Paessler's webpage in a browser window. Note: If you need help, we recommend that you use the **Contact Support** 2934 option in the PRTG web interface instead.

The **About** section shows information about the version of installed PRTG programs and copyright.

Send Logs to Paessler

Note: You can send log files more easily with the support bundle via **Contact Support** 2934 in the PRTG web interface.



Send Logs to Paessler

If you open a support ticket, Paessler support might ask you to send log files for further analysis. With the **Send Logs to Paessler...** button, PRTG will automatically collect, compress, and send your log files.

SEND LOGS TO PAESSLER

Name	Enter your name.
Email	Enter your valid email address. You can provide any of your addresses; however, recommended and default is the email address of your PRTG account.
Ticket No.	This field is optional. If you have already opened a ticket at Paessler support, please provide the ticket number you received. Your files will then be associated with your ticket automatically. Please enter the ticket number starting with PAE followed by four or more digits, for example, PAE12345. If you do not have a ticket number, leave this field empty.

SEND LOGS TO PAESSLER

Configuration	Define if your configuration file will be included in the data. PRTG will remove all passwords from the config file before sending it to our support team.

Click on the **Send** button to start data upload. Ensure that FTP and HTTP connections are allowed on this machine.

Part 12

Advanced Topics

12 Advanced Topics

In this section, we cover topics that address more advanced PRTG users. If you already gained some experience with PRTG, you might want to learn more about the topics following.

Advanced Topics

12.1 Active Directory Integration

PRTG offers a detailed rights management via different user groups. For detailed information please see **User Access Rights** 101.

To make user management easier, you can integrate an existing Active Directory into PRTG in four steps. During this process, you connect an Active Directory (AD) group with a user group in PRTG. All members of your AD group can then log in to PRTG using their AD domain credentials.

Note: You cannot add single AD users to PRTG, but only allow access for entire groups. PRTG automatically creates a user account for each AD user who logs in to PRTG successfully.

Step 1: Prepare Your Active Directory

- In your Active Directory, enure users you want to give access to PRTG are member of the same AD group.
- You can also organize users in different groups, for example, one group whose members will have administrator rights within PRTG, and another one whose members will have read-only rights within PRTG.

Step 2: Prepare Your PRTG Server

- Make sure the computer running PRTG is member of the domain you want to integrate it to. You can check this setting in your machine's **System Properties** (for example, **Control Panel | System and Security | System**, click **Change settings** link).

Step 3: Add Domain and Credentials (optional) to System Settings

- In the PRTG web interface 108, open the **System Administration—Core & Probes** 2887 settings.
- In section **Active Directory Integration**, enter the name of your local domain into the **Domain Name** field.
  Note: You can only integrate one AD domain into PRTG.
- Optional: PRTG uses the same Windows user account that you use to run the "PRTG Core Server Service". By default, this is the "local system" Windows user account. If this user does not have sufficient rights to query a list of all existing groups from the Active Directory, provide credentials of a user account with full AD access by using the **Use explicit credentials** option as **Access Type**.
  Note: If you cannot save changes to **Core & Probes** settings because you get an **Error (Bad Request)** with the message **Active Directory Domain not accessible**, change from "local user" to **Use explicit credentials** for **Active Directory Integration** and provide the correct credentials for your domain.
- **Save** your settings.

Step 4: Add a New User Group

- Switch to the **User Groups** tab (see **System Administration—User Groups** 2896).
- Click on the **New User Group** button to add a new PRTG user group.

- In the dialog appearing, enter a meaningful name and set the Use Active Directory setting to **Yes**.
- From the Active Directory Group drop down menu, select the group of your Active Directory whose members will have access to PRTG. If you have a very large Active Directory, you will see an input field instead of a drop down. In this case, you can enter the group name only; PRTG will add the prefix automatically.
- With the New User Type setting, define the access rights 101 a user from the selected Active Directory group will have when logging in to PRTG for the first time. You can choose between **Read/Write User** or **Read Only User** (latter is useful to show data only to a large group of users).
- **Save** your settings.

Done

That's it. All users in this Active Directory group can now log in to PRTG using their AD domain credentials. Their user accounts will use the PRTG security context of the PRTG user group you just created.

Notes and Limitations

- Active Directory users can log on to the web interface 110 using their Windows username and password (please do not enter any domain information in PRTG's **Login Name** field). When such a user logs in, PRTG will automatically create a corresponding local account on the PRTG core server. Credentials are synchronized every hour.
- All requests to the Active Directory servers are cached for one hour, for performance reasons. If a password is changed in the Active Directory, you must either wait for 1 hour or clear the cache manually by clicking on the **Clear Caches** button on the **System Administration—Administrative Tools** 2901 page in the **Setup** 2828 menu).
- By default, there are not set any rights for the new PRTG user group. Initially, users in this group will not see any objects in the PRTG device tree. Edit your device tree object's settings 159 and set access rights for your newly created user group in the **Inherit Access Rights** section.
  Note: The easiest way is to set these rights in the **Root Group Settings** 260.
- PRTG only supports explicit group rights. If your AD uses groups which are member of another group, PRTG will not regard inherited implicit rights of the parent group and therefore refuse login for members of those groups.
- PRTG ignores AD information about Organizational Units (OUs). These values cannot be read by PRTG. However, if you use the AD in an auto-discovery group 221, you can restrict the search to computers which are part of an OU.
- PRTG does not support SSO (single sign-on).
- You can integrate only one AD domain into PRTG.
- For very large Active Directories, you will see an input field instead of a drop down when you add or modify a user group. In this case, you can enter the group name only. PRTG will add the prefix automatically.

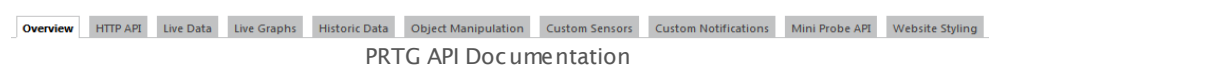
- A PRTG user account for an AD user is only created if this AD user logs on to PRTG successfully! So if you want to send email notifications 2841 to an AD user group (using the option "Send to User Group" in the notification settings), for example, by choosing the default notification "Email to all members of group [AD group name]", a member of this AD group has to log on to PRTG at least once to be able to receive an email notification. If you want to avoid these single logons of your AD group members to create user accounts, enter the email address of the AD group into the "Send to Email Address" field in the notification settings and choose "None" for the "Send to User Group" option.
- If you want to delete an AD group from PRTG (due to some changes to the AD, for example), you have to delete all users which are in this PRTG user group first. This is because AD users always have this group as their primary group which cannot be changed.
- If you want to reflect changes to your AD in PRTG, you have to delete the AD user group and all members first. Then add the AD group anew. This is because PRTG does not synchronize with your AD automatically.

12.2 Application Programming Interface (API) Definition

The PRTG Application Programming Interface (API) enables you to access monitoring data and manipulate objects using HTTP requests, run your own written sensors and notifications, implement Mini Probes, and customize the web interface.

Detailed HTTP API Documentation

An interactive documentation of the API is integrated into your PRTG installation: Login to the web interface 110 and select **Setup | PRTG API** from the main menu.



PRTG API Documentation

In different tabs, the documentation provides information about:

- **HTTP API**: Access monitoring data and manipulate monitoring objects using HTTP requests (includes an interactive query builder).
- **Custom Sensors**: Create your own sensors for customized monitoring.
- **Custom Notifications**: Create your own notifications to send alarms to external systems.
- **Mini Probe API**: Create your own small probes to get monitoring data from any platform. See section **More** 3086 below for sample usages of the Mini Probe interface.
- **Website Styling**: Customize the look and feel of PRTG by adding your own CSS statements. See section **More** 3086 below for sample customizations.

You can also have a look at Paessler's PRTG demo installation's API documentation. But only the documentation that comes with your PRTG installation fits exactly the PRTG version you are using.

12.3 Filter Rules for xFlow, IPFIX and Packet Sniffer Sensors

You can use filter rules for the include, exclude, and channel definition fields of Packet Sniffer 3010, xFlow, and IPFIX 3012 sensors. The filter rules are based on the following format:

```
field[filter]
```

VALID FIELDS FOR ALL SENSORS

FIELD	POSSIBLE FILTER VALUES
IP	IP address or DNS name (see Valid Data Formats 3090 below)
Port	Any number
SourceIP	IP address or DNS name (see Valid Data Formats 3090 below)
SourcePort	Any number
DestinationIP	IP address or DNS name (see Valid Data Formats 3090 below)
DestinationPort	Any number
Protocol	TCP, UDP, ICMP, OSPFIGP, any number
TOS	Type Of Service: any number
DSCP	Differentiated Services Code Point: any number

ADDITIONAL FIELDS FOR PACKET SNIFFER SENSORS ONLY

FIELD	POSSIBLE FILTER VALUES
MAC	Physical address (see Examples 3090 below)
SourceMAC	Physical address
DestinationMAC	Physical address
EtherType	IPV4, ARP, RARP, APPLE, AARP, IPV6, IPXold, IPX, any number

ADDITIONAL FIELDS FOR PACKET SNIFFER SENSORS ONLY

VlanPCP	IEEE 802.1Q VLAN Priority Code Point
VlanID	IEEE 802.1Q VLAN Identifier
TrafficClass	IPv6 Traffic Class: corresponds to TOS used with IPv4
FlowLabel	IPv6 Flow Label

ADDITIONAL FIELDS FOR NETFLOW V5 AND JFLOW V5 SENSORS ONLY

FIELD	POSSIBLE FILTER VALUES
Interface	Any number
ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3090 below)
SourceASI	Any number
DestinationASI	Any number

ADDITIONAL FIELDS FOR NETFLOW V9 AND IPFIX SENSORS ONLY

FIELD	POSSIBLE FILTER VALUES
Interface	Any number

ADDITIONAL FIELDS FOR NETFLOW V9 AND IPFIX SENSORS ONLY

ASI	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3090 below)
SourceASI	Any number
DestinationASI	Any number
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address
Mask	Mask values represent subnet masks in with a single number (number of contiguous bits).
DestinationMask	Mask values represent subnet masks in with a single number (number of contiguous bits).
NextHop	IP address or DNS name (see Valid Data Formats 3090 below)
VLAN	VLAN values represent a VLAN identifier (any number)
SourceVLAN	VLAN values represent a VLAN identifier (any number)
DestinationVLAN	VLAN values represent a VLAN identifier (any number)

ADDITIONAL FIELDS FOR SFLOW SENSORS ONLY

FIELD	POSSIBLE FILTER VALUES

ADDITIONAL FIELDS FOR SFLOW SENSORS ONLY

Interface	Any number
InboundInterface	Any number
OutboundInterface	Any number
SenderIP	IP of the sending device. This is helpful if several devices send flow data on the same port, and you want to divide the traffic of each device into a different sensor channel. Possible values: IP address or DNS name (see Valid Data Formats 3090 below)
MAC	Physical address
SourceMAC	Physical address
DestinationMAC	Physical address

Valid Data Formats

- IP fields support wildcards (*), range (10-20) and hostmask (/10, /255.255.0.0) syntax, as well as DNS names.
  Note: IPv6 wildcards, IPv6 ranges, and IPv6 hostmasks are not supported.
- Number fields support range (80-88) syntax.
- Protocol and EtherType fields support numbers and a list of predefined constants.

For detailed information on IP ranges, please see **Define IP Ranges** 3094 section.

Examples

All of the following filter rules are valid examples:

```
SourceIP[10.0.0.1]
SourceIP[10.*.*.*]
SourceIP[10.0.0.0/10]
DestinationIP[10.0.0.120-130]
DestinationPort[80-88]
Protocol[UDP]
MAC[00-60-50-X0-00-01]
DSCP[46]
```

You can create more complex expressions using parentheses **( )** and the words **and**, **or**, or **and not**. For example, this is a valid filter rule:

```
Protocol[TCP] and not (DestinationIP[10.0.0.1] or SourceIP[10.0.0.120-130])
```

Related Topics

- **Monitoring Bandwidth via Flows** 3012

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- http://kb.paessler.com/en/topic/60203

12.4 Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors

When adding Custom xFlow sensors, Custom IPFIX 3012, or Custom Packet Sniffing sensors 3010, you have the option to provide a **Channel Definition**. In this field enter your channel definitions using the following syntax (one entry per channel):

```
#<id>:<Name>
<Rule>
```

Syntax

- **<id>** needs to be 1 or greater and must be unique for the sensor (so each channel definition must have a unique ID).
  Note: The maximum channel ID you can use is 2147483648 (2^31). Higher IDs are not supported. We recommend that you use channel IDs 1, 2, 3, and so on.
- The **<id>** is linked to the historic data: As soon as it has been changed, the history for this particular channel is lost.
- One rule can span multiple lines.
- The next rule starts with a # as first character in a line.
- **<name>** is the channel's display name.
- The rules are processed top to bottom (the number does not matter) and the data is accounted to the first match.
- PRTG adds one channel named **Other** automatically. This channel counts all traffic for which you have not defined a channel.
- Behind the name you can use an optional **[<unit>]** to override the automatic unit which is based on the source sensors.

The **<Rule>** syntax is identical to the one described in the **Filter Rules for xFlow and Packet Sniffer Sensors** 3087 section. Because data is accounted to the first match, make sure you start with the most specific rule at the top and get less specific to the bottom.

Note: We recommend that you write the rule list in an external editor and paste it into the **Channel Definition** field of the sensor in PRTG. Otherwise, if the rules contain an error, the entries will be removed when adding the rules in case!

Example

General example:

```
#5:HTTP
Protocol[TCP] and
(SourcePort[80] or DestinationPort[80] or SourcePort[8080] or
DestinationPort[8080])
```

Channel definition example for differentiating by protocol:

```
#1:TCP
Protocol[TCP]

#2:UDP
Protocol[UDP]

#3:ICMP
Protocol[ICMP]
```

12.5 Define IP Ranges

In some setting fields, you can either enter a host name or single IP address, or you can define IP ranges. PRTG follows a common syntax for this. IP ranges are available, for example, for xFlow and Packet Sniffer sensors 349, and for probes settings 2883.

Note: For the supported syntax of the automatic network discovery functionality in PRTG, please see section **Auto-Discovery** 222 (**IP Selection Method** setting).

Available Options

OPTION	DESCRIPTION	SYNTAX	EXAMPLE(S)
Simple	Enter a fixed IP address.	a.b.c.d	10.0.10.9
Hostname	Enter a hostname. PRTG will resolve it to an IP address in your network.	hostname	device-xyz
Hostmask	Enter a hostmask. A hostmask defines the relevant bits of the IP address.	a.b.c.d/h or a.b.c.d/e.f.g.h	10.0.0.0/255
Range	Enter an IP address range. Replace each of **a**, **b**, **c**, **d** by either ▪ * (asterisk) for any value; corresponds to 0-255 —or— ▪ **x-y** for any range between 0 and 255.	a.b.c.d	10.0.0.1-20 or 10.*.0.* or 10.0.0-50.*

12.6 Define Lookups

PRTG uses **lookups** for some sensor types and for some sensors with custom channels. In general, lookups make data more human friendly because they map status values as returned by a device (usually integers) to more informative expressions in words that show you the status of a monitored device as a clear message.

Additionally, lookups can also define the sensor status [135] that will be shown in correlation with certain status codes, just like sensor channel limits [2712] can define a sensor status, too. For example, for a printer, PRTG can show a sensor in a yellow **Warning** [135] status with channel values, provided by lookups, like "Toner Low" instead of simple status codes, like "1".

You can customize lookups individually and define your own texts that a sensors channel can show. See the section **Customizing Lookups** [3101] below.

Note: If a channel uses lookups, we strongly recommend that you control the sensor status only via the lookup definition and not use channel limits! See also section **Sensor Channels Settings** [2712].

Note: Lookups do not change data in the PRTG database, but they merely change the way sensor channels are shown. Any change to lookup definition files will apply to historic data as well as to live data.

Note: Some exceptions apply to the **SNMP Custom String Lookup Sensor** [1607] that basically does an "inverse lookup". It does not map an integer to a text message but looks only for matching strings in the lookup definition and shows a status based on this text value.

Requirement: Channel Unit "Custom"

All sensor channels with enabled **Value Lookup** need to use the channel **Unit** "Custom". For details, refer to the section **Sensor Channels Settings** [2712].

Important note: There are sensors that provide the unit **Value Lookup** for channels in their sensor settings. Do not use the "custom" unit for channels of these sensors if you want to use lookups! This would result in malfunctioning lookup channels. For the following sensor types, choose the unit **Value Lookup** in the sensor settings and select your lookup file directly when adding the sensor:

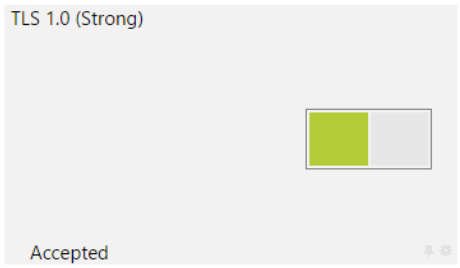
- **Google Analytics Sensor** [768]
- **Microsoft SQL v2 Sensor** [1075]
- **MySQL v2 Sensor** [1090]
- **Oracle SQL v2 Sensor** [1187]
- **PostgreSQL Sensor** [1297]
- **SNMP Custom Advanced Sensor** [1586]
- **SNMP Custom Table Sensor** [1617]

Visualization of Lookup Channels

PRTG can display gauges or switches for channels which use lookups. We recommend that you stay below 120 lookup values to display informative gauges for primary channels. Non-primary channels have an upper limit of around 40 lookup values for gauges.

Note: The various states displayed in gauges always follow the clockwise order **Up** (green) < **Warning** (yellow) < **Down** (red) < **Unknown** (Gray / Black).

A Gauge Showing the Status of a Lookup Channel



A Switch Showing the Status of a Boolean Lookup Channel

Lookups Directory and Format

Lookups are defined in XML format in files ending in **.ovl**. PRTG's standard lookup files are located in the PRTG program directory 3135 in the **\lookups** subfolder. These files are maintained by PRTG itself. In each of the files lookups are defined for one or more sensors. Furthermore, the lookups folder contains the **\custom** subfolder to store your customized lookups.

The files follow a basic principle. For each numeric value you can define:

- A message that the sensor will look up and show instead of the numerical value
- The status that the sensor will show

Note: Use the **SNMP Custom String Lookup Sensor** 1607 to map a string into a corresponding status. Please use the lookup type 3103 **SingleInt** for this purpose.

Example

The following code illustrates the lookup definition for the toner status of the **SNMP HP LaserJet Hardware** 1720 sensor:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" xmlns:xsi="http://www.w3.org/2001/X
       <Lookups>
              <SingleInt state="Ok" value="0">
                     Toner Okay
              </SingleInt>
              <SingleInt state="Warning" value="1">
                     Toner Low
              </SingleInt>
              <SingleInt state="Error" value="2">
                     No Toner Cartridge Loaded
              </SingleInt>
       </Lookups>
</ValueLookup>
```

The schema in the example provides an insight how lookups are defined:

- The **<?xml>** tag in the first line defines the content as XML.
- The **<ValueLookup>** tag in the second line contains:
  - The **ID** which is shown in the **Sensor Channels Settings** 2711.
  - The **desiredValue** 3102 attribute contains the value which is used for the calculation of the "Coverage". In this example, **1** is defined as desired value.
  - The **xsi** attributes refer to PRTG's predefined XML schema definitions (which allow easy editing of lookup files with supported editors). We recommend that you use the default value.
- Between the tags **<Lookups>** and **</Lookups>** the particular lookups for the sensor data are defined:
  - A lookup entry starts with a tag containing the type of the status value, the lookup type (in this example, this is always **<SingleInt>**).
  - Separated by whitespace, the **state** attribute defines the status the sensor will show. Allowed values are: **Ok**, **Warning**, **Error**, and **None** ("None" does not trigger a status change).
  - The **value** attribute defines which numeric value will trigger the lookup. This is the value that PRTG will receive from the device.
  - The **text** defines the substitution text that is shown instead of the value. For example, this can be a status message.

- The same way all other possible lookups are defined. The lookup definitions are closed by the tag **</Lookups>**. The file closes with **</ValueLookup>**.

In our example, the lookup file will have the following effect:

Value as Reported from HP Printer	Value Shown in PRTG (Sensor Channel)	Sensor Status Shown by PRTG
0	Toner Okay	Up
1	Toner Low	Warning
2	No Toner Cartridge Loaded	Down

The XML Schema

An exemplary schema of the XML files containing the lookup definitions can be sketched like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="..." desiredValue="..." undefinedState="..." xmlns="..." xsi="...">
       <Lookups>
              <SingleInt state="..." value="...">
                     status text
              </SingleInt>
              <Boolean state="..." value="...">
                     status text
              </Boolean>
              <BitField state="..." value="...">
                     status text
              </BitField>
              <Range state="..." from="..." to="...">
                     status text
              </Range>

              [several other lookup definitions]

       </Lookups>
</ValueLookup>
```

Element	Description	Attributes, Value Assignment, and Content
<?xml> content	This is the XML declaration. Every XML file begins with it.	▪ **version** and **encoding** are "1.0" resp. "UTF-8" ▪ content: **<ValueLookup>**contentValueLookup**</ValueLookup>**
<ValueLookup> contentValueLookup **</ValueLookup>**	Defines the **ID** of the channel, what **desiredValue** is used, the status for undefined values (**undefinedState**), and links to PRTG's predefined schema definitions, which allow editing of lookup files with supported editors.	▪ **id**: Specifies how the name of the lookup file is shown in the Sensor Channels Settings 2711. ▪ desiredValue 3102: Please see below. ▪ **undefinedState**: Optionally define a status for values that are not defined in the lookup file. If the target device returns a value that is not included in the lookup definition, the sensor will show this status (**Ok**, **Warning**, **Error**, or **None**) with an according message. Without a definition of "undefinedState", the sensor will only show the returned value. ▪ **xmlns:xsi/xsi**: refers to predefined XML schema definition ▪ contentValueLookup: lookup definitions **<Lookups>**contentLookups**</Lookups>**
<Lookups> contentLookups **</Lookups>**	Defines the particular lookups for the sensor data.	▪ contentLookups: one or more lookup entries, see below
<SingleInt> status text **</SingleInt>** **<Boolean>** status text **</Boolean>** **<BitField>** status text **</BitField>** **<Range>** status text	Each element defines one lookup entry. There can be one or more entries in this format. SingleInt, Boolean, BitField, and Range are lookup types 3103.	▪ **state**: defines the state the sensor will show; allowed values: **Ok**, **Warning**, **Error**, **None** ▪ **value**: defines the value which triggers the lookup. Please enter an integer value. Note: **Range** needs always both values "from" and "to". ▪ status text: defines a **status text** that will be used as substitution text and shown instead the integer value. For example, a status message.

Because all the XML files containing lookup definitions are delivered in a pre-given schema as indicated above, you can customize lookups accordingly.

Customizing Lookups

If you want to change the status definitions of a specific sensor channel, you basically have to do the following:

1) Find out the (file) name of the lookup file in the settings of the sensor channel 2711 you want to change the behavior for.

2) From the PRTG program directory 3135 subfolder **\lookups**, copy this file into the **\lookups \custom** subfolder (ensure you do not change the file name!).

3) Change the duplicated file as you like. See the example below.

All default lookup files are located in the **\lookups** subfolder in the PRTG program directory 3135. To customize existing lookups, copy the desired lookup file from the lookups folder to the **\lookups\custom** subfolder or create a new .ovl file there. When using the same ID in the ValueLookup tag, the files in the **\lookups\custom** folder will have a higher priority than the original files in the **\lookups** folder. This way, PRTG handles your customizations preferably instead of the original lookup settings. If you want to use custom lookup definitions in addition to the existing lookups, define a new ID in the lookup file which is not used by another lookup file. PRTG identifies lookup definitions via this ID, it does not use the file name.

Open the file with an XML or text editor and adjust the lookups to your personal preferences. You can define your own messages as well as you can customize sensor states for the particular return values. For example, if you do not want show an "Error" (a sensor **Down** status) for the return value "2" but only a warning, then you can replace "Error" with "Warning".

Note: The possible states are given in the **LookupState.xsd** file in the custom directory. Following the schema of the XML files that are delivered with PRTG enables you to edit the lookups in a safe way.

Note: If you imported an oidlib file 1848 that contains lookups 3095 (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. If you add an **SNMP Library Sensor** 1845 using this oidlib, PRTG creates a lookup definition file using the **lookupname** of the chosen library as **id** parameter. Override this lookup definition with your own custom lookup as described in this section. If you use an **SNMP Custom String Lookup Sensor** 1607, you can create a new custom lookup definition in the **\lookups\custom** directory with the expected return values. In this case, use the **lookupname** of the chosen library as **id** parameter to override the lookups from the oidlib file.

Example for Lookups Customization

For example (just for illustration purposes), imagine you would like

1) to have the status "Warning" for all undefined values that the target device might return,

2) to change the status for the return value "2" from "Down" to "Warning",

3) and to add the status "None" to the example 3097 above.

Then do the following:

- Copy the file oid.paessler.hplaserjet.tonerstatus to the **\lookups\custom** subfolder of your PRTG installation.
- Open this file with an editor.
- Leave the ID value unchanged to prioritize the customized lookup to the original file.
- Insert the status definition for undefined values into the ValueLookup element: undefinedState="Warning"
- Replace "Error" with "Warning" for value "2".
- Add a a "SingleInt" element with status "None" for the (hypothetical) return value "3".
- Save the file and reload 3104 the custom lookup folder in PRTG.

The customized lookup file will finally look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="oid.paessler.hplaserjet.tonerstatus" desiredValue="1" undefinedState="Warning" xmlns:xsi=
	<Lookups>
		<SingleInt state="Ok" value="0">
			Toner Okay
		</SingleInt>
		<SingleInt state="Warning" value="1">
			Toner Low
		</SingleInt>
		<SingleInt state="Warning" value="2">
			No Toner Cartridge Loaded
		</SingleInt>
		<SingleInt state="None" value="3">
			Unknown status of toner
		</SingleInt>
	</Lookups>
</ValueLookup>
```

Note: See also **SNMP Custom String Lookup Sensor—Example** 1614 for a lookup definition that maps a string value to a sensor status.

desiredValue Attribute

It is necessary to define a **desiredValue** in the lookup files. The desiredValue corresponds to a status value triggering a lookup. PRTG calculates the percentage of time this specific state has been monitored. The result is displayed for all data tables and graphs that show averaged values.

Considering the example above where the desiredValue is "1", PRTG will calculate the percentage of time the toner status has been "Warning". If in a time span of five minutes four of five sensor scans returned a "Warning" status, PRTG would show an average of 80% for this time span, because in 80% of the time the sensor showed a "Warning".

Lookup Types: SingleInt, Boolean, BitField, Range

Besides the lookup type **SingleInt** as seen above, there are three other lookup types: **Boolean**, **BitField** and **Range**. Using these types you can define lookup values beyond simple integers.

Lookup Type	Description	Syntax
SingleInt	Uses an **integer** to define a lookup for one status value.	value="int"
Boolean	Uses or **0** or **1** to define a lookup for two different status values.	value="0" value="1"
BitField	Uses a **bitfield** for multiple status values.	Only use it if you have basic knowledge about bitmasks. Please see the section **More** 3104 below for a general introduction. Note: Every value has to equal a power of two (for example, 1, 2, 4, 8, 16, 32, 64, etc.). Note: The **SNMP Custom String Lookup Sensor** 1607 does not support BitFields.
Range	Uses an inter range **from-to** to define a lookup for several status values.	from="int" to="int" Note: Using ranges, the parameters "from" and "to" always have to be defined. If you want to query only one single value in a range file, this value must be set as parameter for "from" **and** "to" (for example, from="2" to="2"). Note: The **SNMP Custom String Lookup Sensor** 1607 does not support ranges.

Note: You can use only **one** kind of lookup type in **one** lookup file. This means, only or SingleInts, or Boolean, or BitField, or Ranges. Different lookup types in one file are not allowed.

Define Lookup Files in Sensor Channel Settings

For each sensor with a custom channel, you can define a lookup file to use with the option **Value Lookup** in the sensor channel settings 2711. This option is visible for many **SNMP sensors**, some **application sensors**, and always for the following sensor types:

- **EXE/Script Sensor** 699
- **EXE/Script Advanced Sensor** 711 (if a **Custom** unit is defined)
- **SNMP Custom Sensor** 1577

For details, please see the **Sensor Channel Settings** 2711 section.

Loading Lookups

You can (re)load the defined lookups in the custom folder by clicking the **Load Lookups** button in the PRTG web interface under **Setup | System Administration | Administrative Tools** 2900.

Note: Before reloading your lookup files, please **Pause** any sensor whose lookup file you have changed and resume after loading is completed.

Debugging—What will happen if...?

- A return value is defined in the lookups that never will be returned by a device because the value is not assigned: The value will never be triggered, so PRTG simply ignores this entry.
- PRTG receives a return value that is not defined for lookups: No substitution message can be found. PRTG will just show the return value. You can optionally define a status for unknown values with a definition of **undefinedState** in the **ValueLookup** element (see section **Define Lookups—The XML Schema** 3098 above).
- Different lookup types are in one lookup file: This is not allowed and PRTG will discard this lookup definition. If you use miscellaneous lookup types in one file, for example, ranges and singleInts together, the PRTG system will create a ticket when loading lookups or restarting the PRTG server with the following error message: Value lookup file "[...]" could not be loaded ("" is not a valid integer value)".
- Incorrect XML code: PRTG will create a new ticket when loading lookups or restarting the PRTG server with a corresponding error message and discard this lookups definition.

- http://en.wikipedia.org/wiki/Bit_mask

12.7 Regular Expressions

For some sensors (for example, some HTTP sensors 349 and email sensors 354), you can use regular expressions to match a search pattern. PRTG suppors PCRE-RegEx. Please see below for examples with the most common patterns.

Common Search Patterns

Find matches containing the word **error** or **alarm**:

```
\b(error|alarm)\b
```

Find matches containing the words **error** and **alarm** in any order:

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

Find matches containing all of the words **tree**, **flower**, **leaf**, and **bug**, in any order:

```
(?=.*\btree\b)(?=.*\bflower\b)(?=.*\bleaf\b)(?=.*\bbug\b).*
```

Note: It is not possible to match an empty string using PRTG's regex search with sensors.

Example

The search pattern

```
(?=.*\berror\b)(?=.*\balarm\b).*
```

will match the following expressions:

- alarm error
- error alarm
- I am an error and I evoke an alarm
- I am an alarm and I indicate an error
- An alarm combined with an error indeed!
- An error combined with an alarm, too!

12.8 Calculating Percentiles

PRTG not only monitors your network and informs you in the case of issues that are worth you taking a closer look at in the here and now. PRTG also stores a lot of historical measurement data gathered from your sensors. This means that you have a great base for statistical analysis and evaluation of what is and was happening in your network.

When creating a **Report** 2786 with PRTG, you get raw data, sums, averages and percentages of your monitoring data.

Additionally, PRTG also offers percentile calculation. This statistical method puts your data in order, for example, from the lowest value to the highest value, and calculates the percentile you want, optimally informing you about the distribution of your network relevant data. For example, if you request the 95th percentile, you know that 95 percent of the measured data is below a certain value, and thanks to PRTG, you know what this certain value is.

If applied, for example, to bandwidth, you know what values you are talking about when talking about the 5 percent of unusually high bandwidth consumption and which value your users do not exceed 95 percent of the time. Service providers often use percentiles to offer a fairer billing that excludes infrequent usage peaks.

If you want to know more about the formula that PRTG uses for percentile calculation, see the

More 3107 section.

Create a report for more sensors and even device groups using PRTG's comprehensive **Report** 2786 feature or create reports for single sensors using the **Historic Data Reports** 146.

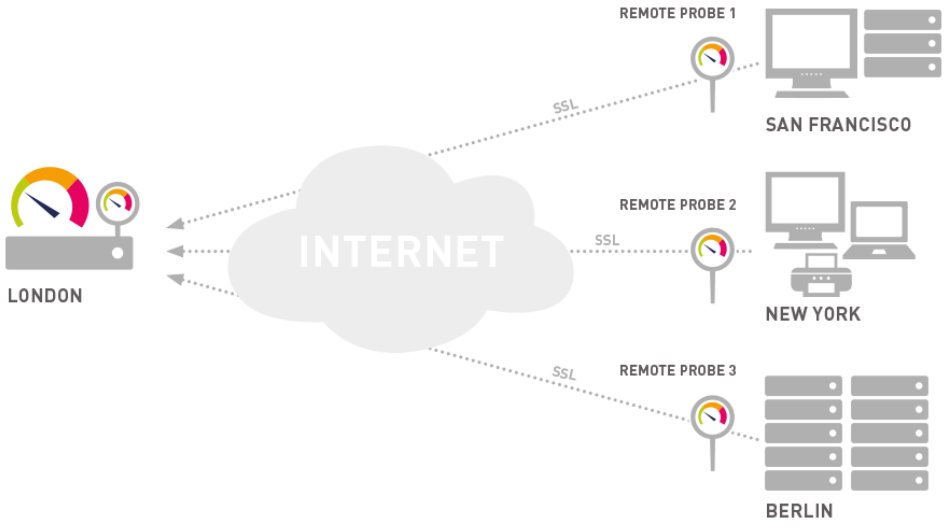
12.9 Add Remote Probe

To monitor different sub-networks that are separated by a firewall, to keep an eye on remote locations, or for several other scenarios, you can extend your monitoring by installing one or more **Remote Probes**.



Monitoring Remote Locations via Remote Probes

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/monitoring-remote-locations-via-remote-probes.png

Extend Your Monitoring Now

Installing remote probes is easy—you can do it within a few minutes. Please see the sections linked below for further instructions.

- Background: **Remote Probes and Multiple Probes** 3109
- Installing: **Remote Probe Quick Install** 3112
- Step by Step: **Remote Probe Setup** 3117

More

Video Tutorial: Core Server and Remote Probes

- https://www.paessler.com/support/video_tutorials/distributed_monitoring

12.9.1 Remote Probes and Multiple Probes

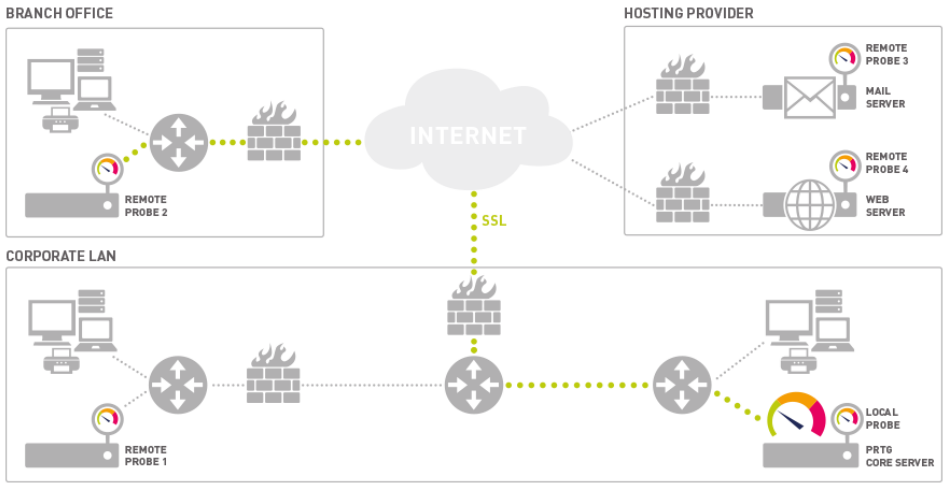
Upon installation, PRTG creates the first probe automatically, called the **Local Probe**. It runs on the same machine as the PRTG core server and monitors all devices from this system, using the sensors you have configured. Working with only one local probe should suffice for Local Area Network (LAN) monitoring and if you want to monitor one location only.

Scenarios Requiring Remote Probes

However, there are several situations making it necessary to work with **Remote Probes** in the same LAN or in remote locations. Among these situations are the following:

- You have more than one location and you need to make sure that services are available from all locations.
- Your network is separated in several LANs by firewalls, and the local probe cannot monitor specific services across the firewalls.
- You want to monitor systems in a secure network, and you need a secure connection between the PRTG server and this network.
- You want to sniff packets on another computer.
- You want to monitor NetFlow data on another computer.
- You experience performance issues with CPU intensive sensors like packet sniffer or NetFlow sensors and need to distribute the load over more than one PC.

The following chart shows an example for a remote probe scenario.



Monitoring a Distrubuted Network with PRTG

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/remote_probes_en.png

The PRTG core server inside the Corporate LAN (bottom right) is able to monitor:

- Services inside the Corporate LAN using the **Local Probe**.

- Services behind a firewall in the Corporate LAN using **Remote Probe 1**.
- Secured services inside the Branch Office (top left) using **Remote Probe 2**.
- Secured services on Mail Server and Web Server using **Remote Probe 3** and **Remote Probe 4** installed directly on these servers.
- Public services on the internet using any of the probes.

How Probes Work

As soon as a probe is started, it automatically connects to its core server 84, downloads the sensor configuration, and begins its monitoring tasks. The core server sends new configuration data to a probe as soon as the monitoring configuration is changed by the user. Probes monitor autonomously and send the monitoring results back to the core server for each check they have performed.

If the connections between core and probe fails for any reason (for example, a reboot of the computer running the core server) the probe continues its monitoring and stores the results. During a connection loss a buffer stores a maximum of 500,000 sensor results in RAM memory of the remote probe system (up to 50 - 200 MB). This means that for 100 sensors with one minute interval the monitoring results of up to 3 days can be buffered (or 52 minutes for 10,000 sensors with one minute interval). The probe automatically reconnects to the core as soon as it is available again and transmits all monitoring results gathered during the connection loss.

The connection between probe and core is initiated by the probe, secured using Secure Sockets Layer (SSL). This means that the data sent back and forth between core and probe is not visible to someone capturing data packets. The core server provides an open TCP/IP port and waits for connection attempts from probes. If a new probe connects for the first time, the administrator will receive a ToDo ticket 171 and will then see the new probe in the device tree.

As a security precaution, the probe must be manually acknowledged by the administrator in the device tree before any sensors can be created and monitored. The administrator can also deny a probe which will then be disconnected. No further connection attempts will be accepted and the probe IP is added to the **Deny IPs** list in the probes system settings (see **System Administration—Core & Probes** 2883 section). This ensures that unauthorized probes cannot connect to a core server.

Because the probe initiates the connection, you must ensure that a connection can be established from the outside world onto your core server. For example, you may need to open any necessary ports in your firewall and you may need to specify a Network Address Translation (NAT) rule for your network. The process is the same as if you wanted to allow access to the web server provided by the PRTG core server via port 443, for example. Usually it is sufficient to open or forward TCP port 23560 (default) on the machine that runs the core server; on probe side it is not necessary to open any port in most cases.

If you run PRTG in a cluster installation, remote probes also connect to your failover node(s) in addition to the master node and send monitoring data. This works as described above for a single PRTG server. If your master node fails, you can still see monitoring data on your failover (s). You can define the **Cluster Connectivity** of each probe in its **Administrative Probe Settings** 295.

Automatic Probe Update

Whenever a new version of PRTG is installed on the core server, all remote probes will automatically download and install the updated version of the probe as soon as they reconnect to the updated core installation.

The local probe has already been updated during the core installation. All remote probes are automatically downloading the new binaries using the SSL-secured probe/core connection. The download of the 4 MB file takes between a few seconds (in a LAN) and a few minutes (via internet connections), depending on the available bandwidth. As soon as the update has been downloaded the probe disconnects, installs the update and reconnects to the core server. This takes between 20 and 100 seconds. Please note that during the update phase the monitoring of the local probe can be affected due to the bandwidth required for the downloads.

Note: If the automatic update of a remote probe fails for some reason, please update the remote probe manually by downloading and executing the installer 3117 on the probe computer. If a remote probe keeps being disconnected after an update, please check if the server with the remote probe has two network connections with different IP addresses. Make sure these addresses are in the list of allowed IPs in the Core & Probes settings 2884.

12.9.2 Remote Probe Quick Setup

PRTG provides an easy, semi-automatic installation mechanism for a new Remote Probe. You can perform a remote installation of a probe directly in PRTG's web interface by right-clicking on a device in the PRTG device tree.

Note: This is an experimental feature. It is possible that direct installation does not work in all situations. In this case, please see Debugging 3116 and **Remote Probe Setup Using Installer** 3117 .

To install a Remote Probe directly from the web interface, follow the steps below:

- Step 1: Meet the Requirements 3112
- Step 2: Prepare the Core Server 3112
- Step 3: Provide Credentials 3114
- Step 4: Install the Remote Probe 3114
- Step 5: Approve the New Remote Probe 3115

Please look carefully at the requirements in the first three steps.

Step 1: Meet the Requirements

There are some conditions that you have to meet to be able to install a probe remotely on another computer. Please ensure the following:

- The target computer must be running the operating system Windows 7 or later.
- The target computer must be accessible through Remote Procedure Call (RPC). This is usually the case when your PRTG server and the target computer are located in the same LAN segment. Otherwise, open Windows services.msc on the target computer. Start the Remote Procedure Call (RPC) service.
- You cannot install a remote probe on a probe device.
- You have to permit programs to communicate through your Windows Firewall. Open the settings of your Firewall and choose **Allow programs to communicate through Windows Firewall**. Mark the checkbox for **Remote Service Management**, and the checkbox **Public** in the corresponding line.
- You cannot install a remote probe on the computer on which the PRTG core server runs.
- The IP address setting for probe connections to the core server must not be 127.0.0.1. Please see Step 2 3112 how to prepare the **Core Server**.

Step 2: Prepare the Core Server

Before remote probes can connect to the core server, you have to edit the relevant settings in the **PRTG Administration Tool** 3047 on your core server.

By default, a core server accepts connections **from the Local Probe only** (this is, IP address 127.0.0.1). This setting does not allow remote probes to connect. It is the most secure setting. To allow external probes to connect, choose the **Core Server** 3051 tab in the PRTG Administration Tool. In the **Probe Connection Management** section, choose one of the following options:

- **Accept connections from remote probes on all IPs**: We recommend that you use this setting for easy setup (this is, IP address 0.0.0.0).
- **Accept connections from remote probes on selected IPs only**: Specify the IP addresses that accept incoming connections.
- Please make sure the default port 23560 for probe connections is not blocked by firewall rules on your core server's side. If you need to set a different port (not recommended), see the **More** 3116 section for details.

When you are done, click **Save & Close** to save your settings. The core server process must restart so that the changes take effect.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the **Enterprise Console** 2938, or of **Smartphone Apps** 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

For detailed information about these settings, please see **PRTG Administration Tool on Core Server** 3051 section.

Important note: If you use the **Clustering** 87 feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Please check your cluster node settings under **System Administration—Cluster** 2905 before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) there which are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already installed a remote probe outside your LAN and the probe is disconnected because of this issue, perform the following steps:

1. Uninstall the remote probe again.
2. Update the cluster node settings 2905 with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

Please see also section **Failover Cluster Configuration—Remote Probes in Cluster** 3125.

Step 3: Provide Credentials

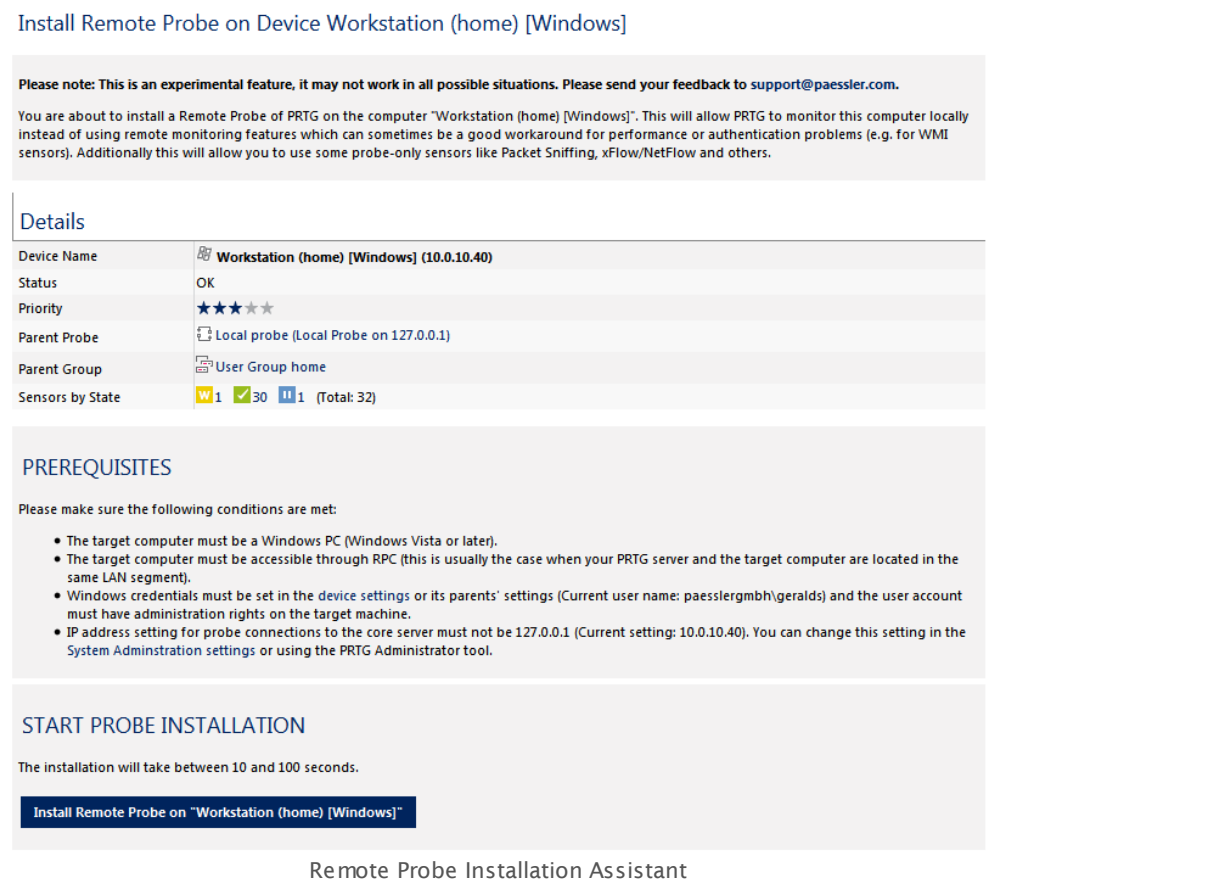
If not done yet, add a device 324 to PRTG that represents the target computer on which you want to install the remote probe. You have to set the correct Windows credentials for this device.

- Open the **Device Settings** 324.
- In the **Credentials for Windows Systems** section, provide **Domain or Computer Name**, **User**, and **Password** for the target computer.
- You can also inherit 94 the credentials from the settings of a parent object in the device tree.

Please make sure this user account has administration rights on the target computer.

Step 4: Install the Remote Probe

- In the device tree overview, open the context menu 192 of the target device.
- Choose **Device Tools > Install Remote Probe...**.
- The install assistant will appear on a new page.

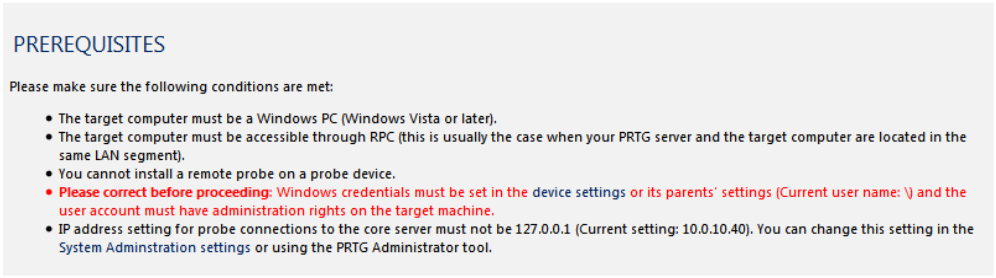


Remote Probe Installation Assistant

The installation assistant is divided into four sections:

- Experimental feature notice and short introduction
- **Details**: Overview about the device: name, status, priority, parent probe, parent group, and sensor states in place with their number
- **Prerequisites**: For details, see Step 1 3112
- **Start Probe Installation**: Time estimation for installation and installation start button

If these prerequisites are not met, you cannot start the installation process. Open requirements will be highlighted in red. Please correct them to continue!



Installation Unable to Start because Prerequisites Are Not Met

If all prerequisites are met, you can install the remote probe on the target computer by clicking the button **Install Remote Probe on "[device name]"**. Wait until the process has ended. If the installation was successful, the following message will appear in the **Start Probe Installation** section: **Done. Result is: OK**.

Note: Every time you start an installation, no matter if it is successful or not, a key will be added automatically to **Access Keys** in System Administration—Core & Probes 2883.

Step 5: Approve the New Remote Probe

If the installation was successful, you are given further instructions after the result message. As indicated, go back to the device tree 123 and acknowledge the new probe. The approval button will appear at the bottom of the device list. You will also get a new ToDo ticket 172.

Click **Approve new probe** to acknowledge the created remote probe. You can also discard the new probe by clicking **Deny new probe**.

Note: When denying or removing a remote probe, this device's global ID (GID) will be entered to **Deny GIDs** in System Administration—Core & Probes 2883.

Note: Denying the remote probe in the PRTG device tree does not uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

After approving, the approval button will turn into a **Working** status. Please wait while the probe connects. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend that you keep these sensors. Now you can create groups, devices and sensors to customize your monitoring via the new probe.

Debugging

Please be aware that installing a remote probe from PRTG's web interface is an experimental feature. It may be the case that this approach is not possible in all situations.

However, please follow the steps of this chapter closely when encountering problems with the Remote Probe Quick Install. Especially consider the conditions as described in Step 1 3112 of this section like Windows Firewall settings.

If the quick installation procedure described in this section does not work with your setup, please install your remote probes manually and see how to do so in **Remote Probe Setup Using Installer** 3117.

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- http://kb.paessler.com/en/topic/65084

12.9.3 Remote Probe Setup Using Installer

This section will guide you through the steps to set up a remote probe using the Remote Probe Installer. For a semi-automatic installation of a Remote Probe directly from PRTG's web interface, see the section **Remote Probe Quick Setup** 3112.

- Step 1: Prepare the Core Server 3117
- Step 2: Download and Install Remote Probe 3119
- Step 3: Configure Remote Probe Connection 3119
- Step 4: Approve New Probe and Start Monitoring 3120
- Debugging Probe Connection Problems 3121

To make your PRTG core server accept incoming remote probe connections, you should prepare it first. After that, you log in to the computer on which you want to install the remote probe, download the installer from your PRTG web interface, and install it. Just follow these steps:

Step 1: Prepare the Core Server

Before remote probes can connect to the core server, you have to edit the relevant settings in the **PRTG Administration Tool** 3047 on your core server.

By default, a core server accepts connections **from the Local Probe only** (this is, IP address 127.0.0.1). This setting does not allow any remote probe to connect to the PRTG core server. It is the most secure setting. To allow external probes to connect, choose the **Core Server** 3051 tab in the **PRTG Administration Tool** 3047. In the **Probe Connection Management** section, choose one of the following options:

- **Accept connections from remote probes on all IPs**: We recommend that you use this setting for easy setup (this is, IP address 0.0.0.0).
- **Accept connections from remote probes on selected IPs only**: Specify selected IP addresses that accept incoming connections.
- Please make sure the default port 23560 for probe connections is not blocked by firewall rules on your core server's side. If you need to set a different port (not recommended), see the **More** 3121 section for details.

When you are done, click **Save & Close** to save your settings. The core server process must be restarted so that the changes take effect.

Then log on to the Ajax web interface 110. From the main menu, select **Setup | System Administration | Core & Probes** to access the probes settings.

Probe Connection Settings in System Administration

- From the **Access Keys** field, copy one access key you will use for the remote probe connection. You can also enter a new access key with arbitrary signs and length if you like. In any case, save the correct access key for later use.
- In the **Allow IPs** field, enter the IP address of the computer you will install a remote probe on. To make things easier, you can also enter the word **any:** this will set the core server to accept remote probes connecting from any IP address.
  Note: If you use **any**, please make sure you write the word in lower case only! Any other variations will not be recognized!
- Make sure the IP address of the computer on which you want to install a remote probe is not listed in the **Deny IPs** field.
- When you are done, click **Save** to save your settings. The core server process must be restarted so that the changes take effect.

Note: If you change this setting, PRTG needs to restart the core server. Because of this, all users of PRTG's web interface, of the Enterprise Console 2938, or of Smartphone Apps 2995 will be disconnected. After clicking on the **Save** button, a dialog box will appear which asks you to confirm the required core server restart. Click **OK** to trigger the restart and follow the instructions on the screen.

For detailed information about these settings, please see the System Administration—Core & Probes 2883 section.

Important note: If you use the **Clustering** 87 feature of PRTG and you want to run remote probes outside your local network, you have to make sure your cluster nodes and the addresses they use are reachable from the outside! Please check your cluster node settings under **System Administration—Cluster** 2905 before installing a remote probe outside your local network. Enter addresses (DNS names or IPs) there which are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot connect to your cluster nodes if they use local addresses.

If you already installed a remote probe outside your LAN and the probe is disconnected because of this issue, perform the following steps:

1. Uninstall the remote probe again.
2. Update the cluster node settings 2905 with addresses that are reachable from outside your LAN.
3. Restart your PRTG core servers.
4. Install the remote probe again. It will then obtain the IP address or DNS name entries that it can reach.

Please see also section **Failover Cluster Configuration—Remote Probes in Cluster** 3125.

Step 2: Download and Install the Remote Probe

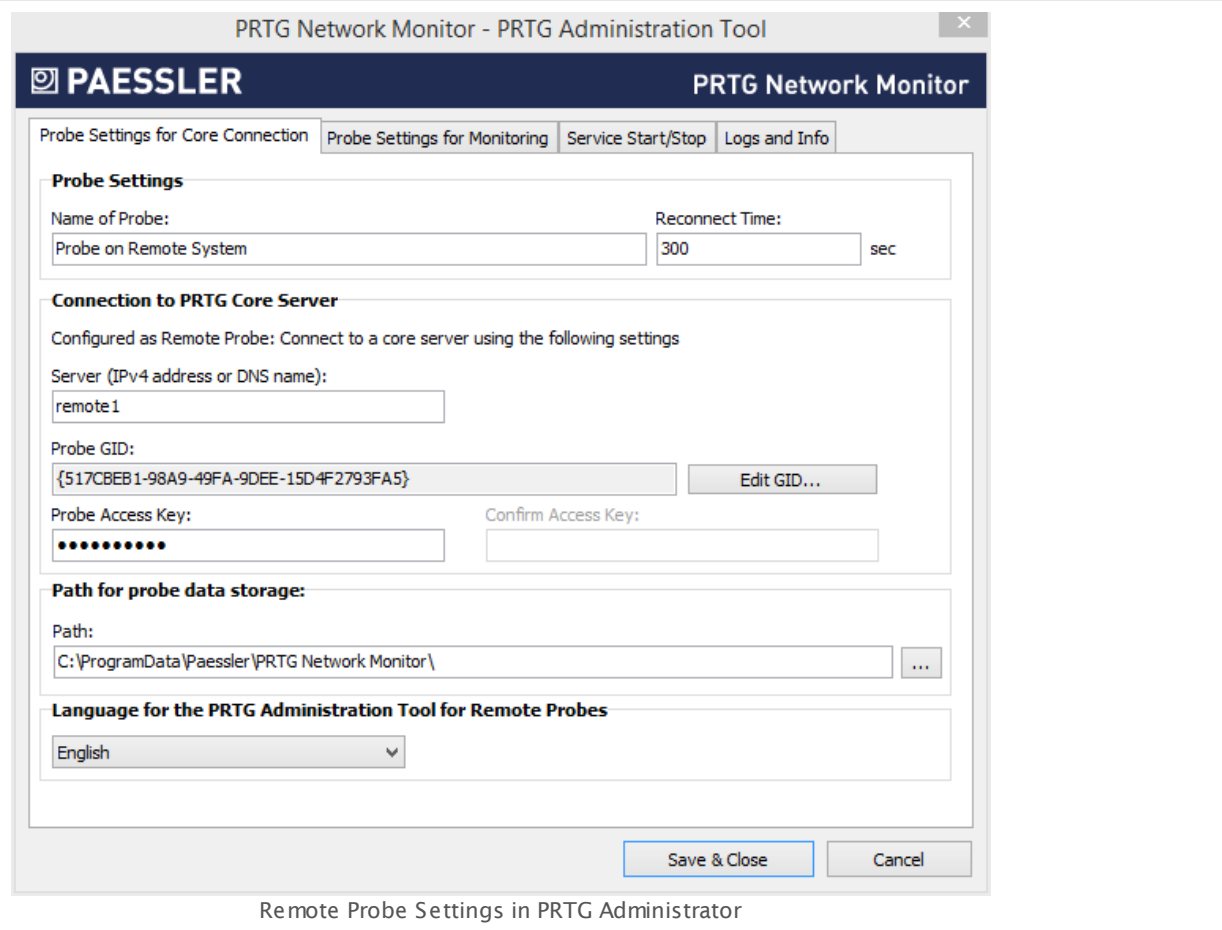
From the computer on which you want to install a remote probe, connect to the Ajax web interface 110, download the setup file, and install it. For detailed instructions, please see **Install a PRTG Remote Probe** 67.

Note: You cannot install a remote probe on a system running already a PRTG core installation.

At the end of the remote probe installation the **PRTG Administration Tool** 3046 starts (or you can start it manually from the Windows start menu later).

Step 3: Configure the Remote Probe Connection

On the Windows system on which you installed the remote probe, open the **PRTG Administration Tool** 3073 to configure the connection to the core server.



Remote Probe Settings in PRTG Administrator

In the **Connection to PRTG Core Server** section, you can then edit the following settings:

- **Server**: Enter the IP address or DNS name of the core server the remote probe will connect to. If Network Address Translation (NAT) is used, this must be the IP address that is externally visible, as the remote probe will connect from outside of your network.
- **Probe Access Key** and **Confirm Access Key**: Enter the access key the probe will send to the core server. You saved this key in Step 2 3119. This key has to match exactly the one shown in the web interface's probes settings, so a connection can be established.

For detailed information about these settings, see the **PRTG Administration Tool** 3073 section. Click **Save & Close** to confirm your settings and to start the probe service.

Step 4: Approve the New Probe and Start Monitoring

When a new probe connects to the core server for the first time, PRTG creates a new ToDo ticket 172 and the probe shows up as a new object of your setup in the device tree.

Please click on **Approve new probe** to fully enable the probe. You have to do this once for every new probe. Once approved, PRTG automatically creates a set of sensors for the probe to ensure that bottle-necks on the probe will always be noticed. We recommend that you keep these sensors. You can now create groups, devices and sensors for monitoring via the new probe.

You can also discard the new probe by clicking **Deny new probe**.

Note: When you deny or remove a remote probe, PRTG will automatically add this device's global ID (GID) to the **Deny GIDs** list in **System Administration—Core & Probes** 2883.

Note: Denying the remote probe in the PRTG device tree does not uninstall the probe, but only denies access to the core server. The probe will continue to run on the target system until you uninstall it manually.

Debugging Probe Connection Problems

If you have trouble with the setup of remote probes please look at the probe's log files.

The probe process writes log files with a file name in the format **PRTG Probe Log (x).log**. Please open the one with the most recent date.

For a correct connection the probe log should look similar to this:

```
11.08.2012 16:15:15 PRTG Probe Server V12.3.2.5101
11.08.2012 16:15:15 Starting Probe on "WINXPVMWARE"
11.08.2012 16:15:15 Data Path: C:\documents and settings\All Users\a[...]
11.08.2012 16:15:15 Local IP: 0.0.0.0
11.08.2012 16:15:15 Core Server IP and Port: 10.0.2.167:23560
11.08.2012 16:15:15 Probe ID: -1
11.08.2012 16:17:01 Connected to 10.0.2.167:23560
11.08.2012 16:17:06 Login OK: Welcome to PRTG
```

If the connection fails, for example due to an incorrect **Access Key**, or due to incorrect **IP** settings (see **Step 2** 3119), you will see:

```
11.08.2012 16:31:02 Try to connect...
11.08.2012 16:31:02 Connected to 10.0.2.167:23560
11.08.2012 16:31:07 Login NOT OK: Access key not correct!
```

More

Knowledge Base: How can I customize PRTG's ports for core-probe-connections?

- http://kb.paessler.com/en/topic/65084

12.10 Failover Cluster Configuration

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers ("Current Master" node and "Failover" node), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data.

Illustration of a Single Failover Cluster

Click here to enlarge: http://media.paessler.com/prtg-screenshots/clustering-1_en.png

For setting up a cluster you need two or more servers and there is one core installation [56] necessary on each of them—with different settings configured for each type of node. In return, you benefit from seamless high-available monitoring with automatic failover and/or multi-location monitoring.

In a cluster, you can run:

- **1 Master Node**
  On the master node, you set up your devices and configuration. Also notifications, reporting, and many other things are handled by the master node.

- **Up to 4 Failover Nodes**
  You can install one, two, three, or four additional nodes for fail-safe, gapless monitoring. For more than one failover node you need additional licenses [3133]. Each of these nodes can monitor the devices in your network independently, collecting their own monitoring data. You can review the data in a summarized way, which enables you to compare monitoring data from different nodes.

Note: During an outage of one node, you will see data gaps for the time of the outage on that node. However, data for that time span will still be available on all other cluster nodes.

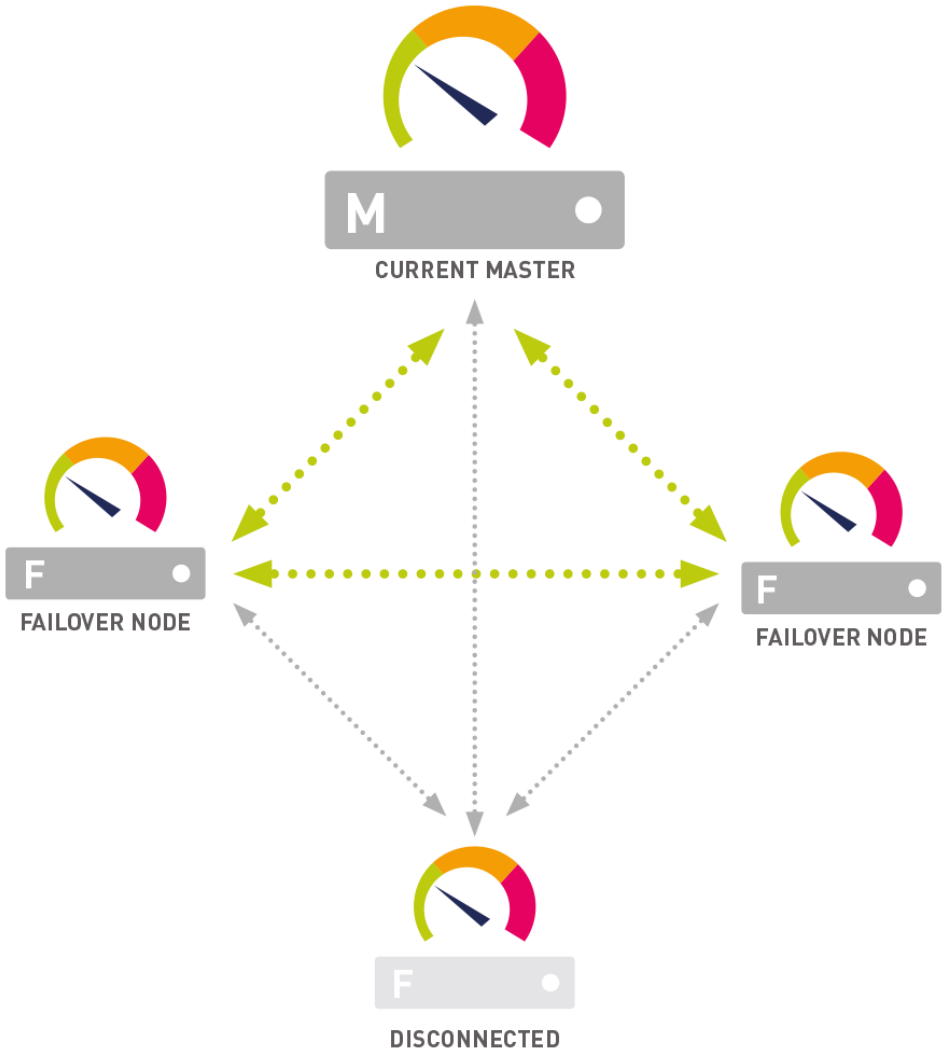


Illustration of More Than One Failover Cluster

Click here to enlarge: http://media.paessler.com/prtg-screenshots/clustering-2_en.png

Before Getting Started

Configuring a cluster with one failover node is the most common way to set up a seamless network monitoring with PRTG. You will need two servers running any Windows version (Windows 7 or later). Your servers can be real hardware (strongly recommended!) or virtual machines. For details, please see section Detailed System Requirements 23.

Please ensure the following:

- Your servers must be up and running.
- Your servers must be similar in regard to the system performance and speed (CPU, RAM memory, etc.).

- In a cluster setup, each of the cluster nodes will individually monitor the devices added to the **Cluster Probe**. This means that monitoring load will increase with every cluster node. Please make sure your devices and network can handle these additional requests. Often, a larger scanning interval for your entire monitoring is a good idea. For example, set up a scanning interval of 5 minutes in the **Root Group Settings** 260.
- We recommend installing PRTG on dedicated real-hardware systems for best performance.
- Please bear in mind that a server running a cluster node may in rare cases be rebooted automatically without notice (for example, because of special software updates).
- Both servers must be visible for each other through the network.
- Communication between the two servers must be possible in both directions. Please make sure that no software or hardware firewall blocks communication. All communication between nodes in the cluster is directed through one specific TCP port. You will define it during cluster setup (by default, it is **TCP port 23570**).
- **Email notifications for failover:** The Failover Master will send notifications if the Primary Master is not connected to the cluster. To ensure that PRTG can deliver emails in this case, please configure the **Notification Delivery** 2877 settings so that PRTG can use them to deliver emails from your failover node as well. For example, use the option to set up a secondary Simple Mail Transfer Protocol (SMTP) email server. This fallback server must be available for the failover master so that it can send emails over it independently from the first email server.
- Make your servers safe! From every cluster node, there is full access to all stored credentials as well as other configuration data and the monitoring results of the cluster. Also, PRTG software updates can be deployed through every node. So, please make sure you take security precautions to avoid security attacks (hackers, Trojans, etc.). You should secure every node server the same careful way as the master node server.
- Run the nodes in your cluster either on 32-bit or 64-bit Windows versions only. Avoid using both 32-bit and 64-bit versions in the same cluster, as this configuration is not supported and may result in an unstable system. Also, ZIP compression for the cluster communication will be disabled and you may encounter higher network traffic between your cluster nodes.
- If you run cluster nodes on Windows systems with different timezone settings and use **Schedules** 2856 to pause monitoring of defined sensors, schedules will apply at the local time of each node. Because of this, the overall status of a particular sensor will be shown as **Paused** every time the schedule matches a node's local system time. Please use the same timezone setting on each Windows with a cluster node to avoid this behavior.
- We recommend that you stay below 5,000 sensors per cluster for best performance in a single failover. For each additional failover node, divide the recommended number of sensors by two.

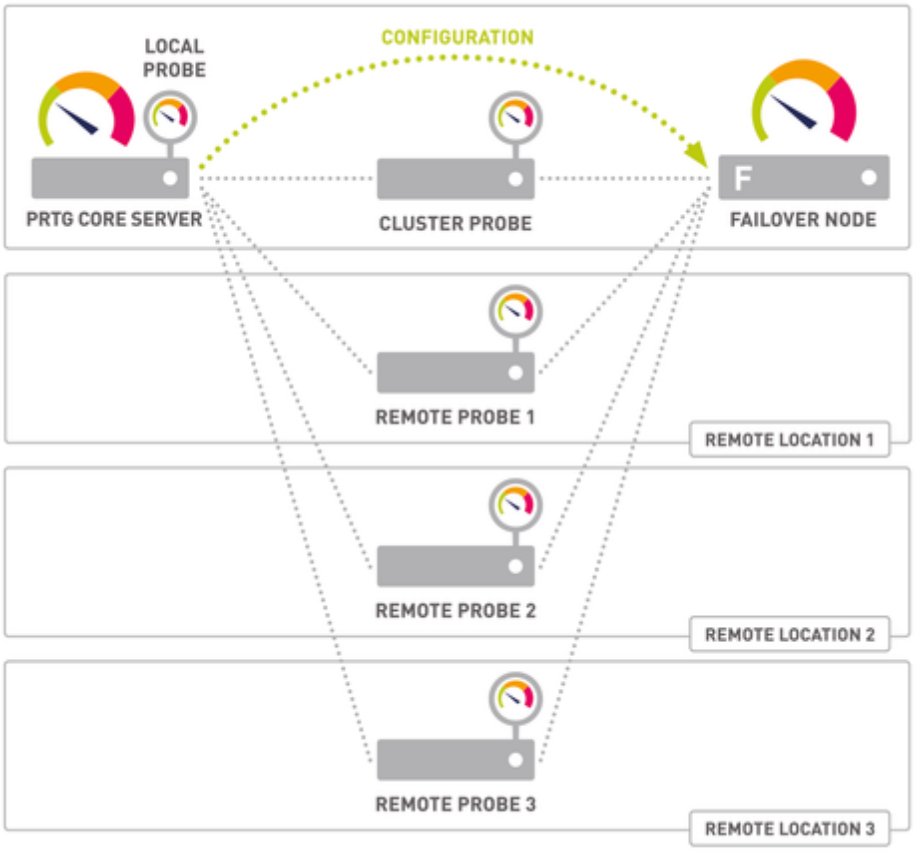
In cluster mode, you cannot use sensors which wait for data to be received. Because of this, you can use the following sensor types only on a local or remote probe 84:

- HTTP Push Count 870
- HTTP Push Data 879
- HTTP Push Data Advanced 890
- IPFIX 1003 and IPFIX (Custom) 1015
- jFlow V5 1035 and jFlow V5 (Custom) 1047

- NetFlow V5 1141 and NetFlow V5 (Custom) 1153
- NetFlow V9 1164 and NetFlow V9 (Custom) 1176
- Packet Sniffer 1211 and Packet Sniffer (Custom) 1222
- sFlow 1393 and sFlow (Custom) 1405
- SNMP Trap Receiver 2082
- Syslog Receiver 2245

Remote Probes in Cluster

PRTG provides cluster support for remote probes. This means that all your probes can connect to all your cluster nodes, the primary master node as well as the failover node. Because of this you can still see monitoring data of remote probes and sensor warnings and errors even when your master node fails.



Remote Probes with Cluster Connectivity

Remote probes in a cluster work this way:

- You have to allow remote probe connections to your failover nodes. To do so, log in to each server in your cluster and open the PRTG Administration Tool 3051. On the **Core Server** tab, define to accept connections from remote probes on each cluster node.

- Note: If you use remote probes outside your local network: You have to use IP addresses or DNS names for your cluster nodes that are valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Open the **System Administration—Cluster** 2905 settings and adjust the entries for cluster nodes accordingly so that these addresses are reachable from the outside. New remote probes try to connect to these addresses but cannot reach cluster nodes which use private addresses.
- Note: If you use Network Address Translation (NAT) with remote probes outside this NAT: You have to use IP addresses or DNS names for your cluster nodes that are reachable from the outside. If your cluster nodes are inside the NAT and the cluster configuration contains internal addresses only, your remote probes from outside the NAT will not be able to connect. The PRTG core server must be reachable under the same address for both other cluster nodes and remote probes.
- A remote probe connects only to the PRTG core server with the defined IP address when starting. This PRTG server must be the **Primary Master**!
- Initially, existing remote probes are not visible on failover nodes. You need to set their **Cluster Connectivity** first in the **Administrative Probe Settings** 295 to be visible and working with all cluster nodes. Choose option **Probe sends data to all cluster nodes** for each remote probe that you want to connect to all cluster nodes.
- Newly connected remote probes are visible and working with all cluster nodes immediately after you have acknowledged the probe connection. The connectivity setting **Probe sends data to all cluster nodes** is default for new probes.
- As soon as a probe is activated for all cluster nodes, it connects automatically to the correct IP addresses and ports of all cluster nodes.
- Once a remote probe has connection data from the Primary Master, it can connect to all remaining cluster nodes also when the Primary Master fails.
- Changes to connection settings of cluster nodes are automatically sent to your remote probes.
- If a PRTG server (which is a cluster node) in your cluster is currently not running, your probes will deliver monitoring data 3110 after the restart of this server. This happens individually for each PRTG server in your cluster.
- If you switch on cluster connectivity for a probe, it will not deliver monitoring data from the past when cluster connectivity was off. For sensors using difference values, the difference between the current value and the last value is shown with the first new measurement (if the respective sensor previously sent values to the PRTG server).
- Except for this special case, all PRTG servers show the same values of sensors on devices you add to the Cluster Probe.
- The responsible PRTG server for the configuration and management of a remote probe is always the master that is currently active. This means that all tasks of the PRTG core server are only executed by the current master. If you use a split cluster with several master nodes, only the master that appears first in the cluster configuration is responsible.

Note: You can use remote probes in a cluster as described above, which is showing monitoring data of all your probes on all nodes in your cluster. However, you cannot cluster a remote probe itself. To ensure gapless monitoring for a specific remote probe, install a second remote probe on a machine in your network next to the existing probe, and create all devices and sensors of the original probe on it. For example, you can clone 2740 the devices from the original probe. The second probe would be a copy of the first probe then and you can still monitor the desired devices if the original probe fails.

Note: Probes that send data to all cluster nodes result in increased bandwidth usage. Choose the option **Probe sends data only to primary master node** in the **Administrative Probe Settings** 295 for one or more remote probes to lower bandwidth usage if necessary.

Note: Please check explicitly on each cluster node if a remote probe is connected. PRTG does not notify you if a remote probe is disconnected from a node in the cluster. For example, log in to the PRTG web interface on a cluster node and check in the device tree if your remote probes are connected.

Start Now!

12.10.1 Failover Cluster Step by Step

This section will guide you through a step-by-step process to set up a failover cluster. Please follow these instructions carefully, in order to successfully integrate two or more PRTG installations into one failover cluster.

Note: Before getting started, please make sure you consider the information in section **Failover Cluster Configuration** 3122.

Step 1: Install Core Servers

We will start with setting up a single failover cluster, consisting of two PRTG core server installations, each running on an individual server. Please use your license key twice to install the PRTG core server on two different computers.

If you already run an installation of PRTG, this will be your future Master Node. In this case, please install a second core server on another computer only. Make sure you use the same license key for both installations.

Before you begin to set up a cluster, please make sure you run exactly the same PRTG version (build number) on all (future) nodes (install updates for existing installations, if necessary).
Note: Once the cluster is established, any updates you install on one node will be deployed to all other cluster nodes automatically.

For details about the installation process, please see **Install a PRTG Core Server** 56.

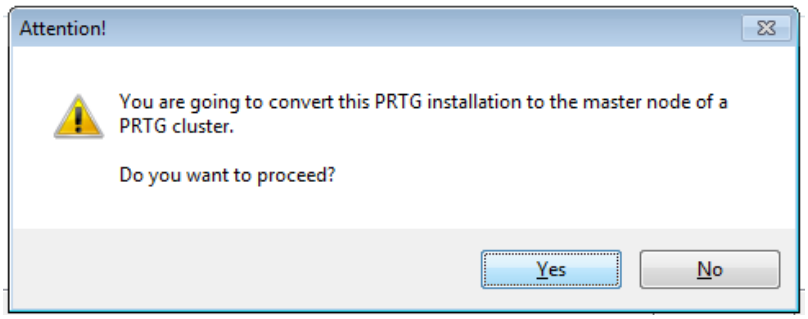
Step 2: Configure Master Node

Decide which of your PRTG core server installations will be your future Master Node. If you already run an installation of PRTG in your network for some time, this should be your master, so your existing monitoring configuration is being kept.

On the Master Node server, from the Windows start menu, open the **PRTG Administration Tool** 3053. In the Cluster tab, click on the following button:

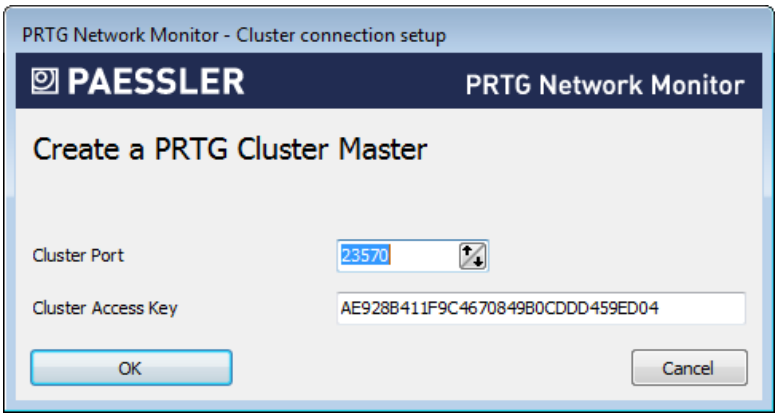
Create a PRTG Cluster...

- Start creating a cluster by clicking this button. The current PRTG core server will then be the **Master Node** of your cluster.
- After you click this button, please confirm converting this installation into a master node by clicking on the **Yes** button.



Converting an Installation into a Cluster Master Node

- A new dialog box will appear.



PRTG Administrator: Creating a Cluster Master

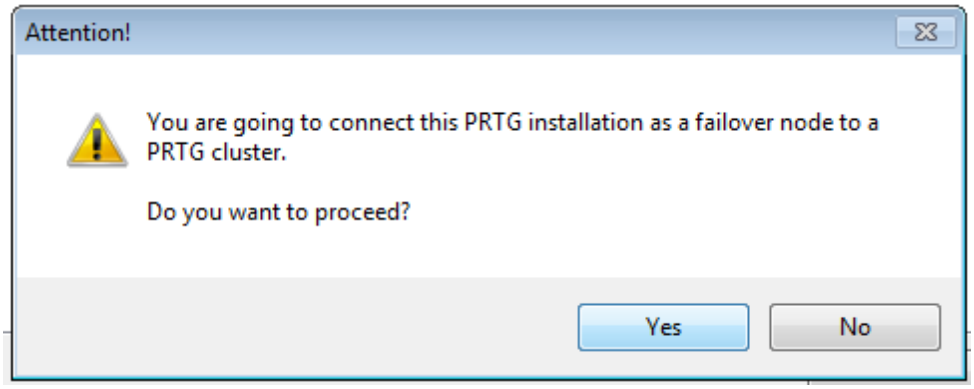
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.
- We recommend that you use the default value.
- Save the **Cluster Access Key** so you have it at hand when configuring your Failover Node (s).
- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

Step 3: Configure Failover Node

On the server that will be your Failover Node, from the Start menu, open the PRTG Administration Tool 3053. In the Cluster tab, click the following button:

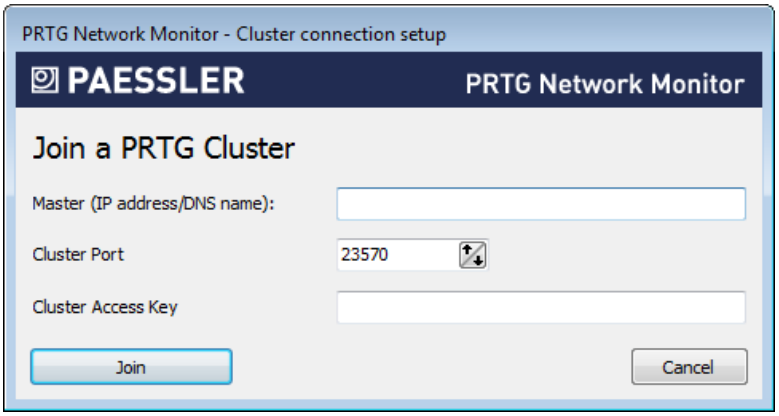
Join a PRTG Cluster...

- Add this installation to an existing cluster which already has a **Master Node**, by clicking this button. The current PRTG core server will then be a **Failover Node** in the cluster.
- Note: This button is also available if you are currently running your PRTG installation in **Cluster Mode: Master Node**. This option will then change your master node to a failover node!
- After you click this button, confirm converting this installation into a failover node by clicking on the **Yes** button.



Converting an Installation into a Cluster Failover Node

- A dialog box will appear.



PRTG Server Administrator

- Enter the cluster's **Master IP address/DNS name**. It must be reachable from the machine running the failover node.
- Enter the other settings as defined in your **Master Node**'s settings. Please make sure you use the same settings on all nodes in your cluster.
- Enter a **Cluster Port**. This is the port on which the internal communication between the different cluster nodes is sent. Make sure connections between cluster nodes are possible on the selected port.
- Enter or paste a **Cluster Access Key**. This is a unique access key. All nodes in a cluster have to be configured with the same cluster access key in order to join the cluster. Connection attempts with the wrong access key will be rejected.

- After confirming your settings you will be asked to restart Windows services. Please do so in order for your changes to take effect.

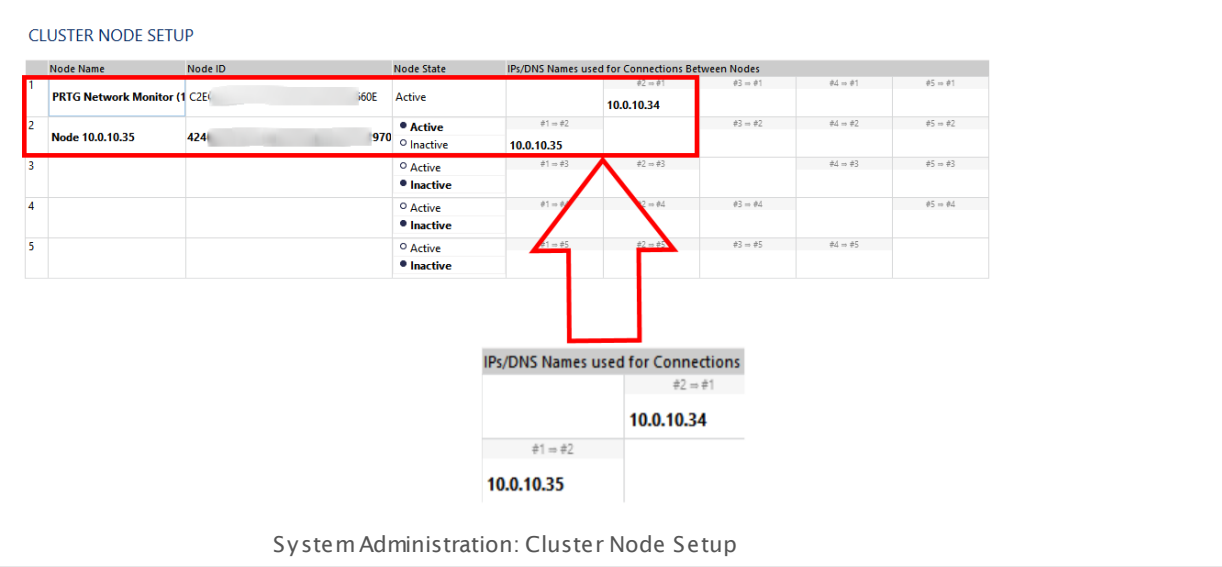
Step 4: Confirm Failover Node

Now you need to confirm the new failover node by setting it to **Active** in the master node's settings.

In a browser window, log in to PRTG's web interface 110 of the Master Node server.

In the **System Administration—Cluster** 2905 settings, you will see your "Master Node" server in the first line of the cluster list and your "Failover Node" server below.

Note: If you use remote probes 3109 outside your local network, for each core server in the cluster use a DNS name or IP address that the probes can reach from the outside. Enter the entries in the **Cluster Node Setup** 2905 table accordingly (see below). The addresses must be valid for both the cluster nodes to reach each other and for remote probes to reach all cluster nodes individually. Remote probes outside your LAN cannot reach private IP addresses or DNS names!

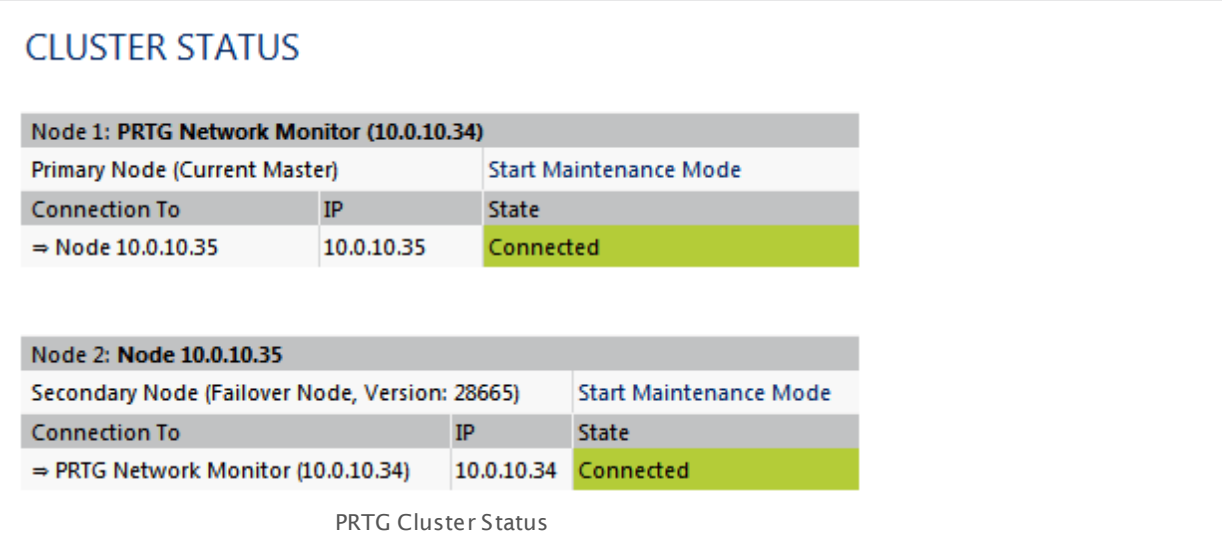


System Administration: Cluster Node Setup

For the "Failover Node", set the radio button for **Node State** to **Active** and **Save** the changes. The nodes will now connect and exchange configuration data. This may take a few minutes.

Step 5: Check Cluster Connection

In two browser windows, log in to PRTG's web interfaces of both of your PRTG installations. Open the cluster status page in both windows by clicking on the narrow cluster information bars at the top of each window. You should see a cluster status with your two nodes in a **Connected** state after a few minutes.



PRTG Cluster Status

Step 6: Trouble Shooting

Having any problems? If your nodes cannot connect, please see

- the cluster log entries on the **PRTG Status—Cluster Status** page of the web interface
- the core server log file, a text file in the logs directory of your PRTG data folder (see **Data Storage**).

In the latest entries of these logs, you can see messages about any errors that might have occurred. These will give you hints on where to find a solution.

If you encounter connection problems between the two cluster nodes, please make sure no software- or hardware firewall is blocking communication on the cluster port defined during cluster setup. Communication between the nodes must be possible in both directions in order for the cluster to work properly.

Step 7: Move Sensors to the Cluster Probe Now

That's it. You have successfully set up your failover cluster. All devices that you create or move under the **Cluster Probe** are monitored by both servers.

To monitor your existing configuration via all cluster nodes, on your master node, please move your groups, devices, and sensors from the local probe to the cluster probe! Objects, including their settings, will then be transferred to all cluster nodes automatically.

Step 8: Move Custom Content to Failover Nodes

On startup of the cluster master node, maps 2810 and custom lookups 3095 are automatically transmitted to the failover nodes. While changes to maps are automatically synchronized, you have to manually (re-)load lookups 3104 on all nodes. Other custom content has to be copied manually from the according folders 3135 on the master node to the same folders on the failover nodes:

- Device templates 2747: **\devicetemplates** subfolder of PRTG
- Custom sensors 2707: **\Custom Sensors** subfolder of PRTG
- MIB files 3002: **\MIB** subfolder of PRTG
- SNMP libraries 1845: **\snmplibs** subfolder of PRTG
- Notifications 2836: **\Notfications** subfolder of PRTG
- The **\webroot** subfolder of PRTG if you customized the PRTG web interface, for example

Add More Failover Nodes

If you want to add an additional failover node to your cluster, you will need an additional license key for two and three failover nodes, and two additional license keys to run four failover nodes.

Note: In a cluster, only core servers running on the same size of license 20 can be combined. For example, you can use several "PRTG 5000" licenses or several "PRTG 1000" licenses in one cluster.

To add another failover node to your cluster, please set up a new PRTG core server installation on a new server, using an additional license key. Then proceed with **Step 3** 3129 and following.

Note: Use a second license key to set up both your second and third failover node, and use a third license key to set up your fourth failover node.

Each failover cluster is technically limited to five cluster nodes: As a maximum, you can run one master node and four failover nodes in one cluster.

Note: We recommend that you stay below 5,000 sensors per cluster for best performance in a single failover. For each additional failover node, divide the recommended number of sensors by two.

12.11 Data Storage

PRTG stores the monitoring configuration, monitoring data, logs, tickets, and reports, as well as support and debug data into different folders on the core server or the system running a **Remote Probe** 3108. Additionally, there is data from PRTG in the program directory (for example, scripts for your custom sensors 2707) and in the Windows registry.

You can find data in different locations. For a detailed information please see the article linked in the **More** 3136 section below.

PRTG Program Directory

32 bit systems:

```
%programfiles%\PRTG Network Monitor
```

64 bit systems:

```
%programfiles(x86)%\PRTG Network Monitor
```

Note: These are the default paths. If you specified another installation directory, you will find your data there.

PRTG Data Folder

On Windows Vista, Windows 7, Windows 2008, Windows 8, and Windows 2012:

```
%programdata%\Paessler\PRTG Network Monitor
```

On Windows XP and Windows Server 2003 (Note: Both operating systems are not officially supported.):

```
%ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor
```

Note: These are the default paths, depending on your Windows version. If you specified a custom path for data storage, please look it up in the **PRTG Administration Tool** 3051: Open this application and switch to the **Core Server** tab. You will find the path there.

Windows Registry

System settings on 32 bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor
```

System settings on 64 bit systems:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor
```

Enterprise Console settings:

```
HKEY_CURRENT_USER\Software\Paessler\PRTG Network Monitor\WinGUI
```

HTTP Full Web Page Sensor: Cached Files

If you use the HTTP Full Web Page Sensor, files might be cached in this directory;

```
C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.
```

12.12 Using Your Own SSL Certificate with PRTG's Web Server

This section gives you a brief overview on how to use your own trusted SSL certificate files with the PRTG web server.

What is SSL?

PRTG supports Secure Sockets Layer (SSL) to encrypt all data entered and shown in the **Web Interface** 108, in the **Enterprise Console** 2938, or in the **Smartphone Apps** 2995. This ensures that no sensitive information can be intercepted when sending data between the PRTG core server and your client software.

By default, PRTG is already delivered with an SSL certificate so you can use secure connections to your PRTG core server. However, these certificate files are not signed by a valid authority, which is why browsers show an **SSL Certificate Warning** 113 when you try to access the web interface. Despite this warning your connection is still encrypted successfully.

To remove the browser warning, you can obtain a certificate that is valid for your own domain name and signed by a valid authority. You can request your own trusted certificate from an issuer like GoDaddy, DigiCert, InstantSSL, or StartSSL, for example. The certificate must be provided in a suitable format and you have to import it correctly for your PRTG server.

Importing Trusted SSL Certificates for PRTG

There are many different issuers for certificates, and there are different formats certificates can be provided in. PRTG needs three different files, named correctly, containing data in the expected encoding and format. This makes the manual import of an issued certificate a bit complicated sometimes because there are various certificate files that you get from a certificate authority (CA). So, to ease the installation of a trusted certificate, we provide the freeware tool **PRTG Certificate Importer**.

The PRTG Certificate Importer combines and converts all files that a CA bundle contains automatically for the use with PRTG and stores the certificate files into the correct path on your PRTG server. In the best case, you just provide the path to your received CA bundle and let the tool do the rest. We strongly recommend that you use the PRTG Certificate Importer if you want to install a trusted certificate for PRTG!

For more information about this tool and to download it, please see section **More** 3138.

Manual Certificate Import

Although we recommend using the PRTG Certificate Importer because it is much more comfortable, you still can import your trusted certificate manually. If you do so, please note that PRTG needs three different certificate files in PEM encoded format and an unencrypted private key:

- **prtg.crt**: This is the certificate for your PRTG server. It has to be stored in PEM encoded format.

- **prtg.key**: This is the private key matching your server certificate. It has to be stored in PEM encoded format and may not be encrypted! Please make sure that you provide this file in decrypted format! The best way to check this is to open the file in a text editor. If you find a line containing the word "ENCRYPTED", the file still needs to be decrypted before you can use it with PRTG. Please decrypt using an SSL tool (for example, OpenSSL) and your key password.
- **root.pem**: This is the public root certificate of your certificate's issuer. It has to be stored in PEM encoded format and must contain all necessary root certificates of your issuer in one file. If there is more than one PEM encoded root certificate, please use a text editor to copy all of them into a single file (the order does not matter).

Note: PEM encoded files must not contain Unix line breaks! Only Windows line breaks are supported.

Once ready, copy these three files to the /cert sub folder of your PRTG program directory (please backup existing files) and restart your PRTG core server service (see **PRTG Administration Tool** 3063). Note: PRTG services won't restart if the files are not provided in exactly the expected format!

For detailed instructions and examples, installation descriptions for various certificates (including Wildcard certificates), as well as links to certificate tools and converters, please see the **More** 3138 section below.

Part 13

Appendix

13 Appendix

Please find further information about PRTG and used terms in the following sections.

13.1 Glossary

This section explains special words used in the context of PRTG Network Monitor. Note: Here, only explanations are given. For information on where to find detailed instructions for a specific key word, please see the **Index** section.

Channel

The monitoring data of a sensor 3144 is shown in sensor channels. For example, for sensors that measure network traffic, there is one channel each for traffic in and traffic out. You can set various triggers for each channel, so you can define sensor status changes or notifications based on the monitoring data received.

Cluster

You can configure PRTG as a failover cluster for fail-safe monitoring. In a cluster, one or more core servers 3141 work together in one configuration. Every node can monitor all devices in a network for gapless monitoring, so you can additionally compare monitoring results measured from different perspectives.

Cluster Node

Sometimes used as synonym for Node 3143.

Cluster Probe

When running PRTG in cluster mode, a cluster probe is automatically created. All objects 3143 created on the cluster probe or below in the device tree 3142 are monitored by all nodes in the cluster. Create or move objects 3143 there to monitor them fail-safely. If one node fails, the other nodes will continue to monitor them. You can add groups 3142 and devices 3142 to the probe. On a PRTG installation, the cluster probe runs as part of this installation's local probe 3143. Your remote probes 3144 can send monitoring data to your cluster nodes so you can view the data of each probe on each cluster node.

Core Server

The central unit of PRTG. It receives monitoring data from the probe(s) 3143 and handles reporting and notifications, provides the web server for the user interfaces, and many other things. In a cluster 3141, one core server is installed on every node.

Dashboard

In the **Home** menu of the web interface are several pre-configured dashboards available which show a quick overview of the overall status of your monitoring configuration. YOu can create custom dashboards using the Maps 3143 function.

Device

A device in PRTG represents a "real" physical device in the network. For an easily understandable tree structure, you usually create one PRTG device for each physical device you want to monitor (exceptions apply to some sensors that you can only create on the local probe 3143 device, and for sensor types that are not bound to a certain device, such as HTTP sensors, which are also usually created on the local probe). You can add one or more sensors 3144 on every device.

Device Tree

The configuration of PRTG is represented in a hierarchical tree structure, the device tree, containing all objects 3143. While building the tree, you can relate to your network's topology to make your monitoring setup easy to understand.

Failover Master (Node)

If the primary master 3143 node fails, a failover node 3142 is promoted to current failover master and takes over the master role until the primary master node re-joins the cluster 3141.

Failover Node

In a cluster 3141 a failover node monitors all sensors 3144 on the cluster probe 3141, providing monitoring data for the core server 3141. Additionally, it serves as a backup in case the master node 3143 fails.

Geo Maps

Geo Maps show the different locations of your devices on a map, depending on the location data that you provide in the settings of groups or devices. The tiles on the maps that represent your devices also show the overall status of a location. This is useful for monitoring distributed networks.

Group

A group is an organizational unit in your PRTG tree structure that helps to arrange your devices. To existing groups, you can add devices, or additional sub-groups. This way you can model your physical network's topology within the PRTG configuration.

Library

Libraries are a way to show parts of your device tree 3142 in a different layout or with different filters enabled. There is an editor available that allows you to create libraries directly in your browser.

Local Probe

The local probe is installed together with the core server. All objects created on the local probe, or below it in the device tree, are monitored by the local core system. You can add groups and devices to the probe.

Map

Maps (sometimes referred to as "dashboard") are a way to present monitoring the way you want to arrange it. There is an editor available that allows creating maps directly in your browser.

Master Node

In a cluster, the master node controls the settings and cluster management. It also takes over notifications. All changes to the monitoring configuration are made on the master node.

Node

In a cluster there is one master node and one or more failover nodes. On each node, one PRTG core server installation is running independently. All nodes are connected to each other, exchanging configuration and monitoring data.

Object

All different items in the device tree are generally referred to as objects or monitoring objects. An object can be a probe, a group, a device, or a sensor.

Primary Master (Node)

The primary master node in a cluster is the node that is master by configuration. Only if it fails, one of the failover nodes becomes failover master and takes over the master role until the primary master node re-joins the cluster.

Probe

On a probe, the actual monitoring takes place. A probe can run as local probe on the local system where the core server is installed. There are also cluster probes and remote probes.

Remote Probe

A remote probe is a small piece of software installed on a computer in the local or remote network. It scans the network from there and sends monitoring results to the core server 3141. Once the connection is established, the remote probe is shown in the PRTG tree structure. All objects 3143 created on the remote probe, or below it in the device tree 3142, are monitored by the remote system running the remote probe. You can add groups 3142 and devices 3142 to the probe. In a cluster 3141, remote probes can connect to all cluster nodes so you can view monitoring data of a probe on all nodes.

Sensor

A sensor monitors one aspect of a device 3142. For example, monitoring if a device responds to a Ping request is done by one sensor. Monitoring the traffic of one ethernet port of a router device is done by another sensor. For monitoring the CPU load of the local system yet another sensor is set up, and so on. The data of sensors is shown in their respective channels 3141.

Sensor Tree

Sometimes used as synonym for device tree 3142.

Tickets

Tickets 171 are created by the system or a PRTG user and contain important messages or action steps to take for the administrator or another specific user. Every ticket should be viewed to take appropriate actions. You can access the list of tickets from the main menu.

xFlow

Paessler designates all kinds of flow protocols as xFlow. Currently, PRTG supports NetFlow V5 and V9, IPFIX, sFlow V5, and jFlow V5.

13.2 List of Abbreviations

Please see below for a list of abbreviations used in this documentation.

ADO: ActiveX Data Objects (ADO)

ADSL: Asymmetric Digital Subscriber Line (ADSL)

AJAX: Asynchronous Java Script and XML (AJAX)

API: Application Programming Interface (API)

CBQoS: Class Based Quality of Service (CBQoS)

cDOT: clustered Data ONTAP (cDOT)

CGI: Common Gateway Interface (CGI)

CIFS; Common Internet File System (CIFS)

CLI: command-line interface (CLI)

CoS: Class of Service (CoS)

CSV: Comma Seperated Values (CSV)

DAG: Database Availability Group (DAG)

DHCP: Dynamic Host Configuration Protocol (DHCP)

DMZ: Demilitarized Zone (DMZ)

DSCP: Differentiated Services Code Point (DSCP)

DNS: Domain Name Service (DNS)

DSCP: Differentiated Services Code Point (DSCP)

FAT: File Allocation Table (FAT)

FTP: File Transfer Protocol (FTP)

FQDN: Fully Qualified Domain Name (FQDN)

GID: global ID (GID)

GUI: Graphical User Interface (GUI)

GUID: Globally Unique Identifier (GUID)

HTTP: Hypertext Transfer Protocol (HTTP)

HTTPS: Hypertext Transfer Protocol Secure (HTTPS)

ICMP: Internet Control Message Protocol (ICMP)

ICPIF: Impairment Calculated Planning Impairment Factor (ICPIF)

iDRAC: Integrated Dell Remote Access Controller (iDRAC)

IIS: Microsoft Internet Information Services (IIS)

iLO: HP Integrated Lights-Out (iLO)

IMAP: Internet Message Access Protocol (IMAP)

IPFIX: IPFIX (Internet Protocol Flow Information Export)

IPMI: Intelligent Platform Management Interface (IPMI)

IPsec: Internet Protocol Security (IPsec)

iSCSI: internet Small Computer System Interface (iSCSI)

JSON: JavaScript Object Notation (JSON)

LAN: Local Area Network (LAN)

LDAP: Lightweight Directory Access Protocol (LDAP)

MIB: Management Information Base (MIB)

MoID: Managed Object ID (MoID)

MOS: Mean Opinion Score (MOS)

MSP: Managed Service Provider (MSP)

NAS: Network Attached Storage (NAS)

NAT: Network Address Translation (NAT)

NFS: Network File System (NFS)

NSA: Network Security Appliance (NSA)

NTFS: New Technology File System (NFTS)

NTLM: NT LAN Manager (NTLM)

OID: Object Identifier (OID)

OMSA: OpenManage Server Administrator (OMSA)

PDF: Portable Document Format (PDF)

PDV: Packet Delay Variation (PDV)

POP3: Post Office Protocol version 3 (POP3)

QoS: Quality of Service (QoS)

RADIUS: Remote Authentication Dial-In User Service (RADIUS)

REST: Representational State Transfer (REST)

RMON: Remote Monitoring (RMON)

RPC: Remote Procedure Call (RPC)

RTT: Round Trip Time (RTT)

SaaS: Software as a Service (SaaS)

SAN: Storage Area Network (SAN)

SASL: Simple Authentication and Security Layer (SASL)

SCVMM: System Center Virtual Machine Manager (SCVMM)

SIP: Session Initiation Protocol (SIP)

SLA: Service Level Agreement (SLA)

S.M.A.R.T.: Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.)

SMB: Server Message Block (SMB)

SMTP: Simple Mail Transfer Protocol (SMTP)

SNI: Server Name Identification (SNI)

SNMP: Simple Network Management Protocol (SNMP)

SNTP: Simple Network Time Protocol (SNTP)

SOAP: Simple Object Access Protocol (SOAP)

SPAN: Switched Port Analyzer (SPAN)

SQL: Structured Query Language (SQL)

SRP: Secure Remote Password (SRP)

SSH: Secure Shell (SSH)

SSL: Secure Sockets Layer (SSL)

SSO: Single Sign-On (SSO)

TCP: Transport Control Protocol (TCP)

TFTP: Trivial File Transfer Protocol (TFTP)

TLS: Transport Layer Security (TLS)

UAC: User Account Control (UAC)

UCS: Unified Computing System (UCS)

UDP: User Datagram Protocol (UDP)

UNC: Uniform Naming Convention (UNC)

UPnP: Universal Plug and Play (UPnP)

UTC: UTC (Coordinated Universal Time)

UUID: Universally Unique Identifier (UUID)

VoIP: Voice over IP (VoIP)

VPN: Virtual Private Network (VPN)

WAN: Wide Area Network (WAN)

WBEM: Web-Based Enterprise Management (WBEM)

WMI: Windows Management Instrumentation (WMI)

WQL: Windows Management Instrumentation Query Language (WQL)

WSUS: Windows Server Update Services (WSUS)

XML: Extensible Markup Language (XML)

13.3 Support and Troubleshooting

Need help with PRTG? There are several ways to get support and trouble shooting.

Video Tutorials

A video says more than a thousand words—watch tutorials for PRTG from Paessler and other PRTG users.

- https://www.paessler.com/support/videos

Paessler Knowledge Base

In the Knowledge Base you can search in hundreds of articles about PRTG. You can post your own questions and answers, too!

- https://kb.paessler.com

Open a Support Ticket

Users that have purchased a license can open support tickets which will usually be answered by Paessler's staff in less than 24 hours on business days. Please use the support form 2932 that is available in PRTG to contact our support team. This the best way to get detailed help quickly. If you cannot use this form, contact us via our webpage.

- https://shop.paessler.com/en/openticket

13.4 Legal Notices

Build using Indy Internet Direct (http://www.indyproject.org/). This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).
