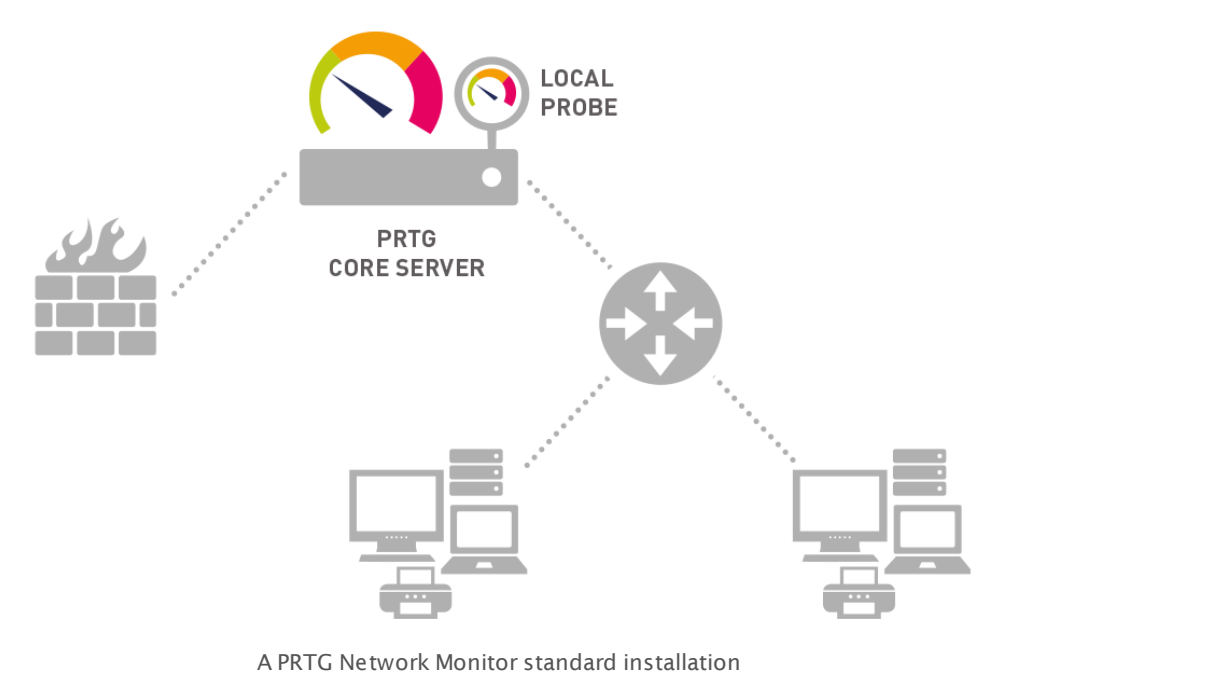
Welcome to PRTG Network Monitor

1 Welcome to PRTG Network Monitor

Welcome to PRTG Network Monitor! You have chosen an easy-to-use software product that comes with a powerful set of features to monitor your entire network.



A PRTG Network Monitor standard installation

Why Network Monitoring is Important

Today, nearly every business relies on a computer and network infrastructure for internet, internal management, telephone, and email. A complex set of servers and network equipment is required to ensure that business data flows seamlessly between employees, offices, and customers. The economical success of an organization is tightly connected to a hitch-free flow of data.

That's why your computer network has to work successfully: reliability, speed, and efficiency are crucial. But, like all other technical objects, network devices may fail from time to time—potentially causing trouble and loss of sales, no matter what migration efforts have been made up-front.

So network administrators need to take three key steps to maintain network uptime, reliability, and speed:

1. Set up a well-planned network with reliable components.
2. Create recovery plans for the event of device failure.
3. Monitor the network to get informed about failures when they build up or actually happen.

PRTG Network Monitor, the software described in this document, is a complete solution for monitoring small, medium, and large networks.

Monitoring Networks with PRTG Network Monitor

PRTG Network Monitor is a powerful network monitoring application for Windows-based systems. It is suitable for small, medium, and large networks and capable of LAN, WAN, WLAN, and VPN monitoring. You can also monitor physical or virtual web, mail, and file servers, Linux systems, Windows clients, routers, and many more. PRTG monitors network availability and bandwidth usage, as well as various other network parameters such as quality of service, memory load, and CPU usages, even on remote machines. It provides system administrators with live readings and periodical usage trends to optimize the efficiency, layout, and setup of leased lines, routers, firewalls, servers, and other network components.

The software is easy to set up and use and monitors a network using Simple Network Management Protocol (SNMP), Windows Management Instrumentation (WMI), packet sniffer, Cisco NetFlow (as well as IPFIX, sFlow, and jFlow), and many other industry standard protocols. It runs on a Windows-based machine in your network for 24-hours every day. PRTG Network Monitor constantly records the network usage parameters and the availability of network systems. The recorded data is stored in an internal database for later analysis.

1.1 About this Document

This document introduces you to the system concepts of **PRTG Network Monitor** and explains how to set up the software to achieve the best monitoring results. You will learn how to plan your monitoring setup, how to set up your devices and sensors, dependencies, reports, notifications, maps, user accounts, and clustering for fail-safe monitoring.

This document is also meant to be a reference for all available settings in PRTG. Short contextual help is already provided within PRTG's Ajax web interface. In this manual you often get some more help regarding the different options that are available.

This document does not explain monitoring protocols and file formats in-depth. Also, the use of the Application Programming Interface (API) built into PRTG is only briefly addressed. Whenever possible, hyperlinks to more detailed resources are provided, such as articles in the **Paessler Knowledge Base**.

To start using PRTG right away, please see the **Quick Start Guide** 32 section. For more detailed instructions, browse the manual content and choose the section you want to read.

1.2 Key Features

PRTG Network Monitor follows and analyses your network and requires no third party software. It's quick to download and install. PRTG will be up and running in a just a few minutes including a first auto-configuration. **Smart Setup,** the built in interactive guidance dialog, will lead you through the whole process.

What is PRTG for?

- Monitoring and alerting you to up-/downtimes or slow servers,
- System health monitoring of your various hardware devices,
- Network device monitoring, bandwidth accounting,
- Applications monitoring,
- Monitor virtual servers,
- Service Level Agreement (SLA) monitoring,
- System usage monitoring (for example, CPU loads, free memory, free disk space),
- Database performance as well as main parameter monitoring,
- Email server monitoring and reviewing various backup solutions,
- Monitoring the network's physical environment,
- Classifying network traffic by source/destination as well as content,
- Discovering unusual, suspicious, or malicious activity with devices or user,
- Measuring Quality of Service (QoS) and Voice over IP (VoIP) parameters,
- Cloud monitoring services,
- Discovering and evaluating network devices,
- Collecting system information for various hardware,
- Finding unexpected relationships between your network components to detect potential security issues and assessing the real usage of your network and hardware,
- Monitoring a fail-safe using a failover cluster setup.

What is included in PRTG?

The PRTG installer contains everything necessary to run your monitoring system immediately without any for third party modules:

- High performance - PRTG's own fast and efficient database system stores the raw monitoring results, as well as logs, toplists, and tickets (outperforms SQL servers for monitoring data), accessible through the Application Programming Interface (API). You can distribute high loads on multiple probes.
- Low system requirements: An average PC (not older than 2 years) is sufficient and even a netbook can monitor over thousand sensors. Fur detailed system requirements see here 22.

- High security standards: SSL encryption for connections and web servers, a personalized user rights management, and much more.
- A built-in SSL secured web server with HTTP and HTTPS support for the user interface.
- Fast web interface, works as Single Page Application (SPA) to avoid time-extensive reloading of the page.
- A mail server for automatic email delivery.
- Customizable, personalized alerting
  - Various notification technologies, for example, email, push, SMS-text messages, syslog and SNMP traps, HTTP requests, event logs, Amazon SNS, executing scripts.
  - Multiple triggers, for example, status alerts, limit alerts, threshold alerts, multiple condition alerts, escalation alerts.
  - gradual dependencies to avoid alarm floods, acknowledment of certain alarms to avoid further notifications for this alarm, and alert scheduling.
- In-depth report generator to create reports on-the-fly as well as scheduled reports in HTML or Portable Document Format (PDF). Several report templates are available by default.
- Graphics engines for user-friendly live and historic data graphs.
- Network analysis modules to automatically discover network devices and sensors.
- Distributed monitoring to monitor several networks in different locations.
- Special features for Managed Service Provider (MSP) to monitor customer networks and increase the quality of service.
- Data publishing with real time dashboards—private and public—including live performance and status information. You can design these maps as you like with many different objects, as well as you can integrate external custom objects.
- Multiple languages such as English, German, Spanish, French, Portuguese, Dutch, Czech, Japanese, and Simplified Chinese.
- Customization: The PRTG Application Programming Interface (API) allows you to develop your own features. Additionally, you can create custom sensors, notifications, and device templates according to your specific requirements.

PRTG Network Monitor supports monitoring up to several thousand sensors per installation, depending on various parameters. It can optionally work with multiple remote probes to monitor multiple sites or network segments from one central core installation, and to distribute high loads. You can also configure fail-safe monitoring using a cluster installation to perform automatic failovers. Single failover installations are allowed with every PRTG license.

The software is based on the Paessler's reliable monitoring technology, which is being constantly improved since 1997. We already have more than 150,000 daily users. Our outstanding support ensures your inquiries are answered within one business day for best possible network monitoring. Attractive licensing packages from freeware (up to 100 sensors) to enterprise level (with thousands of sensors) make sure every user finds the best-possible solution.

1.3 New in This Version

Our continuous development and rollout constantly improves and expands the functionalities provided by PRTG. Instead of delivering only a few versions each year with massive changes in every update, PRTG is automatically and seamlessly enhanced with new features and fixes—fast and with high quality.

We provide three release channels for PRTG:

- **Stable**: best tested version of PRTG for live systems; updated about once or twice a month; for usage on live systems
- **Preview**: offering the latest features and fixes; updated several times a month; consider this version as "beta", so **do not use** this version on live systems you depend on!
- **Canary**: providing "nightly builds"; updated very often; not tested extensively; **never use** on live systems you depend on!

Via these three channels, you can choose either maximum stability, early access to new features, or a mix of both.

For an overview of all recent changes [19] in the current version, visit the version history [19] on our website.

- https://www.paessler.com/blog/2012/04/25/

1.4 Available Licenses

Our licenses count by sensors. We define one sensor as one aspect that you monitor on a device.

There are four different PRTG flavors available.

Freeware Edition

The Freeware Edition is a good solution to get started with PRTG or for private use:

- Free for personal and commercial use
- Can monitor up to 100 sensors.
- Supports all available sensor types.

Note: If you want to use the Freeware Edition, please first install the **Trial Edition** 20 and get a free trial key. After the trial period has ended, your Trial Edition will automatically revert into a Freeware Edition.

Trial Edition

The Trial Edition is intended for evaluation purposes for customers who are interested in purchasing commercial licenses:

- Can monitor an unlimited number of sensors.
- Supports all available sensor types.
- Temporary license key must be requested from Paessler's website. Usually you see the license details including the key if you click the free download button on paessler.com
- Trial period limited to 30 days (automatically reverts to Freeware Edition 20 afterwards)
- With each license one single failover cluster setup 87, consisting of two nodes, is included. Cluster installations with two and three failover nodes will require one additional trial license key; a cluster installation with four failover nodes will require two additional trial license keys.

After the trial period has ended, a Trial Edition will revert into a Freeware Edition, allowing you to monitor up to 100 sensors for free.

Commercial Editions

There are several licenses of PRTG Network Monitor available to suit the demands of smaller as well as larger customers and organizations:

- Can monitor a maximum number of sensors (please consider our recommendations 25).
- Supports all available sensor types.

- With each license one single failover cluster setup 87, consisting of two nodes, is included. Cluster installations with two and three failover nodes will require one additional license of the same size. A cluster installation with four failover nodes will require two additional licenses of the same size.

For more information about available commercial licenses, please see the **More** 21 section below.

- https://www.paessler.com/support/faqs#e1912

1.5 System Requirements

To install and work with PRTG Network Monitor, you need to meet the following requirements:

- A current PC or server with at least a dual core CPU and minimum 2048 MB RAM memory.
- We recommend that you use the operating system Microsoft Windows Server 2012 R2 for best performance.
- Web browser to access the web interface. The following browsers are supported:
  - Google Chrome 49 or later (recommended)
  - Mozilla Firefox 45 or later
  - Microsoft Internet Explorer 11

Planning an Installation With Hundreds of Sensors or More?

The maximum number of sensors you can monitor with one installation of PRTG mainly depends on the monitoring technology and the monitoring intervals you use. In general, we recommend that you use a dedicated physical machine to run both the PRTG core server and PRTG remote probes. For more information, please see section **Detailed System Requirements** 23.

1.5.1 Detailed System Requirements

This section shows different aspects of system requirements for PRTG. Please consider these requirements to avoid issues while network monitoring.

Supported Operating Systems

The 32-bit and 64-bit versions of the following operating systems are officially supported for PRTG **Core Service** and **Probe Service**:

- Microsoft Windows Server 2012 R2* (recommended)
- Microsoft Windows Server 2012*
- Microsoft Windows 10**
- Microsoft Windows 8.1
- Microsoft Windows 8
- Microsoft Windows 7
- Microsoft Windows Server 2008 R2
- Microsoft Windows Server 2008 (not recommended)
- Microsoft Windows Vista (not recommended)

* Windows Server 2012 in Core mode and the Minimal Server Interface are not officially supported.

** The PRTG Enterprise Console is not fully compatible with Windows 10.

The version (32-bit or 64-bit) of the PRTG Core Server depends on the version of your operating system. The 64-bit version of the PRTG Core Server will be installed if

- the operating system is a 64-bit Windows system, and

- the system provides 6 GB RAM or more.

Otherwise the 32-bit version of the PRTG Core Server will be installed.

- For best performance of VMware sensors, EXE/Script sensors, and some other sensor types, we recommend Windows Server 2012 R2 on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

- For best performance of hybrid sensors using Windows Performance Counters and Windows Management Instrumentation (WMI), we recommend Windows 2008 R2 or higher on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

- **Microsoft .NET Framework**: We recommend that you provide Microsoft .NET Framework versions 4.0 or 4.5 (with latest updates) on all systems running a PRTG probe. Note: The .NET framework is imperatively needed for monitoring VMware and XenServer virtual environments.
  More details: Some sensor types need the Microsoft .NET Framework to be installed on the computer running the PRTG probe. This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109. Depending on the sensor type, the required versions are 4.0 or 4.5. See the **More** 29 section for details about the PRTG usage of .NET.

Hardware Requirements

Hardware requirements for PRTG **Core Service** and **Probe Service** mainly depend on the sensor types and intervals used. The following values are provided as reference for common usage scenarios of PRTG (based on a default sensor interval of 60 seconds).

- **CPU**
  A current PC or server with at least a dual core CPU can easily monitor up to 2,000 sensors (see sensor type specific notes below). PRTG supports native x86/x64 architectures.
- **RAM memory**
  Minimum requirement: 2048 MB RAM. You need about 150 KB of RAM per sensor.
- In general, we recommend at least 1 additional CPU core and 1 GB RAM per additional 1,000 sensors.
- **Hard Disk Drive**
  You need about 200 KB of disk space per sensor per day (for sensors with 60 second interval).
- **Internet connection**
  An internet connection is required for license activation (via HTTP or email).
- **Stable network connection for remote probes**
  Remote probes require a stable network connection between the PRTG core server and the remote probe. Unstable connections, for example via 3G, might work but it could be possible that you lose monitoring data if the connection is non-reliable.

There are also non-hardware dependent limitations for some sensor types, for example, WMI and SNMP V3 sensors. These limitations can be overcome by distributing the sensors across multiple remote probes 3106. For clusters we recommend that you stay below 2,500 sensors per cluster.

Note: It is crucial for a properly working PRTG server to have a certain amount of hardware resources available. Because of this PRTG sends according warning and emergency messages to the primary email address of the **PRTG System Administrator** user if disk space or memory on the PRTG core server system is running out. You will get warning messages if available disk space falls below 1 GB or memory below 500 MB, and emergency messages if available disk space or memory falls below 50 MB. Please react immediately in this case and free your system resources!

Network Size: Recommendations

- Rule of thumb: Typical PRTG installations almost never run into performance issues when they stay under 2,000 sensors, under 30 remote probes, and under 30 user accounts.
- PRTG can scale much higher when the installation is planned well. Please read on if you plan to go beyond these numbers and/or if you plan elevated use of resource intensive features like reporting, xFlow sensors, or clustering.
- If you plan an installation that monitors more than 5,000 sensors from one instance of PRTG on a physical device or more than 2,500 sensors with PRTG running on a virtual machine we ask you to contact our pre-sales team for consultation.
- For your information: To monitor 5,000 sensors in a 1-minute interval, PRTG takes 7.2 million measurements and evaluates, notifies, and stores them—this adds 700 MB of additional data to the database every single day.
- Note: PRTG users usually monitor each device in their network with about 5-10 sensors, so for 50 servers you need about 250-500 sensors.

Apart from the processing power required for the monitoring itself, several aspects can affect the number of sensors that you can use with PRTG. The following recommendations are for a PRTG single core setup (without clustering) on a physical machine. You can overcome some of these limitations if you distribute the sensors across multiple remote probes.

SIZE RECOMMENDATIONS

Operating System	We recommend that you use Windows Server 2012 R2 to run the PRTG core server and probes. This offers superior performance for monitoring, especially if you have more than 2,000 sensors.
Sensor Types	Ping 1252 and SNMP sensors 350 create much less load than complex sensors like xFlow sensors 3012, VMware sensors 354, Sensor Factory sensors 1374, WMI sensors 352, or Syslog 2245/Trap receiver 2082 sensors, for example.
Scanning Interval	We recommend that you mainly use 1-minute scanning intervals 272 for up to 2,000 sensors and 5-minute intervals if you have more sensors.

SIZE RECOMMENDATIONS

Number of Users	We recommend that you stay below 30 active user accounts 2890 for each PRTG core server. You can work well with more users if these do not all use the UI at the same time (including public dashboards).
Number of Remote Probes	Our general recommendation is to stay below 30 remote probes 3109 on one PRTG core server. PRTG still scales well up to 60 probes as long as you have less than 100 sensors per probe.
CPU Intensive Features	Try keeping the usage of the following features down: Many quickly refreshed dashboards 2810, frequent generation of huge sensor reports 2786, heavy usage of packet sniffing 3010, factory sensors 1374, and toplists 2734, frequent automatically scheduled auto-discoveries 219 for large network segments, constant queries of monitoring data via the API 3086, among others.
Network Connection Quality	The quality of your network also plays an important role. When monitoring via UDP, for example, a high packet loss rate can lead to frequent timeouts. Remote probes that connect via unstable (WAN) connections can lead to delays as well.

In general, consider the following rules for the performance impact of different sensor types:

- **SNMP V1** and **V2**, **Ping**, **Port**, and **HTTP**
  We recommend that you use these sensor types for scenarios with thousands of sensors.
- **SNMP V3**
  You can monitor about 5,000 SNMP V3 sensors with an interval of 60 seconds on a common two core computer, and about 10,000 sensors on a four core system (the main limiting factor is your CPU power).
- **WMI**
  Try to keep the number of WMI sensors per probe below 120 sensors (with 60s interval), or 600 sensors (with 300s interval).
- **xFlow (IPFIX, NetFlow, sFlow, jFlow)**
  Monitoring the maximum number of sensors depends on the traffic pattern, the number of xFlow packets per second received by the PRTG probe, as well as the performance of the probe system.
- **Packet Sniffer**
  These sensors create the highest CPU load on the probe system. This technology is only recommended for monitoring of low traffic connections (<50 Mbit/s steady stream). When traffic is often over 10 Mbit/s a dedicated remote probe should be used.
- **VMware Monitoring**
  Monitoring of VMware is limited to about 20 sensors at a 60 seconds monitoring interval, or 100 sensors at a 5 minutes interval. On probes running on Windows Server 2012 R2, you can use more VMware sensors. These limitations issue from the VMware platform. For details please see **More** 29 section below and refer to the Knowledge Base article "Increasing Maximum Connections for VMware sensors".

- **Other sensor types**
  The impact of a specific sensor type on performance is indicated by a color range when adding a sensor to a device. It ranges from dark green (very low impact) to bold red (very high impact).

To overcome any limitations mentioned above you should distribute the sensors over two remote probes 3109 or more.

Running PRTG on Virtual Machines

You can run the PRTG core server as well as PRTG remote probes on virtualized platforms. However, we strongly recommend that you use a dedicated physical machine to run the PRTG core server or the PRTG remote probes 3109. There are several reasons why we recommend that you run PRTG (core server and remote probes) on real hardware, especially for thousands of sensors. Each sensor request will have to go through many virtualization layers, which costs performance and makes measurements less exact. In our experience, a physical machine simply works best for a thousand sensors and more.

Our recommendation to use real hardware is valid for the PRTG core server and for remote probes. If you must run PRTG on a virtual machine, please stay below 2,500 sensors per virtual machine and consider running several PRTG core server instances instead.

Important note: We cannot offer technical support regarding performance and stability problems for PRTG installations on virtual machines that run with more than 5,000 sensors. In this case, please migrate PRTG to one or more, preferably physical, machines.

Note: When running PRTG on a virtual machine, do not use dynamic resource allocation, but please make sure that full resources are available to the virtual machine at any time. In our experience, dynamic resource allocation is not working efficiently for a monitoring software and can therefore lead to massive performance issues.

Please see also the **More** 29 section for information on running PRTG on VMware.

Running PRTG in a Failover Cluster

We recommend a single failover setup 87 if you need fail-safe monitoring. This consists of two PRTG core servers, each working as a cluster node.

In a PRTG failover cluster, the monitoring load doubles with each cluster node, so you will encounter half performance for each additional cluster node. In a single failover cluster, please divide our recommended numbers from above in half.

Web Browser Requirements

The following browsers are officially supported by the PRTG web interface (in order of performance and reliability):

- Google Chrome 49 or later (recommended)
- Mozilla Firefox 45 or later

- Microsoft Internet Explorer 11

Note: Deprecated Internet Explorer versions as well as mobile browsers might not be able to display the full featured **Ajax web interface** 108. Using these browsers, you can access the feature-limited **Mobile Web GUI** 2991, which does not require CSS or Javascript capability.

Screen Resolution

A screen resolution of at least 1024x768 pixels is sufficient for most functions of PRTG. However, we recommend a screen resolution of 1200x800 or higher.

Requirements for Monitored Devices

- **SNMP monitoring**
  The monitored device(s) must be equipped with SNMP Version 1, 2c, or 3 (an SNMP-compatible software must be installed on the device). SNMP must be enabled on the device and the machine running PRTG must be granted access to the SNMP interface. For details, please see section **Monitoring via SNMP** 3001.
- **Windows/WMI monitoring**
  To use Windows Management Instrumentation (WMI) monitoring, you need a Windows network. For client PCs monitored with WMI, only the operating systems as given above 23 are officially supported. Please do not use Windows Vista or Windows 2008 R1 for WMI monitoring (they both have WMI performance issues). For details, please see section **Monitoring via WMI** 3005.
- **xFlow (IPFIX, NetFlow, sFlow) monitoring**
  The device must be configured to send NetFlow data packets (NetFlow version 5, 9, or IPFIX) or sFlow packets (version 5) to the machine running the PRTG probe. For details, please see section **Monitoring Bandwidth via Flows** 3012.
- **Packet Sniffer monitoring**
  Only data packets passing the local machine's network card can be analyzed. Switches with so-called 'monitoring ports' are necessary for network-wide monitoring in switched networks. For details, please see section **Monitoring Bandwidth via Packet Sniffing** 3010.
- **Other sensor types**
  Depending on the specific sensor type, you can find requirements (for example, modules, components, device configurations) which may have to be fulfilled in the corresponding manual section, as well as when adding the sensor to a device.

Requirements for the Enterprise Console

The optional PRTG **Enterprise Console** 2938 (EC) runs under all supported Windows versions 23, but it is not fully compatible with Windows 10. Running the EC on Windows 10 results in several issues so please use another operating system. We will consider full Windows 10 support for future PRTG desktop clients.

The EC has a built-in webkit browser engine and requires no specific browser installed on the system. See also **Enterprise Console—Requirements for Connections to PRTG Web Server (s)** 2938.

Requirements for Mobile Web GUI (deprecated)

The feature-limited mobile web interface is optimized for low bandwidth and mobile access. It has been designed for and tested with iOS, Android (including BlackBerry), and Windows Phone devices, and also with deprecated Internet Explorer versions. For details, please see section **Mobile Web GUI** 2991.

Note: This user interface is deprecated. For mobile access to your PRTG server, please use the PRTG mobile apps.

Requirements for Smartphones and Tablets

PRTG supports optional mobile apps for iOS and Android devices, as well as for Windows Phone. For more information and system requirements, please see section **PRTG Apps for Mobile Network Monitoring** 2995.

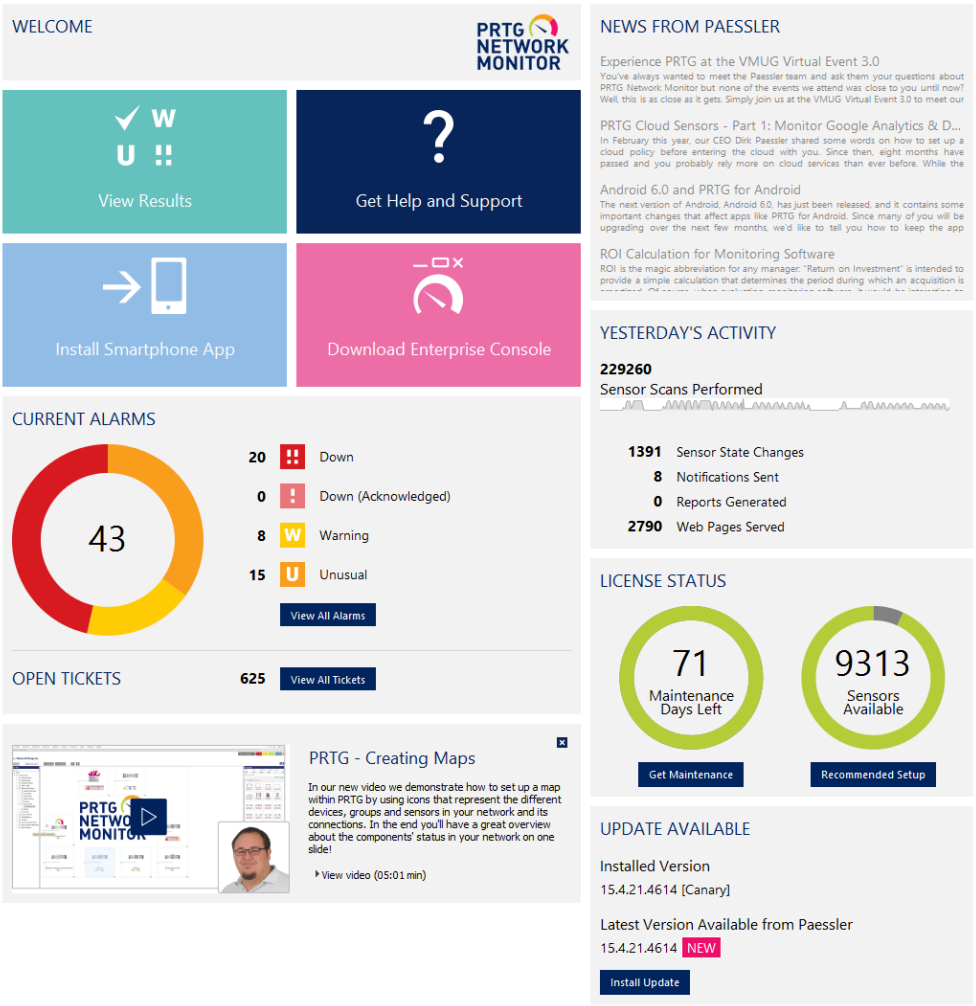
Part 2

Quick Start Guide

2 Quick Start Guide

Welcome to the PRTG Network Monitor! This section gives a quick start into PRTG, so you can start monitoring your network right away!



Welcome Screen

Setting up monitoring for your network is easy! You only need to download the PRTG installer from the Paessler website, run through the installation wizard, and provide some information about your network in the Smart Setup. PRTG will start monitoring your network immediately without any further complicated stumbling blocks! Of course, later on, you can still adjust everything to your needs.

Please see the following quick steps.

Quick Start Guide—Topics

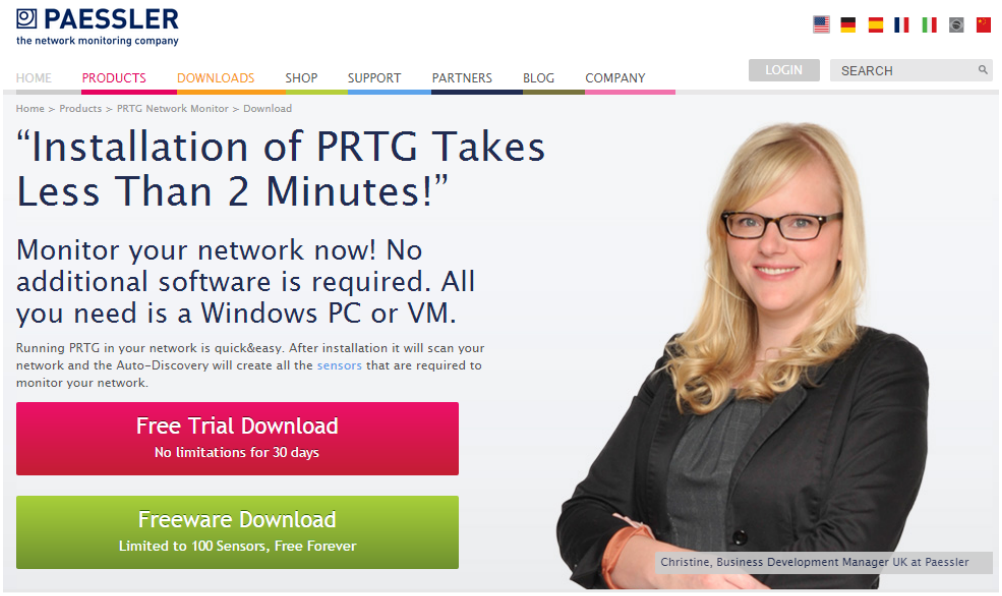
- TWO—Smart Setup 37

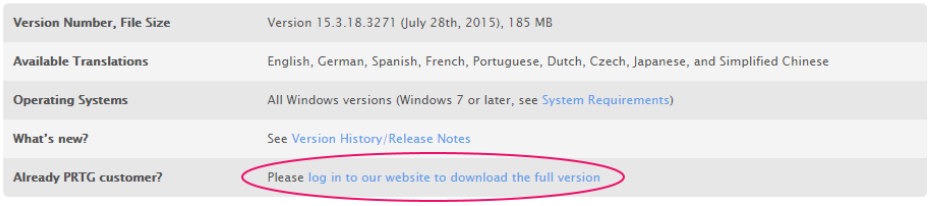
2.1 ONE—Download, Installation, and First Login

Simply download and install the version of PRTG Network Monitor which meets your needs. For video tutorials with PRTG basics, please see the More 36 section below.

Download

On the Paessler website, you find two different installers for PRTG, a public download for the Freeware and Trial editions, and a login link to download a commercial edition, which is available for paying customers only.





Download the Trial or Freeware Edition, or log in to get a Commercial PRTG Edition

Downloading the Freeware or Trial Edition

Please download the latest publicly available program version from the Paessler website. Simultaneously, you will receive a trial key. Enter this license key during the installation of PRTG.

- https://www.paessler.com/prtg/download

Note: Every Freeware installation starts as a Trial version, permitting you an unlimited number of sensors for 30 days. After the trial period expires, your installation automatically reverts to a Freeware edition with 100 sensors. Please understand that Commercial Edition users get prioritized support.

Downloading the Commercial Edition

Downloads and updates are free to customers with an active maintenance contract. Please log in to the Paessler website to get the latest PRTG version. There you can also find your license key, which must be entered during the installation:

- **https://shop.paessler.com/accounts/login/**

If you do not have an active maintenance contract and need one, please contact sales@paessler.com.

Note: Once installed, usually PRTG's **Software Auto-Update** will automatically provide and install new software versions. This helps you keep PRTG up to date.

Installation

Double click the setup file on the computer you want to use as PRTG server. Follow the installation wizard and install the software.

At the end of the installation, PRTG opens a new browser window automatically. It connects to the PRTG web interface, shows the device tree, and starts the setup assistant. Please make sure you load the web interface with one of the supported browsers:

- Google Chrome 49 or later (recommended),
- Mozilla Firefox 45 or later, or
- Microsoft Internet Explorer 11.

Note: Due to scripting incompatibilities, you might not be able to use all functionalities of the PRTG Ajax web interface with Internet Explorer 10 or earlier and other older browsers. If you cannot access the PRTG web interface, please open the URL of the PRTG in another browser.

Login

If everything works fine, the first thing you will see will not be the login screen, but the device tree. You only have to log in manually if you use a different browser.

PRTG Login Screen

- Leave the **Login Name** and **Password** fields empty.
- Choose the **Use AJAX Web GUI (All features, optimized for desktop access)** option.
- Click the **Default Login** button to login.

Please make sure you use a supported web browser when logging in to PRTG. Please use Google Chrome 49 or later (recommended), Mozilla Firefox 45 or later, or Microsoft Internet Explorer 11. Only with a supported browser you can log in with the **Use AJAX Web GUI (All features, optimized for desktop access)** option. If you see this option grayed out, please change your browser and open the URL again.

Please see the next step for more information about the initial configuration of PRTG using the **Smart Setup**!

More

Video tutorials for PRTG Network Monitor:

- https://www.paessler.com/support/videos

2.2 TWO—Smart Setup

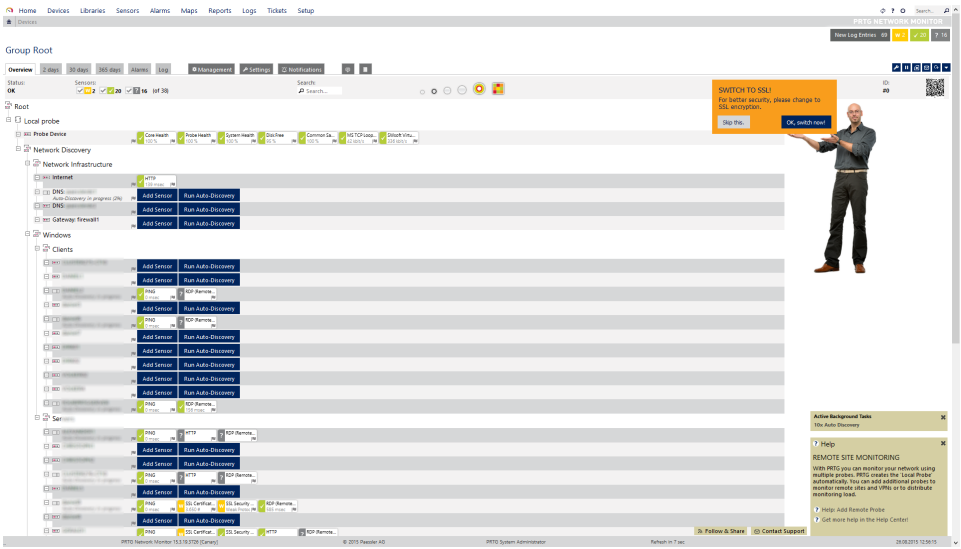
For a new installation on a computer or server, PRTG automatically shows the **Smart Setup**. This setup assistant, represented by some members of the Paessler team, will guide you through the initial setup of your network monitoring system. The Smart Setup will reappear until you have completed all steps. You can skip the introduction altogether right at the beginning.

First Start

When logging in for the first time, PRTG will show you the device tree 123. It already contains several devices 91 with sensors 92 that monitor your network, ordered in different suitable groups 90. PRTG automatically creates the device tree during the installation process by using its **Auto-Discovery** 219 function. You do not have to fill out any forms but will directly see the availability and first monitoring results of various devices in your network at your first start of PRTG!

PRTG scans your network by pinging IP addresses in the subnet of your PRTG system and adds all reachable devices to your specific network monitoring structure.

Note: The smart setup scans only for devices with IP addresses in private network ranges. You can manually start an Auto-Discovery for other subnets later.

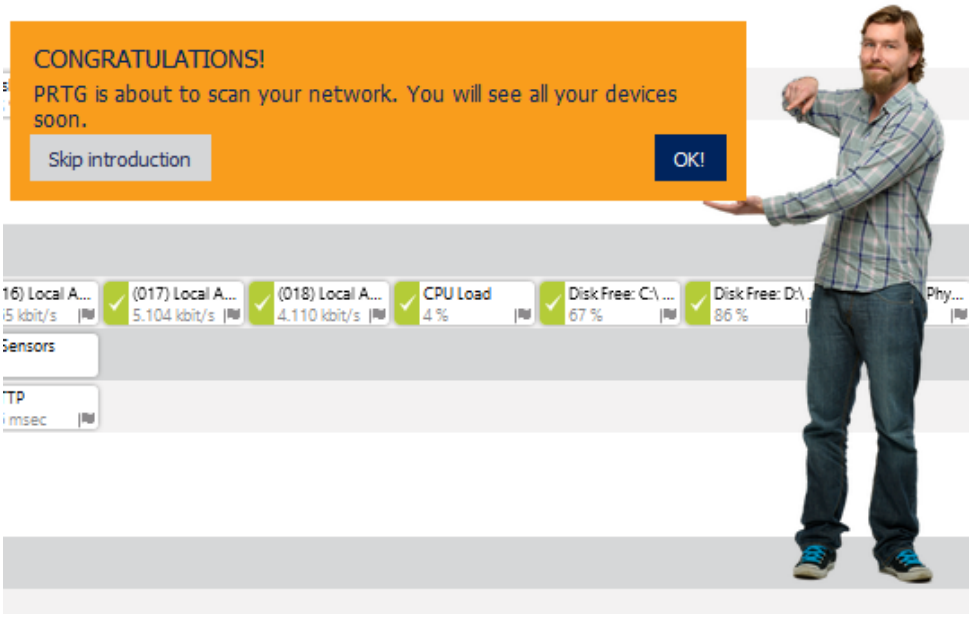


Device Tree after Initial Auto-Discovery

You will notice a Paessler employee in the upper right corner of the PRTG web interface. He will guide you through 5 simple setup steps where you can enter more information about your network. PRTG will run another auto-discovery with this information to add additional devices and sensors to your monitoring. Of course, you can still edit the monitoring settings provided during the Smart Setup later on. And you can always adjust the monitoring to your needs.

Click **OK!** to start a guided tour, follow the instructions, and discover your network with PRTG!

Note: If you choose **Skip introduction** now, then the Smart Setup assistant will never appear again! We strongly recommend that you take the guided tour if you are new to PRTG.



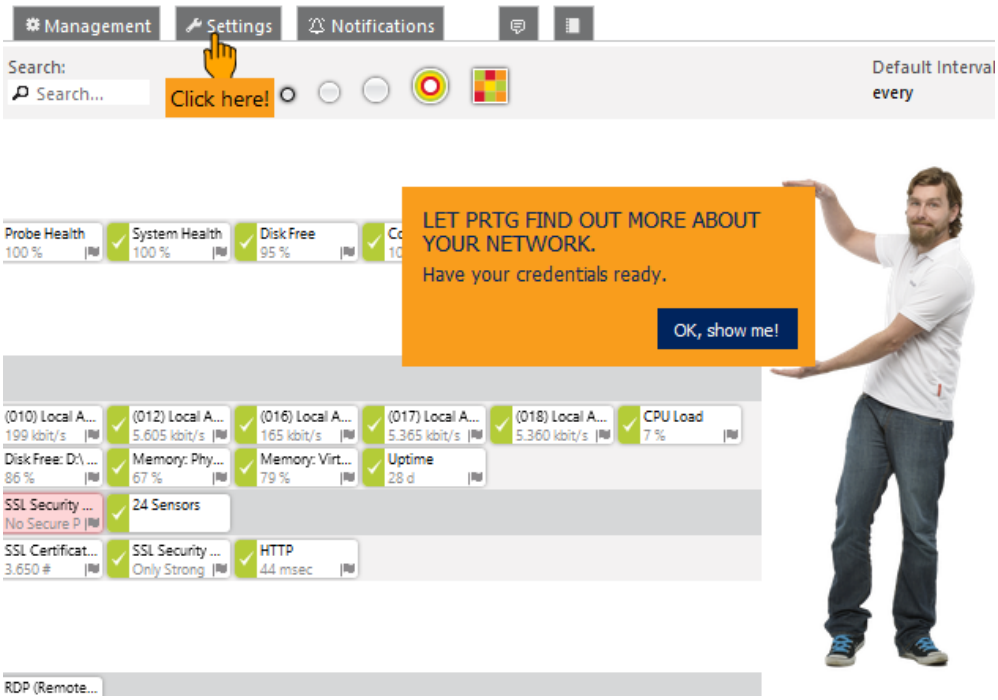
Start Your Introduction to PRTG

The steps to go are:

- Provide Credentials 38
- Enter Location Information 41
- Change Your PRTG Login Password 42
- Confirm Your Email Address 44
- Switch to SSL 45 (if you access PRTG from another computer)

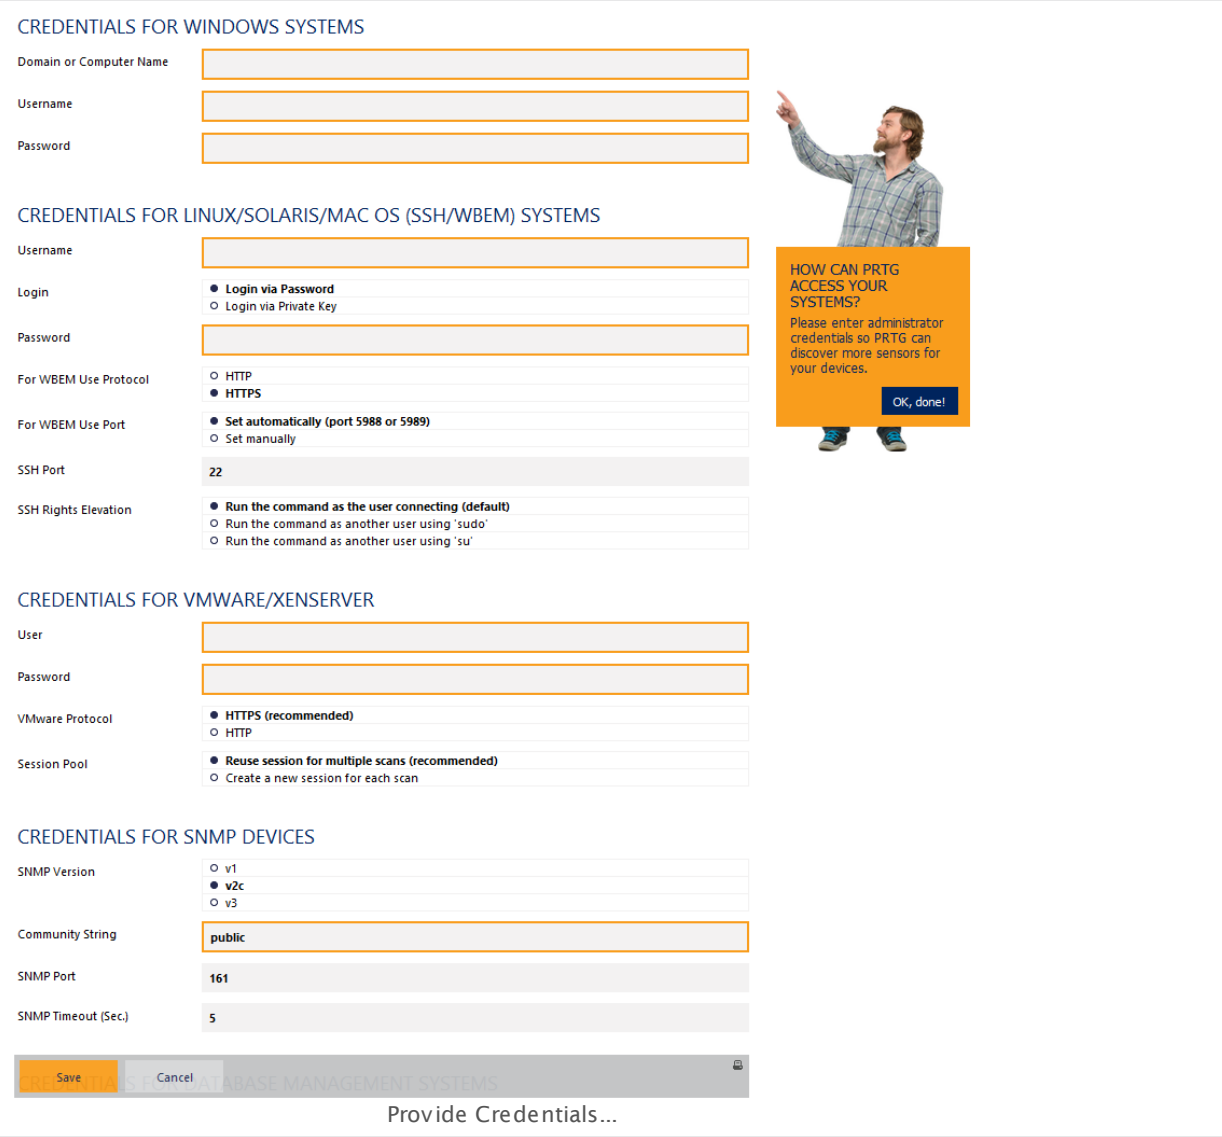
Step 1: Provide Credentials

Your personal setup assistant Greg asks you to provide credentials for devices in your network. Click **OK, show me!**, follow the animated yellow mouse pointer, and open the **Settings** tab of the **Root** group.



Have Your Credentials Ready

In the **Settings** tab, enter various administrator credentials for your network environment. With these credentials, PRTG can add a large number of additional devices and sensors automatically to your device tree. This way, PRTG helps you to set up your network monitoring so there is no need for you to manually add every single devices one by one.



Provide Credentials...

- To monitor your Windows clients and servers via Windows Management Instrumentation (WMI), enter Windows administrator credentials for your network. We recommend that you use Domain Administrator credentials (if you use an Active Directory). For a general introduction to the technology behind WMI, see the manual section **Monitoring via WMI** 3005.
- If you have systems running on Linux, Solaris, or Mac OS X, enter root access credentials for these systems. For a general introduction to SSH monitoring, see the manual section **Monitoring via SSH** 3008.
- If you use the virtual environments VMware or Citrix XenServer, enter root access credentials for these systems. For a general introduction to the monitoring of virtual environments, see the manual section **Monitoring Virtual Environments** 3025.
- To monitor your hardware (router, switches, etc.), Simple Network Management Protocol (SNMP) is the most common protocol used. Usually, all SNMP-enabled devices use the same settings by default: SNMP v2c, community string public, SNMP port 161). For a general introduction to the technology behind SNMP, see the manual section **Monitoring via SNMP** 3001.

PRTG will store these credentials in the **Root** 260 group of your device tree. All dependent devices automatically inherit and use them for monitoring. You can discontinue **Inheritance of Settings** 94 at any level if you enter other credentials instead.

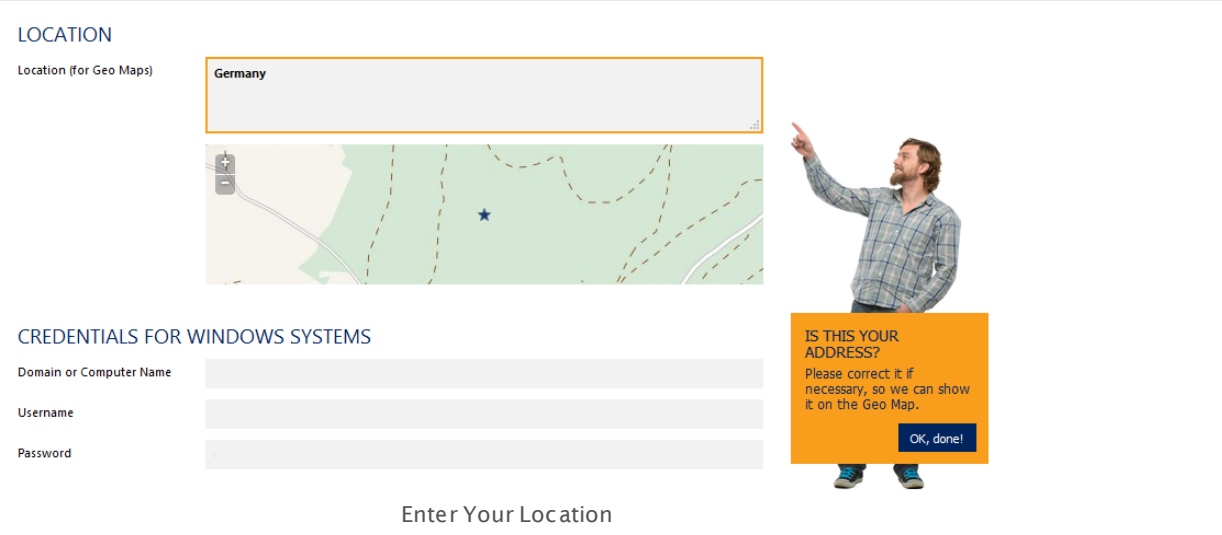
Click **OK, done!** to finish this setup step and confirm to start a detailed auto-discovery with the **OK, do it!** button.

...and Start a Detailed Auto-Discovery

For details about the available options, please see the manual section **Root Group Settings** 261.

Step 2: Enter Location Information

While PRTG runs a new auto-discovery in your network with the provided credentials, the setup assistant asks you to provide the location of your PRTG server. This information will be displayed on PRTG **Geo Maps** 2753. Enter your location and confirm with **OK, done!**. Click **OK, show me!** to get back to the device tree.



Enter Your Location

For details about the available options, please see the manual section **Root Group Settings** 260.

Step 3: Change Your PRTG Login Password

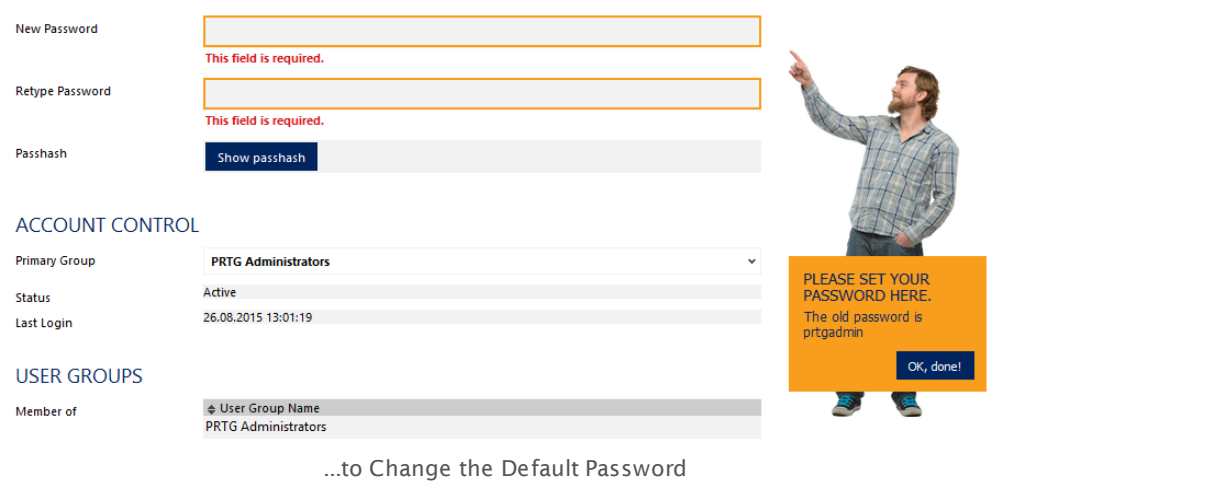
Back on the device tree, the setup assistant asks you to change your password. Click **OK, show me!**, follow the assistant to your account settings. By default, PRTG uses the administrator account with login name **prtgadmin** and password **prtgadmin.** So we strongly recommend that you change the password to secure your PRTG installation against unauthorized access.

Follow the Assistant...

Enter your **New Password**, confirm it with **Retype Password**. The password must meet the following requirements:

- at least eight characters long
- at least one numeral
- at least one capitalized letter

Click **OK, done!** to save your new password.



...to Change the Default Password

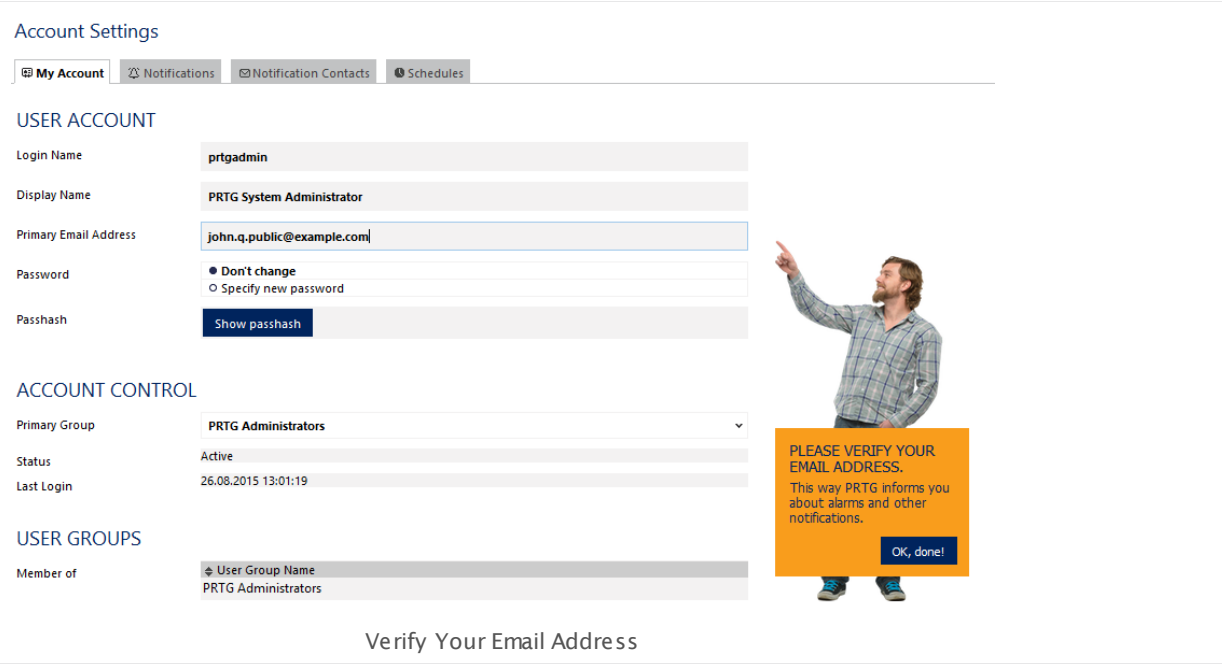
For details about the available options, please see the manual section [Account Settings—My Account](2830).

Step 4: Confirm Your Email Address

To complete the PRTG Smart Setup, check whether the email address that you have entered during the installation is correct.

Note: A working email address is absolutely mandatory for PRTG to reach you via email notifications, alarms, and other important messages.

If the address is correct, click **OK, done!** and follow the assistant back to the device tree.



Verify Your Email Address

For details about the available options, see the manual section **Account Settings—My Account** 2830.

Step 5: Switch to SSL

If you access the PRTG web interface from another computer than from the computer on which you installed PRTG, the assistant will appear and ask you to switch to a secure connection with Secure Sockets Layer (SSL) encryption. We strongly recommend that you run the PRTG web interface using SSL encryption (Hypertext Transfer Protocol Secure (HTTPS)), especially if you make your web interface available from the internet. Without encryption your passwords are sent unencrypted over your network.

- Click **OK, switch now!** to get more information about using SSL for the PRTG web server.
- In the new window, click the button **Yes, switch to SSL now** to switch to an SSL encrypted connection.
- PRTG must restart its services to apply the changes and is reachable under an https URL afterwards.
- When the web interface reloads, most likely it will show a certificate warning 113. Confirm it to proceed to the login screen.

Switch to a Secure SSL Connection

For more details, see the manual sections **System Administration—User Interface** 2862 and **SSL Certificate Warning** 113.

You Are Done!

While you were busy with the Smart Setup, PRTG created additional devices and sensors for you. There are first monitoring values available, too. Now you are all-in in your personal unified network monitoring! In the meantime, you can follow PRTG on Facebook, Twitter, and Google+. Just click the **Follow & Share** button on the page footer and connect to your new favorite monitoring tool!

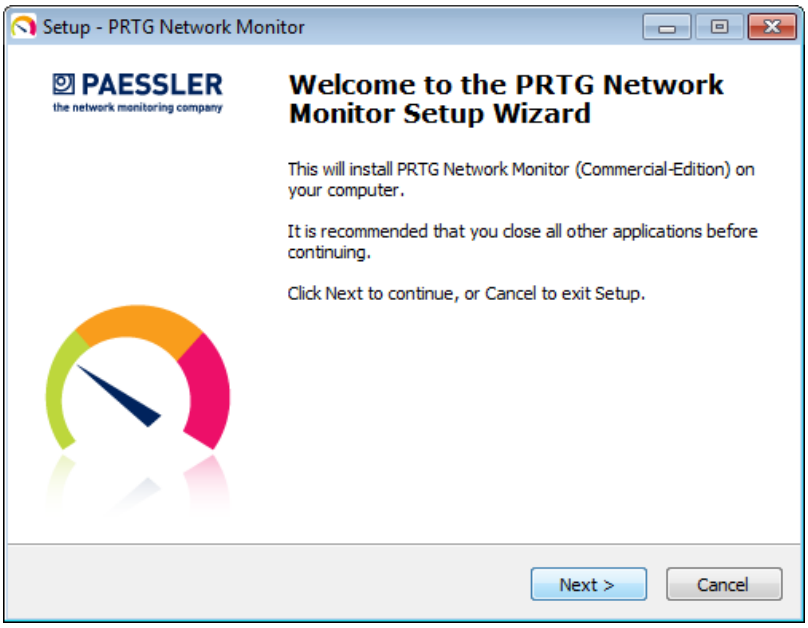
To become familiar with the PRTG web interface, we recommend that you read on in the manual section **General Layout** of the web interface.

Part 3

Installing the Software

3 Installing the Software

This section describes how to download and install your PRTG product.



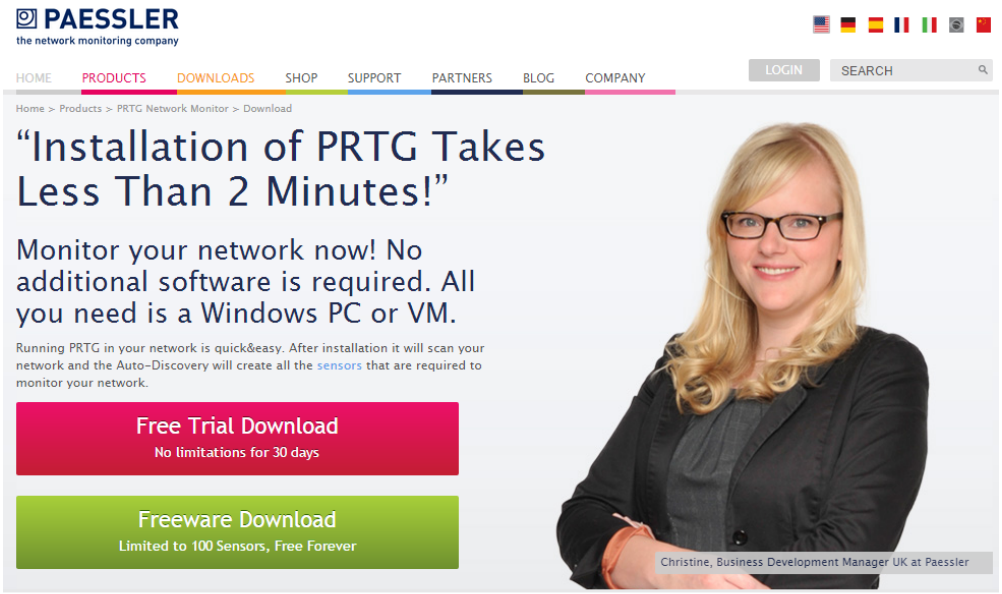
PRTG Setup

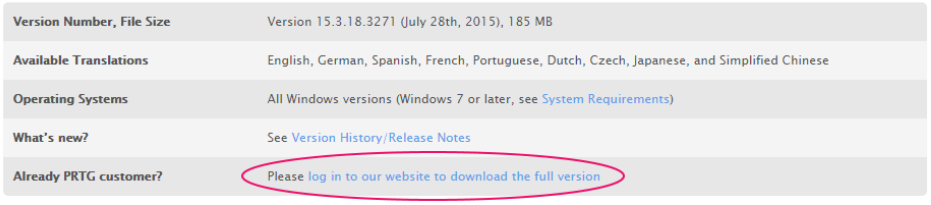
Please see the following sections for more information.

Installing the Software—Topics

3.1 Download PRTG

On the Paessler website, you find two different installers for PRTG, a public download for the Freeware and Trial editions, and a login link to download a commercial edition, which is available for paying customers only.





Download the Trial or Freeware Edition, or log in to get a Commercial PRTG Edition

Downloading the Freeware or Trial Edition

Please download the latest publicly available program version from the Paessler website. Simultaneously, you will receive a trial key. Enter this license key during the installation of PRTG.

- https://www.paessler.com/prtg/download

Note: Every Freeware installation starts as a Trial version, permitting you an unlimited number of sensors for 30 days. After the trial period expires, your installation automatically reverts to a Freeware edition with 100 sensors. Please understand that Commercial Edition users get prioritized support.

Downloading the Commercial Edition

Downloads and updates are free to customers with an active maintenance contract. Please log in to the Paessler website to get the latest PRTG version. There you can also find your license key, which must be entered during the installation:

- **https://shop.paessler.com/accounts/login/**

If you do not have an active maintenance contract and need one, please contact sales@paessler.com.

Note: Once installed, usually PRTG's **Software Auto-Update** will automatically provide and install new software versions. This helps you keep PRTG up to date.

3.2 Update From Previous Versions

If you already have installed a previous software version, there are several things you have to consider before you update to the current PRTG version. Please see section **Detailed System Requirements** 23 to see all requirements for the current PRTG version.

Note: We recommend that you always have a proper backup of your monitoring data and configuration. In most cases both will be maintained when upgrading. Anyway, we recommend a backup before upgrading. Please see **More** 54 section below.

Update from PRTG Network Monitor 16.1.22 or later

If you run PRTG Network Monitor with version 16.1.22 or later, simply install 56 the latest version on top of the previous version. Your configuration will be kept. PRTG updates remote probes 3109 automatically as well. If you have configured PRTG as a cluster 87, you only have to install an update on any node server (master or failover). PRTG deploys the new version to the cluster automatically.

We recommend that you use the **Auto-Update** 2918 of PRTG to install the latest version. Please always have a proper backup of your monitoring data.

Note: As of PRTG 16.2.23, several sensor types are deprecated and will be completely removed with PRTG version 16.x.25. Please see this article for details: https://kb.paessler.com/en/topic/68227

Update from PRTG Network Monitor 13.1.1 through 16.1.21

As of version 16.1.22, PRTG is signed with renewed certificates. To be able to seamlessly update to version 16.1.22 or later an **intermediate update** is required for the PRTG core server and all probes if you currently run a PRTG version previous to 16.1.21.1691/1692. If you auto-update 2918 from previous versions (lower than 16.1.21.1691/1692), PRTG will automatically install this intermediate version first. You have to perform an additional auto-update to install the latest version. PRTG will notify you with a ticket 171 about this approach. Your configuration will be kept.

Note: We recommend that you use the auto-update 2918 to install the latest PRTG version. If you update manually with an installer downloaded from the Paessler online shop, the intermediate update is only necessary if you currently run a PRTG version **previous to 16.1.21.1691/1692 with one or more remote probes or in a cluster setup.** If you do not perform this intermediate update, you will have to update your remote probes and cluster nodes manually. Please contact our technical support team 2932 to get the installer for this version if you do not use the auto-update.

- As of PRTG 14, **Internet Explorer 9 is no longer officially supported** for access to the PRTG web interface.
- Also as of PRTG 14, PRTG core and probes do not support **Windows XP** and **Windows Server 2003** (including SP1 and SP2) officially anymore.
- As of PRTG 15, **Internet Explorer 10 is no longer officially supported** for access to the PRTG web interface.

Web Interface Customizations as of PRTG Network Monitor 13.2.3

As of PRTG version 13.2.3, the website folder of the PRTG program directory is not used any more. This means that if you update from an older PRTG version than 13.2.3 to the current version, all existing customizations of the web interface will be disabled and you have to revise them. You may find a way for a similar customization that you can add to the files in the current webroot folder that contains the web interface files now. For details, please see the section **More** 54.

Update from PRTG Network Monitor 9 and 12

If you use PRTG 9 or 12 now, your configuration will be kept when installing the current PRTG version in **Standalone Mode** or when installing a **Master Node**. There are only a few things you should consider.

Note: We recommend that you always have a proper backup of your monitoring data.

- **Intermediate versions:** You have to install two intermediate versions before you can update to the latest version.
  - If you currently run PRTG version 12.4.5.3164/3165 or lower, install the **intermediate version 12.4.7.3507** before you proceed.
  - If you have installed version 12.4.7.3507, install the **intermediate version 16.1.21.1691/1692** before you proceed. Afterwards you can seamlessly update to the latest PRTG version. For details about this intermediate update, please see section **Update from PRTG Network Monitor 13.1.1 through 16.1.21** 51 above.
  - We recommend that you use the **Auto-Update** 2918 feature. In this case PRTG will automatically install the intermediate versions. Run the auto-update three times if you come from a version previous to 12.4.7.3507, run it twice if you come from a version previous to 16.1.21.1691/1692. If you do not use the auto-update, please contact our technical support team 2932 to get the installers for these intermediate versions.
- **Discontinued Sensors:** Existing instances of the following sensor types will stop working as of PRTG V12 and must be replaced with their successor sensor types!

  - VMware Host Server (SOAP)
  - VMware Virtual Machine (SOAP)
  - Xen Virtual Machine

  If your configuration contains these sensor types, they will stop monitoring after upgrading to the current version. We recommend that you to pause them to keep their data. In order to continue monitoring, please add the sensors anew (for example, using the auto-discovery).
- **Please install .NET 4.0:** We strongly recommend that you install .NET 4.0 on systems that run the core server (and the remote probes, if you use those). Otherwise the following features will not work: VMware 354 auto-discovery and monitoring, Citrix XenServer 502 auto-discovery and monitoring, SIP Options Ping Sensor 1425, Windows Last Update Sensor (deprecated as of PRTG 16.x.23).
- **Changed Geo Maps Provider:** When you update to the current PRTG version, the provider for geographical maps will automatically be switched from Google Maps to MapQuest (using Open Street Map data).

- **Windows 2000 Not Supported:** Since PRTG 7 we do not officially support Windows 2000 systems any more. This means, PRTG cannot be installed on systems running Windows 2000, and you cannot officially monitor Windows 2000 systems (for example, via WMI). However, if you could successfully monitor your Windows 2000 systems with PRTG 9, this might actually not be possible any more with the current PRTG version. Especially the WMI Service Sensor 2620 will show an error message when monitoring Windows 2000 systems under the current PRTG version. For a work around, please see the **More** 54 section below.

Note: We recommend that you to have a look at the **Detailed System Requirements** 23 before updating to the current version! Officially supported operating systems, browsers, and other requirements may have changed since version 9.

Update from PRTG Network Monitor 7 or 8

Note: If at all possible for you, we strongly recommend that you perform a clean install of the latest PRTG version instead of updating from an existing PRTG 7 or 8!

If you use PRTG 7 or 8 now, you have to update PRTG to intermediate versions first to ensure all data is carried over correctly. You **cannot update to PRTG 15 or later directly** from PRTG 7 or 8!

- We recommend that you first update to the latest PRTG 8 version.
- From the latest PRTG 8 version update to PRTG version 9.
- From PRTG 9, update to both intermediate versions 52 12.4.7.3507 and 16.1.21.1691/1692 and then to the current PRTG version.

Please contact our technical support 3150 to obtain download links for these PRTG versions. Always keep a proper backup of your configuration and monitoring data!

Updating from PRTG 7 or 8 to Current PRTG Version

- Packet Sniffer (Content) sensors are not supported any more. Existing sensors of this type will automatically be switched to Packet Sniffer (Header) sensors after the update. As a benefit, you can now also sniff IPv6 traffic.
- Internet Explorer 8 is no longer supported for access to the PRTG Ajax web interface or to the mobile web GUI.
- You may experience a slow Enterprise Console 2938 (former 'Windows GUI') due to different reasons. For detailed information, please see the Knowledge Base article linked in the **More** 54 section below.
- When installing a failover node on top of an existing stand-alone PRTG 7, 8, 9, 12, or 13+ installation, the configuration cannot be kept and is written to a backup folder. Then, the new cluster configuration is received from the master node of the cluster. As all nodes work with the same configuration, a failover node's old configuration and monitoring data can no longer be used. If you want to keep a configuration of PRTG 7, please install the master node on top of the old installation and use other servers for the failover node installations.
- Since PRTG 9 the SNMP sensors use the **IPv4 Outgoing IP** set for the probe service (this setting was formerly ignored by those sensors, using the **auto** setting instead). If you experience failing sensors, please check the setting in the probe settings 295. For detailed information please see the **More** 54 section below.

- If you have (manually) configured the PRTG probe or PRTG core service to run under a different Windows user account (for example, for successful internet access through an ISA server firewall), please apply the respective Windows user account for the "PRTGProbeService" and/or "PRTGCoreService" anew after installing the current PRTG version. For detailed information please see the **More** 54 section below.

- System Requirements for the PRTG core server and probes: Please have a look at our latest **Detailed System Requirements** 23.

- If you use the default data path in your PRTG setup, it will be changed automatically. Up to version 8 all data was stored in a sub folder reflecting a PRTG version number (v7 or v8). As of version 9 this sub folder is omitted, and data is stored directly at %ALLUSERSPROFILE%\Application data\Paessler\PRTG Network Monitor. During setup, all data will be moved to the new directory. If you use a custom data path it will not be changed.

- Up to version 8 all data in the registry was stored in a sub key reflecting a PRTG version number (v7 or v8). As of version 9 this sub key is omitted, and registry data is stored directly under the key HKEY_LOCAL_MACHINE\SOFTWARE\Paessler\PRTG Network Monitor (on 32-bit systems) respectively HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Paessler\PRTG Network Monitor (on 64-bit systems). During setup, all existing registry values will be moved to the new key.

Note: We strongly recommend that you to have a look at the **Detailed System Requirements** 23 before updating to the current version! Officially supported operating systems, browsers, and other requirements may have changed since version 8.

Updating from PRTG 7 to Current PRTG Version

- Regarding custom sensors, the interpretation of returned values is handled more strict as of PRTG 8. If you use custom sensors with PRTG 7, these may not work with the current PRTG version if they do not fully apply to the API definition 3086.

Update from Older PRTG Products

For all other predecessor products, a direct data import into the current version is not possible.

If you have been using IPCheck 5 or PRTG Traffic Grapher 6, please perform a clean installation of PRTG Network Monitor and set up your configuration anew. Using PRTG's **Auto-Discovery** 219 is the easiest way to quickly configure a monitoring of your entire network. Please see **Quick Start Guide** 32 section for more information.

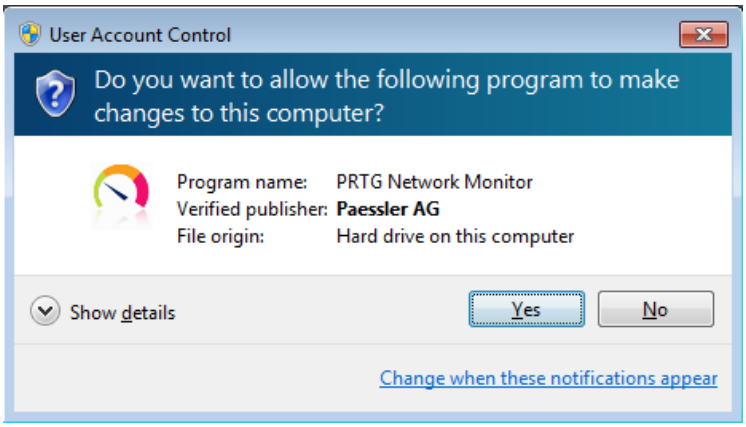
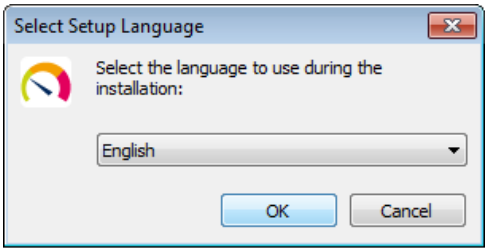
3.3 Install a PRTG Core Server

Installing PRTG is easy. It is similar to other Windows-based applications. To install the application please run the installation setup program from the ZIP file that you have downloaded.



Windows User Account Control Confirmation Request

Confirm the question of the Windows User Account Control with **Yes** to allow the program to install. The usual software installation wizard will guide you through the installation process.

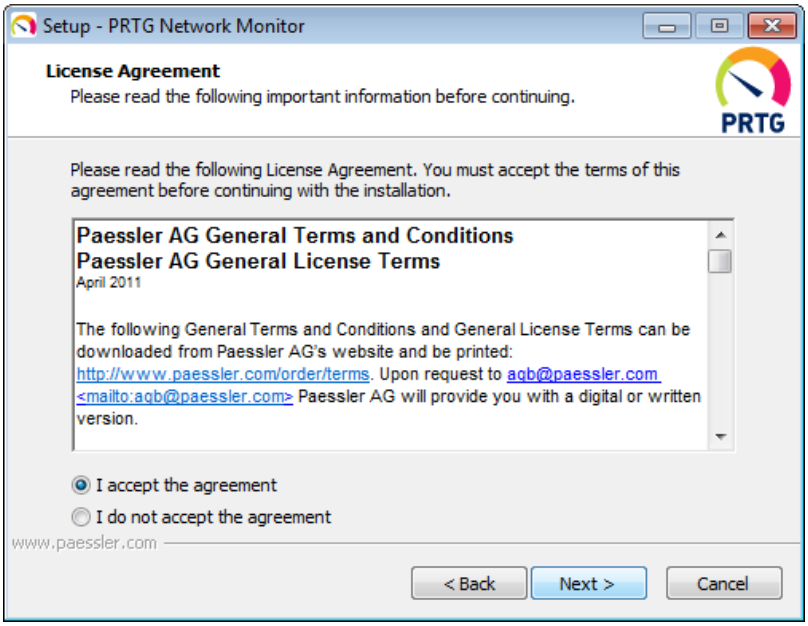


Setup Language Selection

Select a language for the program and click the **OK** button. The available language options depend on both your Windows version and the setup file.

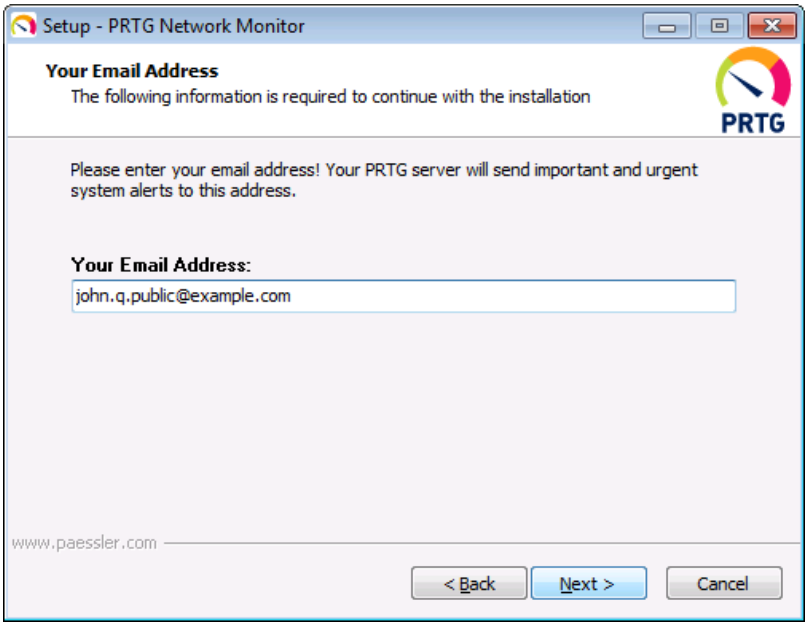
Setup Wizard Start Screen

Click **Next** to start the walk through the wizard.



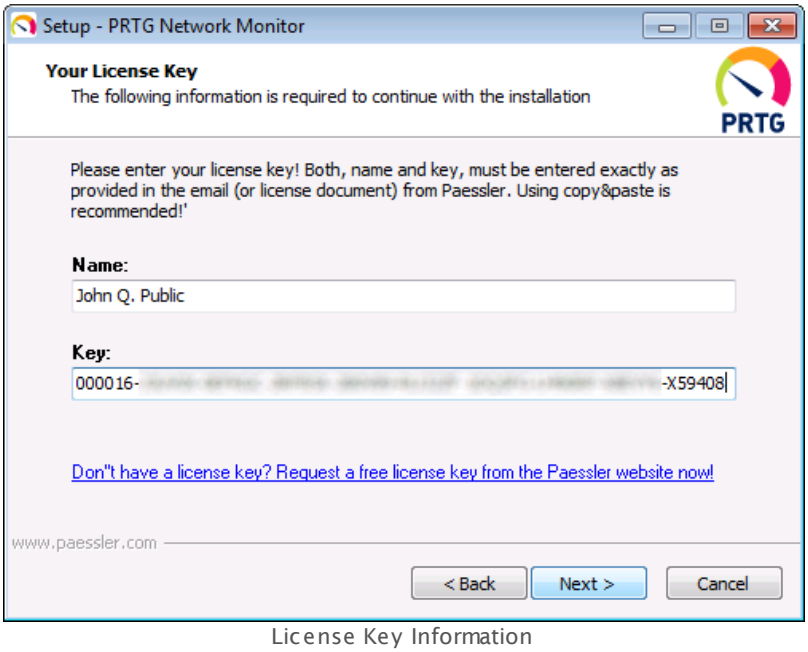
Setup Wizard License Agreement

Accept the license agreement and click **Next**.



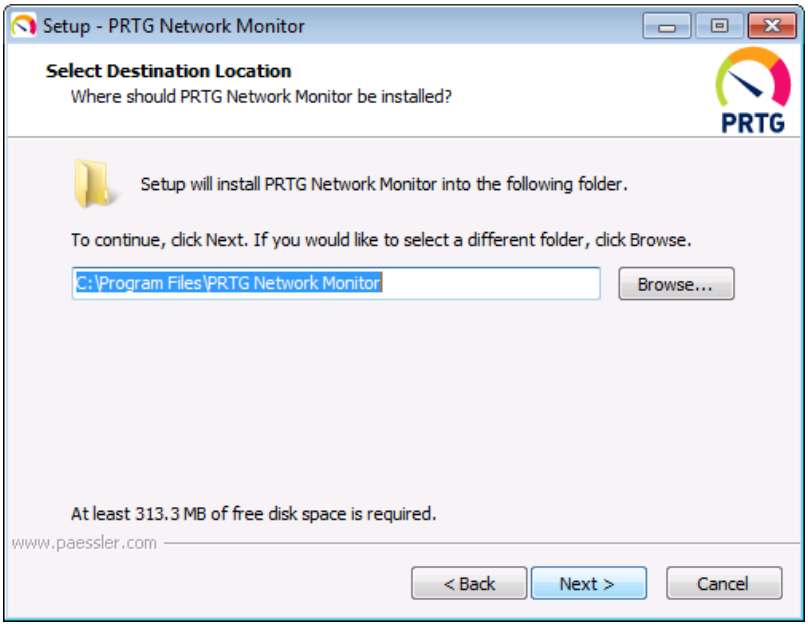
Administrator Email Address

Enter a valid email address. Your PRTG server will send important and urgent system alerts to this address. Click the **Next** button to continue.



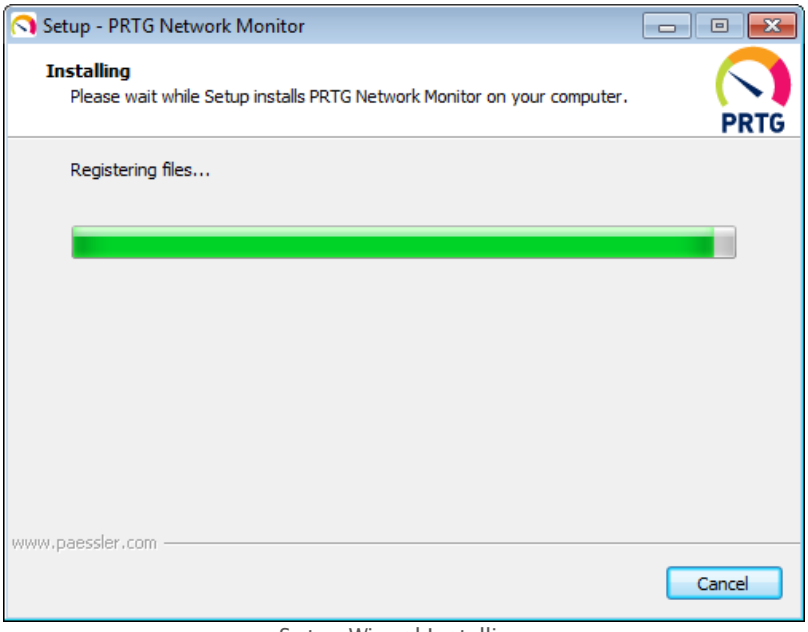
License Key Information

Enter your license information. You have to provide the **License Name** and the **License Key** exactly as you received it in the email or license document from Paessler. We recommend that you use copy&paste to avoid typos. Click **Next** to confirm.



Setup Wizard Destination Location

Choose the folder you wish to install the software in. We recommend that you use the default value. As soon as you click **Next**, PRTG will copy the necessary files to your disk.

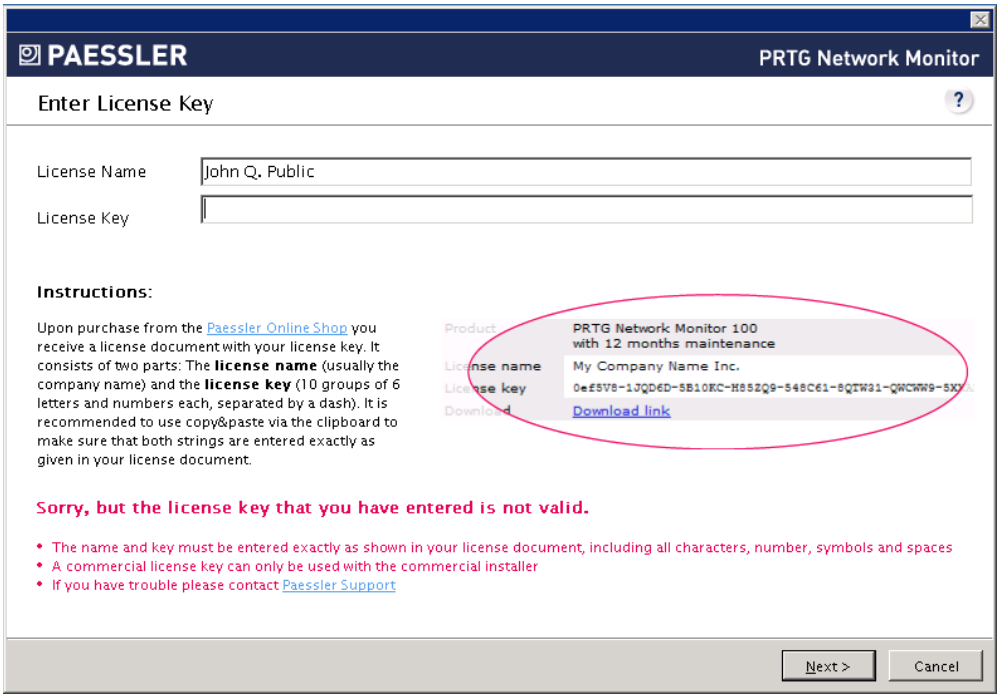


Setup Wizard Installing

After installation, PRTG opens the [Ajax Web Interface](#) 108 in your system's default browser. Make sure there is Google Chrome 49 or later (recommended), Mozilla Firefox 45 or later, or Microsoft Internet Explorer 11 available on the system, and set as default browser (see [System Requirements](#) 22).

Enter License Information

Only if you entered incorrect license information before, PRTG will ask you to enter a correct license name and key.



Enter License Key Dialog

Please enter both **Name** and **Key** exactly as stated in the email received from Paessler. We recommend that you use copy&paste to avoid typing mistakes. For details, please see **Enter a License Key** 62.

More

Knowledge Base: How can I establish a secure web interface connection to PRTG?

- http://kb.paessler.com/en/topic/273

Knowledge Base: PRTG blocks port 80 although I'm using SSL on port 443. How to free port 80?

- http://kb.paessler.com/en/topic/5373

3.4 Install a PRTG Cluster

PRTG offers single failover clustering in all licenses—even using the freeware edition. A single failover cluster consists of two servers ("Current Master" Node and "Failover Node"), each of them running one installation of PRTG. They are connected to each other and exchange configuration and monitoring data. You can run a cluster with up to 5 nodes.

Illustration of a Single Failover Cluster

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/clustering-1_en.png

For detailed information, please see **Failover Cluster Configuration** 3122.

More

Knowledge Base: What's the Clustering Feature in PRTG?

- http://kb.paessler.com/en/topic/6403

3.5 Enter a License Key

A license key for PRTG Network Monitor consists of the license name and a license key. The key is a string consisting of approximately 60 characters.

Your Personal License Information

You have received the license name and key from Paessler via email or in a license document on Paessler shop. This is either the information for a Trial or a Commercial Edition. When you click the according button to download the trial or freeware version of PRTG on the Paessler webpage, it will show a page with license details (license name and license key). Please copy this information and insert it when PRTG asks you to about you license information.

EXAMPLE OF LICENSE INFORMATION

License Name: **John Q. Public**
License Key: **0223515-FFSEJC-ZHGRDFM-UR1CS8-U73FGK-G645F2-YVF1DD-H8323N-D11HG9-M2DRG**

During the setup process, PRTG will ask you to enter your license information. Please use copy and paste to fill out the form in the dialog shown by the installer.

- **Trial/Freeware license key:** When entering a Trial license key, you can experience unlimited functionality of PRTG during the trial period. Your installation automatically switches to a Freeware Edition afterwards. For details about how to get your free Trial installer, please see **Download PRTG** 49 section.
- **Commercial license key:** You can only enter this key if you install the Commercial Edition of PRTG, available for download in the customer service center. See **Download PRTG** 50 section for details. Your installation allows the number of sensors according to your license 20.

Change License Key

Usually you do not need to enter a key manually, because it is prompted during installation. However, there are still scenarios where you want to change your key. If you need to enter new license information, please follow these steps.

Step 1: Make Sure You Have Installed the Correct Edition

Please check first if you have installed the proper edition and then enter the license key.

There are two different installers available for PRTG (see **Download** 49 section):

- The publicly available installer only contains the Freeware and Trial Editions. It does not accept any commercial license keys.
- The Commercial installer is only available for download to paying customers.

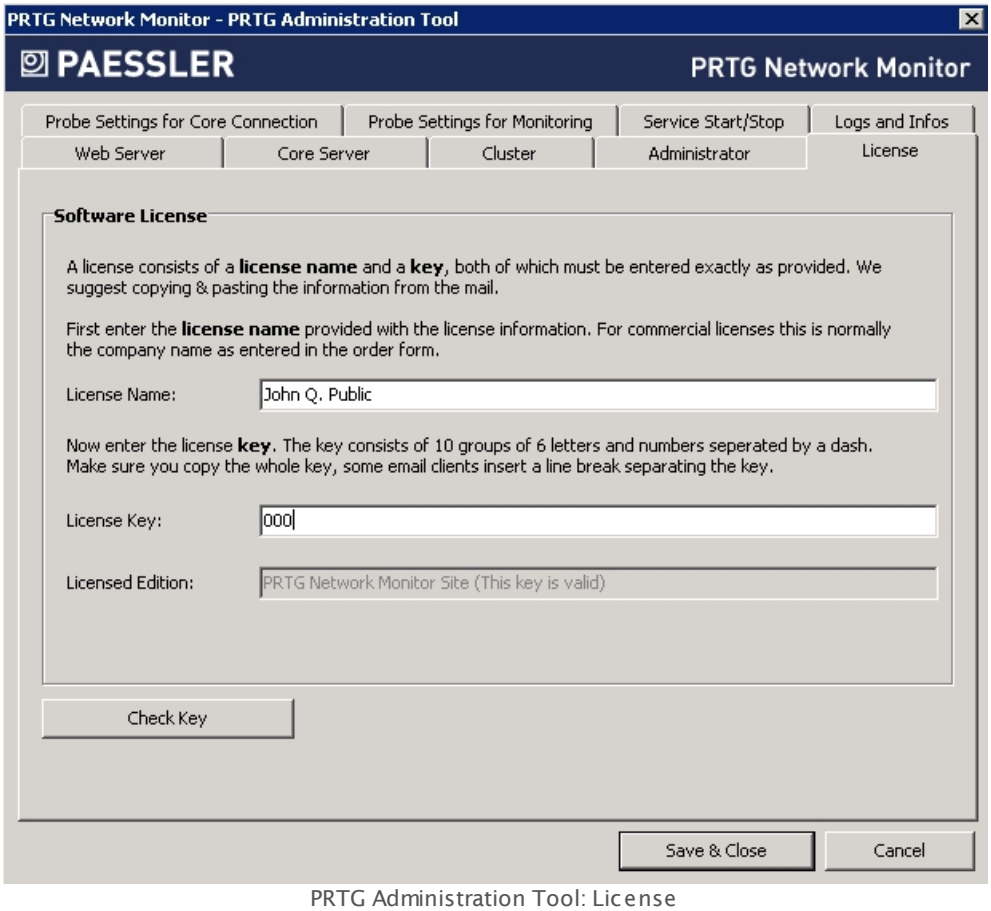
The Commercial Installer must be installed to run the commercial editions of PRTG Network Monitor. **If you have purchased a license key for PRTG, please download and install the latest Commercial Installer from the Paessler website to apply your license key.**

Note: You can install a commercial version "on top" of an existing Trial Edition to maintain your configuration and monitoring data.

Step 2: Enter the License Key

You have two options to enter a license key. If you can log in to the PRTG web interface 108, choose **Setup | Enter License Key** from the main menu bar 200 and provide your license information 2926. Alternatively, start the **PRTG Administration Tool** 3059 from the Windows Start Menu. In this program, select the **License** tab. For a video tutorial on the various settings you can make in the Administration Tool, including the PRTG License settings, please see the **More** 64 section below.

To use a PRTG license with this installation of PRTG, please enter the license information you have received from Paessler via email. To avoid typing errors, please copy and paste both the **License Name** and the **License Key** from the email. Both must be transferred exactly as shown in the email.



PRTG Administration Tool: License

To make sure your key has been entered correctly please click on the **Check Key** button. A popup box will either show success or denial of your license information. License information is also checked if you change tabs.

In the **Licensed Edition** field you will see an accepted license key.

Click the **Ok** button to save and confirm to restart the core server service by clicking on the **Yes** button.

PRTG Administrator: Restart Core Server Service

More

Paessler Website: PRTG Administration Tool (video tutorial)

- https://www.paessler.com/support/videos/prtg-basics/administration-tool

3.6 Activate the Product

PRTG tries to activate your license automatically via the internet on first start up. Only if PRTG cannot connect to the internet directly, the web interface will display a **Software Activation Required** notice.

You have to run through the product activation process once to use PRTG continuously (only Freeware and Trial Edition are always activated automatically and do not require a special procedure). The activation has to be done within ten days after installation and only takes a few minutes. If you do not activate PRTG for ten days, it temporarily reverts to the Freeware Edition (with a maximum of 100 sensors) until you activate. Login to the PRTG web interface 110 to activate.

Activate via Internet

In the PRTG web interface, choose **Setup | PRTG Status** from the main menu and open the **Activation** tab.

Click **Start Activation Now** to start product activation. PRTG now connects to the Paessler license server to check your license (via SSL on port 443). A few seconds later you see **Activation OK** in the License Activation Status.

Note: The PRTG core server needs an internet connection on port 443 to activate. If a proxy connection is needed, please configure it in the **System Administration—Core & Probes** 2883 settings. Please see **More** 66 section for details about activation servers. In case activation fails, you can activate via email.

Activate via Email

In the PRTG Web Interface, choose **Setup | PRTG Status** from the main menu and open the **Activation** tab.

If there is no internet connection available, you can activate PRTG via email. To do so, first click **Start Activation Now**. You will then see **Last message about activation: Activation failed** in the License Activation Status.

- Once the activation via internet fails, the activation via email is available.
- Open the **Start Activation per Email** tab. You see an **Activation Request Code**.
- Copy it and send it to the email address shown.
- Within two business days you will receive an email reply from Paessler, containing an activation code.
- When you receive this email, open the **Finalize Activation per Email** tab and copy the activation code into the according field.
  Note: Ensure you only copy the code itself and nothing else from the email. Also, please omit the "Activation Code Start/End" markers.
- Click on **Confirm Activation**.

A few seconds later you should see **Activation OK** in the License Activation Status.

More

Knowledge Base: Which servers does PRTG connect to for Software Auto-Update and for Activation?

- http://kb.paessler.com/en/topic/32513

3.7 Install a PRTG Remote Probe

The local probe is already included in a PRTG core server installation 56. You can install additional remote probes on other computers in order to take load from the system running the core installation or to extend monitoring to distributed networks.

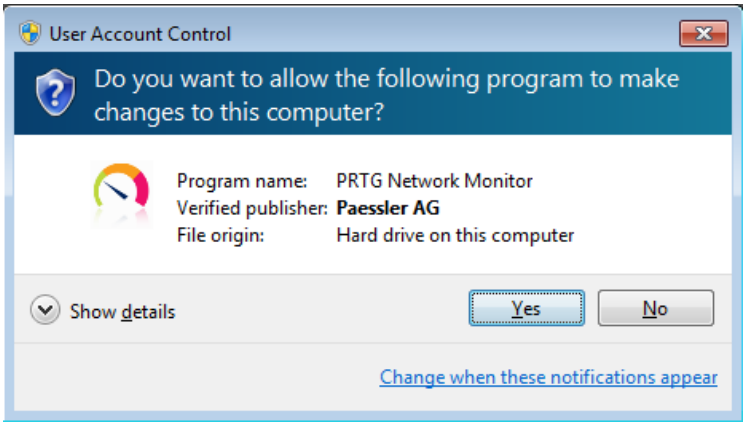
Note: You cannot install a remote probe on a system running already a PRTG core installation.

Download the Remote Probe Installer from the Web Interface

The remote probe version has to fit the PRTG core server version you will connect to. To download the correct setup program to the computer on which you want to install the remote probe, please connect to the Ajax web interface 110 from this target computer. On the login screen 110, enter login name and password and from the main menu, select **Setup | Downloads | Remote Probe Installer**. Click **Download: Remote Probe Installer**. Your browser will show a download dialog. Save the setup program to your local hard disk drive.

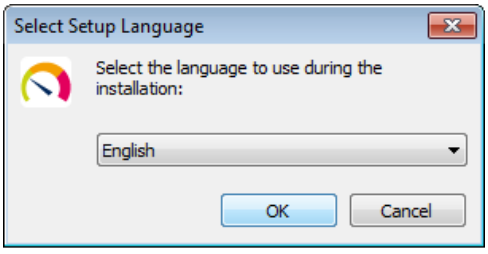
Install the Remote Probe

Please execute the setup program that you have just downloaded.



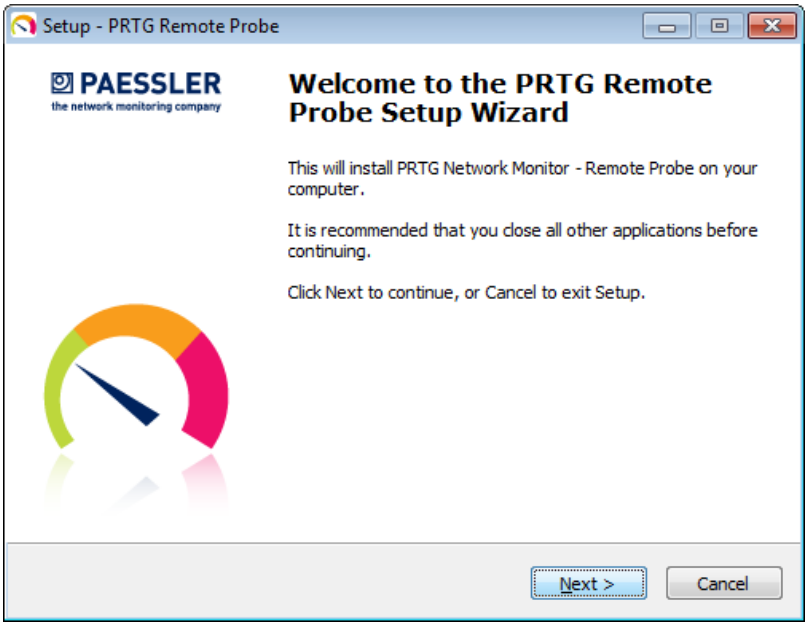
Windows User Account Control Confirmation Request

Confirm the question of the Windows User Account Control with **Yes** to allow installation. The usual software installation wizard will guide you through the installation process.



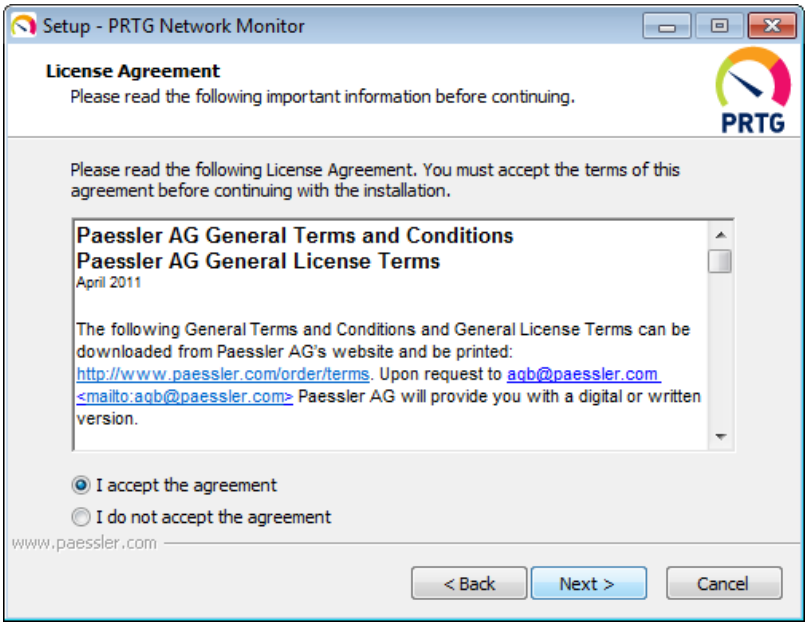
Setup Language Selection

Select a language for the program and click the **OK** button. The available language options depend on both your Windows version and the setup file.



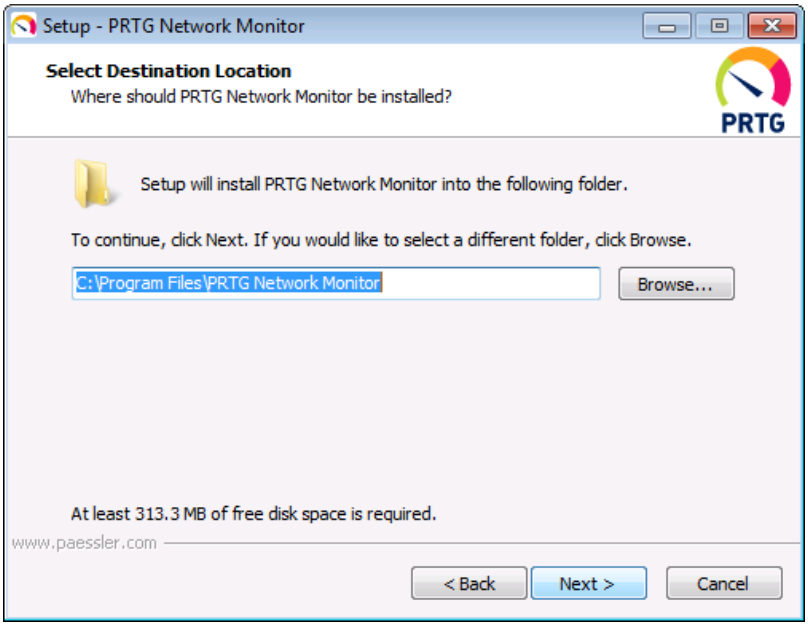
Remote Probe Setup Wizard Welcome Screen

Click **Next** to walk through the wizard.



Setup Wizard License Agreement

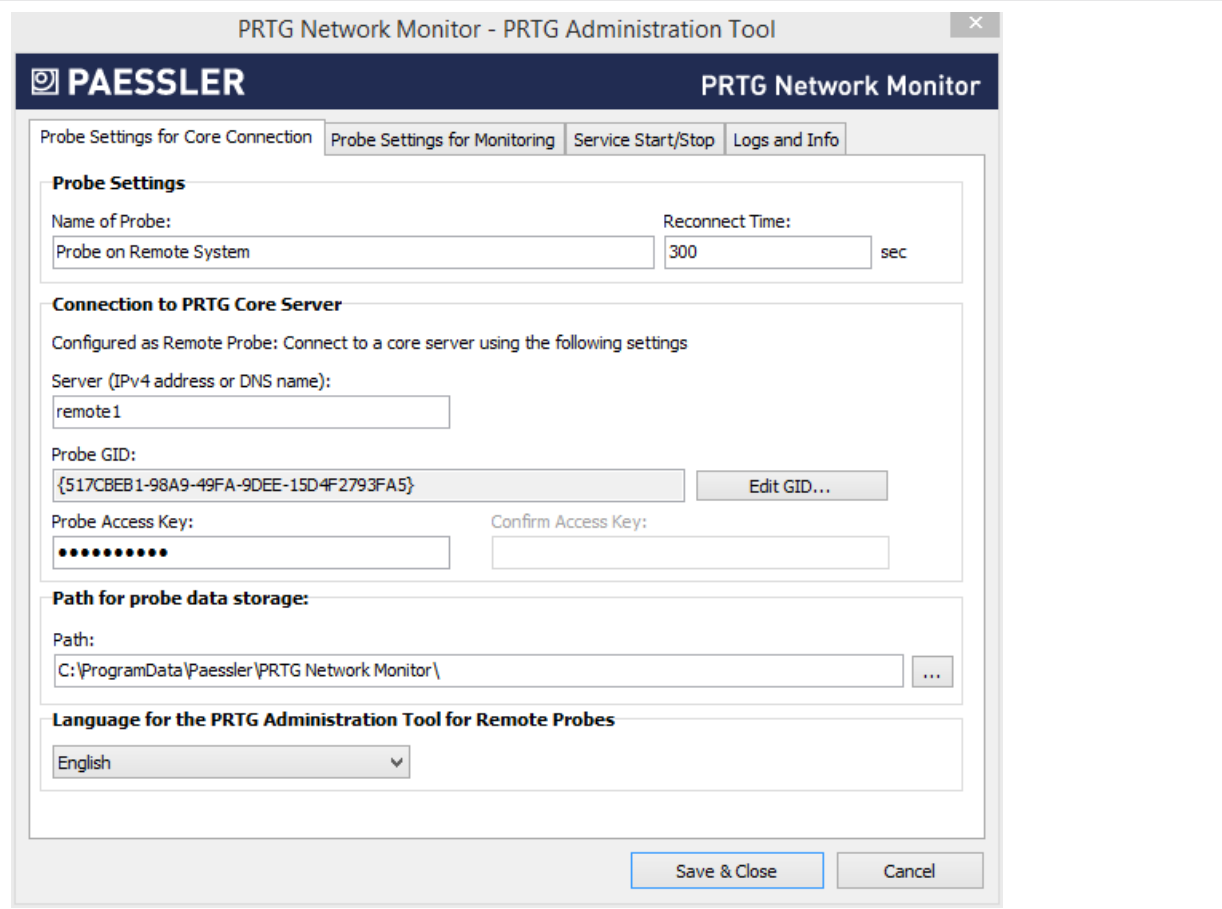
After accepting the license agreement, you can choose the folder for the remote probe software. We recommend that you use the default value.



Setup Wizard Destination Location

As soon as you click **Next**, the necessary files will be copied to your disk.

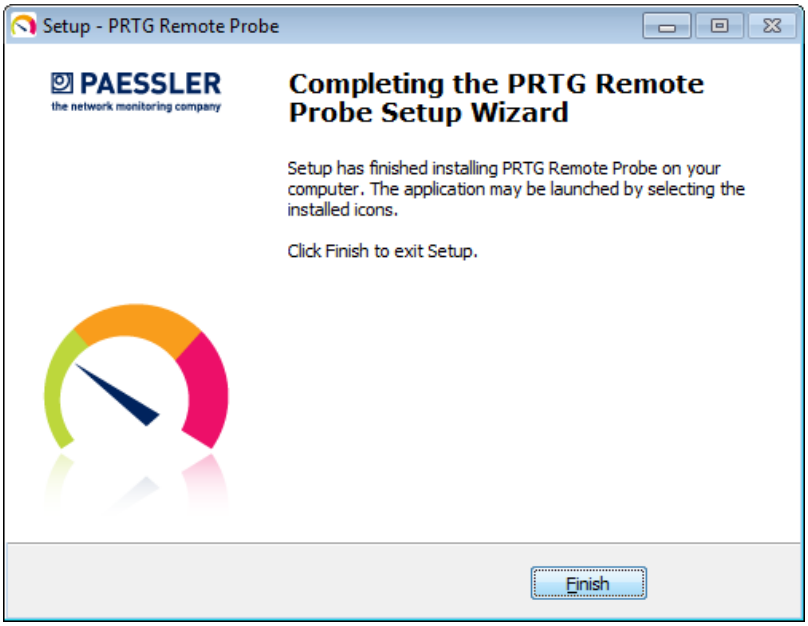
The PRTG Administration Tool 3046 starts. Please enter the correct settings to connect your remote probe to your PRTG core installation. See the Remote Probe Setup 3117 section for more information. Click **Ok** to continue.



Probe Settings in PRTG Administration Tool

When asked if you want to start the probe service, confirm with **Yes**. The installation is complete.

After that, click **Finish** in the installation wizard.



Remote Probe Setup Wizard Finish

Your remote probe is now installed on this computer as a Windows service.

More

After clicking the **Finish** button, the PRTG Administration Tool 3046 is shown, allowing you to configure connections. Please see Remote Probe Setup 3117 for more information on how to connect the remote probe to your PRTG core server installation.

Note: You can also install a Remote Probe directly from PRTG's web interface. For details, refer to Remote Probe Quick Install 3112.

3.8 Install the Enterprise Console

The Enterprise Console is already included in a PRTG core server installation 56. You can install additional Enterprise Consoles on other computers.

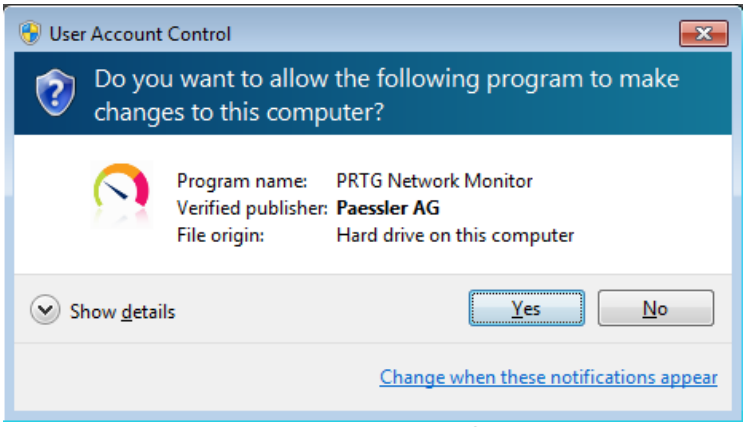
Download Enterprise Console from the Web Interface

The version of the Enterprise Console (EC) has to match the PRTG core server version you want to connect to. It can connect to a PRTG server where the third entry in the version number is equal to the third entry of the EC version number. For example, EC version 15.1.16.2023 can connect to any PRTG server with version 15.1.16.xxxx.

1. From the computer you want to install the Enterprise Console on, connect to the Ajax 108 web interface of PRTG.
2. On the login screen 110 of the web interface, enter login name and password and select **Download Client Software (for Windows, iOS, Android)**.
3. You will see the downloads page 2928 in the **Mobile Web GUI** 2991 version of PRTG, so you can also download the EC if you can only use an unsupported browser that cannot access the fully featured web interface.
4. Click **PRTG Enterprise Console (Windows GUI)** and save the setup program to the local hard disk drive.

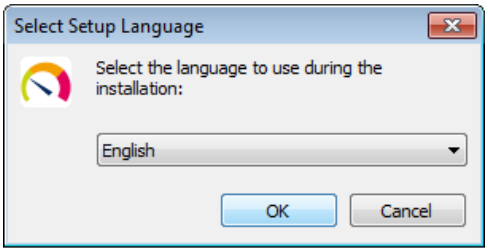
Install Enterprise Console

Execute the setup program **PRTG_Enterprise_Console_Installer.exe** that you have downloaded.



Windows User Account Control Confirmation Request

Confirm the question of the Windows User Account Control with **Yes** to allow the program to install. The common software installation assistant will guide you through the installation process.

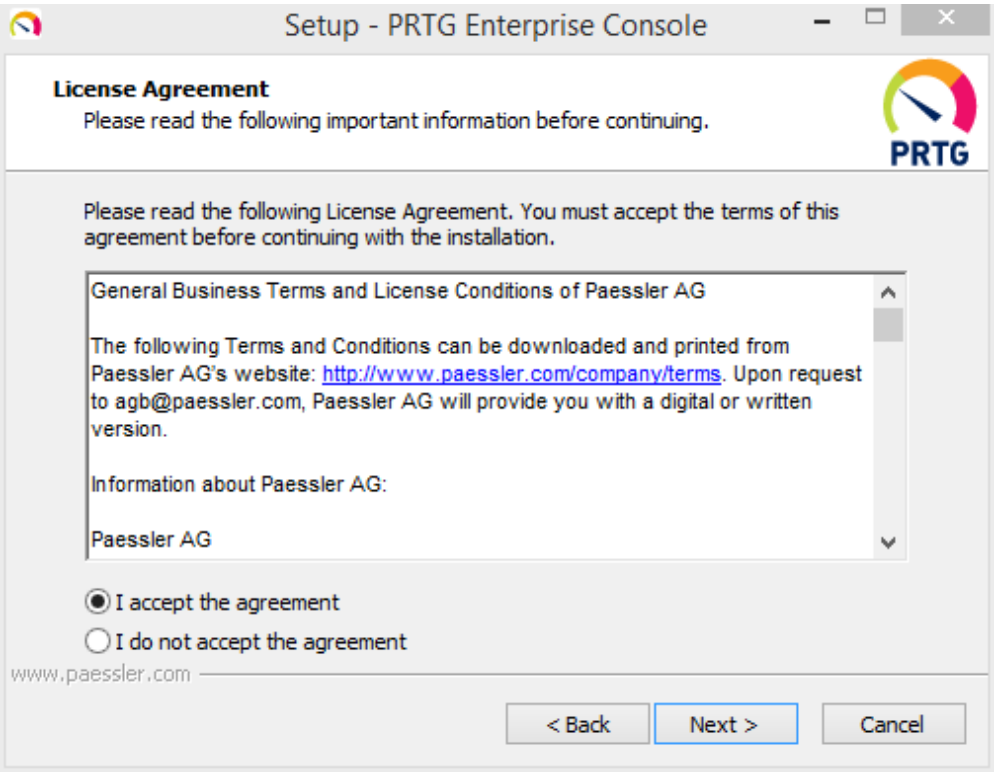


Setup Language Selection

Select a language for the program and click the **OK** button. The available language options depend on both your Windows version and the setup file.

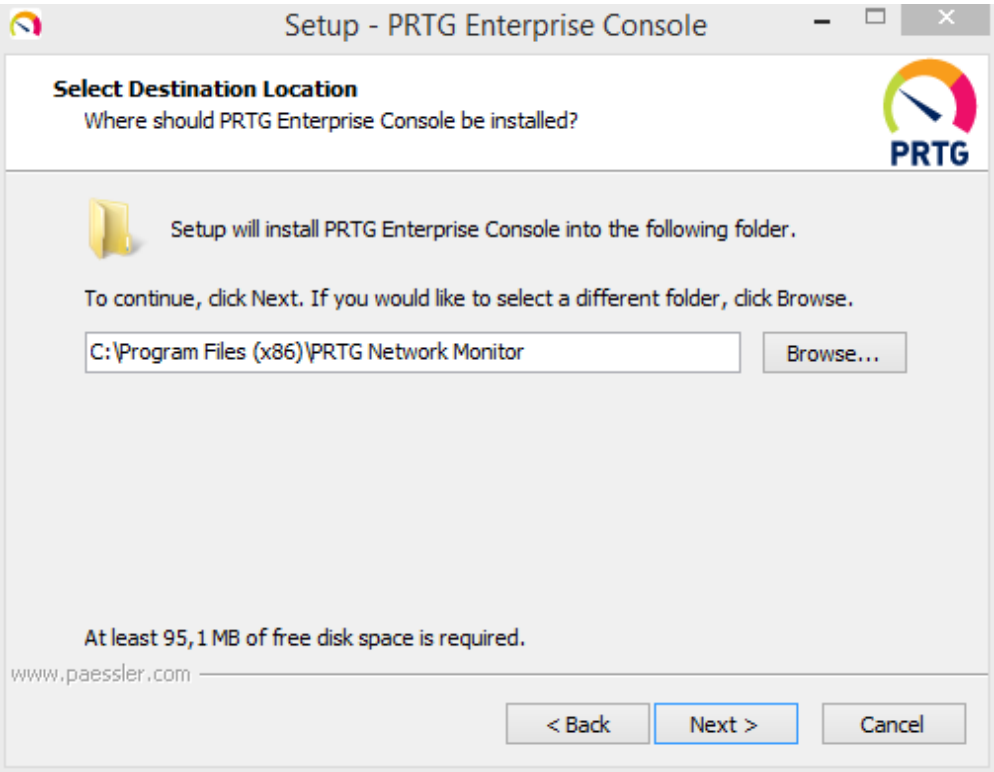
Enterprise Console Setup: Welcome Screen

Click **Next** to walk through the wizard.



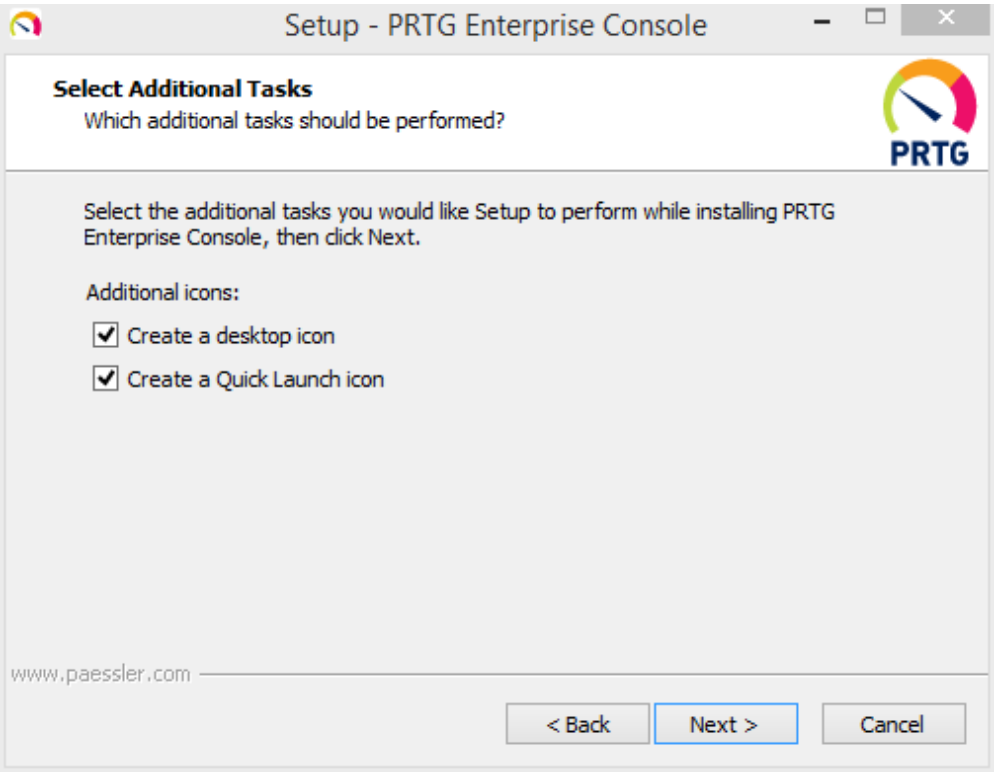
Enterprise Console Setup: License Agreement

After accepting the license agreement, you can choose the folder you wish to install the software in. We recommend that you use the default value.



Enterprise Console Setup: Installation Folder

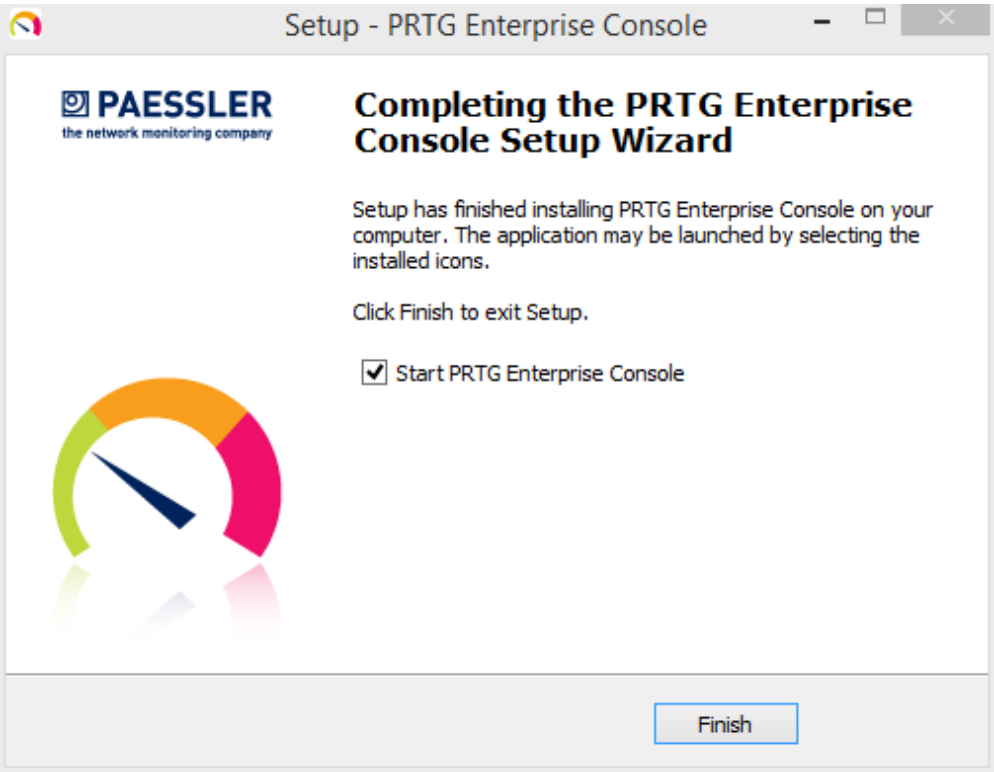
Select the start icons you want to create for the Enterprise Console. We recommend that you use the default value.



Enterprise Console Setup: Additional Tasks

Click **Next** to copy the necessary files to the disk of your computer.

After installation, click **Finish** to start the Enterprise Console. Enter the settings for the connection to your PRTG server in the appearing dialog.



Enterprise Console Setup: Finish

More

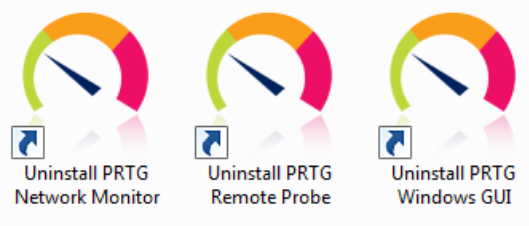
Please see the section **Enterprise Console** 2938 for more information on how to use this Graphical User Interface (GUI).

3.9 Uninstall PRTG Products

The uninstall process has six steps—regardless of if you are uninstalling an entire PRTG Network Monitor installation, a single Enterprise Console installation, or a PRTG Remote Probe installation. Use the Windows uninstall routines to remove the PRTG software from your system.

Step 1

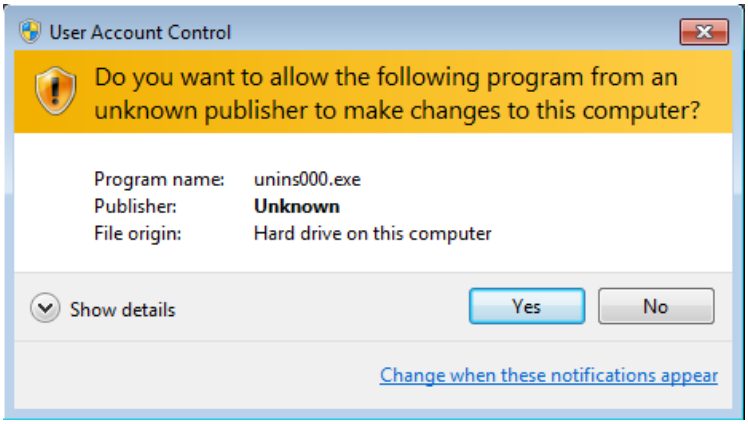
From the Windows Start Menu, select the **Uninstall PRTG Network Monitor** icon, the **Uninstall PRTG Enterprise Console** icon, or the **Uninstall PRTG Remote Probe** icon, or open your Windows Control Panel and choose the respective entry in the **Programs** section. Depending on the installed products, not all uninstall programs are available.



Start Menu Icons

Step 2

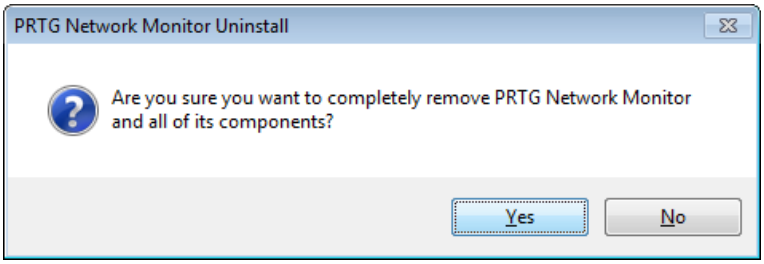
If asked, confirm the question of the Windows User Account Control with **Yes** to allow the program to uninstall. The usual software uninstall wizard will guide you through the uninstall process.



Windows User Account Control Request

Step 3

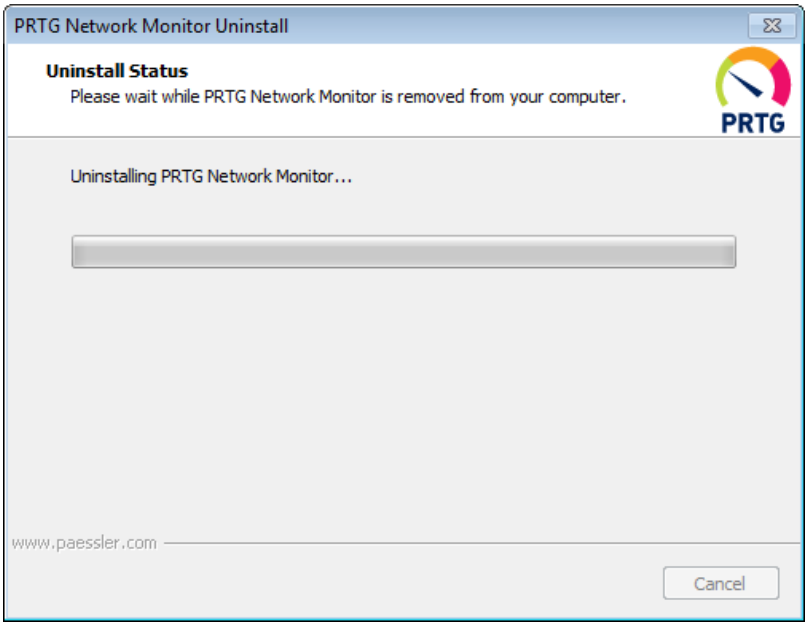
Confirm the removal of the software by clicking the **Yes** button.



Uninstall PRTG Network Monitor Step 1

Step 4

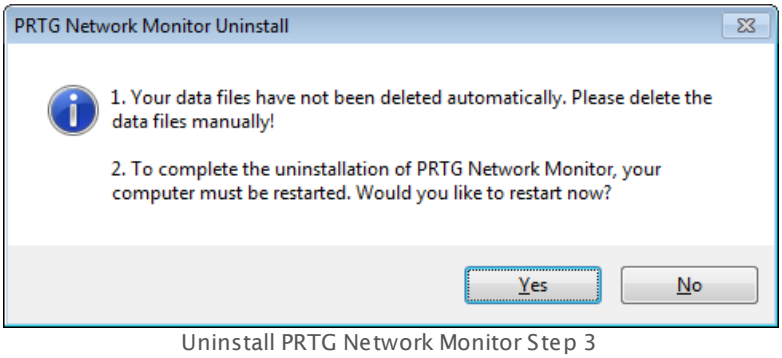
Wait while the software is being removed.



Uninstall PRTG Network Monitor Step 2

Step 5

Confirm a system restart by clicking the **Yes** button.



Uninstall PRTG Network Monitor Step 3

Step 6

After system restart, the software is removed. However, there are still custom data in the PRTG program folder left. If you have uninstalled an entire PRTG Network Monitor installation or a remote probe installation, your monitoring data is still stored on the system. To completely remove all PRTG data, please delete the **PRTG Network Monitor** program folder as well as the **Paessler\PRTG Network Monitor** folder in your data path. For more information on where the data is stored see the **Data Storage** 3135 section.

Part 4

Understanding Basic Concepts

4 Understanding Basic Concepts

There is a number of basic concepts that are essential for understanding the functionality and ease of use of PRTG Network Monitor. We have made using our software as easy-to-use as possible. Setting it up for the first start and getting first monitoring results happens almost automatically 37.

Nevertheless, there are some basic principles we would like to explain to you. Please read these sections carefully to understand the underlying workflow like architecture of the monitoring system, hierarchy of objects, settings inheritance, and notifying. You will be able to enhance your monitoring experience permanently as soon as you know the basic principles of PRTG!

Understanding Basic Concepts—Topics

4.1 Architecture and User Interfaces

PRTG Network Monitor consists of different parts which you can divide into three main categories: System parts, control interfaces, and a basic administration interface.

TYPE	PART OF PRTG
System Parts	**Core Server** 84 This is the central part of a PRTG installation and includes data storage, web server, report engine, a notification system, and more. The core server is configured as Windows service which runs permanently. **Probe(s)** 84 The part of PRTG which performs the actual monitoring. There are local probes, remote probes, and cluster probes available. All monitoring data is forwarded to the central core server. Probes are configured as Windows services which run permanently. Note: We assume that all computers on which the PRTG core server with its local probe or any remote probes run are secure. It is every administrator's responsibility to make sure that only authorized persons can access these machines. For this reason we highly recommend that you use dedicated machines for your PRTG system parts.
User Interfaces	**Ajax Web Interface** 108 The Ajax-based web interface is used for configuration of devices and sensors, as well as for the review of monitoring results. Also system administration and user management are configured here. **Enterprise Console** 2938 A native Windows application as alternative to the web interface to manage your monitoring. With the Enterprise Console, you can connect to different independent PRTG core server installations and review their data at a glance! **PRTG Apps for Mobile Network Monitoring** 2995 Monitor your network on the go with PRTG and apps for iOS, Android (including BlackBerry devices), and Windows Phone. **Mobile Web GUI** 2991 **(deprecated)** A read-only interface for mobile access to your PRTG installation. View latest states, tables, and graphs. Using jQuery Mobile, this interface is compatible with almost all mobile devices available on the market, as well as with older and unsupported browser versions. Note: This user interface is deprecated. Please use a supported browser version or the PRTG apps for mobile access.

TYPE	PART OF PRTG
System Administration Program	PRTG Administration Tool on Core Server System 3047 Used to configure basic core server settings, such as administrator login, web server IPs and port, probe connection settings, cluster mode, system language, and more. PRTG Administration Tool on Remote Probe System 3073 Used to configure basic probe settings such as name of the probe, IP and server connection settings, and more.

Core Server

The core server is the heart of your PRTG system and performs the following processes:

- Configuration management for object monitoring
- Management and configuration of the connected probes
- Cluster management
- Database for monitoring results
- Notification management including a mail server for email delivery
- Report generator and scheduler
- User account management
- Data purging (culling data that is older than 365 days, for example)
- Web server and API server

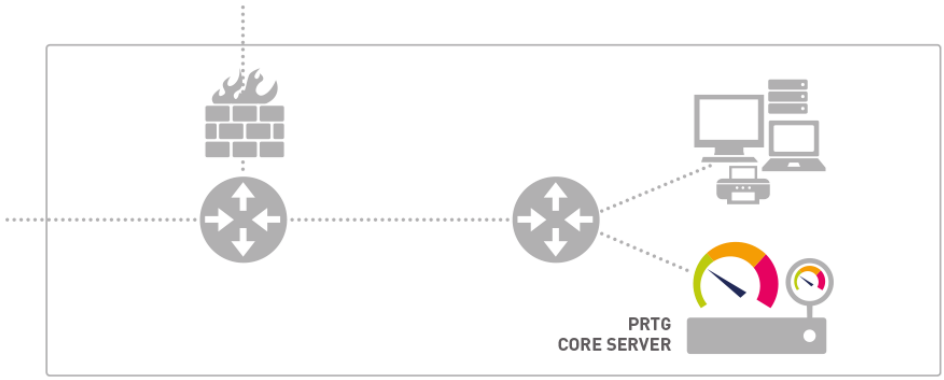
In a cluster 87, the current master node is responsible for all of these tasks.

The built-in, fast, and secure web server (no additional IIS or Apache is required) supports HTTP as well as secure HTTPS (via SSL). It serves the web interface when you access it with a browser and also answers PRTG Application Programming Interface (API) calls (for example, for user scripts or the Enterprise Console).

Note: Core server and probe(s) are configured as Windows services which are permanently run by the Windows system without the requirement for a logged-in user.

Probe(s)

On a probe, PRTG performs the actual monitoring with the sensors created on a device (for example, computer, router, server, firewall). The probe receives its configuration from the core server, runs the monitoring processes, and delivers monitoring results back to the core server. On every system running a PRTG core server, there is always a local probe running with it on the same machine.



PRTG Core Server and Local Probe Monitoring a Local Area Network

Click here to enlarge: http://media.paessler.com/prtg-screenshots/probes.png

The actual monitoring is performed by PRTG probe processes which run on one or more computers. During installation, the system automatically creates the **Local Probe**. In a single-probe installation—which is the default setup—the local probe performs all monitoring.

The PRTG core server with the local probe inside the corporate LAN (bottom right in the figure above) is able to monitor services and servers in the entire Local Area Network (LAN).

Note: Core server and probe(s) are configured as Windows services which are permanently run by the Windows system without the requirement for a logged-in user.

You can create additional **Remote Probes** to achieve monitoring of multiple locations, or for several other scenarios. They use SSL-secured connections to the core and allow to securely monitor services and systems inside remote networks which are not openly accessible or secured by firewalls. For more information, please see **Remote Probes and Multiple Probes** 3108. For a video on this please see the **More** 235 section below.

In a cluster setup 87, a cluster probe runs on all nodes. This is the additional **Cluster Probe**. All devices that you create on it are monitored by all nodes in the cluster, so data from different perspectives is available and monitoring for these devices always continues, also if one of the nodes fails.

PRTG Mini Probes allow you to create small probes on any device (not just on Windows systems). You can implement mini probes to gather monitoring data exactly like you need it and create them on any platform. For more information, see the **Mini Probe API** definition in the PRTG web interface.

PRTG automatically monitors system health of its own core server and of each probe to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors. These include **Core Health** 555 and **Probe Health** 1311, **System Health** 2257, **Cluster Health** 542, disk free 2509, and bandwidth 2376 sensors for all installed network cards, as well as a **Common SaaS sensor** 547 that checks the availability of widely used SaaS providers.

We recommend that you keep these sensors, but you can optionally remove all except the **Health** sensors. They measure various internal system parameters of the probe system hardware and the probe's internal processes and computes a resulting value. Frequent or repeated values below 100% should be investigated. Please check the channels 137 of a particular sensor for details.

More

Video Tutorial: There is a video available on the Paessler video tutorials page.

- https://www.paessler.com/support/video_tutorials

4.2 Clustering

A PRTG Cluster consists of two or more installations of PRTG 56 that work together to form a high availability monitoring system. The objective is to reach true 100% uptime for the monitoring tool. Using clustering 3122, the uptime will no longer be degraded by failing connections because of an internet outage at a PRTG server's location, failing hardware, or because of downtime due to a software update for the operating system or PRTG itself.

How a PRTG Cluster Works

A PRTG cluster consists of one **Primary Master Node** and one or more **Failover Nodes**. Each node is simply a full installation of PRTG which could perform the whole monitoring and alerting on its own. Nodes are connected to each other using two TCP/IP connections. They communicate in both directions and a single node only needs to connect to one other node to integrate into the cluster.

During normal operation the **Primary Master** is used to configure devices and sensors (using the web interface 108 or Enterprise Console 2938). The master automatically distributes the configuration to all other nodes in real time. All nodes are permanently monitoring the network according to this common configuration and each node stores its results into its own database. This way, the storage of monitoring results also is distributed among the cluster (the downside of this concept is that monitoring traffic and load on the network is multiplied by the number of cluster nodes, but this will not be a problem for most usage scenarios). The user can review the monitoring results by logging into the web interface of any of the cluster nodes in read only mode. Because the monitoring configuration is centrally managed, it can only be changed on the master node, though.

By default, all devices created on the **Cluster Probe** are monitored by all nodes in the cluster, so data from different perspective is available and monitoring for these devices always continues, even if one of the nodes fails. In case the **Primary Master** fails, one of the **Failover Nodes** takes over the master role and controls the cluster until the master node is back. This ensures a fail-safe monitoring with gapless data.

If you use remote probes in a cluster, each probe connects to each node of your cluster and sends the data to all cluster nodes, the current primary master as well as the failover nodes. You can define **Cluster Connectivity** of each probe in the **Probe Administrative Settings** 295 .

Note: During the outage of a node, it will not be able to collect monitoring data. The data of this single node will show gaps. However, monitoring data for this time span is still available on the other node(s). There is no functionality to actually fill in other nodes' data into those gaps.

If downtimes or threshold breaches are discovered by one or more nodes, only one installation, either the Primary Master or the Failover Master, will send out notifications (via email, SMS text message, etc.). Thus, the administrator will not be flooded with notifications from all cluster nodes in case of failures.

Note: For clusters we recommend that you stay below 5,000 sensors per cluster.

Set Up a PRTG Cluster

For detailed information, please see **Failover Cluster Configuration** 3122.

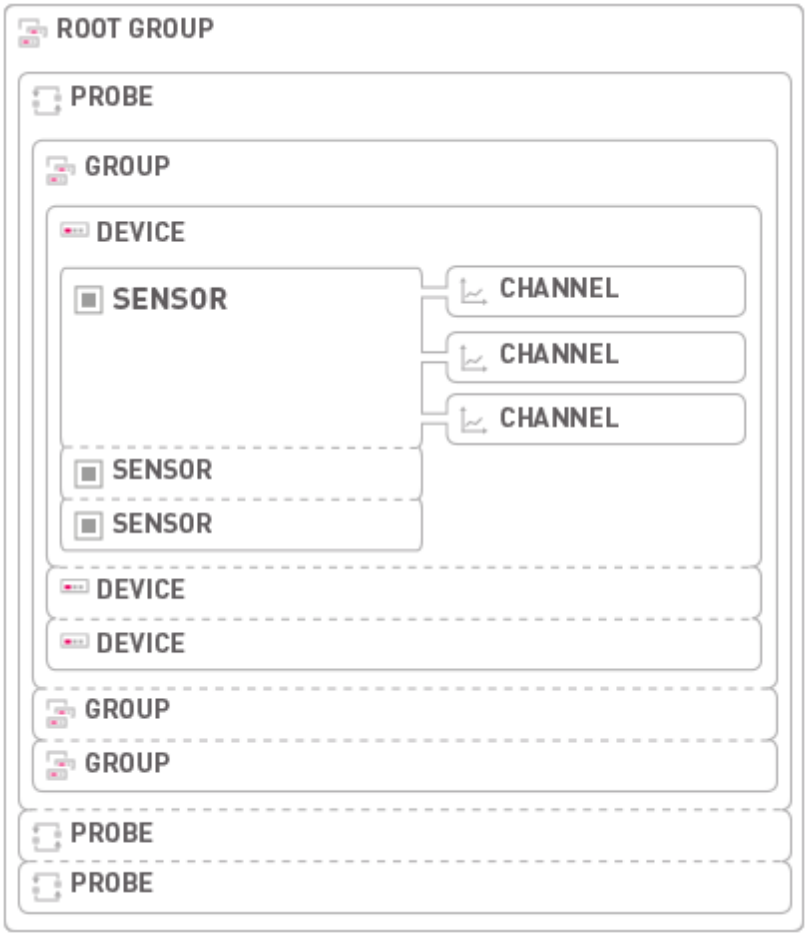
More

Knowledge Base: What's the Clustering Feature in PRTG?

- http://kb.paessler.com/en/topic/6403

4.3 Object Hierarchy

All objects in a PRTG monitoring configuration are arranged in a tree-like hierarchy to create an easy to navigate list and to give the user the possibility to arrange them in groups that monitor similar devices, services, or same locations. The hierarchical order described is also used to define common settings for larger groups of objects, for example, settings of the **Root** group apply by default to all other objects underneath (see section Inheritance of Settings 94).



Object Hierarchy in PRTG

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/object-hierarchy_en.png

The figure shows the object hierarchy in PRTG:

- **Root** group contains all objects in your setup; all probes are directly under the root node.
- A **Probe** contains one or more groups.
- A **Group** contains one or more devices.
- A **Device** represents one component in your network which is reachable via an IP address. On a device are several sensors.

- A **Sensor** monitors one single aspect of a device and has at least one channel.
- A **Channel** receives the monitoring results and is part of a sensor.

Root Group

The **Root** group is the topmost instance in PRTG. It contains all other objects in your setup. Using the inheritance 94 mechanism, we recommend adjusting the default settings for the Root group 260. This makes configuration easier later on, because all other objects inherit these standard settings by default and, thus, you will not have to set up the same configuration for each object anew.

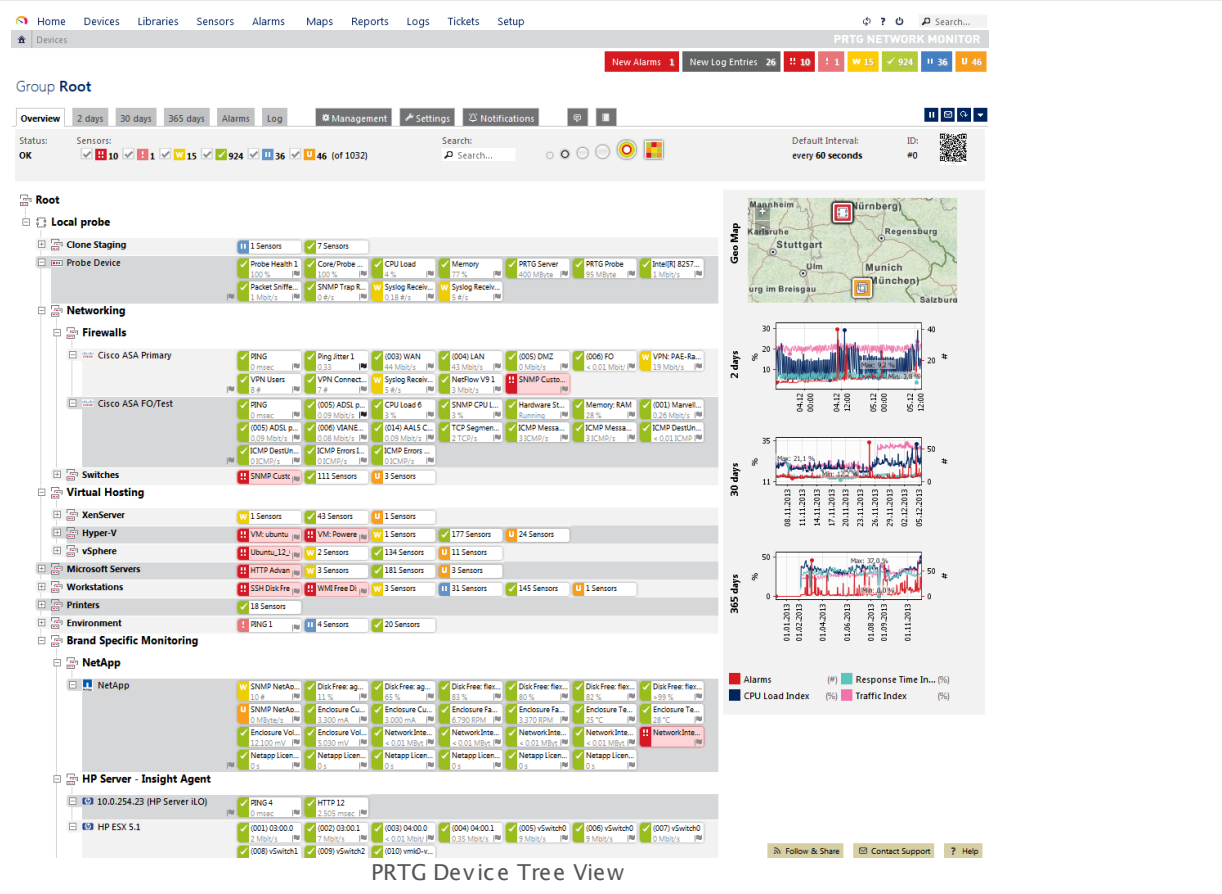
Probe

Each group (except the **Root** group) is part of a **Probe**. This is the platform on which the monitoring takes place. All objects configured below a probe will be monitored via that probe. Every PRTG core installation automatically installs a **Local Probe** service. You can add additional probes and remote probes to your configuration to include remote devices from outside your network into the monitoring (see section **Multiple Probes and Remote Probes** 3108). In a cluster, there is an additional **Cluster Probe** running on all nodes. Devices on the cluster probe are monitored by all nodes of the cluster, so data from a different perspective is available and monitoring for these devices will always continue, even if one of the nodes fails.

Group

On each probe, there are one or more **Groups**, which serve merely structural purposes. Use groups to arrange similar objects in order to inherit same settings to them. To a group, you add the devices. You can arrange your devices in different nested groups to reflect the structure of your network.

Find below a sample configuration: A device tree with local probe, several groups, devices and their sensors.



PRTG Device Tree View

Device

To each probe or group, you can add **Devices** that you want to monitor. Each device in your PRTG configuration represents a real hardware or virtual device in your network. These can be, for example:

- Web or file server
- Client computer (Windows, Linux, or Mac OS)
- Router or network switch
- Almost every device in your network that has its own IP address

Note: Sometimes you may want to add the same device in PRTG several times to get a better overview when using many sensors for a very detailed monitoring, or to use different device settings for different groups of sensors. In PRTG you can simply add multiple devices with the same IP address or DNS name. The sensors on all of these PRTG devices will then query the same real hardware device in your network.

PRTG additionally adds a so called **Probe Device** to the local probe. This is an internal system device. It has access to the computer on which the probe is running on and monitors its health parameters with several sensors running on it.

To get a better and more detailed picture about your devices, PRTG automatically analyzes the devices which you add and recommends appropriate sensor types 348 on the device overview tab 137. In the **Recommended Sensors** table, click on the **Add Sensors** button in the corresponding table row to create recommended sensor types with one click.

Note: You can turn off the sensor recommendation in **System Administration—Monitoring** 2874.

Sensor

On each device you can create a number of **Sensors.** Every sensor monitors one single aspect of a device. This can be, for example:

- One network service like SMTP, FTP, HTTP, etc.
- One network switch port's traffic
- CPU load of a device
- Memory load of a device
- Traffic on one network card
- One NetFlow device
- System health of a device
- Other content (for example, of databases, mails, HTTP, XML, files, etc.)
- etc.

Channel

Every sensor has a number of **Channels** through which it receives the different data streams. The available channels depend on the type of sensor. One sensor channel can contain, for example:

- **Downtime** and **uptime** of a device
- **Traffic in** of a bandwidth device (for example, a router)
- **Traffic out** of a bandwidth device (for example, a router)
- **Traffic sum** of a bandwidth device (for example, a router)
- **WWW traffic** of a NetFlow device
- **Mail traffic** of a NetFlow device
- **Other traffic** of a NetFlow device
- **CPU load** of a device
- **Loading time** of a web page
- **Download bandwidth** of a web page
- **Time to first byte** of a web page

- **Response time** of a Ping request to a device
- **Response time** of a Remote Desktop service
- etc.

4.4 Inheritance of Settings

The hierarchical tree 89 is not only used to group sensors for organizational reasons, there is also an important aspect involved that we call inheritance. To ensure administration is quick and easy—especially for large monitoring setups—certain settings are inherited from the overlying level. For example, you can change the monitoring interval for all sensors by editing the interval setting of the topmost **Root** group (unless no other setting is defined below).

Settings are Inherited to Child Objects

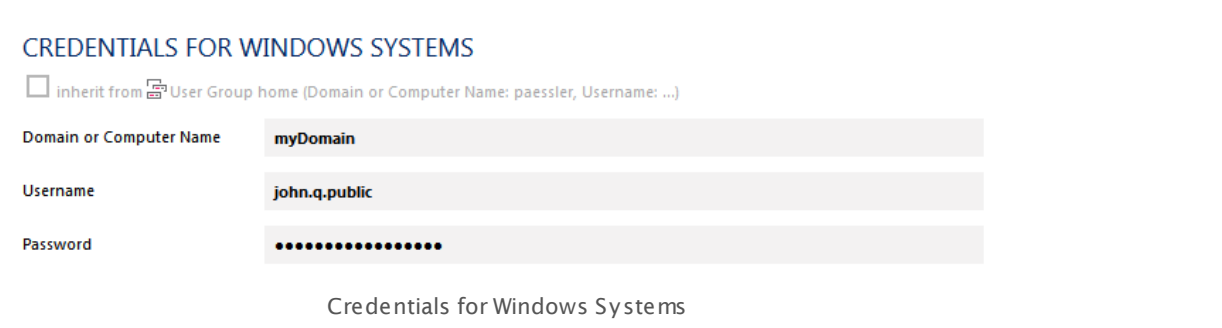
You can override this inheritance on any level of the hierarchy by setting a different value for a specific probe, group, device, or sensor. All objects below will inherit these new settings; object settings from levels above will stay unchanged.

Settings that are inherited among all objects include:

- Monitoring interval
- Notification triggers
- Authentication settings for several systems
- Compatibility settings (for certain types of sensors)
- Channel and unit configuration
- User access rights 101
- Tags 96
- Paused status: If an object is paused by the user, or a schedule, all sensors on it are paused as well
- etc.

There is one exception for devices and sensors: The **IP address** or **DNS name** of a device and compatibility settings are always inherited by sensors and can not be changed on sensor level.

The actual overriding of the parent's settings takes place in an object's settings: Remove the check mark symbol at the beginning of the respective line **inherit from [parent object]**. For example, the screenshot below shows Windows systems credentials settings after removing the check mark symbol.



Credentials for Windows Systems

Default Values Set in Root Group

For all settings (except passwords), PRTG already includes a set of default values so you can get started with the software immediately. For example, the following settings will be inherited by all sensors from the **Root** group:

- Default monitoring interval of one minute
- SNMP version 1 with community string set to **public** (default values for most devices)
- Dependency type **Use parent**
- etc.

You may need to change some of the default entries as you become used to the interface. However, these settings will initially suffice for most situations.

Before sensor setup, please review the **Root** group's settings and set the default values to suit your setup, including necessary credentials for all kinds of systems in your network you want to monitor (Windows, Linux, virtual servers, etc.).

See section Root Group Settings 260 for more details.

Inheritance of Notification Triggers

If you add notification triggers on probe, group, or devices level, these will also be inherited to all sensors underneath, unless you cancel inheritance with specific settings.

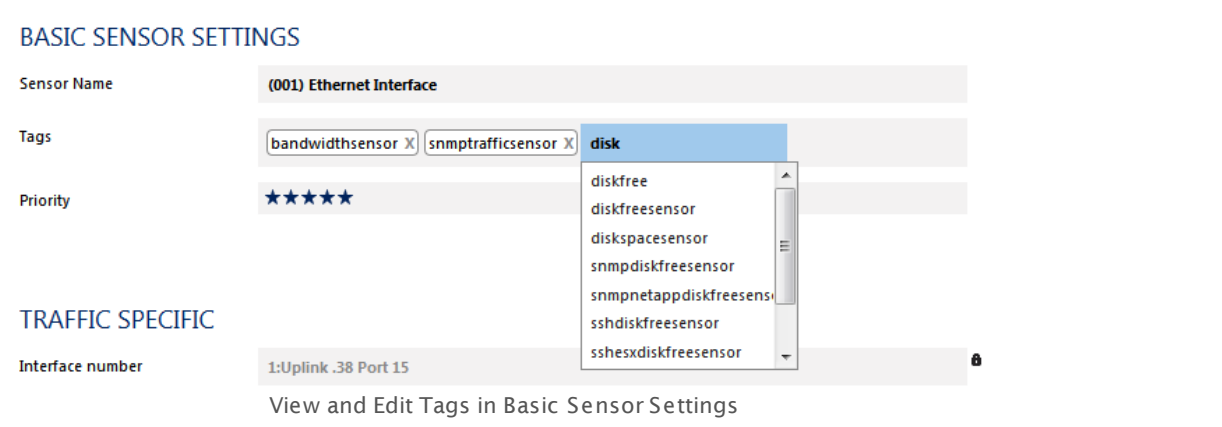
See section Sensor Notifications Settings 2719 for details.

4.5 Tags

For every object in your PRTG setup, you cannot only name objects, but also define tags in the object settings 159 to additionally mark an object as a member of certain categories. Although there are tags predefined when adding objects 236, you are completely free in the way you add tags. For example, you can mark all of the bandwidth sensors which are especially important for you with the tag bandwidth_important.

Later, you can view lists of objects with certain tags (helpful for multi-edit 2742 of settings), or choose sensors by tag when creating reports 2786. A clever arrangement of tags can save you a lot of time at some point. Press one of the keys enter, space, or comma to confirm a tag.

Note: You can also change tags for several objects at a time using the multi-edit 2742 function.



View and Edit Tags in Basic Sensor Settings

Tags Are Inherited

The tags in the settings of an object are automatically inherited 94 by all other objects underneath in the **Object Hierarchy** 89. You can view inherited tags in section **Parent Tags** in the settings of a sensor 92, device 91, or group 90. So, for example, a device with the tag myExampleTag automatically passes on this tag to all sensors which you create on it. These sensors appear in lists then whenever you search for myExampleTag. This is useful, for example, when you add sensors by tag in reports 2786 settings.

This way, to configure your setup for fetching all sensors on a device by tag, you do not have to tag every single sensor, but it is enough to tag the device. Inheritance for tags cannot be disabled.

Filtering with Tags

You can use tags to filter table lists 178 for specific objects, or to add sensors to **Libraries** 2770 and **Reports** 2786. For example, you can show only sensors on the sensors overview page 205 which have the tag bandwidth_important. You can also use more than one tag to filter for monitoring objects like sensors.

When filtering with tags, you can also use plus (+) and minus (-) signs in front of tags to categorize them:

- Tags with + must exist for an object to be shown
- Tags with – must **not** exist for an object to be shown
- At least one tag of the tags without + or – must exist for an object

The filter shows an object only if all three conditions are true. The order of the tags in a tag field does not matter.

For example, if you enter –windows into a tag field, all sensors/devices that do not have "windows" as tag are shown. With +windows or windows you filter for objects which are tagged with "windows".

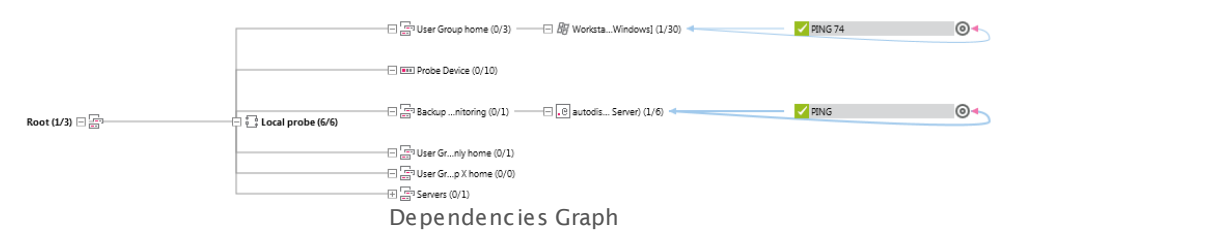
You can use more than one logical operator in a tag field: For example, if you enter +netflow –bandwidth_important into a tag field, the corresponding list, library, or report includes all sensors that are tagged with "netflow" but not with the tag "bandwidth_important". If you enter netflow bandwidth_important, a sensor has to be tagged with "netflow" or "bandwidth_sensor" or both to be affected.

4.6 Dependencies

Using dependencies, you can pause sensor monitoring based on the status [135] of another sensor to avoid false alarms and incorrect downtime recording. A dependency stops the monitoring of one sensor or a set of sensors as soon as a specific sensor is in **Down** status. This means, for example, you can stop monitoring remote network services when the corresponding firewall is down due to connection problems.

When using the auto-discovery [219] function, the **Ping Sensor** [1252] on a device is by default set as the master object for this device. This means that monitoring for the entire device is paused if the Ping sensor is in a **Down** status. Usually, it does not make sense to monitor other aspects of a device with other sensors while the **Ping** sensor indicates that the device is not even reachable.

To view a list of all dependencies or only selected dependencies, choose **Devices | Dependencies** and the corresponding dependencies path from the main menu [202]. From there you can also access the **Dependencies Graph** [2751] that visualizes all dependencies within your network.

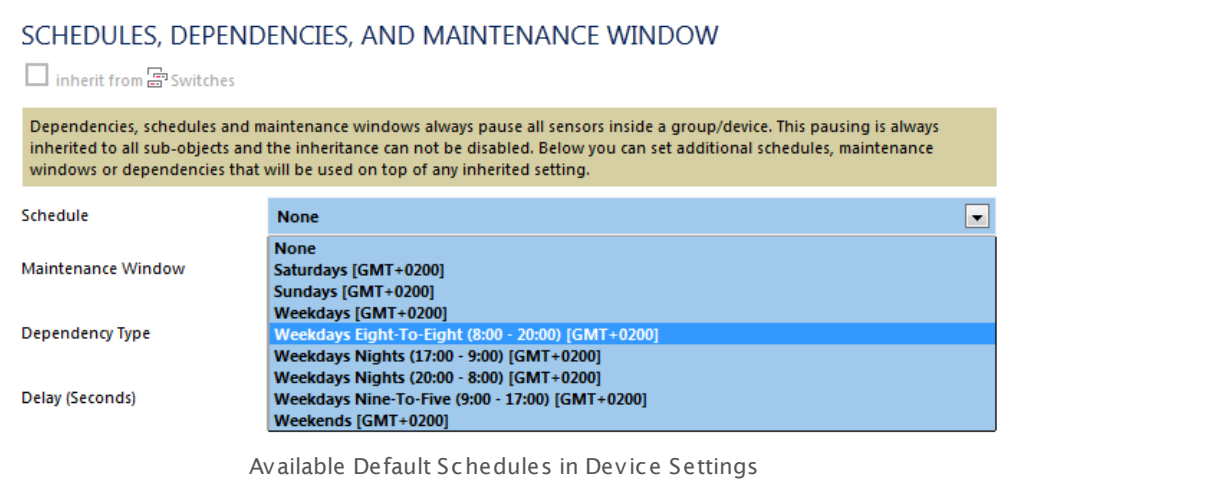


Dependencies Graph

For more information about the dependency settings, please see the settings of the object [159] you want to set a dependency for, section **Schedules, Dependencies, and Maintenance Window** [342] respectively.

4.7 Scheduling

Using schedules, monitoring of an object can be paused [185] for a certain time, for example, Sundays between 4 and 8 a.m. A paused sensor will not collect monitoring data, will not change its status, and will not trigger any notifications [100]. With schedules you can limit the monitoring time automatically. You can also pause monitoring for planned system maintenance time spans to avoid false alarms. You can apply different schedules to every object. They are also used for reports and notifications.



Available Default Schedules in Device Settings

Schedules are user account specific. To change the default pre-defined schedules or to add your own schedule, please see **Account Settings—Schedules** [2856] section.

Note: If you use failover clustering with nodes in different timezones, scheduling applies at the local time of each node. For more information, please see section **Failover Cluster Configuration—Before Getting Started** [3123].

4.8 Notifying

PRTG Network Monitor keeps the administrator or other responsible persons informed about the current status of the network. There are several methods how the administrator can stay up to date.

Notifications

This is the most powerful information tool. Whenever PRTG discovers downtime, an overloaded system, threshold breaches (for example, a disk runs full), or similar situations, it can send a notification. Notifications use various methods by which you can be notified (for example, email 2841, SMS 2836, push messages 2842, and others). After creating notifications in the system settings, you can select them on the notifications tab of probes, groups, devices, and sensors, as well as on the root group. See **Notifications** 2759 section for more details and **Setting Up Notifications Based on Sensor Limits: Example** 2762 for a step-by-step guide.

Limits

In a sensor channel's settings 2711, you can set limits to change the status of the sensor when certain limits are breached. This way, you can set, for example, a traffic sensor (typically never in a error status) to **Down** status whenever bandwidth values are measured that you consider critical. This sensor will then show up in the alarms list.

Alarms

The alarms list shows all sensors that are currently in a **Down**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. This is useful to keep track of all irregularities in your network. In the table list, you can re-sort the items by clicking on the column's header items. See **Alarms** 161 section for more details.

Logs

In the logs list, the log file with all monitoring events is shown. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected. See **Logs** 169 section for more information.

Tickets

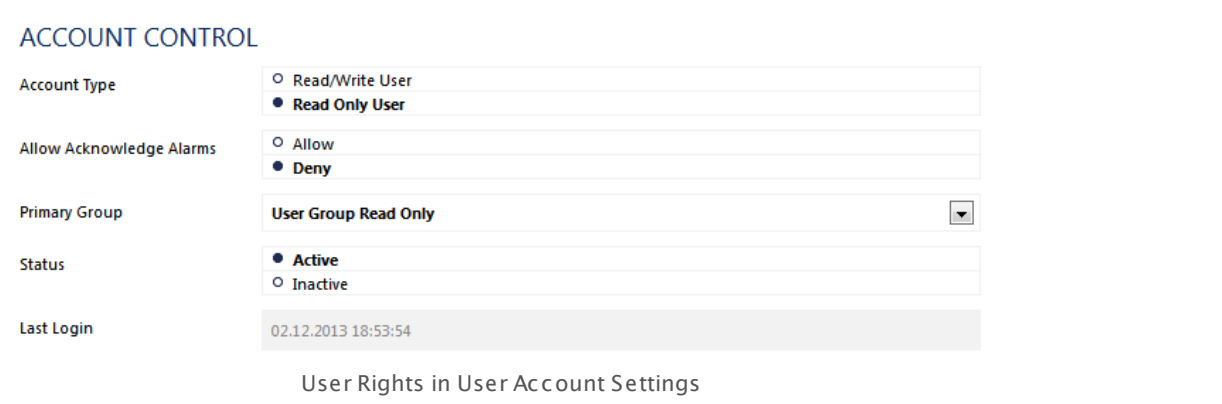
The tickets list shows items with important system information or action steps to take for the administrator. You should view every ticket and take appropriate actions. Per default, an email is sent to the administrator for every new ticket that is created by the system or another user. If a ticket is assigned to a specific user, this user will get an email by default. See **Tickets** 171 section for more information.

4.9 User Access Rights

Define which user can access what in your PRTG Network Monitor installation and manage all user rights with the access rights system of PRTG.

The default administrator can be the only user of a PRTG installation as or can create a nearly unlimited number of other users. Single users are organized in a nearly unlimited number of user groups. Each user group can separately have access rights for each individual object in your PRTG device tree 89 (except for sensor channels). Objects can also inherit 94 access rights according to the hierarchic structure of the device tree.

In addition, every single user has specific rights: There are administrator users, read/write users, and read only users. You can define these settings in **System Administration—User Accounts** 2890. With these tools, you can create an access rights management that allows you to specify exactly what users will be able to see and edit and what they will not be able to access.



User Rights in User Account Settings

Individual user rights in combination with access rights of the group(s) they belong to conduct the access rights to certain objects in the device tree. This means that group membership particularly controls what a user is allowed to do and which objects the user will see when logged in.

The actual access rights for each object in the device tree can be defined in an object's settings. You can define different access rights for all sensors, devices, groups, or probes via the corresponding **Context Menus** 186 or in the **Object Settings** 159.

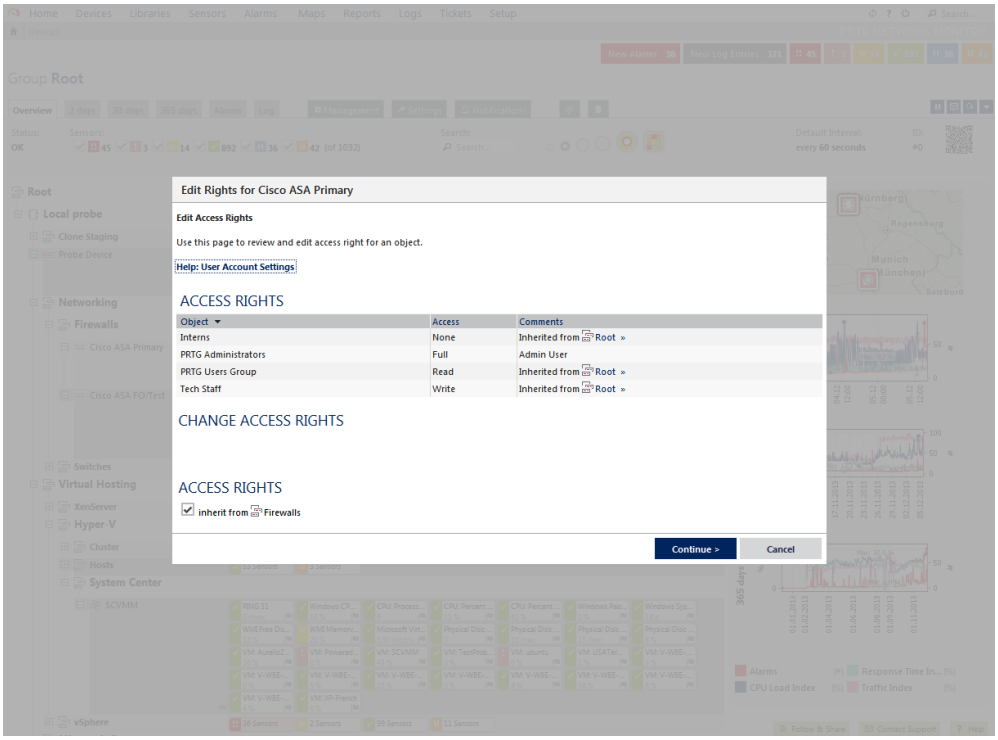
Access Rights Overview

The following classes of access rights for objects are available in hierarchical order as they can be given to user groups (lowest rights to highest rights):

- **None:** The object will not be displayed to the users of the group; no logs, no tickets, no alarms regarding this object will appear.
- **Read**: You can see only monitoring results and change your own password if allowed by your administrator.
- **Write**: You are allowed to review monitoring results and edit settings. In addition, you can add objects to and delete them from the device tree.

- **Full**: Review monitoring results, edit settings, and edit access rights. In addition, you can add objects to and delete them from the device tree.
- **Admin rights**: If a user group has administrator rights, all options are available, including creating users, creating user groups, and deleting objects from the device tree. Users in the administrator user group always have maximum access rights to all objects and will never have access restrictions.

Note: Access rights that are defined locally on an object, for example, on a device, override inherited[94] rights. On a certain object, the highest directly set access right applies for a user group. If there is no access right set directly on an object, the next higher object level will be checked for access rights. This process is repeated until defined access rights are found to be inherited or there is no higher object level.



Different Access Rights for a Firewall in the Device Tree Depending on User Groups

Please see the table below for which user rights apply when. Column headings show access rights of user groups for objects in the device tree; line headings show the type of user.

Note: Users are either in PRTG user groups or in Active Directory Domain user groups. They cannot be in both of them. We recommend that you use only one type of user group (either PRTG or Active Directory) to minimize your administration effort.

▪ **PRTG User Group**	▪ **PRTG User Group**	▪ **PRTG User Group**	▪ **PRTG System Administrator**
▪ **Domain User Group**	▪ **Domain User Group**	▪ **Domain User Group**	▪ **Domain Administrator**

	READ ACCESS	READ/WRITE ACCESS	FULL ACCESS	
▪ **PRTG User Read Only** ▪ **Domain User Read Only**	Read-only rights	Read-only rights	Read-only rights	Admin rights
▪ **PRTG User Read/Write** ▪ **Domain User Read/Write**	Read-only rights	Read/write rights	Full access	Admin rights

- **Users in an administrator group** always have administrator access rights, no matter what access rights have been defined for an object.
- **Read-only users** just have read rights, no matter what access rights their group has. Users who are members of an administrator group are an exception. Read-only users can change their own passwords in their user account settings 2830, if the administrator has enabled them to do so.
- **Read/write users** in a group with full access to a given object have full access rights to this object only.
- If a user is in more than one group, access rights of the user group with the **highest rights apply**.
- Administrator rights can only be given via the administrator group.

For more information about defining access rights, please see the following sections:

- **System Administration—User Accounts** 2890
- **System Administration—User Groups** 2896

For information about connecting PRTG to an existing Active Directory, please see **Active Directory Integration** 3083.

4.10 Data Reporting

With **Reports** 2786 you can analyze and review monitoring data for specific time spans. There are several ways to create data reports in PRTG for your individual needs.

View Historic Data

To get a report for a single sensor, there is a function included to review historic data in PRTG. It allows you to generate reports and charts for a single sensor's data. See the **Historic Data Reports** 146 section for more information.

Generate Reports

You can use the sophisticated reports machine included in PRTG to create exhaustive reports for all monitoring data. See the **Reports** 2786 section for more information.

Export Data Using the API

You can also export all monitoring raw data to XML or CSV files and generate your own reports using any third party software. See the **Using the PRTG API (Application Programming Interface)** 3086 section for more information.

Make Data Available

You can make monitoring data available to other persons using a special user with read-only rights (see the **User Access Rights** 101 section), or you can create public or semi-public HTML pages with monitoring data using the Maps feature. See the **Maps** 2810 section for more information.

Bill Customers

You can also create custom billing reports based on PRTG's monitoring data, using the open source **Billing Tool** for PRTG. For details and download, please see the **More** 104 section below.

More

Paessler Website: Billing Tool

- https://www.paessler.com/tools/billingtool

4.11 IPv6

PRTG supports the IPv6 protocol for most sensor types. You can define whether you want PRTG to query data from your network devices via an IPv4 or IPv6 connection. Indicate your wishes in the **Device Settings** 324 of each device. The sensors you create on them will use the protocol you indicated.

Note: Not all sensor types are IPv6 compatible. You can see which sensors support IPv6 in the **Add Sensor** 256 dialog. Incompatible sensors are not selectable on IPv6 devices.

In the **Outgoing IP Settings** of the **PRTG Administration Tool** 3076, you can additionally choose which IPv6 address will be used for outgoing monitoring requests. Note: The the same option is also available for IPv4.

Part 5

Ajax Web Interface—Basic Procedures

5 Ajax Web Interface—Basic Procedures

The Ajax-based web interface is your access to PRTG. Use it to configure devices and sensors, to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, using Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While you are logged in 110, the PRTG web interface permanently refreshes the data on the screen permanently (via Ajax calls) so it always shows the current monitoring results (you can set 2890 refresh interval and method individually).

Because the web interface works as a Single Page Application (SPA), you rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements are refreshed when necessary. The AJAX web interface shows all object setting dialogs as pop-up layers, so you never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible. The responsive design of the web interface ensures that it always adjusts to the size of your screen to see more information at a glance.

The following sections introduce the features and concepts of the Ajax Graphical User Interface (GUI).

Ajax Web Interface—Basic Procedures—Topics

- Pause 185
- Context Menus 186
- Hover Popup 199
- Main Menu Structure 200

Other Ajax Web Interface Sections

- Ajax Web Interface—Advanced Procedures 2732

Related Topics

- Enterprise Console 2938
- Other User Interfaces 2990

5.1 Login

Once the PRTG core server is installed 56, you can log in to the web interface. In your browser, load the IP address or DNS name of the computer PRTG is installed on and log in using the **Default Login** button.

You can look up and change PRTG's web server settings at any time using the **PRTG Administration Tool** 3048 Windows application on the system where the PRTG core server is installed on. Especially when accessing PRTG from the internet you should use an SSL encrypted connection. You can easily switch to SSL using the **Yes, switch to SSL** button shown on the welcome screen.

Loading the Web Interface

In a web browser window, please enter the IP address or URL of the system PRTG is installed on. When using a cluster, please connect to the primary master node. You can also double click on the **PRTG Network Monitor** icon on the desktop of the system PRTG is installed on.

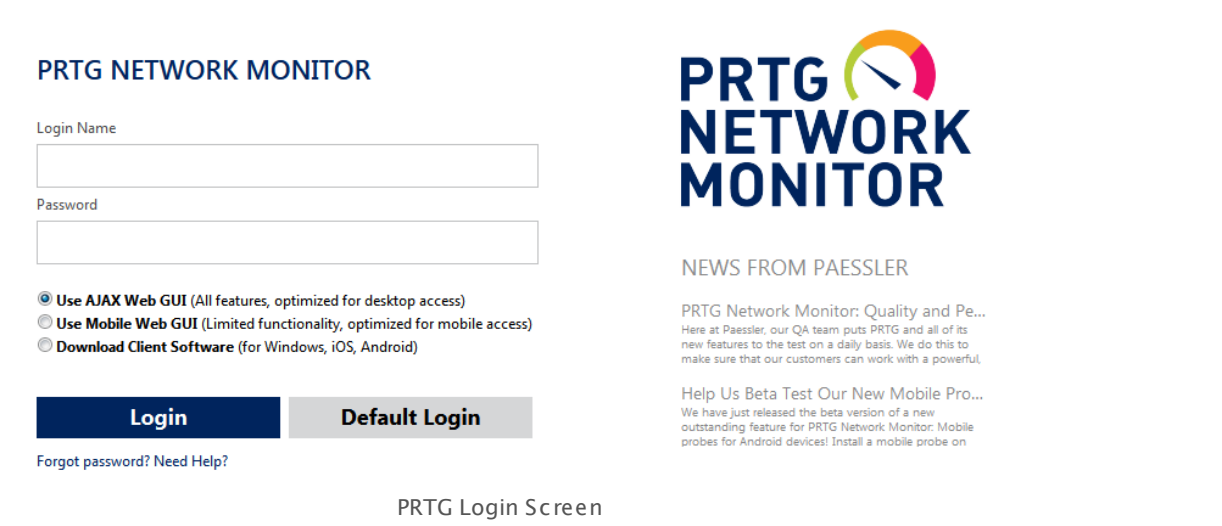
Note: If you run PRTG on localhost, please do not use the DNS name http://localhost to log in to the web server, as this may considerably slow down PRTG's web interface. Please use your local IP address or http://127.0.0.1 instead.

If you see a certificate warning in your browser, you can usually just confirm it. For more information please see **SSL Certificate Warning** 113.

Login Screen

After loading the web interface, the login screen is shown. You can either login as default administrator or as an other PRTG user. As Administrator user you can use all functionalities of the web interface. Administrators can create additional users 2890 with administrator rights or with more restricted privileges (for example, read only users).

Additionally, there are different GUI versions available.



PRTG Login Screen

Login as Default Administrator (First Time Login)

When logging in for the first time, login name and password for the default administrator login are both **prtgadmin**. You can leave the **login name** and **password** fields empty and click on the **Default Login** button to log in using these default credentials.

Note: After login you should change the default password. To do so, go to **Setup | Account Settings | My Account** and specify a new password in section **User Account**.

Note: If you are not logged in into the web interface, you can change the credentials for this default user account any time in the **PRTG Administration Tool** 3058 Windows application.

Login as PRTG User

If you have received user credentials from your administrator, please enter them here to login. Also, when using other administrator credentials, please enter them here.

Choose GUI version

Depending on the used browser, different Graphical User Interface (GUI) options are shown:

- **Use AJAX Web GUI (All features, optimized for desktop access)**: The standard interface. We recommend to use this option for PRTG whenever possible. It offers the full functionality of PRTG. Use Google Chrome 49 or later (recommended) or Mozilla Firefox 45 or later for best performance. In some browsers, the Ajax option is not shown, for example, in old browser versions.
  - Note: Although you can login using Microsoft Internet Explorer 11, the Ajax web interface might not be fully compatible with Internet Explorer! When using Microsoft Internet Explorer 11, please set the security level at least to **Default level Medium-high** and make sure you do not use the **Compatibility View**! For detailed information, please see the **More** 112 section below.
- **Use Mobile Web GUI (Limited functionality, optimized for mobile access)**: The Mobile Web GUI 2991 interface is optimized for slow network connections and old browsers. It only offers read-only functionality and comes with less scripting. It is also a fallback solution when using a browser that is not supported by the Ajax interface.
  Note: This user interface is deprecated. For mobile access to your PRTG server, please use the PRTG mobile apps 2995.
- **Download Client Software (for Windows, iOS, Android)**: This option calls PRTG's download page in the Mobile Web GUI. You can optionally download the native Windows application **Enterprise Console** to the desktop (called Windows GUI in previous deprecated PRTG versions). It has to be installed 2938 on the client computer before use. The Enterprise Console 2938 provides full functionality. However, for some functions the Ajax Web GUI is opened. As an additional feature, the Enterprise Console can view data of several independent PRTG core installations in one single application.
  You can also access pages on Paessler's website from here for information about the PRTG apps 2995 PRTG for iOS, PRTG for Android and PRTG for Windows Phone. These pages also contain the download links to the corresponding app stores. Note: Also when using this download option, your name and password (or a **Default Login**) are required for login!

Note: Only Google Chrome 49 or later (recommended) and Mozilla Firefox 45 or later are fully compatible with the Ajax web interface. For more information about Internet Explorer support, please see the **More** 112 section below.

Click on the **Login** button to proceed to the PRTG web interface.

5.2 SSL Certificate Warning

If you use PRTG outside your internal LAN, especially when you use it on the internet, you should switch the internal web server to use SSL 2862. After doing so, your browser shows a certificate warning because the certificate that comes with PRTG cannot be signed by a valid authority. Anyway, the connection to your PRTG web server is secured via SSL, and you can confirm the claimed security risk. For more information on secure browser connections, please see the **More** 116 section below.

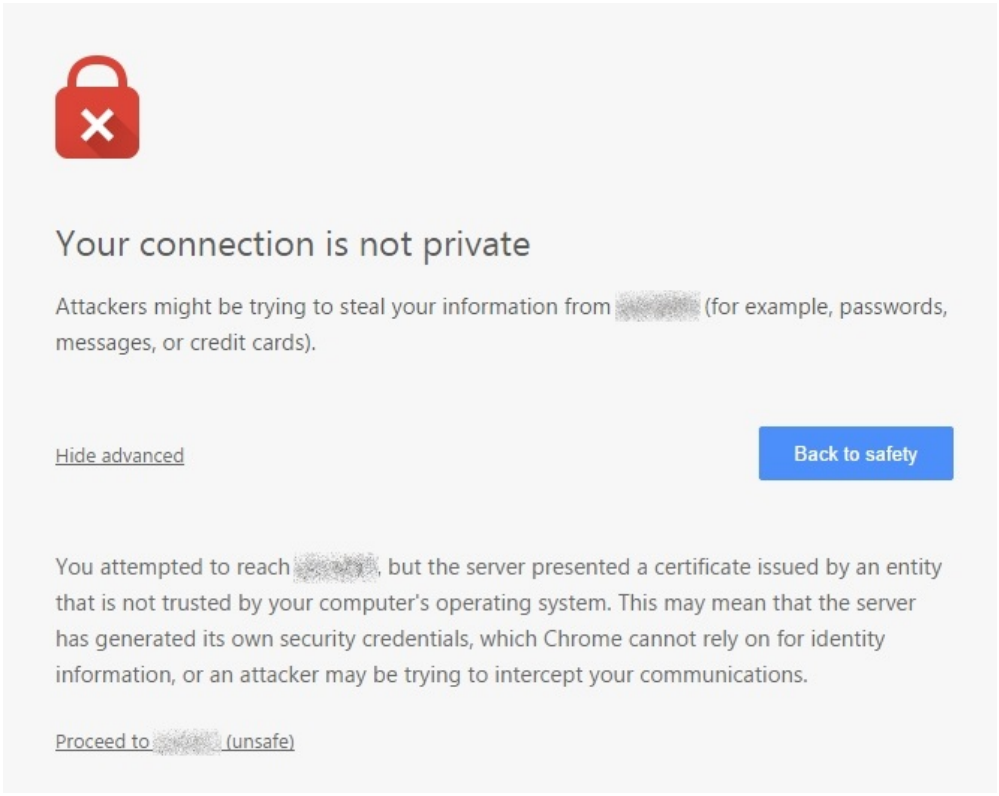
Every browser shows the certificate warning in a different layout. The steps to take are similar for every browser, yet different in detail:

- Google Chrome 113
- Mozilla Firefox 114
- Internet Explorer 115
- Other 116

You can avoid these browser warnings by using your own trusted SSL certificate 3137 with PRTG. For this purpose we provide the freeware tool PRTG Certificate Importer 3137.

Google Chrome

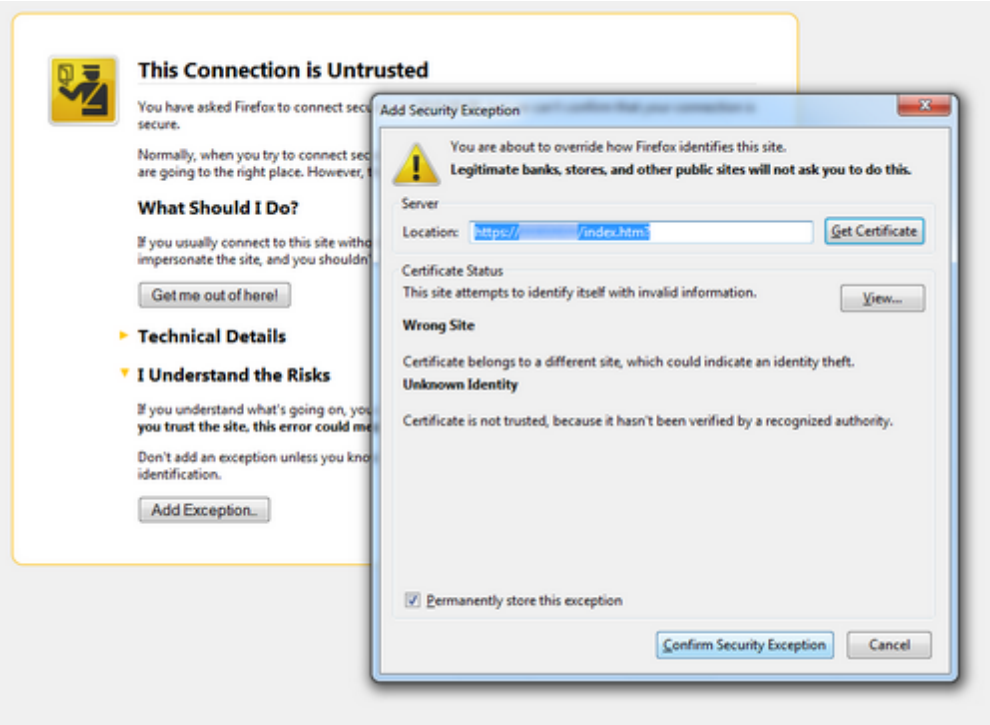
In **Google Chrome**, click on **Advanced** and then on **Proceed to [yourPRTGserver] (unsafe)** every time you call the PRTG web interface.



Security Warning in Google Chrome Browser

Mozilla Firefox

In **Mozilla Firefox**, click on **I Understand the Risks** and then on the **Add Exception...** button. In the appearing window, leave the check mark for **Permanently store this exception** and finally click on the **Confirm Security Exception** button.

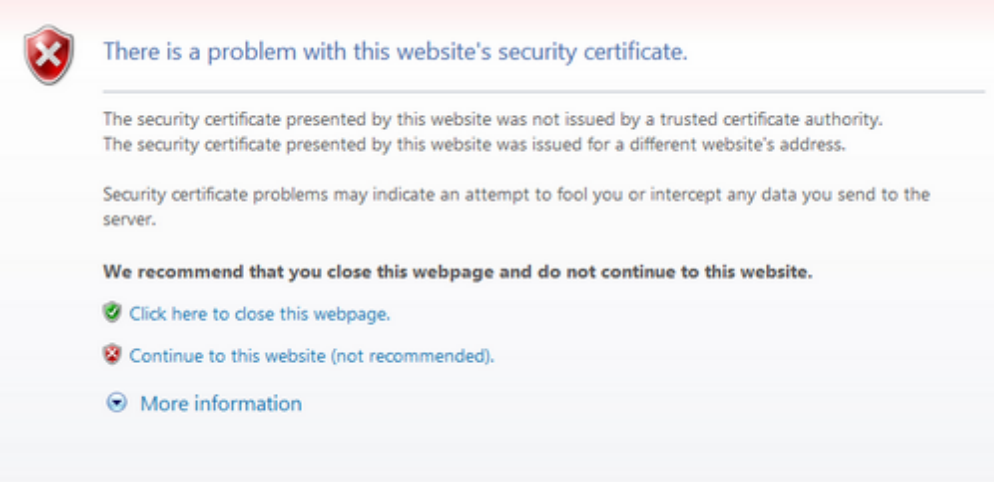


Security Warning in Mozilla Firefox

You only have to go through this procedure once for every Firefox browser and PRTG core server.

Internet Explorer

In **Internet Explorer**, click on **Continue to this website (not recommended)** every time you call the web interface.



Security Warning in Internet Explorer

Other

For other browsers that are not officially supported, the procedures to confirm the certificate are similar to the ones described above.

5.3 Welcome Page

After completing the **Smart Setup** 37, you will see PRTG's welcome page as default when you log in to the web interface. You can set another homepage in your account settings 2830, section **Web Interface**.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

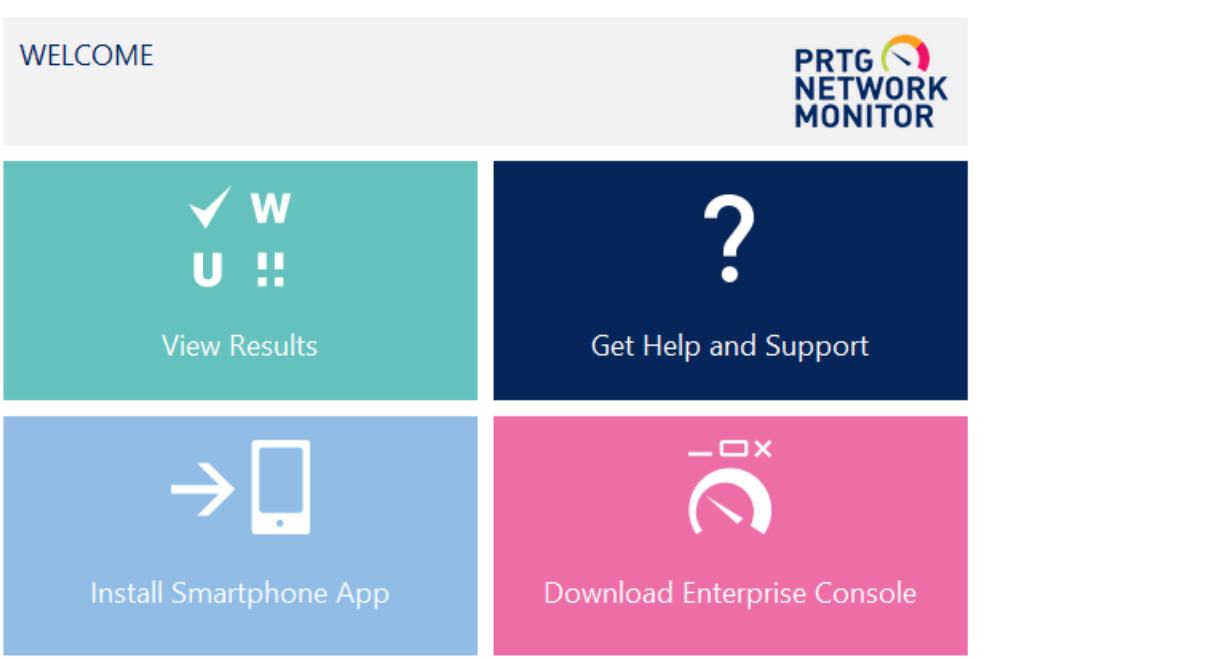
Welcome to PRTG Network Monitor

The PRTG welcome page shows you various information about your PRTG installation at a glance, similar to a dashboard. You can also directly access several pages in the PRTG web interface from the welcome page.

You have the following options on the welcome page:

- **View Results**: Open the device tree 123 that shows your monitoring results.

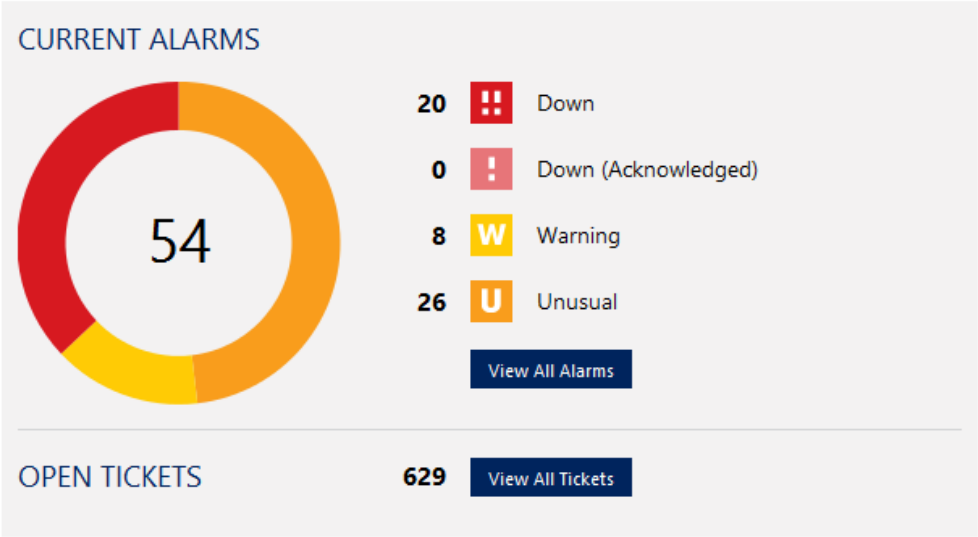
- **Get Help and Support**: Open the PRTG help and support page from where you can access the PRTG user manual, the Knowledge Base, and video tutorials. You can also open support tickets 2932 and contact our customer service 121 from this page.
- **Install Smartphone App**: Open the download page for PRTG's mobile apps 2928.
- **Download Enterprise Console**: Open the download page for the Enterprise Console 2926 in PRTG.



Welcome Page: A Good Starting Point for Your Daily Monitoring Activities

The welcome page keeps you informed about current **Alarms** 161 and open **Tickets** 171:

- **View All Alarms**: Open a list of alarms 161 in your PRTG installation.
- **View All Tickets**: Open a list of all open tickets 171 that are assigned to the currently logged in user.



Welcome Page: Alarms Overview and Open Tickets

Other sections are:

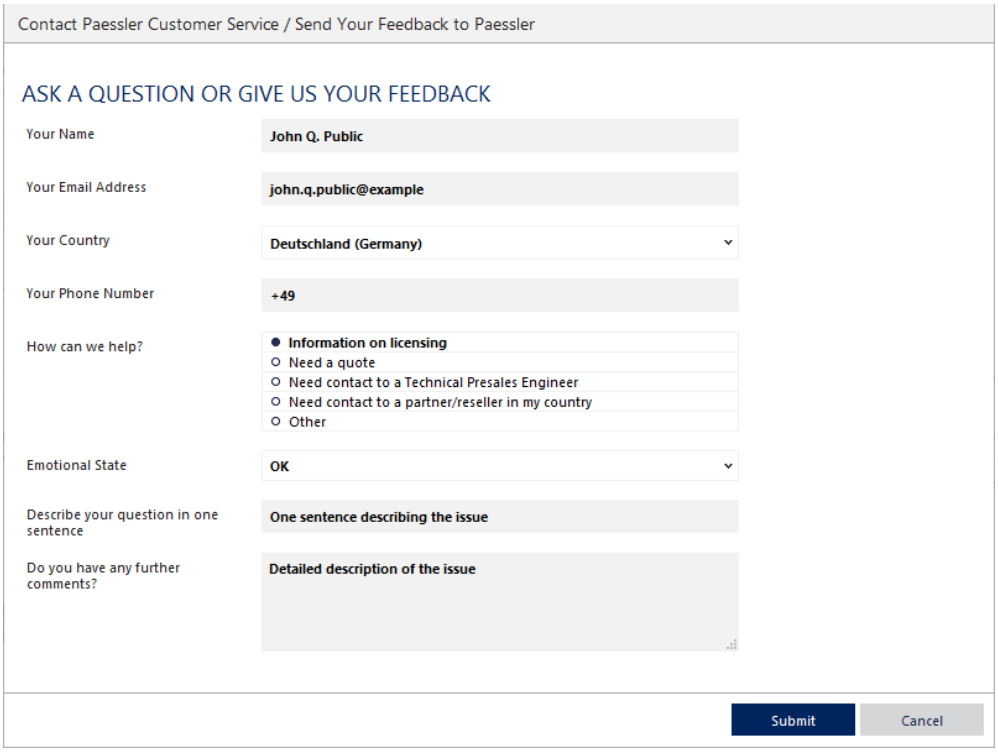
- **News from Paessler**: Shows recent information about PRTG and Paessler. Click the heading of an article to open it on paessler.com with your browser.
- **Yesterday's Activity**: Shows what your PRTG server did for you on the day before. Point with your mouse to the mini graph to show the number of sensor scans on a specific day. See also manual section PRTG Status—System Status 2911, section **Activity History**.
- **License Status**: Shows the number of your left maintenance days for PRTG and the number of sensors you can still add with your current license. Click **Get Maintenance** to open the Paessler shop and extend your maintenance. Click **Get More Sensors** to open the Paessler shop and upgrade your license. See also manual section PRTG Status—License Status and Settings 2925.
  Note: If you use a PRTG license with an unlimited number of sensors, you will see **0 Sensors Available** here for technical reasons. Of course, you can still add sensors if you run an unlimited edition nevertheless. Please consider the system requirements 23 for a properly working PRTG setup and click **Recommended Setup** for more information.
- **Update Available**: Shows the version number of your PRTG core server and the version number of the latest available PRTG version. You will see the label **NEW** if there is a newer version available. Click **Install Update** to open PRTG's Auto-Update 2918 page.
- If your PRTG is currently not SSL secured, the welcome page asks you to enable SSL encryption for the PRTG website. Click **Yes, Switch to SSL** to enable SSL encryption or **Don't Tell Me Again** to remove this note from the welcome page. See also manual section System Administration—User Interface 2862.
- If you still use the default password of the PRTG System Administrator user (prtgadmin), the welcome page asks you to set a secret password if your PRTG website is publicly accessible. Click **Change Default Password Now** to define a new password. See also manual section System Administration—User Accounts 2890.
- In the **video section** you find informative and helpful videos about monitoring with PRTG. Click a video to open and play it on paessler.com.

The collected information about your PRTG installation makes the welcome page a good starting point for your daily monitoring activities. Of course, you can also set up your custom dashboards in PRTG. The **Maps** 2810 feature of PRTG enables you to create dashboards exactly like you want.

5.3.1 Customer Service

If you have any questions about license purchase, upgrade, or maintenance extension, you can directly contact the Paessler **Customer Service** from the **Help and Support Center** in the PRTG web interface. We assist you with quotes and valuable information about license and maintenance, guide you through the purchasing process, and support you with contacting our system engineers or partners in your region.

Note: PRTG transmits your feedback or questions securely to Paessler via the PRTG Cloud. Please make sure your PRTG server has access to the internet and can reach the URL https://api.prtgcloud.com:443 for successful transmission.



Customer Service Contact Form

Ask a Question or Give Us Your Feedback

Provide the following information in this section of the **Contact Paessler Customer Service** form:

- **Your Name**: Enter your full name for contact information.
- **Your Email Address**: Enter an email address under which we can reach you.
- **Your Country**: Select the country in which you run PRTG so we can provide you contact information for a partner near you.
- **Your Phone Number**: Enter a phone number under which we can reach you.
- **How can we help?** Select the scope of your question.

- **Emotional State**: If you want to, you can indicate your current feelings about PRTG and your purchase process.
- **Describe your question in one sentence**: Provide short information that indicates the topic of your request.
- **Do you have any further comments?** Enter your comments here. This can be feedback or any questions for our customer service.

Click **Submit** to send your question or feedback to our customer service. Click **Cancel** to close the customer service contact form without sending it.

Note: If you have technical questions regarding monitoring with PRTG, please contact our technical support 2932.

5.4 General Layout

This manual section provides an overview about the structure of PRTG's web interface. The main focus is on the **Devices** view which you can select via the main menu bar, because there you see your monitoring results at a glance so you will widely use it.

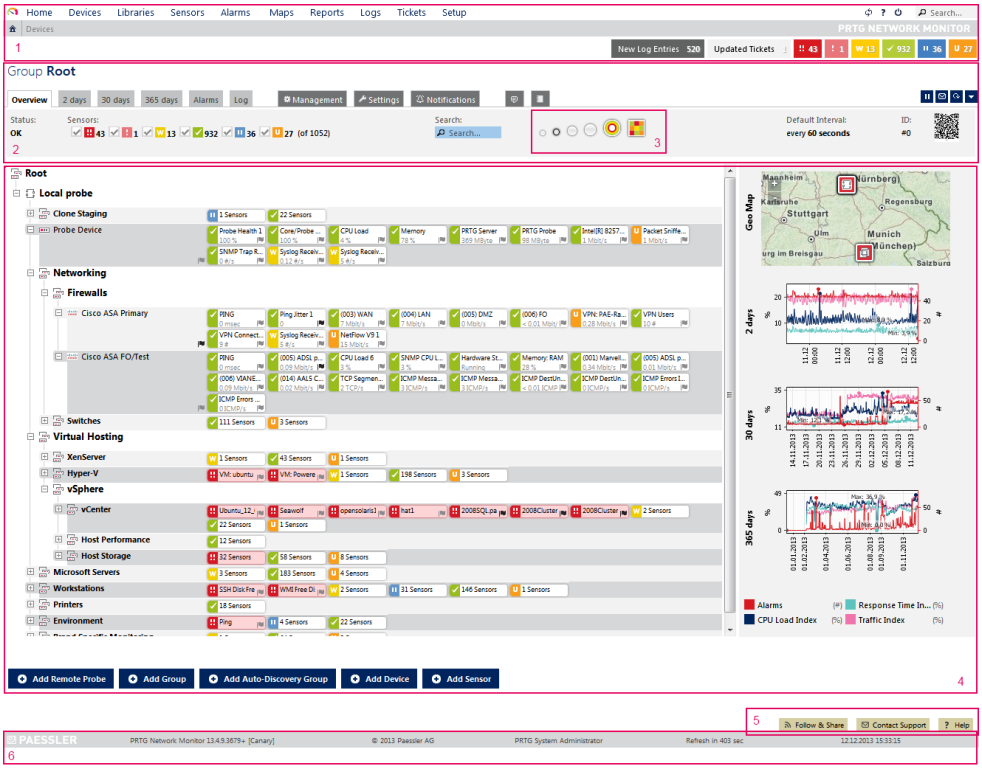
Welcome Page

When you log in to the PRTG web interface, you will see PRTG's Welcome Page 117 as default. You can set another homepage in your account settings 2830, section **Web Interface**.

Click **View Results** to open the device tree view.

Tree View Layout

Click **Review Results** on the welcome screen to display the tree-like device view which will be a starting point for everyday use or click **Devices** in the main menu bar 125.



PRTG Device Tree

From top to bottom, the main layout consists of:

Screen Number	Part	Description
1	Global Header Area 125	This element contains the main menu at the top, the global status bar, the path to the currently selected object, and a quick search box.
2	Page Header Bar 126	This element contains the page heading with the name of the current object, several tabs with settings, monitoring data of the current object, the object's status bar, quick action buttons, and the QR code that links to the current URL.
3	Device Tree View 129	This selection is part of the page header bar. Using the provided options you can define how your device tree is displayed.
4	Page Content 133	This element contains information about the current object and all other objects underneath in the tree hierarchy.
5	Page Footer Icons	With these icons you have quick access to the PRTG **Auto-Update** 2918 page, to PRTG's social network accounts, and to the contact support form 2932. There is also a link to context sensitive help. When running PRTG in a cluster, you will also see a cluster related element. It shows the name of the node you are logged in and displays whether this is a master or a failover node. Click the bar to show the **Cluster Status** 2923. In a failover node, you can review all data, but changes in the settings will not be saved. In order to change settings, please log in to the master node of your cluster.
6	Page Footer	Shows information about the current version of PRTG, the logged in user, the time remaining to the next automatic page refresh, and the current time (depending on the time zone settings 2893 for the currently logged in user).

Simply click an object to see more details about it. In the page heading of the page header bar 126 you always see the name of the object that you have currently selected.

When you navigate through PRTG's web interface you will always use one of the following navigational paths:

- The main menu provides access to all important aspects of the software.
- The quick search is often the fastest way to navigate to an object.
- Using the page's tabs, you can switch between various sub-pages for an object.
- Many objects offer a context menu that open when you right-click them.

- Many objects offer a quick-info menu that open when you point to an object.
- You can drill down into the object hierarchy of probes, groups, devices, and sensors in the object tree by merely clicking an sub-object of the currently displayed object (for example, a sensor on the device page).

These six navigation paths put PRTG's complete functionality at your fingertips. Quite likely you are already familiar with these techniques from many other websites and web-based user interfaces.

In the following, the different areas of the web interface are described.

Global Header Area

PRTG's Global Header Area

The header area of the web interface is both base for the most important information of your installation and starting point for all actions. You can view the global status and navigate through the web interface using the main menu.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

The global header area consists of the following parts:

Screen Number	Part	Description
1	Main Menu Bar	Navigating through the web interface is performed using the main menu. Please take a few minutes to familiarize yourself with all menu items and sub-items. A detailed description can be found in the **Main Menu Structure** 200 section.
2	Icons Refresh, Help Center, Logout	With the icons on the right you can reload the current page, open the help center or log the current user out.
3	White Search Box	To search for any monitoring object, enter the name, part of the name, an IP address, a DNS name or a tag in the search box on the right and hit the enter key. A web page with all items that fit the search term will be returned—even displaying online help articles.
4	Breadcrumbs	Below the main menu you see always a path which leads to the homepage. Use it to go back to where you came from. It can also help you to orient yourself if you get lost. If you click a breadcrumb item, a drop-down menu opens that shows all available objects on the same level. Enter some characters to search for a name, or select an object directly. For example, you can use this to directly access all other sensors or a device, other devices within a group, another group on the same probe, or other probes in your root group.
5	Buttons New Alarms, New Log Entries, New Tickets	These buttons show the number of new alarms and new log entries, as well as the number of new tickets. Click the respective button to view the **Alarms** 161, **Logs** 169, or **Tickets** 171.
6	Global Sensor Status Symbols	This area shows the aggregated status of all sensors you have configured for monitoring, divided into different sensor states. Depending on the sensors' status you will see colored boxes with numbers which symbolize the sensors. For example, you can see how many sensors are in **Up**, **Down**, or **Warning** status. Click a box to view a list of all sensors in the respective status. For a detailed description, please see **Sensor States** 135 section.

Page Header Bar

In the page header under the global header area, you see the name of the current object and the page content underneath. When displaying a group, aggregated sensor states are shown in a sensor bar and there is an option to change the tree view. Furthermore, various information about the current object is reported here.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

PRTG's Page Header Bar

The page header and tabs area consists of the following parts:

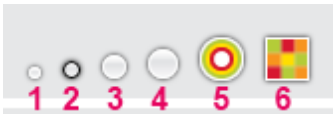
Screen Number	Part	Description
1	Page Heading	This line displays the kind of the current object and the name as page heading. In the screenshot above, it is a group which is called **Root**. Here you also can add the current object to favorites by clicking on the flag, as well as you can define the object's priority by clicking on one of the five stars (not available for the Root group). For details, please see section **Priority and Favorites** 182.
2	Tabs	Using the tabs you can navigate to various sub-pages of an object, showing monitoring data or changing settings. For more information, please see sections **Review Sensor Data** 137 and **Change Device and Sensor Settings** 159.
3	Context Buttons	On the right side are icons which allow you to perform several actions. Depending on the currently viewed page within PRTG, you can pause (and resume) or delete this object, add another object (for example, a sensor to a device), send a link to the current page per email, perform an immediate scan, open a related ticket, and show the corresponding object history page 169. On device lists, there is also a button to open the QR codes of all devices in this list in a printable layout. Click on the down arrow to open the context menu for the currently displayed object with even more options. For more information, please see **Context Menus** 186 section.
4	Object Status	This element indicates the current status of the selected object.
5	Sensor Status Bar	This element is visible when viewing a probe, a group (including **Root**), or a device. It is not available when viewing a sensor's details. The sensor status bar shows the aggregated status of all sensors for the current object, divided into different sensor states. They show the number of sensors in the respective state. For example, you can see how many sensors are in **Up**, **Down**, or **Warning** state. For a detailed description of sensor states, please see **Sensor States** 135 section. You can hide sensors that are in a certain state by removing the check mark symbol in front of the respective sensor symbol. To show them again, re-add the check mark.
6	Tree Search	In the white search box next to the tree view selection, enter a key word to search the device tree for matching names. The tree will highlight matching devices and sensors by graying out all others. This can help to gain a quick overview over sensors monitoring a specific part of your network. For example, you can enter the keyword "firewall" to highlight devices and sensors which match this name.
7	Device Tree View	This element is only visible when viewing a probe or a group. It is not available when viewing a device's or sensor's details. For a detailed description, see Switch Device Tree View 129 below.

Depending on the selected object type, the page header bar shows additional information:

- All objects underneath the Root group show their dependency 98.
- Groups and devices show the past time since the last execution of the auto-discovery 219 on the selected object.
- Devices show their respective DNS/IP address as defined in the device settings 324 and the past time since the last execution of the sensor recommendation 155 on this device.
- Sensors show additional monitoring statistics.

Switch Device Tree View

When viewing a probe or group, you can choose the way your device tree is shown.

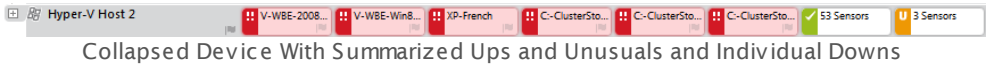


Device Tree View Switch Buttons

Switch Device Tree View—Classic Device Tree

Using the different circle symbols in the page header bar, you can define how much space is used to show devices and sensors in a hierarchical tree structure. In four steps, you can switch from a very condensed view (small circle; marked with 1 in the screenshot) up to an extra large view (big circle; marked with 4 in the screenshot).

In the classic device tree view you can collapse devices, groups, and probes. Click on the minus box left to the object's name. The sensor states will be summarized then. Each status of the sensors on this object will be displayed with the number of sensors currently being in this status—with the exception of the states **Down**, **Down (Partial)**, and **Down (Acknowledged)**. These will be summarized respectively not before there are more than ten sensors in this status, otherwise they are displayed individually.

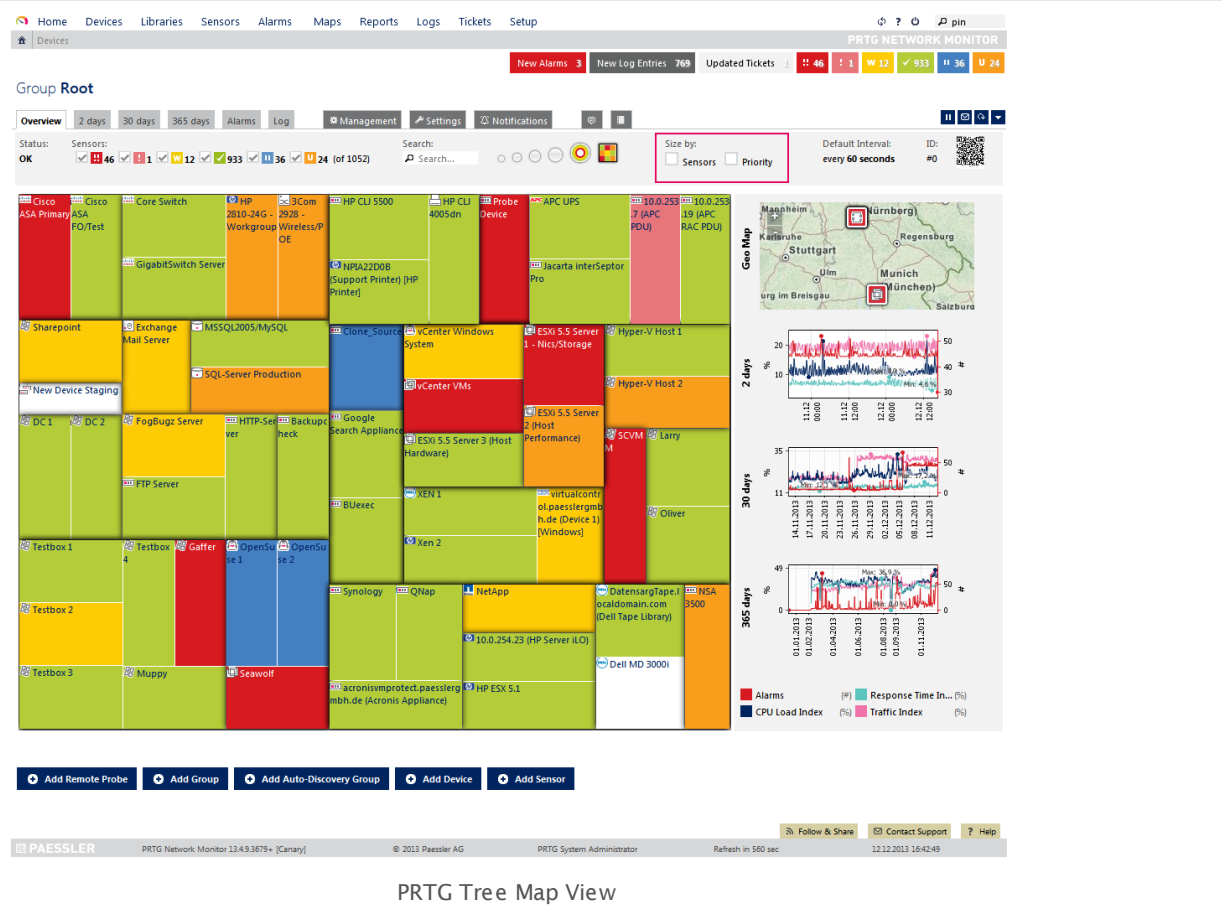


Collapsed Device With Summarized Ups and Unusuals and Individual Downs

Switch Device Tree View—Extended Views

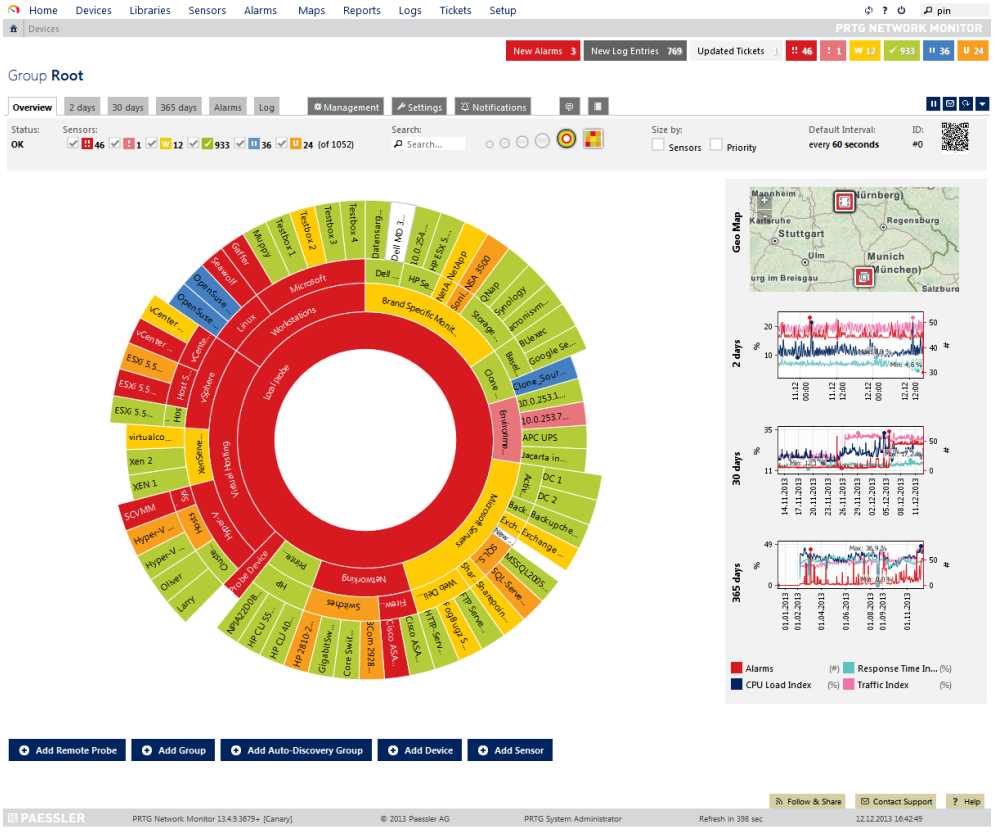
There are two additional options to the simple tree views which enable you to display the status of all sensors of your entire installation in a single overview. Click on one of the icons to change the view:

Tree Map View (6)
The tree map view tiles all devices of your entire installation into one square, arranged by the groups you put them into. Each device changes color dynamically to reflect the overall status of the sensors on the device. You can also adjust the size of the squares: either depending on a device's priority, or depending on the number of sensors on a device, or depending on both. For this concern, add a check mark under the point **Size by:** in front of **Sensors** and/or **Priority** in the page header bar (see the mark in the screenshot below).



PRTG Tree Map View

Sunburst View (5)
The sunburst view shows your entire installation in one circle diagram. The groups are represented as inner circles, and all devices contained within a group are shown as 'cake slices' attached to the outside of a circle element.



PRTG Sunburst View

For both views:

- **Colors**
  A device (or group) element can have different colors, depending on the states of the sensors running on this device or group (see **Sensor States** 135) 135). A more severe status is regarded more important and wins the color battle. For example, if a device currently has sensors in the states **Up** (green), **Paused** (blue), and **Warning** (yellow), the according device tile in this view would be yellow, indicating that at least one sensor on this device is in **Warning** status. If there are any red **Down** sensors, the according device tile will turn red. Following, all possible states in both views are listed ordered by their hierarchy:

Flag	Flag Color	Object Status	Meaning
	Red	**Down**	At least one sensor of this object shows a red **Down** status. Hover over an object's name to view the total number of alarms concerning this object.
	Bright-Red	**Down (Acknowledged)**	At least one sensor of this object is **Down** and the status was acknowledged by a PRTG user, applying the **Acknowledge Alarm** function. The **Down** states of all sensors of this object have to be acknowledged—if at least one sensor is unacknowledged down, this object will be displayed as **Down**.
	Yellow	**Warning**	At least one sensor of this object shows a yellow **Warning** status. There is no sensor in a **Down** or **Down (Acknowledged)** status concerning this object.
	Orange	**Unusual**	At least one sensor of this object shows an orange **Unusual** status. There is no sensor in a **Down**, **Down (Acknowledged)**, or **Warning** status concerning this object.
	Green	**Up**	All sensors of this object are in a green **Up** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Paused**, or **Unusual** status concerning this object.
	Blue	**Paused**	All sensors of this object show a blue **Paused** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, or **Up** status concerning this object.
	Black (Grey)	**Unknown**	All sensors of this object have an **Unknown** status. There is no sensor in a **Down**, **Down (Acknowledged)**, **Warning**, **Unusual**, **Paused**, or **Up** status concerning this object.

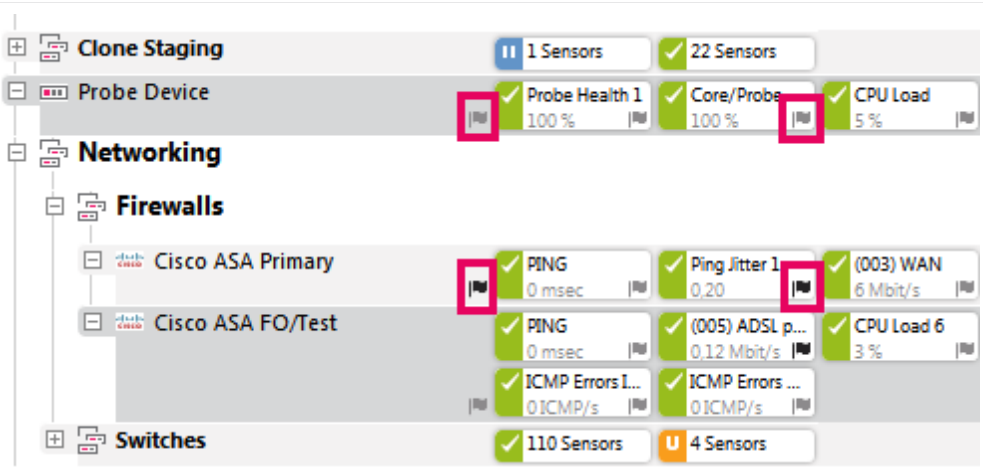
- **Size by Sensors / Size by Priority**
  You can adjust the size of the different squares. They can be calculated by the number of sensors running on a device or within a group, or by the sensors' priority (see Priority and Favorites 182), or both. Use the check boxes in the page header bar (see the mark in the tree map view screenshot) to change view immediately, then use the setting that suits best for your needs.

Page Content

The page content of the general layout varies dependent on the selected object. It shows information about the current object and all other objects underneath in the tree hierarchy. The deeper down in the hierarchy you select an object, the more detailed is the displayed information.

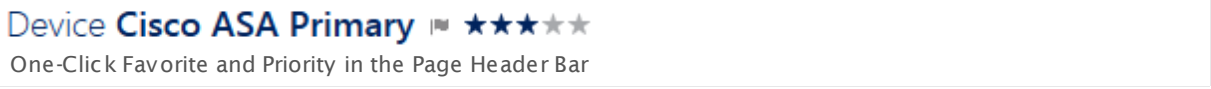
By default, a **Probe Device** is created in the device tree on the local probe. It represents the probe system running with your PRTG installation. PRTG automatically monitors the system health of the core server and each probe in order to discover overloading situations that may distort monitoring results. To monitor the system status of the probe computer, PRTG automatically creates a few sensors. These include a **Core/Probe Health Sensor**, a WMI sensor that measures disk usage, and a bandwidth sensor for all installed network cards. It is recommended to keep these sensors, but you can optionally remove all except the **Core/Probe Health** sensor. In a cluster installation, PRTG also creates a **Cluster Probe Device** with a Cluster Health Sensor 542 that monitors the cluster's system health.

You can add (or remove) a device or sensor to favorites by one click on the respective flag displayed with an object (please see the marks in the screenshot below).



One-Click Favorites in the Devie Tree

Another one-click option for adding/removing favorites or setting the priority for a selected device or sensor is given in the page header bar 126 right to the object name (please see screen number 1 in that subsection). Simply click on the flag for favorites or on a star for priority.



One-Click Favorite and Priority in the Page Header Bar

A black flag means that the respective object is a favorite already; clicking on the black flag will remove the object from favorites. A gray flag indicates that it is not a favorite yet. Please see also Priority and Favorites 182 for this concern.

For more details about page contents, please see the following sections:

- Review Monitoring Data 137

- **Historic Data Reports** 146
- **Object Settings** 159
- **Compare Sensors** 143
- **Geo Maps** 2753

More

Knowledge Base: How can I change the width of the devices and group "boxes" shown in the PRTG 9 device tree?

- http://kb.paessler.com/en/topic/24963

5.5 Sensor States

In PRTG's device tree you usually create several sensors on each 'device 324'. With sensors, you can monitor different aspects of your devices. Using a simple color code, they always show you what is going on in your network.

The color of a sensor always shows its current status. Following, you find a list of states a sensor can show. This list also reflects the hierarchy of states whenever summarized sensor states are shown (in the device tree 123, or on geo maps 2753): the higher a status is in the hierarchy, the higher will be its priority in displaying sensor states. For example, if all the sensors of a specific device are **Up**, but one of its sensors reached a **Down** status, then the overall status of this device will be **Down** as well (for example, displayed red in the Tree Map View 129), as this state is hierarchically higher.

Note: **Down** and **Down (Partial)** states are hierarchically equal.

Sensor	Color	Status Name	Meaning
	Red	**Down**	1. PRTG is not able to reach the device or the sensor has reached an error state. Please see **Sensor Warning and Down Behavior** 136 below for more information. Note: By design, a sensor does not record any data in its channels while it shows this status. 2. Another reason for this status can be an error limit that is set in the **Sensor Channels Settings** 2711, or an error status due to a sensor **Lookup** 3095. Note: In this case, the sensor continues to record data in all sensor channels although the sensor shows an error.
	Green/ Red	**Down (Partial)**	In a cluster, at least one node reports this sensor as **Down**, while at least one other node reports the same sensor as **Up**. Note: This status is not available for sensors on remote probes in a failover cluster 87.
	Bright-Red	**Down (Acknowledged)**	The sensor is **Down** and the status was acknowledged by a PRTG user, applying the **Acknowledge Alarm** function. This can be helpful to mark that an alarm has already been attended to. For acknowledged alarms no more notifications 2759 are sent. To set this sensor status, right-click on a sensor in a **Down** status and from the context menu 186, select **Acknowledge Alarm...**. Then enter a comment and click **OK**.
	Yellow	**Warning**	There was an error reading the sensor, but PRTG will try again. The sensor may soon change to a down status. Please see **Sensor Warning and Down Behavior** 136 below for more information. Another reason for this state can be a warning limit set in a sensor's **Sensor Channels Settings** 2711.

Sensor	Color	Status Name	Meaning
	Orange	**Unusual**	The sensor reports unusual values for this weekday and time of day. The unusual detection is based on the historic average data and can be configured or disabled in the system administration 2872. You can also disable unusual detection for certain groups only (see **Group Settings** 322).
	Green	**Up**	The last check was okay and the sensor receives data.
	Blue	**Paused**	The sensor is currently paused (for a certain time or unlimitedly, or by dependency 98).
	Black (Gray)	**Unknown**	The sensor has not been checked yet by PRTG or there is an error in (network) communication, likely on the probe system. If sensors show this status persistently, a PRTG restart may be necessary. For extended trouble shooting please see **More** 136 section below.

Sensor Warning and Down Behavior

The **Down** status symbolizes that something is wrong with a monitored device. There can be various reasons for a down status, for example, an interruption in the physical connection to the device, an internet connection outage, or a crashed server.

After a failed request, PRTG tries to reach the device again before setting a sensor to **Down** status (this is true for almost all types of sensors):

1. If a request to a device fails for the first time, the sensor is set to **Warning** status. PRTG repeats the request and tries to re-scan the device immediately.
2. If also the second request fails, the sensor is set to **Down** status by default until the device is reachable again. You can change this behavior in the **Scanning Interval** 272 settings of any monitoring object. PRTG tries to reach the device with every scanning interval.

This procedure gives devices and services the chance to recover from a momentary overload and prevents false alarms. Still, you are informed promptly about any failures occurring.

Note: The behavior described above does not apply to a **Warning** or **Down** status that is activated due to a warning or error limit set in the **Sensor Channels Settings** 2711 or to channels using lookups 3095.

More

Knowledge Base: What to check if sensors are black (gray)?

5.6 Review Monitoring Data

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

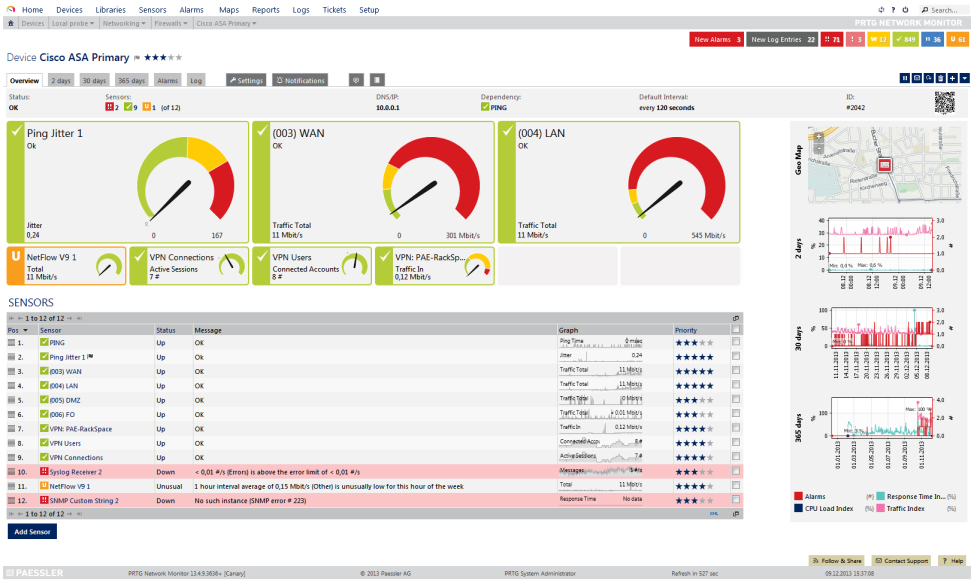
Tabs Bar on Sensor Pages

Overview

The **Overview** tab shows an overview of the currently selected object and of its sensors. The pages share a common layout, but include different elements, depending on the kind of object you look at:

- For probes and groups, the **Overview** tab shows a tree-like view with devices and sensors, a Geo Map, as well as summary graphs for different time spans of the current probe or group.
- For devices, the **Overview** tab shows device details, a Geo Map, and summary graphs for different time spans, colored gauges for high priority sensors, as well as a table list of all sensors on this device. Additionally, you see a table list 178 with **Recommended Sensors** 155.
  - Note: You can turn off the sensor recommendation (and disable this table list) in **System Administration—Monitoring** 2874.
  - Note: To display gauges, you have to tag corresponding sensors with 4 stars (****) or 5 stars (*****) in the priority settings 182. 5 star sensors are represented with bigger gauges than 4 star sensors.
- For sensors, the **Overview** tab shows sensor details, current status, colored gauges, sensor graphs for different time spans, a table with all sensor channels, as well as similar sensors 151 which show correlations in your network.
- Gauges and switches represent sensor values on **Overview** tabs of devices and channel values on **Overview** tabs of sensors. They graphically illustrate the current values of a sensor or a channel, so you can use them as a quick status indicator. The red and yellow parts of gauges correspond to the error and warning limits of the respective sensor channel settings 2711. Device overview tabs show gauges of high priority sensors, sensor overview tabs show gauges of all sensor channels (except the **Downtime** channel), with the primary channel having the biggest gauge. For sensor channels that measure or calculate binary values like on/off or successful/failing using lookups, a switch shows green or red color respectively.

Note: For sensors using lookups 3095, we recommend staying below 120 lookup values in the primary channel to get expressive gauges. For sensors with a priority of 4 stars, the upper limit is around 40 lookup values.



Device Overview Tab with Gauges for High Priority Sensors, Sensors Table List, Geo Map, and Mini Graphs

Toplists

Toplists are available for xFlow and Packet Sniffer sensors [349] only. Toplist graphs are displayed right on the sensor overview page. Please see the section **Toplists** [2734].

Live Data and Data By x Days

Select one of the tabs **Live Data** (available for sensors only), **2 days**, **30 days**, or **365 days** to display an object's monitoring data live (sensors only), or for different time spans and in more or less detail. The time that graph legends and data tables show depends on the time zone settings [2893] for the currently logged in user.

Note: The days mentioned here is the default setting. You can change the shown days of the different graphs under **System Administration—User Interface** [2866].

2 Days Tab of a Firewall with Overview Graph and Sensor Mini Graphs

Live Data and Data By x Days—Probes, Groups, and Devices

For probes, groups, and devices, each of the tabs shows a summary graph for the current object and mini graphs for all sensors on this object, as well as a data table for the current object. There are never more than 50 mini graphs displayed for performance reasons. Hover over a mini graph to see the graph legend.

The summary graph shows the number of alarms as well as three index graphs. These graphs indicate response time, CPU usage, and bandwidth usage for all sensors. Index graphs are similar to a stock index. The shown values are based on the readings of all sensors of this object. PRTG computes these values using statistics and by comparing the values to the highest and lowest readings ever recorded.

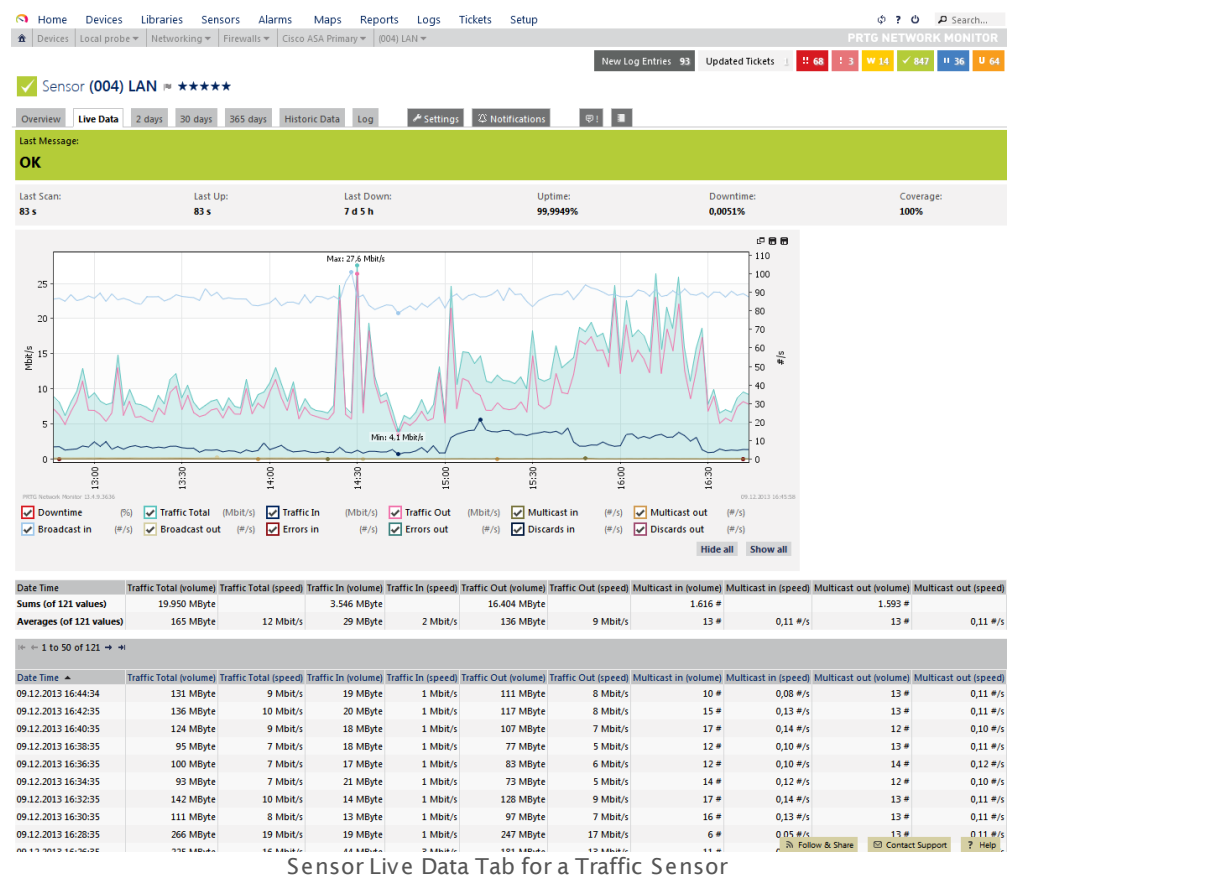
The three index graphs shows overall (or global) trends in your network. If these values increase during a specific time frame, then CPU load, bandwidth load, or response time respectively have worsened during this time. For example, a CPU Load Index value of 90% means that the average CPU load for all CPU sensors of your current configuration is at 90% of the highest ever measured CPU usage value.

The following four channels are available in the summary graph:

- **Alarms**: Sums up the number of all down states of sensors on this object during the given time span. This graph provides you a bird's eye view of trouble in your network. It cannot be hided.
- **Response Time Index**: Indicates request times in your network.
- **CPU Load Index**: Indicates the CPU usage in your network.
- **Traffic Index**: Indicates the bandwidth usage in your network.

See the **More** 142 section for a detailed description of the index graphs.

You can hide single channels individually except the "Alarms" channel. Simply remove the check mark symbol in front of a channel name besides the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons below the channel names. The graph view will be reset immediately.



Sensor Live Data Tab for a Traffic Sensor

Live Data and Data By x Days—Sensors

For sensors, the tabs show a graph and data table of the selected sensor. When viewing data of a sensor running on a cluster probe, you can additionally select if you want to show the data of all nodes, or of one specific node only. Please use the **Select Cluster Member** bar below the tabs.

Note: Multi-node graphs are never displayed filled here, but with single lines only. However, historic data reports can have filled multi-node graphs.

While viewing a sensor graph you can hide single sensor channels individually. Simply remove the check mark symbol in front of a channel name below the graph, and the according channel's line will disappear. You can also **Show all** or **Hide all** channels by clicking on the buttons besides the channel names.

Live Data and Data By x Days—Interactive Graphs

On historic data tabs of sensors and in "zoomed graphs in new windows" (see below) of other monitoring objects, graphs are interactive. You can zoom in and scroll along the time axis with the corresponding buttons.

Graph Buttons

The following actions for graphs are available:

- << scrolls one graph window left and >> one graph window right. The scrolled time depends on the graph you select, for example, 2 days on a 2 days graph.
- < scrolls left and > right on the time axis. The scrolled time depends on the graph you select.
- + zooms into and - out of the graph. The shown time depends on the graph you select. For example, you can zoom in a 30 days graph so that it shows data for 6 days.
- x resets the graph to the default view.

In the upper right corner of every graph, you see three small icons:

You can do the following with them:

- **Zoom graph in new window**: Opens a larger version of the graph in a new browser window.
- **Download the graph (PNG or SVG)**: Shows a PNG or SVG file of the graph in a new browser window. You can then save or copy it for later use.

In every graph, you can also choose which specific channels (only on sensor pages) or indexes you want to see by using the corresponding check boxes or the **Show all** and **Hide all** buttons.

Note: Warning or error limits are only shown in graphs (highlighted in yellow or red) if you select exactly one channel with a limit.

Historic Data

The **Historic Data** tab is available for sensors only. Please see the section **Historic Data Reports** 146.

Sensors Lists

Viewing lists of sensors is a great way to keep an eye on your network status because you can select which kind of sensors you would like to see. There are many different sensor list views available, such as a list of favorite sensors and top 10 lists, lists filtered by current sensor status, value, availability, tag or type, sensor cross reference, and many more.

Sensor lists are available from the main menu bar. Click the **Sensors** entry to show a table list of all sensors. In the table list 178 appearing, you can re-sort the items by clicking on the column's header items (see section **Working with Table Lists** 178). Hover over it to show other menu options. For detailed information about the available options, please see **Main Menu Structure** 205 (**Sensors**) section.

Alarms

The **Alarms** tab is not available for sensors, but for probes, groups, and devices only. Please see the **Alarms** 161 section.

Log

The **Logs** tab shows past activities and events regarding the currently selected object. Please see the **Logs** 169 section.

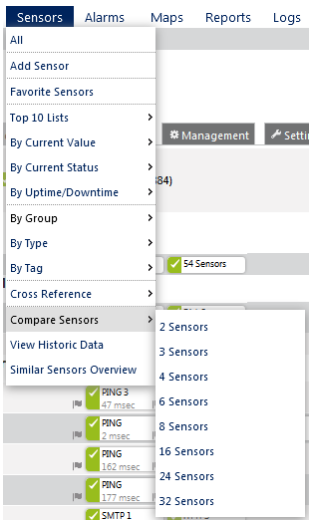
5.7 Compare Sensors

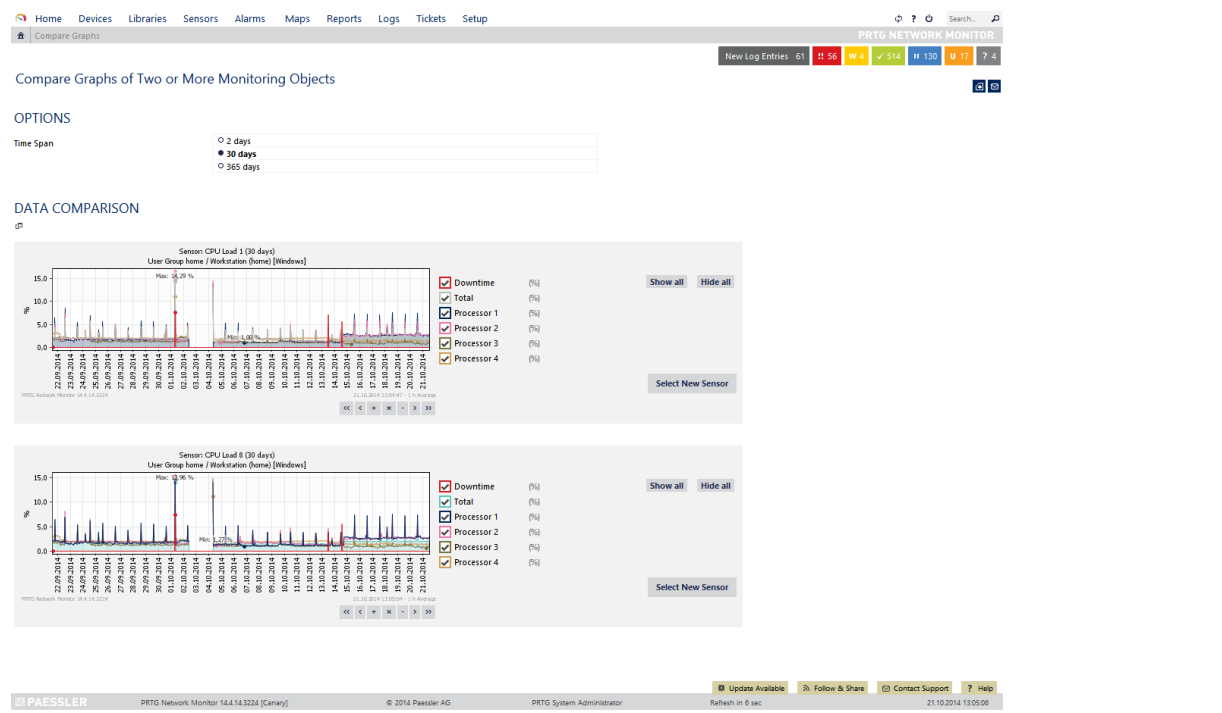
This function allows you to visually compare the graphs of two or more specific sensors. The selected graphs are shown next to each other so you can have a look at all of them at the same time.

To open the page to compare graphs of several sensors, from the main menu, choose **Sensors | Compare Sensors**. Hover over it and select how many sensors you want to compare.



PRTG Main Menu: Compare Sensors

Choose the number of sensors that you want to compare. This opens an assistant where you can define your desired sensors and the time span the particular graphs cover.



Compare Graphs of Two Sensors with 30 Days Time Span

Compare Sensors Settings

OPTIONS

Time Span	Specify the time span for which you want to show the graphs for. Choose between: ▪ **2 days** ▪ **30 days** ▪ **365 days**

Data Comparison

Select the objects you want to show a graph for. Click on **Click here to select an object!** to open the **Object Selector** 181. There appear as many selection screens as you defined before.

Select the Objects to be Compared

PRTG shows the graphs immediately after object selection. You can now work with the compared graphs like on the historic data tabs of sensors 140: select the channels you want to show and zoom and scroll in the graphs. Click **Select New Sensor** to choose another sensor for comparison.

Related Topics

If you want to create a sensor that combines the data of different other sensors, please see the following sensor type:

- **Sensor Factory Sensor** 1374

5.8 Historic Data Reports

For quick reporting of a sensor's monitoring data, use the historic data reports as an alternative to the comprehensive **Reports** 2786 function. You can run and view a report of the historic data for each single sensor, on demand. Additionally, you can export this sensor data to your computer for further processing in external applications.

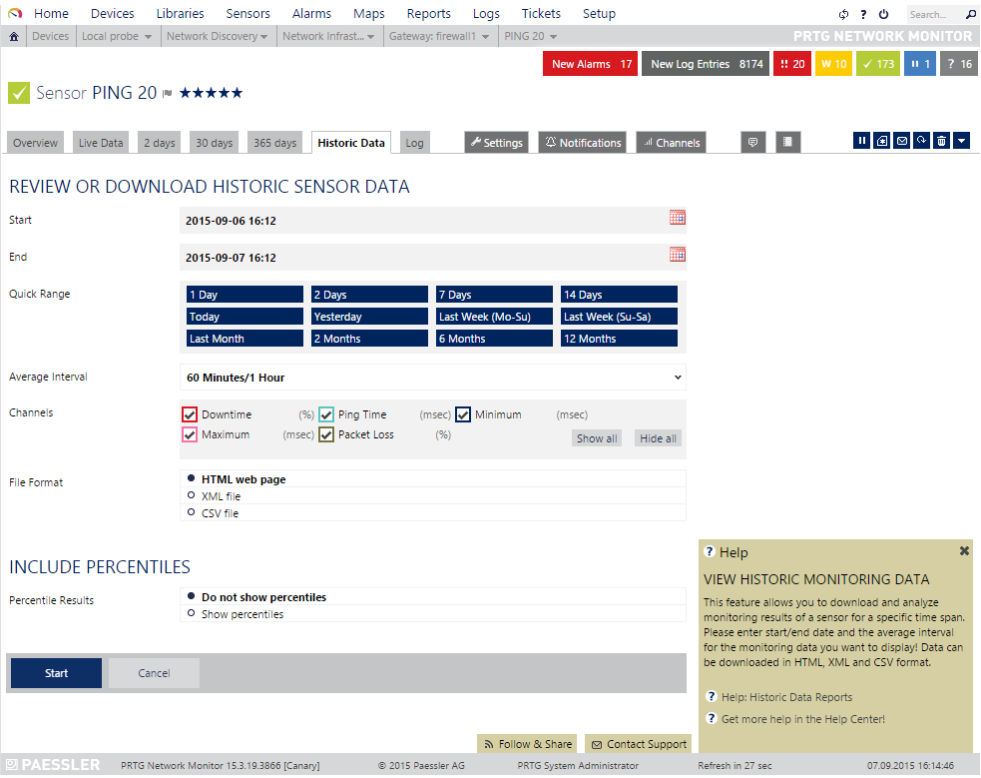
There are two possibilities to call the function for historic data reports: Either you click on the **Historic Data** tab on a sensor's detail page, or you choose **Sensors | View Historic Data** from the main menu 205.

Historic Data (Sensor Tab)

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

Tabs Bar on Sensor Pages

The **Historic Data** tab is available for sensors only (not for probes, groups, or devices). When you call the historic data reports via this tab, there is no sensor selection available because you already determined which sensor you want to create a report for. If you want to select another sensor for the report, choose **Sensors | View Historic Data** from the main menu in the PRTG web interface.



Historic Data Tab of Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/historic_data_tab_ping_sensor.png

Historic Monitoring Data (Sensors Main Menu)

When you call historic data reports via the **View Historic Data** entry from the **Sensors** tab in the main menu, you additionally have to choose the sensor you want to create a report for with the **Object Selector** 181.

Historic Monitoring Data Settings

SETTINGS

Sensor	This field is only visible if you call the historic data function via the main menu. Select the sensor you want to create the report for: Click on the reading-glass symbol to open the object selector. For more information, see section **Object Selector** 181.
Start	Specify the start date and time of the data you want to review. Use the date time picker to enter the date and time.
End	Specify the end date and time of the data you want to review. Use the date time picker to enter the date and time.
Quick Range	In this section you can use several buttons for a faster selection of start and end dates. Click on any of these links to change the **Start** and **End** values above. Choose between: ▪ **1 Day**, **2 Days**, **7 Days**, or **14 Days**: Set the date range to the respective day(s). The current time of the current day is the end date. ▪ **Today**, **Yesterday**, **Last Week (Mo-Su)**, **Last Week (Su-Sa)**, **Last Month**, **2 Months**, **6 Months**, **12 Months**: Set the date range to the last matching period. It starts at 00:00 and ends at 00:00 of the particularly following day.
Average Interval	With this option, you can activate and set up averaging. Select an interval for which PRTG calculates the average value. You can choose between **No Interval** (no averaging is performed and only raw data displayed), a few seconds, minutes, hours, or a whole day (**24 Hours**). A smaller interval results in a more detailed report for this sensor. The best settings for you vary, depending on the scanning interval of the sensor, the selected date period and, of course, the intended use for the report. It might be useful to try different settings to see what the results look like. Please also see the section **Automatic Averaging** 149 below.

SETTINGS

Channels	Select the channels you want to include in the report. You can select or deselect single channels with the respective check boxes, and select or deselect all channels with the buttons **Show all** or **Hide all**. PRTG shows only the data of selected data in the report.
Cluster Node	This field is only visible if the sensor is running on a cluster probe. Select the cluster node's data that PRTG uses for the report. Choose between: ▪ **All nodes**: Include the data of all cluster nodes in the report. ▪ [Several specific nodes]: Use a specific node's data for the report. The nodes you see are specific to your setup.
File Format	Select the output format for the report. Choose between: ▪ **HTML web page**: Display the result directly as HTML web page. This is also a good option to check results before exporting to another file format. ▪ **XML file**: Export the data as Extensible Markup Language (XML) file. Usually, you browser shows a download dialog when you use this option. ▪ **CSV file**: Export the data as Comma Seperated Values (CSV) file, for example, for import into Microsoft Excel. Usually, you browser shows a download dialog when you use this option.

INCLUDE PERCENTILES

Percentile Results	Define if you want to include an additional percentile calculation 3107 of your data in the report. Choose between: ▪ **Do not show percentiles:** PRTG does not use a percentile formula to calculate your monitoring results. It will show only the standard values. ▪ **Show percentiles**: PRTG adds a column to the result data tables, which shows percentiles for every sensor channel. Note: Percentiles are not available for all report templates. If a template does not support percentiles, they will simply not show up in the report, even when you enable this setting.

INCLUDE PERCENTILES	
	Likewise, percentiles are not available if in a cluster setup you choose the option **All Nodes** in the Cluster setting in the sensor section above.
Percentile Type	This setting is only visible if you select **Show percentiles** above. Enter the percentile type you want PRTG to use for the calculation. If you choose, for example, to calculate the 95th percentile, enter "95" here and 5 % of peak values will be discarded. Please enter an integer value.
Percentile Average Interval	This setting is only visible if you select **Show percentiles** above. Enter a value to define the averaging interval on which PRTG bases the percentile calculation. The default value is 300 (seconds), which is equivalent to 5 minutes. This means that PRTG takes 5 minute averages as basic values for the percentile calculation. Please enter an integer value.
Percentile Mode	This setting is only visible if you select **Show percentiles** above. Choose the mode for percentile calculation: ▪ **Discrete**: PRTG takes discrete values to calculate percentile results. ▪ **Continuous**: PRTG interpolates between discrete values and bases the calculation on interpolated values.

Click **Start** to generate a historic data report.

Note: Data reporting is limited to 5 requests per minute.

Note: Reports cannot show uptime or downtime data for the **Sensor Factory Sensor** 1374.

Automatic Averaging

For performance reasons, PRTG automatically averages monitoring data when calculating data for large time spans. Data is then averaged regardless of the selected average interval.

TIME SPAN IN REPORT	MINIMUM LEVEL OF DETAIL (AVERAGE INTERVAL)
Up to 40 days	Any
40 to 500 days	60 minutes/1 hour or larger

A report for a time span of more than 500 days is not possible. If you try to set a larger time span, it will be reduced to 365 days automatically.

Related Topics

- **Review Monitoring Data** 137
- **Reports** 2786

More

Knowledge Base: Why is there missing data in historical data reports?

- http://kb.paessler.com/en/topic/61382

5.9 Similar Sensors

With PRTG you can detect relationships between different components in your network. This function is called similar sensors analysis, a heuristic calculation showing similar behavior of your sensors. The analysis is completely automated and sensor type agnostic. It is based on mathematics and fuzzy logic. This feature helps you find interconnections in your network you were not aware of and optimizes your sensor usage by tracking redundant monitoring of some aspects of your system.

You can adjust the depth of similar sensors analysis or turn it off in **System Administration—Monitoring** 2874. You can also switch on and off the similarity analysis for specific probes, groups, and devices and specify inheritance 94 in the corresponding object settings 159, section **Automatic Monitoring Analysis**.

There are two options to view similar sensors:

- The overview page of sensors contains a similar sensors section. PRTG lists channels there which show similarities to channels of the current sensor.
- In addition, you can call a similar sensors overview page via **Sensors | Similar Sensors Overview** from the main menu 205.

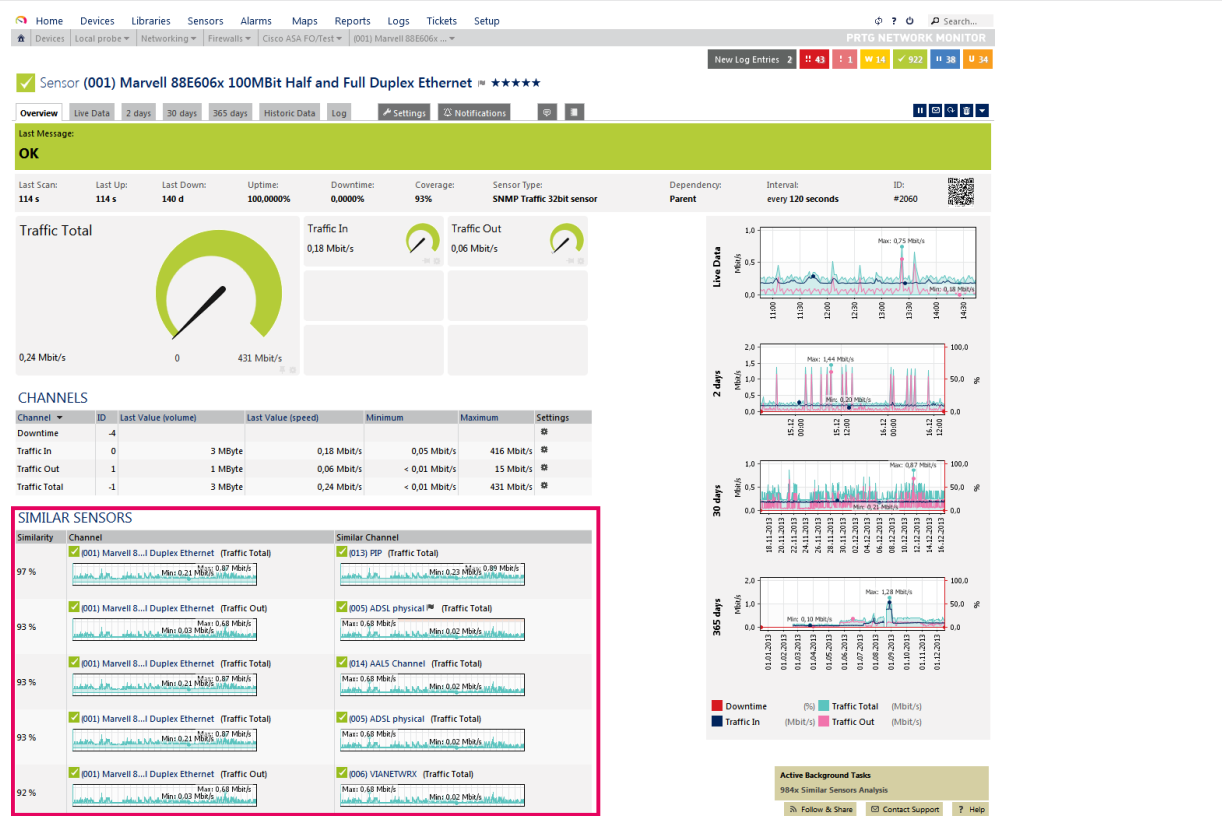
Similar Sensors (Sensor Overview Tab)

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

Tabs Bar on Sensor Pages

On the overview tab of a sensor, PRTG lists channels which show similarities to channels of the currently selected sensor. The table is empty if PRTG detects no similarities regarding the selected sensor.

Note: PRTG only shows similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor at most.



Similar Sensors Section on a Sensor's Overview Tab

The similar sensors section provides the following information:

SIMILAR SENSORS

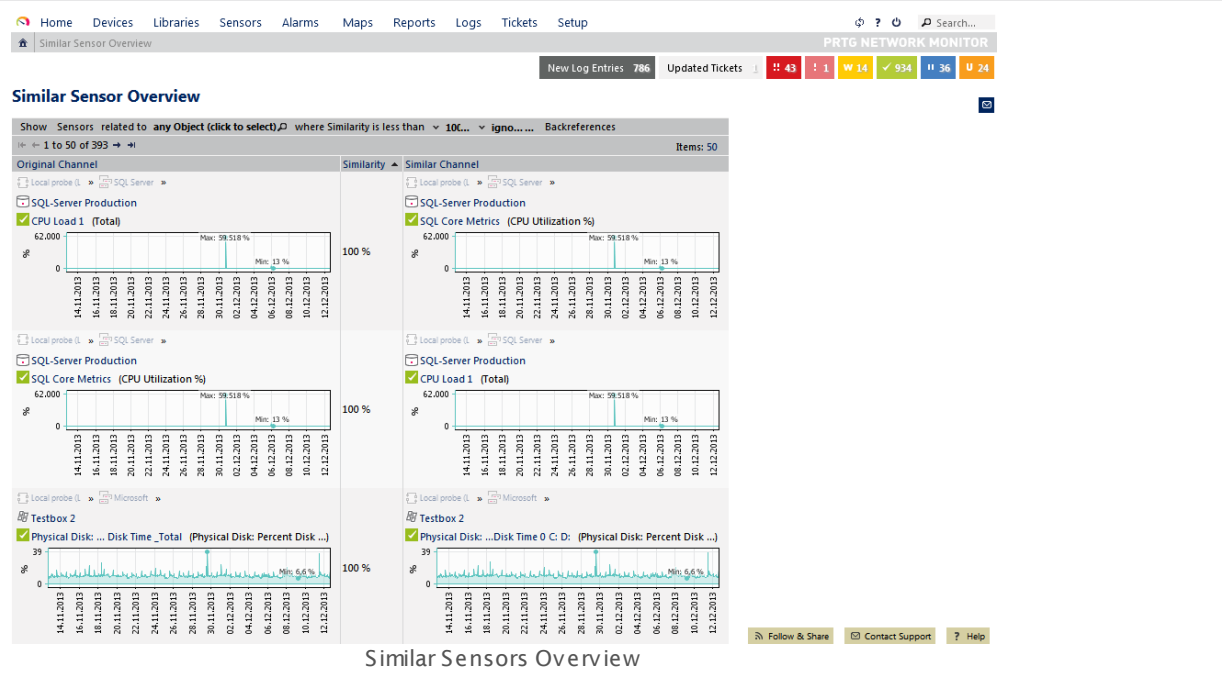
Similarity	Shows a measurement of similarity between two channels in percent.
Channel	Shows a channel of the currently selected sensor.
Similar Channel	Shows a channel of another sensor similar to a channel of the currently selected sensor (the one in the "Channel" column in the same row).

Note: PRTG does not show the similar sensors section when the analysis is off or you have exceeded 1,000 sensor and selected the automatic analysis depth option 2874. You will see a notice in this case.

Similar Sensors Overview (Sensors Menu)

This page shows the results of the similar sensors analysis from the entire monitoring database. PRTG lists all channels with similarities to another one here. On the table top, you have several filter options to display similar sensors as you need it. Choose the object of interest, the degree of similarity, and if you want to display back references. For more details, see also section Working with Table Lists 178.

Note: PRTG only shows similar sensors here when channels have at least 85% similarity. Furthermore, the analysis saves up to 15 entries per sensor at most.



Similar Sensors Overview

You can sort the list by clicking on the column headers. The similar sensors overview page provides the following information:

SIMILAR SENSORS OVERVIEW

Original Channel	Shows channels to which other channels are compared. Click on the column header to sort the list according to the order on the device tree in ascending or descending order.
Similarity	Shows a measurement of similarity between two channels in percent. Click on the column header to sort the list according to the similarities in ascending or descending order.

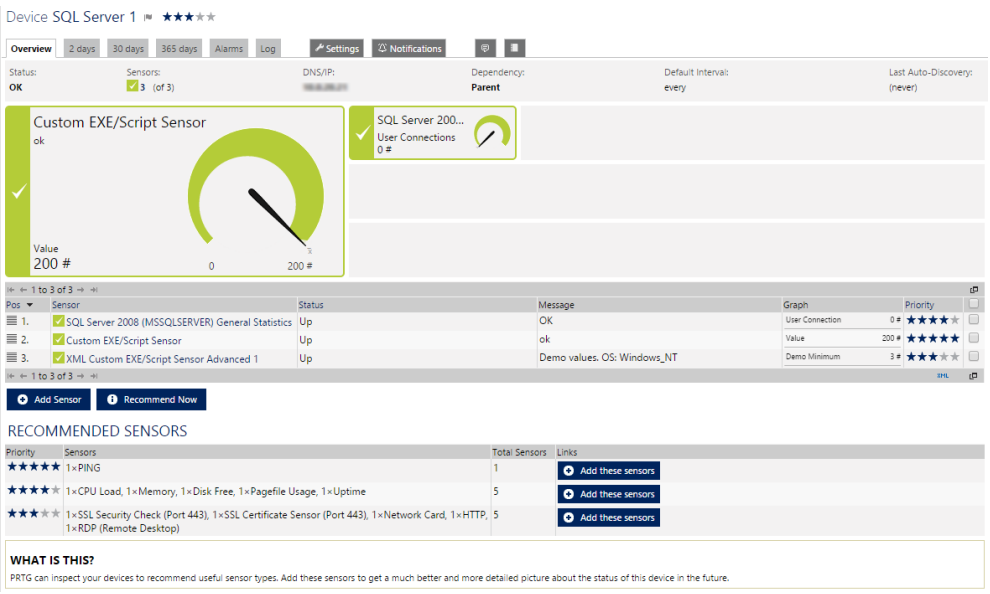
SIMILAR SENSORS OVERVIEW

Similar Channel	Shows a channel compared to the original channel. Click on the column header to sort the list according to the order on the device tree in ascending or descending order.
Item Count	Define how many channel similarities are shown on this page. Choose between **50**, **100**, or **500**.

Note: PRTG does not show the similar sensors overview option in the main menu if you turned off the analysis or if you have exceeded 1,000 sensors and selected the automatic analysis depth option.

5.10 Recommended Sensors

The **Recommended Sensors** function is one of the options that PRTG supports you in setting up a comprehensive monitoring. PRTG can explore any device and check which sensors you have already created. If it finds useful sensors that can complete your monitoring [137] and are not yet created, you will find a list of recommended sensors for your specific device. By adding these sensors, you will not miss any important monitoring data anymore!



Recommended Sensors on Device Overview Tab

Click here to enlarge: http://media.paessler.com/prtg-screenshots/recommended_sensors.png

Get Sensor Recommendations

You want to know which sensors can complete the monitoring of your devices? By default, PRTG recommends sensors for any device you add to PRTG and shows the suggested sensor types for it on the **Overview** tab of the device, as long as your installation contains less than 5,000 sensors in total. All you have to do is to click the **Add These Sensors** button to enhance your monitoring experience.

If you want to manually start the detection engine for sensor recommendations on any desired device, follow the steps below.

You can see the past time since the last execution of the sensor recommendation on a device in the page header bar [126] on the **Overview** tab of this device.

Step 1: Choose the Device

Open the **Overview** [137] tab of the device that you want to analyze.

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

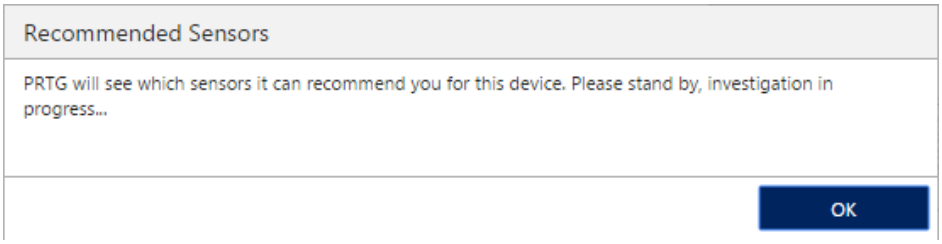
Tabs Bar on Sensor Pages

Step 2: Recommend Now

To start the analysis of your device, click the **Recommend Now** button directly below the sensor list or choose the option **Recommend Now** in the context menu 192.

Note: If you do not see the **Recommend Now** option, make sure that the sensor recommendation is enabled in the **System Administration—Monitoring** 2874 settings. Probe devices do not offer this option.

Depending on the complexity of your device, it can take some time until you see the results of the analysis. Stay tuned!



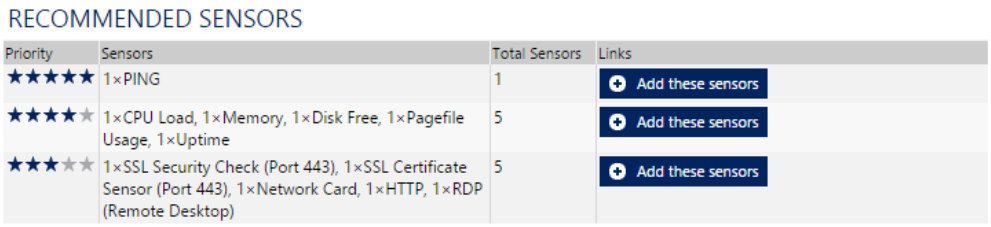
Recommended Sensors Investigation

PRTG runs the device analysis in the background with low priority to prevent potential performance issues. Consequently, the recommended sensors analysis can take more time than expected if PRTG needs resources to ensure gapless monitoring of your network in the first place. By default, the sensor recommendation engine starts automatically when you add a new device, when you do not have more than 5,000 sensors, or when the last analysis was executed more than 30 days ago. You can change these settings in the **System Administration—Monitoring** 2874.

Note: To recommend SNMP sensors 350 for a device, the detection engine uses the SNMP version that you defined in the **Credentials for SNMP Devices** 332 section of the device settings.

Step 3: Get the Results

After analyzing your device, PRTG suggests you a list of sensors that are useful for a more comprehensive monitoring.



List of Recommended Sensors

The list of recommended sensors provides the following information:

RECOMMENDED SENSORS	
Priority	Shows which priority[182] the suggested sensors will have when you add them. The recommended sensors table is sorted by priority, beginning with top priority (5***** stars) in the first row. Note: You can manually change the priority of a sensor after adding it.
Sensors	Shows the suggested sensors and the number of sensors from one type PRTG recommends for this device (for example, you might want to add a sensor from the type SNMP Traffic[2071] multiple times because of several network interfaces).
Total Sensors	Shows the total number of suggested sensors per table row. These sensors have the same priority.
Links	Displays an **Add These Sensors** button for every table row. Click to automatically add the sensors listed in this table row to the device.

Note: The detection engine checks if a certain sensor type currently exists on your device and recommends that you add this sensor if it does not exist. If this sensor type already existed previously on the device but you have deleted it, PRTG will suggest this sensor type again. Please ignore the suggestion of this sensor type or follow Step 4[157].

Step 4: Add Recommended Sensors

Click the **Add These Sensors** button in a table row to add all sensors in this row to the analyzed device.

Note: If you want to add **all** suggested sensors regardless of their priority, click every **Add These Sensors** button in the recommended sensors table. If you like to add only **some** of the sensors of a certain priority and not all of them, please click **Add These Sensors** first and then delete[196] or pause[185] the ones you do not need.

Settings for the Recommended Sensors Analysis

You can also adjust the recommended sensors detection. Go to **System Administration—Monitoring** 2874 to select whether

- you want PRTG to decide on the sensor recommendation (default), or
- you want the recommended sensors to always be displayed, or
- you want to turn off the recommended sensors function.

If you use the default setting, PRTG uses an intelligent assistant that takes care of your specific network monitoring situation. PRTG automatically counts the number of sensors you have and decides whether to start the recommended sensors detection or not. It will not start if your PRTG installation comprises 5,000 sensors or more to prevent performance issues. We recommend that you set this default option so you do not miss any important monitoring data about your network, without risking to run into performance issues.

Note: Disable the recommended sensors feature if you encounter performance issues or you do not want to display this information on device overview tabs.

More

Do you want to get more help with choosing and creating useful sensors? This is possible in PRTG with the **Auto-Discovery** 219! You can activate it when adding a new device 245 to PRTG, manually at any time 220, or choose if you want PRTG to analyze a whole section 222 of your network, for example, devices covered by a certain IP range.

Note: The auto-discovery has a higher priority than the recommended sensors detection. If both are active, PRTG will queue the sensor recommendation and execute the auto-discovery first.

5.11 Object Settings

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

Tabs Bar on Sensor Pages

Device Tree Management

The **Management** tab is available when viewing probes or groups. After clicking this tab you can move devices and sensors right within the tree view. If moving is not possible, the web interface will start a clone process automatically.

For more information, please see the Manage Device Tree 258 section.

General Settings

In the **Settings** tab you can define all settings of the current object. The available options vary, depending on the kind of object you're changing. Please see the following sections for information about the respective object types:

- Root Group Settings 260
- Probe Settings 278
- Group Settings 299
- Device Settings 324
- Sensor Settings 347

Note: The available setting options are different for each sensor, but always the same for probes, groups, and devices. Sensor Channels Settings 2711 are not reachable via tab but directly on a sensor's overview page via channel gauges and the channels table.

Notifications Settings

In the **Notifications** tab, notification triggers can be set for every object. When using these settings for a probe, group, or device, they will be inherited to all sensors on these objects. Available notification trigger options are the same for all objects.

For more information, please see Sensor Notifications Settings 2719 section.

Comments

On the **Comments** tab you can enter free text for each object. You can use this function for documentation purposes or to leave information for other users.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

History

In the **History** tab all changes in the settings of an object are logged with a timestamp, the name of the PRTG user who has conducted the change, and a message. The history log retains the last 100 entries.

Note: On some pages, you can access the history of subordinate objects via the corresponding context button in the page header bar 126. This includes **System Administration** 2860 and the overview pages of **User Accounts** 2890, **User Groups** 2896, **Reports** 2786, **Libraries** 2770, and **Maps** 2810. See the **Logs (Main Menu)** 169 for details.

Related Topics

- **General Layout** 123

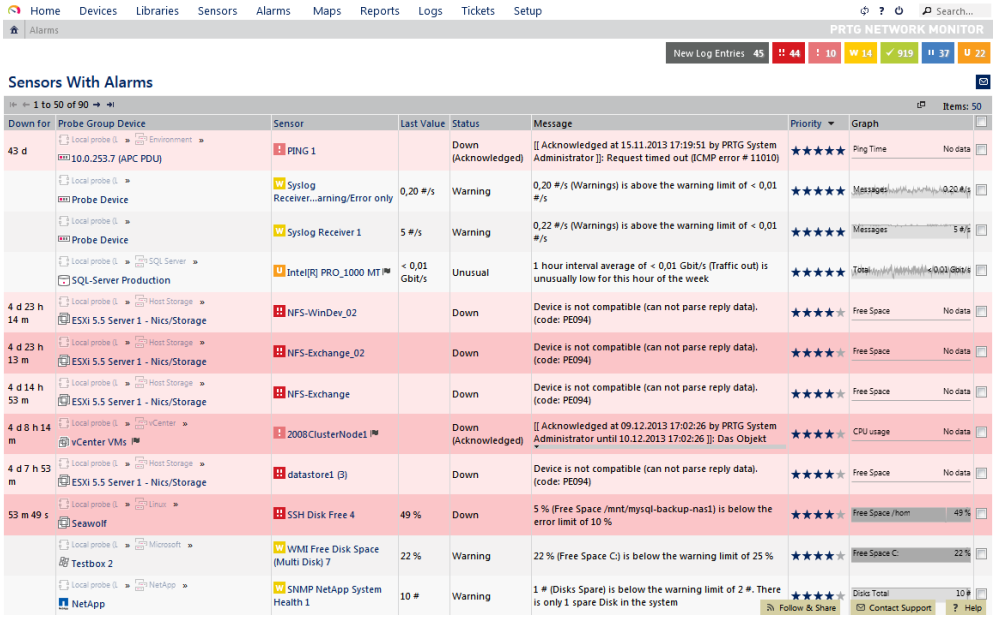
- **Toplists** 2734

5.12 Alarms

The alarms list shows all sensors that are currently in a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. Sensors in other states (for example, **Up**, **Paused**, or **Unknown**) do not appear here. This is useful to keep track of all irregularities in your network.

In the table list 178, you can re-sort the items by clicking the column's header items.



Alarms List

There are two options to call the alarms list: Either you click the **Alarms** tab on the detail page of a probe, group, or device (not available for sensors), or you choose the **Alarms** entry in the main menu.

Alarms (Object Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

Tabs Bar on Group and Probe Level

On an object's detail view, click the **Alarms** tab to show a table list of all sensors on this object that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. You will see a subset of sensors in an alarm status for the current object only. This is a subset of the entries available via the **Alarms | All** option in main menu 208. The tab is not available on a sensor's detail page.

Alarms (Main Menu)

Click the **Alarms** entry from the main menu 208 to show a table list of all sensors in your configuration that currently show a **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. You can also show these sensors as gauges. Point to the **Alarms** entry and select another option to only show a subset of sensors in certain states. Choose between:

ALARMS	
All	Open a list of all sensors which are currently in **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status 135.
Show as Gauges	Open a page with the gauges of all sensors which are currently in **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. The size of the sensor gauges corresponds to their respective priority.
Errors Only	Open a list of all sensors which are currently in **Down**, **Down (Partial)**, or **Down (Acknowledged)** status.
Warnings Only	Open a list of all sensors which are currently in **Warning** status.
Unusuals Only	Open a list of all sensors which are currently in **Unusual** status.

Acknowledge Alarm

An acknowledged alarm shows up in the alarms list as "acknowledged" (see **Sensor States** 135) and will not trigger 2719 any more notifications 2759.

Note: If the alarm condition clears, the sensor usually returns into an **Up** status immediately with the next sensor scan.

To acknowledge an alarm, right-click a sensor entry and choose **Acknowledge Alarm...** from the context menu, enter a message and click the **OK** button. The message will appear in the last message value of the sensor. You can choose between: **Acknowledge Indefinitely...**, acknowledge **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**.

If you choose **Until...** a dialog box appears:

ACKNOWLEDGE ALARM UNTIL

Selected Objects	Shows the sensor(s) for which you want to acknowledge the alarm. You can acknowledge alarms for more than one sensor using multi-edit 2742.
Message	Enter a text, for example, the reason why you acknowledge the alarm. Please enter a string or leave the field empty.
Until	Enter the date when the acknowledge status will end. Use the date time picker to enter the date and time. Note: If the alarm condition still persists after the specified date, the sensor will show a **Down** status again.

Only users 2890 with write access rights may acknowledge alarms. You can give read-only users the right to acknowledge alarms, too. See section **User Accounts Settings** 2890, section **Account Control**.

More

Knowledge Base: Which audible notifications are available in PRTG? Can I change the default sound?

- http://kb.paessler.com/en/topic/26303

5.13 System Information

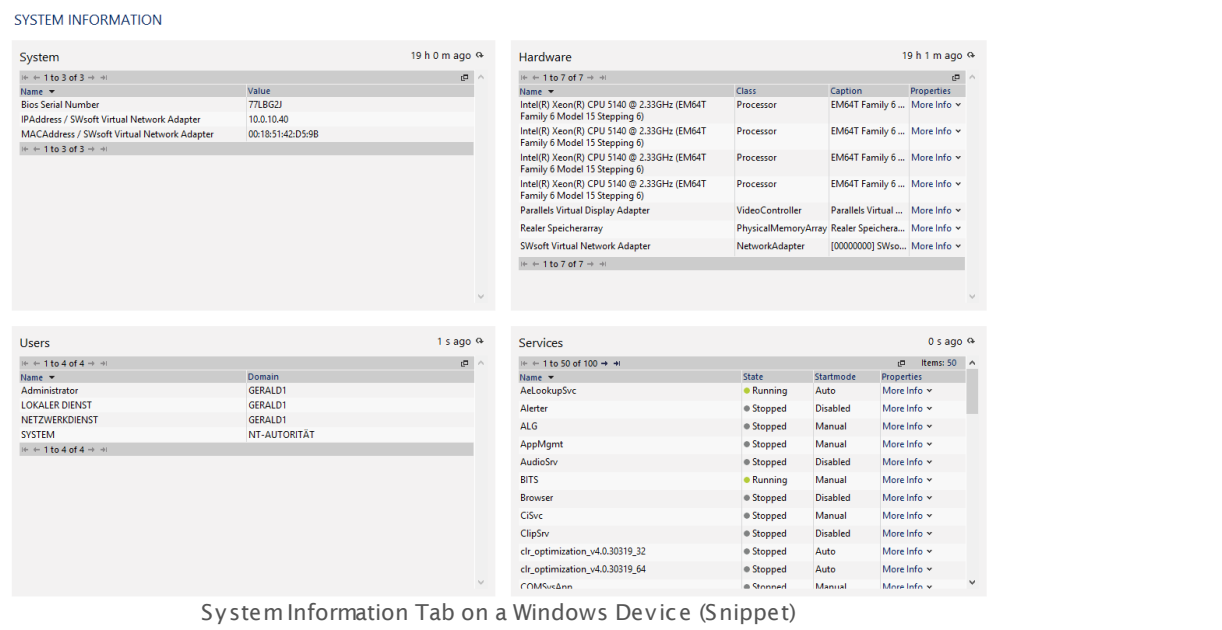
The **System Information** feature can show you various information about a device such as connected hardware, installed software, connected user accounts, running processes, and available Windows services with their current status. This is a great possibility to see at a glance what is currently running on the systems in your network. Together with your everyday monitoring you will receive a really profound knowledge about your IT infrastructure from only a single source—your PRTG Network Monitor!

System information is available for all devices which you add to PRTG and run with an officially supported Windows version 23. You can also retrieve system information from other devices with enabled Simple Network Management Protocol (SNMP). On the overview page of a device, click the **System Information** tab to see available information.

Basically you do not have to configure anything special to use the system information feature. PRTG uses the same technologies 3000 to request system information data as sensors that receive monitoring data from a device. If you already monitor a device with WMI 352 and SNMP sensors 350, the main preconditions for retrieving system information for this device are already met. The data will be displayed in the corresponding table automatically. Section **Preconditions** 165 below shows in detail what you need to get system information.

Note: System information is not supported by the Enterprise Console 2938. Please use the PRTG web interface 108 to access the system information of a device.

Note: System information for your devices only has information purposes. We cannot guarantee that the display in PRTG fully corresponds to the device parameters.



System Information Tab on a Windows Device (Snippet)

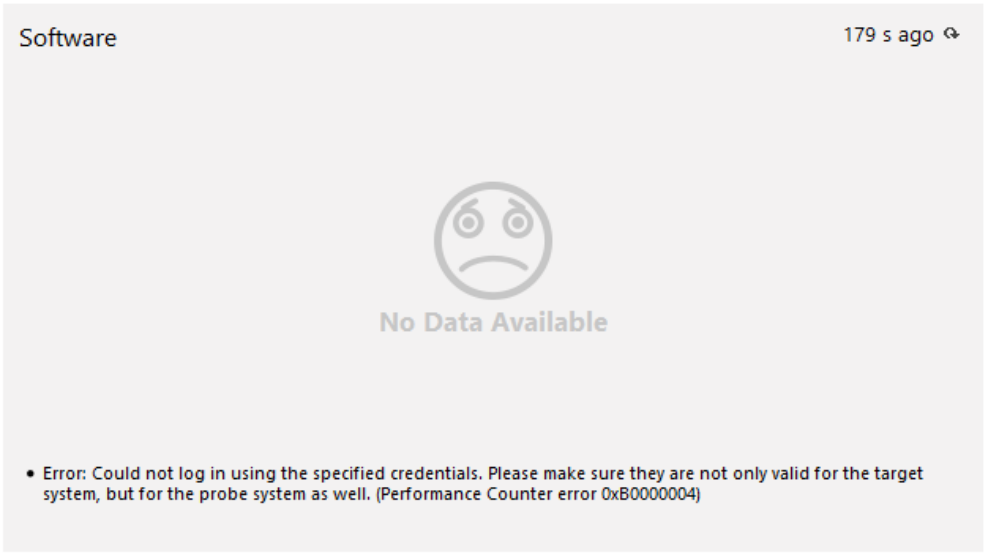
Prerequisites

Fulfill the following requirements to show all available system information data for a device. It is not necessary to meet every single prerequisite but then some tables will not show all data or even remain empty. For example, if you do not configure SNMP on the target device, you will get less information for the **System** table.

- **Valid credentials** in the device settings 324 (or inherited 89): Enter correct settings for the target device in the sections **Credentials for Windows Systems** and **Credentials for SNMP Devices**.
- **Remote Registry** Windows service: Enable the Remote Registry Windows service on the target computer, for example, via services.msc, and set the start type to automatic.
- **Remote Procedure Call (RPC)** Windows service: Enable the RPC Windows service on the target computer, for example, via services.msc, and set the start type to automatic.
- **WMI** on probe and target computer: Configure Windows Management Instrumentation (WMI) on the target computer and on the computer that runs the PRTG probe with the device. Especially configure the firewall of the target computer to allow WMI. For more details, see manual section **Monitoring via WMI** 3005 and the Knowledge Base article **General Introduction to WMI and PRTG**.
- **SNMP** on target computer: Configure Simple Network Management Protocol (SNMP) on the target computer. For more details, see manual section **Monitoring via SNMP** 3003 and the Knowledge Base article **General Introduction to SNMP and PRTG**.

Usually you will see data for a system information table after a few minutes, depending on the used protocols (WMI takes longer than SNMP). A system information table will show an according error message if PRTG cannot get data for a table because of misconfiguration. For details about these messages, please see the Knowledge Base article **How can PRTG get data for System Information tables?**

Note: To show information data, you need to enable **System Information** in section **Advanced Network Monitoring** 345 in the device settings (or inherit it from an object higher in the hierarchy 89). This is the default setting. If system information is disabled, the **System Information** tab will not be available for the device.



No Data Available: Check the Preconditions

System Information (Device Tab)

Pages of probes, groups, devices, and sensors have an interface providing tabs. By using the tabs you can navigate through various sub-pages of an object to show your network's status, view monitoring results, or change settings.

Tabs Bar on Device Level

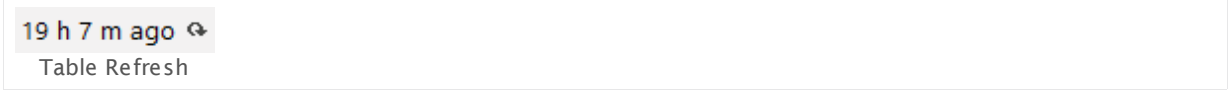
On the details page of a device, click the **System Information** tab to show several tables with information about this device. Each table contains information about one category.

SYSTEM INFORMATION

System	Shows information about the device like BIOS serial number, IP addresses, MAC addresses.
Hardware	Shows hardware connected to the device like disk drives, CD/DVD, video controllers, processors, network adapters, sound devices, printers, and memory. You can see **Class** and **Caption** of a hardware device. In the **Properties** column you can get more information about the hardware (for example, the description).
Software	Shows installed software and the **Version** number on the device. In the **Properties** column you can get more information about the software (for example, the size).

SYSTEM INFORMATION	
	Note: PRTG uses Uninstall registry keys to retrieve the list of installed software, so the displayed software might differ from the software which the target Windows system shows under Programs and Features.
Users	Shows the user accounts connected to the device and their **Domain**.
Services	Shows the available Windows services on the device. This table shows the **State** of the service (running, stopped) and the start type (**Startmode** automatic, manual, or disabled). In the **Properties** column you can get more information about a service (for example, the description).
Processes	Shows the processes that are currently running on the device as listed on the Processes tab of the Windows Task Manager. You can also see the **Start Time** and **Process ID** of a process.

Click the refresh button in the upper right corner of a table to retrieve current information for this system information category. The timestamp shows the passed time since the last table refresh. The tables **Users**, **Services**, and **Processes** refresh automatically each time you open the **System Information** tab. The tables **System**, **Hardware**, and **Software** perform no automatic refresh, so you have to request new information data manually with the refresh button. PRTG also updates all system information tables with a restart of the PRTG server.



You can sort each table by clicking the column headers. Please see **Working with Table Lists** 178 section for more information.

Data Storage

PRTG stores data files with the retrieved system information in the **\System Information Database** subfolder of the PRTG data folder 3135 under the according categories. Please note that if you delete a device in PRTG, the system information files of this device will remain here unless you delete them manually from the folder.

The PRTG uses following subfolders for system information data.

SYSTEM INFORMATION DATABASE: DATA FOLDERS	
hardware	Data for the **Hardware** table

SYSTEM INFORMATION DATABASE: DATA FOLDERS

loggedonusers	Data for the **Users** table
processes	Data for the **Processes** table
services	Data for the **Services** table
software	Data for the **Software** table
system	Data for the **System** table

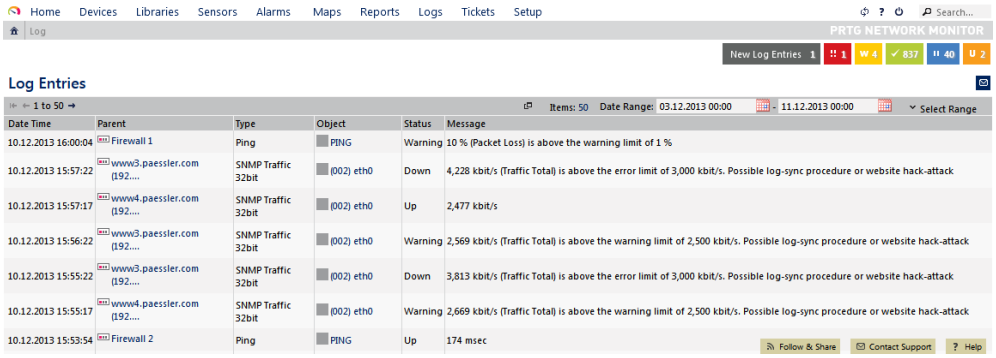
5.14 Logs

The Logs list shows all past activities and events of your PRTG monitoring setup. This is useful to keep track of all important activities and, for example, to check whether messages were sent. In a typical setup, a huge amount of data is produced here. As the activity of every single object is minuted, you can use this data to check exactly if your setup works as expected.

To support you when viewing the log files, there are several filters available. Please see **Working with Table Lists** 178 section for more information.



List with Log Entries

There are two options to call the logs list: Either you click the **Log** tab on the detail page of a probe, group, device, or sensor, or you choose the **Logs** entry in the main menu.

Log (Object Tab)

Pages of probes, groups, device, and sensors have a tab-like interface. Using the tabs you can navigate through various sub-pages of an object in order to show your network's status, view monitoring results, or change settings.

Tabs Bar on Group and Probe Level

On an object's detail view, click on the **Log** tab to show a table list with all log information on this object. This is a more detailed log than the system log available via the **Logs** | **All** option in main menu 210.

Logs (Main Menu)

Click the **Logs** entry from the main menu 210 to show a table list of all system log entries in your configuration. Hover over the Logs entry and select another option to only show a subset of entries for certain objects for certain kind of entries. Choose between:

LOGS

All	Open a table list[178] with log information for all objects in your configuration, newest first.
By Group ›	Open a list with log information for objects in a certain group only, newest first. Hover over **By Group** to show other menu items. Select **All,** or follow the menu path (it is specific to your setup) to select a group you would like to show log information for.
Status Changes ›	Open a list with log information for certain status changes only. Hover over **Status Changes** to show other menu items. Follow the menu path to view log entries with a special value in the **Status** field only. Select between **Up & Down** (shows entries with either **Up** or **Down** in the **Status** field), **Down**, **Warning**, **Unusual**, **Up**, **Paused/Resumed** (shows entries with either **Paused** or **Resumed** in the **Status** field), or **Acknowledged Alarms**.
System Events ›	Open a list with log information regarding certain system event types only. Hover over **System Events** to show other menu items. Select between the following event types: **Probe Related**, **Cluster Related**, **Auto-Discovery**, **Notifications**, or **Status Messages**.
Object History	Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: **My Account**, **System Setup**, **Notifications**, **Schedules**, **User Accounts**, **User Groups**, **Reports**, **Libraries**, or **Maps**. Note: You can open a specific tab directly with the context button **History** in the page header bar[126] on the corresponding pages.

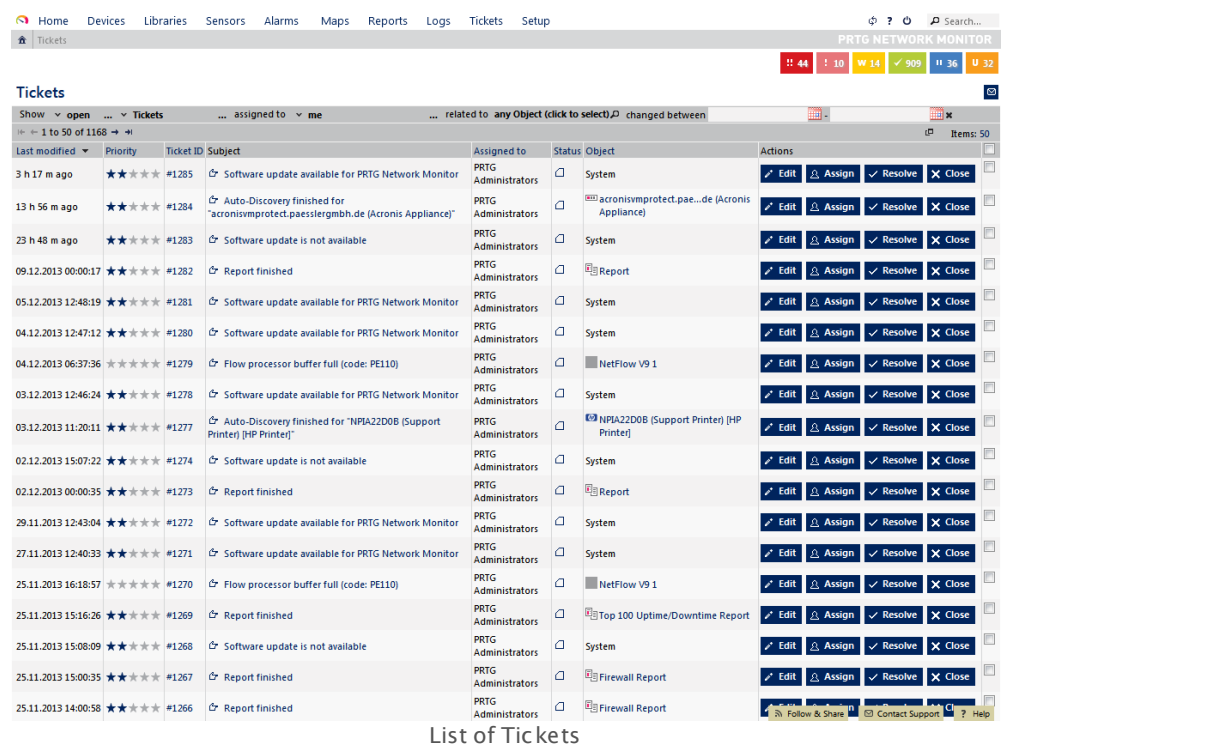
5.15 Tickets

PRTG Network Monitor includes its own ticket system. With tickets you can manage and maintain various issues which may appear while monitoring a network. A ticket in PRTG contains information about recent events in your PRTG installation which need a closer look by the administrator or another responsible person. You can see each ticket as a task for a particular PRTG user.

Each monitoring related task has a lifecycle in the ticket system. PRTG itself can create tickets, for example, when Auto-Discovery 219 has finished, as well as PRTG users can create tickets for every kind of issue. In addition, you can set up notifications which open a ticket when something uncommon occurs in your network. The task gets alive when a ticket is created. Responsible PRTG users then take care of this issue. Once the issue has been resolved, the ticket can be closed and the lifecycle of the task ends.

Every ticket has a unique ID, a priority, and a status, and you can take several actions on each ticket. You should view every ticket and conduct a corresponding action. This way, you always keep an overview about each task and its history in your PRTG installation.

PRTG can also send an email to you whenever there is a ticket assigned to you or one of your tickets has been changed. See section Tickets as Emails 175 for details and how to turn off emails about tickets.



List of Tickets

Note: You can turn off the tickets system for particular user groups in **System Administration—User Groups** [2896] except for the PRTG Administrators group. The users in the admin group will not receive new ToDo tickets (and notifications about changes) by default but only the PRTG System Administrator user. You cannot change this behavior. However, you can turn off ticket emails [175] for every user account.

Types of Tickets

New tickets are created in the following cases:

- New devices or sensors have been created by the auto-discovery process. Note: In the corresponding ticket, only device templates will be listed through which PRTG created sensors.
- A new probe connects to the core and must be acknowledged.
- A new cluster node connects to the cluster and must be acknowledged.
- A new version of the software is available.
- A new report is ready for review.
- In a few other situations, such as when the system runs out of disk space, for licensing issues, when an error occurred, etc.
- A notification [2759] opened a ticket if set in the notification settings.
- A user opened a ticket.

Overall, there are three types of tickets:

- **User Tickets**: Tickets created by PRTG users, for example, to assign monitoring related tasks to a particular PRTG user (or user group)
- **ToDo Tickets**: Tickets created by PRTG to show important system information and in case of specific system events. They are assigned to the PRTG System Administrator user and cannot be turned off.
  Note: The **Related Object** of ToDo tickets is **System**.
- **Notification Tickets**: Tickets created via **Notifications** [2759] in case of monitoring alerts

States of Tickets

Tickets can have three different states depending on the working process regarding the corresponding issue:

- **Open**: New tickets will be open as long as the corresponding issue exists as described in the ticket.
- **Resolved**: The issue as described in the ticket does not persist any longer. Someone took care of it.
- **Closed**: Usually, the ticket has been resolved before, the solution to the issue has been checked for correctness, and the ticket does not require any other action.

Tickets (Main Menu)

Note: This option is only shown in the main menu bar if the user group of the current user is allowed to use the ticket system. You can turn off tickets for particular user groups in **System Administration—User Groups** 2896. Users with **read-only** rights are always excluded from the ticket system and cannot see the tickets entry in the main menu bar.

You have several options to display a list of tickets which is filtered to your needs. In the main menu bar 200, hover over **Tickets** to show all available filter options or click directly to show all tickets assigned to the current user. You can also create a new ticket via the main menu. Available options are:

- **My Tickets**
  Click to show all open tickets which are assigned to the current user. Hover over **My Tickets** show other menu items for filtering these tickets depending on their status:
  - **Open**
  - **Resolved**
  - **Closed**
  - **All**

- **All Tickets**
  Click to show all open tickets of all PRTG users. Hover over **All Tickets** to show other menu items for filtering these tickets depending on their status:
  - **Open**
  - **Resolved**
  - **Closed**
  - **All**

- **ToDo Tickets**
  Click to show all open tickets from the type 172 ToDo. Hover over **ToDo Tickets** to show other menu items for filtering these tickets depending on their status:
  - **Open**
    Click to show all open ToDo tickets. Hover over **Open** to show other menu items for filtering these tickets depending on their event type:
    - **Report Related**
    - **Auto-Discovery Related**
    - **Probe Related**
    - **System Errors**
    - **New Software Version**
  - **Resolved**
  - **Closed**

- **All**

- **Open Ticket**
  This will open the **New Ticket** dialog. In the first step, select the object on which you want to focus in the ticket via the **Object Selector** [181]. Click on **Continue**. Note: You can leave this step out when using the context menu [186] of this object in the device tree to open the ticket.

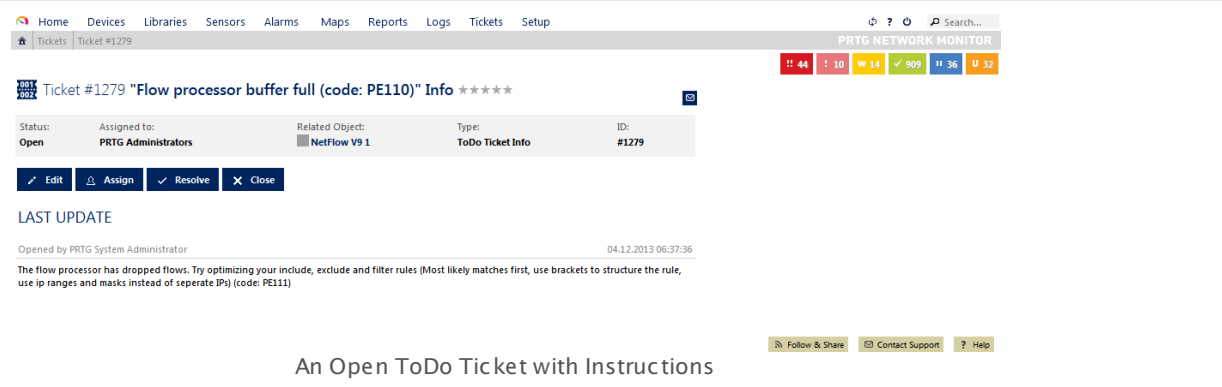
  In step 2, provide the following information and confirm by clicking on **Save** to create a User Ticket:

  - **Subject**: Enter a meaningful title for the ticket which indicates the topic of the issue.
  - **Assigned to**: Select a user (or user group) who will be responsible for this issue from the drop down list.
  - **Priority**: Define a priority [182] from one to five stars.
  - **Comments**: Enter a text message. This message should describe the issue in detail.

After selecting the desired filter or opening a new user ticket, a corresponding list of tickets will appear. In this table list, you can re-sort the items by using the respective options [178]. Additionally, you have several search options using the inline filter directly above the table. The following filters are available:

- **Ticket status**: all, open, resolved, closed
- **Ticket type**: User, ToDo, Notification
- **Concerned user(s)**: Show only tickets which are assigned to a specific user or user group. There are the following types:
  - **anyone**: no user filter is applied so all tickets on this PRTG server are shown
  - **me**: show tickets which are assigned to you (the user who is currently logged in)
  - **Groups**: show tickets which are assigned to a specific user group only
  - **Users**: show tickets which are assigned to a specific user only
  - **Disallowed**: users or user groups which do not have access rights to the selected object are displayed under Disallowed. This for your information only; you cannot select them!
- **Relationship** to a monitoring object: Choose groups, probes, devices, sensors with the **Object Selector** [181].
  Note: ToDo tickets are related to **System**.
- **Time span** to view tickets by last edit of a ticket: Use the date time picker to enter the date and time.

Click on the subject of a ticket to open the ticket's detail page. There you can find all related information, as well as you can conduct several actions.



An Open ToDo Ticket with Instructions

Actions

For best experience with PRTG, check every ticket and select appropriate actions. Note: Only members of user groups which have the corresponding access rights 101 can view and edit to tickets which are related to a certain monitoring object.

The following actions are available when viewing the tickets list or a specific ticket:

- **Edit**: Opens a dialog where you can change the subject and the priority of the ticket, as well as you can assign the ticket to another user. Furthermore, you can add a text message to this ticket. Confirm your changes by clicking on **Save**.
- **Assign**: Opens a dialog in which you can give the ticket to another user. Select a user (or user group) via the drop down menu. Furthermore, you can add a text message to this ticket. Confirm your assignment by clicking on **Save**.
- **Resolve**: Opens a dialog where you can resolve the ticket by clicking on **Save**. The status resolved indicates that the issue as described in this ticket does not persist. Furthermore, you can add a text message to this ticket which indicates, for example, what has been done concerning the issue.
- **Close**: Opens a dialog where you can close the ticket by clicking on **Save**. Usually, this ticket has been resolved before and the correct solution of the issue has been checked. Furthermore, you can add a text message to this ticket.
- **Reopen**: Opens a dialog where you can reopen a ticket after it has been resolved or closed. Do so, for example, if the solution of the issue turned out to be incorrect. Furthermore, you can add a text message to this ticket which indicates, for example, why you have opened the ticket again. Confirm reopening and assignment by clicking on **Save**.

Tickets as Emails

You can receive all tickets which are assigned to you or to your user group as emails. You will be also notified each time this ticket is edited via email. This way, you will keep always informed about new notifications (if set), important system information (if PRTG System Administrator), or within the communication with other PRTG users. You can turn off the setting **Tickets as Emails** in System Administration—User Accounts 2890. If you disable emails for tickets for a user account, this particular user will not receive any ticket emails anymore.

Note: If you have defined to get tickets as emails and you are PRTG System Administrator, you will receive emails for ToDo tickets as well, although ToDo tickets are considered to be opened by the PRTG System Administrator.

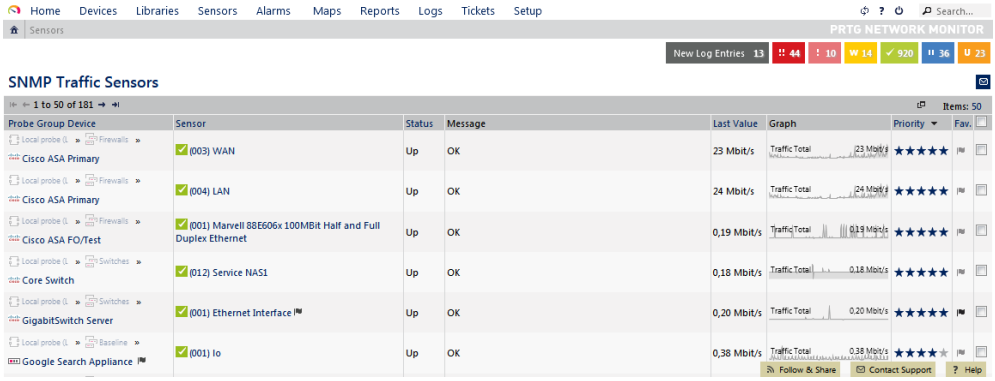
5.16 Working with Table Lists

Throughout the web interface you often see table lists of items, for example, sensor or device lists. Table lists are also available on the overview pages of Libraries 2770, Maps 2810, Reports 2786, Notifications 2759, and Schedules 2856, as well as in Logs 169 and Tickets 171. All these provide common functionality. Depending on the type of content in the list, tables show various information in their columns for each object.

On certain overview pages, such as for sensors 205, tickets 173, and similar sensors 153, there is also an inline filter available directly above the table. The filter options depend on the current page.



Example of a Table List

FEATURE	DISPLAY	WHAT IT DOES
Paging		The content of a table is displayed on several pages. Click the arrow symbols at the beginning or the end of a list to view other pages, or to jump to the beginning or the end of the list.
New Window		Click the window symbol at the beginning or the end of a list to open the table in a new window.
Date Range		Use the date time picker to show table list entries within a specific time span only. Click the first date field for the start date and on the second field for the end date. A calender dialog opens where you can particularly select date and time. Click the **Done** button to apply the selected date and time.
Select Range		When viewing log lists (not available in other lists), point to the **Select Range** option at the upper right corner of the list to select the time span you want to show log entries for. Choose between **Today**, **Yesterday**, and several other time spans. Choose **Unlimited** to disable this filter again.
Items		Point to the **Items** option at the beginning or end of the list to select how

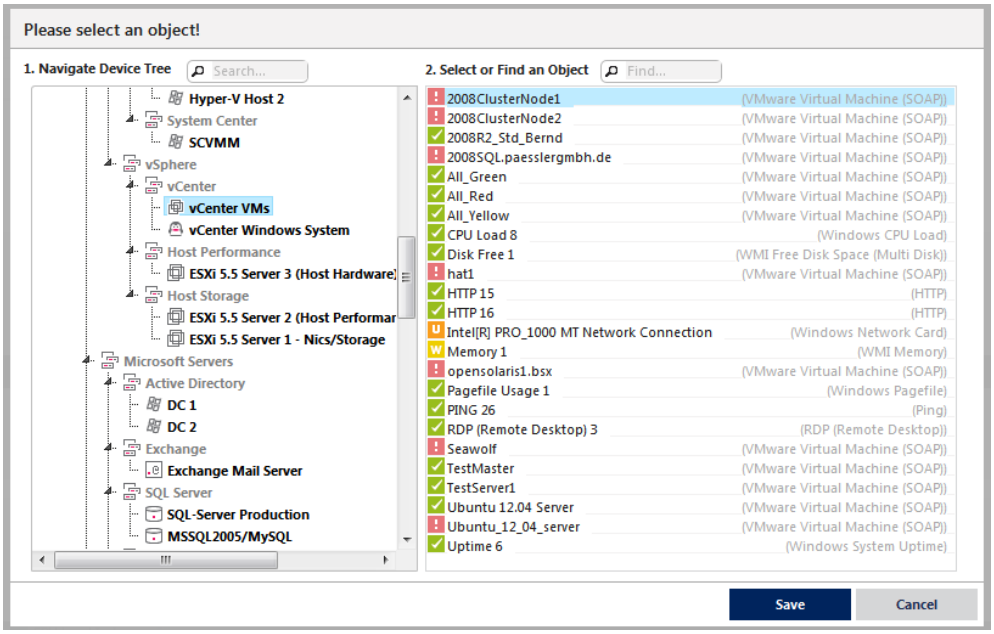
- Multi-Edit Lists 2742

5.17 Object Selector

For some functions, the object selector is shown. It enables you to browse all objects in your configuration and select an object in two steps.



Object Selector

Step 1: Navigate Device Tree

On the left hand side, you see a device tree specific to your setup that you can browse by clicking on the corresponding nodes. Click on a device to view its sensors on the right hand side.

You can directly browse for objects in the device tree by entering a probe name, group name, or device name into the **Search...** field above the device tree navigation. You can also use a substring only. The resulting objects will be displayed immediately without any manual confirmation.

Step 2: Select an Object

If you have selected a device on the left hand side, you will see the sensors on this device here, on the right hand side. Also, the sensor type is shown. Hover over a sensor on the right side to view its parent device and group.

You can also directly search and find sensors by entering its sensor name, group name, device name, or tag into the **Find...** box above the sensor list.

Select an object and click on the **Save** button.

5.18 Priority and Favorites

You can set priorities for all your monitoring objects and also categorize devices or sensors as favorites. Both settings affect how your objects are displayed.

Note: Settings for priority and favorites are stored for the entire installation. They are not user specific.

Priority for All Objects

The priority setting affects in which order your objects are displayed when you view table lists. PRTG lists objects with a higher priority first, others underneath, depending on their own priority. Furthermore, device overview pages display gauges 137 for sensors with a high priority.

To change priority settings, right-click an object to open the context menu 186 and select **Priority**. You can choose between 5 stars ***** (top priority) and one star * (lowest priority). By default, all objects are set to medium priority (3 stars ***). In the page header bar and in lists, you can set a priority directly by one click on a star, for example, for sensors on a device overview page.

Context Menu: Priority

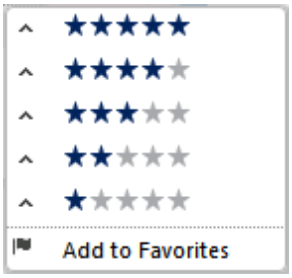
Note: Select 4 or 5 stars for particular sensors to activate their gauges on device overview pages.

Note: Select 5 stars for a map to show it as an entry in the main menu 200 under **Home**.

Favorites for Devices and Sensors

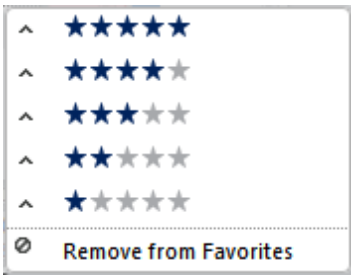
To call a list of all your favorite devices or sensors, select **Devices | Favorite Devices** or **Sensors | Favorite Sensors** from the main menu. These lists are sorted by priority as well.

You can mark any device or sensor as favorite to add it to the favorite list. Right click on it to open the context menu 186. Select **Priority/Favorite | Add to Favorites**. A small black flag symbol will be added next to the object's name.



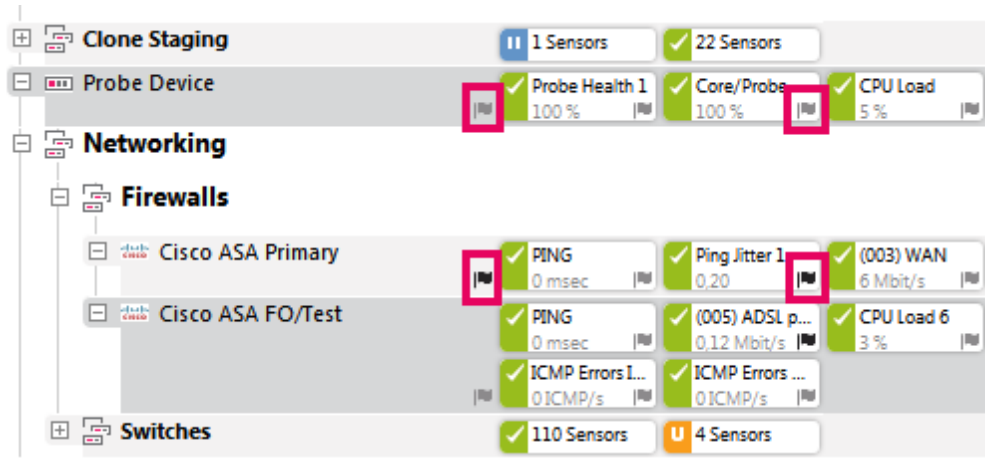
Context Menu:
Priority/Favorites (Add)

To remove an object from the favorites list, select **Priority/Favorite | Remove from Favorites** from the context menu 186.



Context Menu:
Priority/Favorites (Remove)

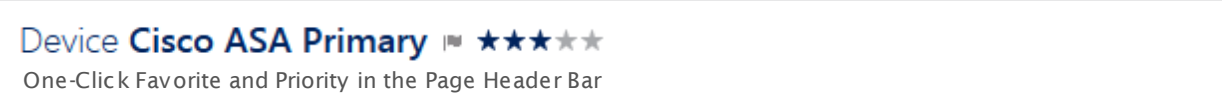
There is also the option to add a device or sensor to favorites by one click in the device tree. Just click on the small flag symbol right to the respective object name for this concern. If the flag is black, the specific object is already a favorite; clicking anew on the flag will remove it from favorites and the flag will turn gray again.



One-Click Adding to Favorites in the Device Tree

Priority and Favorites in the Page Header Bar

You can add any device or sensor to favorites on its details page by clicking on the small flag symbol in the page header bar[126]. If the flag is black, the selected object is already a favorite. Clicking anew on the flag will remove it from favorites and the flag will turn gray again. It is also possible to set the priority of the object by a click on one of the five stars in the page header; five stars ***** means top priority, one star * is the lowest priority.



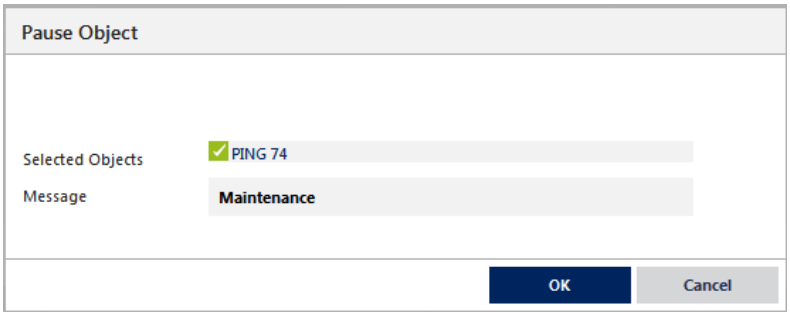
One-Click Favorite and Priority in the Page Header Bar

5.19 Pause

While a sensor is paused, it will not collect any monitoring data, will not change its status 135, and will not trigger any notifications 100. You can pause monitoring for every object by selecting **Pause** from the context menu 186 of a probe, a group, a device, or a sensor. All sensors on this object will then be paused. You can choose **Pause Indefinitely**, or select a time after which monitoring will be resumed automatically, such as **5** or **15 minutes**, **1** or **3 hours**, **1 day**, or **Until** a certain date. You can also set up a one-time maintenance window to pause sensors automatically at a specified time.

Note: When selecting the **Pause** symbol from an object's hover popup 199 or while using multi-edit 2742, the object(s) will be paused indefinitely until resumed.

When selecting a pause option, you are prompted to enter a message. This will be shown in the status message of the object as long as it is paused. Confirm with **OK** to pause the object or click **Cancel** to not pause it.



PRTG Pause Message Prompt

Note: Monitoring for objects can also be paused by applying a schedule (see **Account Settings—Schedules** 2856) in the **Object Settings** 159.

Inheritance and Resume

If you pause monitoring for an object in the device tree 123, all child objects underneath will be paused as well. For example, when pausing a group, all sensors on all devices in it will also be paused. Once an object is paused, you can resume monitoring any time by selecting **Resume** from the context menu 186. However, you cannot resume monitoring for single child objects that are paused by a parent object, but only for the object you originally set to pause. Note: Also after a restart of PRTG, a pause status will be kept.

5.20 Context Menus

Right-click on an object to view a context menu with many options for direct access to monitoring data and functions. You can also access many of the functionalities via the main menu 200 or the hover popup 199 window. However, using the context menus is the easier way in most cases.

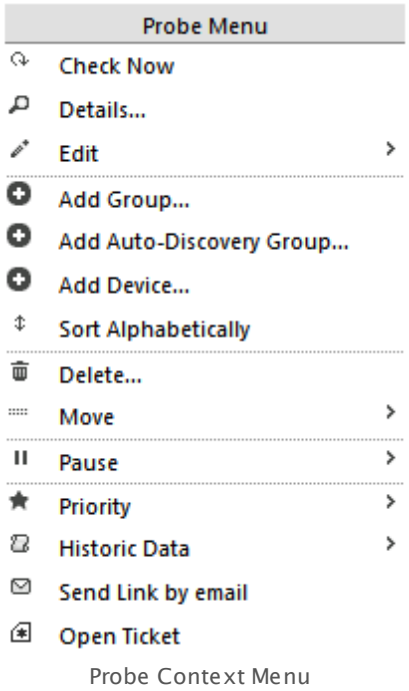
Note: To view your browser's context menu, hold down the Ctrl key (Chrome) or the Shift key (Firefox) while right-clicking. You will then see the menu of your browser instead of the PRTG menu. This is not possible with Internet Explorer.

The content of the PRTG context menu varies, depending on the type of object you have selected. Please see the following sub sections for an overview of the available options.

- **Probe Context Menu** 186
- **Group Context Menu** 190
- **Device Context Menu** 192
- **Sensor Context Menu** 196

Probe Context Menu

The **Probe Menu** contains actions for your local probe, remote probes, or mini probes 90.



Probe Context Menu

PROBE MENU

Check Now

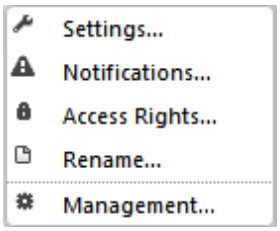
Perform an immediate scan for the selected probe. This queries the data for all devices and sensors underneath in the object hierarchy 89.

Details...

Show the overview tab 137 of the selected probe.

Edit ›

Hover over **Edit** to show the **Edit** menu.



Edit Menu

The following actions are available:

- **Settings...**
  Open the **Probe Settings** 278 tab of this probe.
- **Notifications...**
  Open the **Notifications** 2759 tab of this probe.
- **Access Rights...**
  Open an assistant to edit **User Access Rights** 101 for this probe.
- **Rename...**
  Open an assistant to edit the name of this probe.
- **Management...**
  Open the **Management** 258 tab of this probe.

Add Group...

Open an assistant which guides you through the process of adding a new group to the selected probe. For detailed instructions, please see **Add a Group** 237.

Add Auto-Discovery Group...

Open an assistant which guides you through the process of adding a new auto-discovery group to the selected probe. PRTG creates a new group and runs an auto-discovery in your network to add devices and sensors automatically. For more information, please see section **Using the Auto-Discovery** 219.

Add Device...

Open an assistant which guides you through adding a new device to the selected probe. For detailed instructions, please see **Add a Device** 244.

PROBE MENU

Sort Alphabetically

Sort direct children (groups and devices) of the selected probe in alphabetical order.

Note: The ordering is stored in the monitoring configuration and cannot be revoked.

Delete...

Delete the selected probe. PRTG will ask for confirmation before anything is actually deleted.

Move ›

Hover over **Move** to open the **Move** menu.

Move Menu

The following actions are available:

- **Top**: Move the probe to the top of the root group.
- **Up**: Move the probe one entry up under the root group.
- **Down**: Move the probe one entry down under the root group.
- **Bottom**: Move the probe to the bottom of the root group.
- **Management...**: Open the Management 258 tab of the probe.

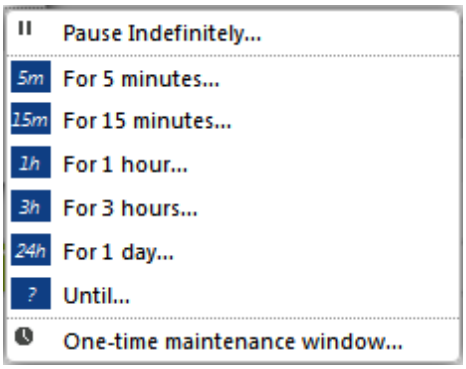
Pause ›

—or—

Resume

Hover over **Pause** to open the **Pause** menu.

If the probe is already in paused or in "simulate error" status, **Resume** appears. Click to restart monitoring on this probe.



Pause Menu

PROBE MENU

You can pause and resume monitoring on the selected probe. The monitoring for all sensors in the object hierarchy [89] underneath will be paused resp. resumed.

You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this probe. Use the date time picker to enter the date and time.

Priority ›

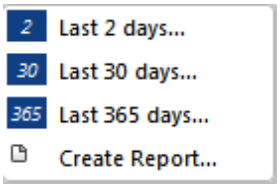
Hover over **Priority** to open the **Priority** menu.

Context Menu Priority

Define the priority of the selected probe. For details, please see **Priority and Favorites** [182].

Historic Data ›

Hover over **Historic Data** to open the **Historic Data** menu.



Context Menu Historic Data

The following actions are available:

- Open the historic data report tabs for the specified interval [139]: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
- **Create Report...**: Open an assistant to add a new report to PRTG. For details, please see **Reports Step by Step** [2790].

PROBE MENU	
Send Link by Email	Send the link to the selected probe by email. Click to create a new email using your system's standard email client. It contains a direct link to the overview tab 137 of the selected probe.
Open Ticket	Open the **New Ticket** dialog. For details, please see the section **Tickets** 174.

Group Context Menu

The **Group Menu** contains actions for your groups 90.

Note: The context menu of the **Root** group is special and differs from the other groups' menu.

GROUP MENU	
Check Now	Perform an immediate scan for the selected group. This queries the data for all devices and sensors underneath in the object hierarchy 89.
Details...	Show the overview tab 137 of the selected group.
Edit ›	Hover over **Edit** to show the **Edit** menu. The following actions are available: ▪ **Settings...** Open the **Group Settings** 299 tab of this group. ▪ **Notifications...** Open the **Notifications** 2758 tab of this group. ▪ **Access Rights...** Open an assistant to edit **User Access Rights** 101 for this group. ▪ **Rename...** Open an assistant to edit the name of this group. ▪ **Management...** Open the **Management** 258 tab of this group.
Add Group...	Open an assistant which guides you through the process of adding a new group to the selected group. For detailed instructions, please see **Add a Group** 237.

GROUP MENU

Add Auto-Discovery Group...	Open an assistant which guides you through the process of adding a new auto-discovery group to the selected group. PRTG creates a new group and runs an auto-discovery in your network to add devices and sensors automatically. For more information, please see section **Using the Auto-Discovery** 219.
Add Device...	Open an assistant which guides you through adding a new device to the selected group. For detailed instructions, please see **Add a Device** 244.
Auto Discovery	This option is only available for auto-discovery groups. These are groups with automatic device identification or sensor creation enabled 300. Point on **Auto-Discovery** to show its menu. The following actions are available: ▪ **Run Auto-Discovery**: Start an automatic search immediately to automatically add new sensors to the selected device. The search is running in the background. If found, you see new devices with sensors after a few minutes (if found). For more information, please see **Auto-Discovery** 220 (**Run Auto-Discovery Now**). ▪ **Run Auto-Discovery with Template**: Open an assistant 222 to start an automatic search with a desired device template.
Sort Alphabetically	Sort direct children (groups and devices) of the selected group in alphabetical order. Note: The ordering is stored in the monitoring configuration and cannot be revoked.
Delete...	Delete the selected group. PRTG will ask for confirmation before anything is actually deleted.
Clone...	Open an assistant which guides you through cloning the selected group. For detailed instructions, please see **Clone Object** 2740.
Move ›	Hover over **Move** to open the **Move** menu. The following actions are available: ▪ **Top**: Move the group to the top of the mother node (here usually a probe or another group). ▪ **Up**: Move the group one entry up under the mother node. ▪ **Down**: Move the group one entry down under the mother node. ▪ **Bottom**: Move the group to the bottom of the mother node.

GROUP MENU

	▪ **To Other Group...**: Move the group to another group to become a sub-group. ▪ **Management...**: Open the **Management** 258 tab of the group.
Pause › —or— **Resume**	Hover over **Pause** to open the **Pause** menu. If the group is already in paused or in "simulate error" status, **Resume** appears. Click to restart monitoring on this group. You can pause and resume monitoring on the selected group. The monitoring for all sensors in the object hierarchy 89 underneath will be paused resp. resumed. You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date. You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this group. Use the date time picker to enter the date and time.
Priority ›	Hover over **Priority** to open the **Priority** menu. Define the priority of the selected group. For details, please see **Priority and Favorites** 182.
Historic Data ›	Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available: ▪ Open the historic data report tabs for the specified interval 139: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...** ▪ **Create Report...**: Open an assistant to add a new report to PRTG. For details, please see **Reports Step by Step** 2790.
Send Link by Email	Send the link to the selected group by email. Click to create a new email using your system's standard email client. It contains a direct link to the overview tab 137 of the selected group.
Open Ticket	Open the **New Ticket** dialog. For details, please see section **Tickets** 174.

Device Context Menu

The **Device Menu** contains actions for your devices 91.

DEVICE MENU

Check Now	Perform an immediate scan for the selected device. This queries the data for all sensors underneath in the object hierarchy 89.
Details...	Show the overview tab 137 of the selected device.
Edit ›	Hover over **Edit** to show the **Edit** menu. The following actions are available: ▪ **Settings...** Open the **Device Settings** 324 tab of this device. ▪ **Notifications...** Open the **Notifications** 2759 tab of this device. ▪ **Access Rights...** Open an assistant to edit **User Access Rights** 101 for this device. ▪ **Rename...** Open an assistant to edit the name of this device. You can also select another device icon.
Add Sensor...	Open an assistant which guides you through adding a new sensor to the selected device. For detailed instructions, please see **Add a Sensor** 256.
Auto-Discovery	Hover over **Auto-Discovery** to show the **Auto-Discovery** menu. The following actions are available: ▪ **Run Auto-Discovery**: Start an automatic search immediately to automatically add new sensors to the selected device. The search is running in the background. If found, you see new sensors on this device after a few minutes. For more information, please see **Auto-Discovery** 220 (**Run Auto-Discovery Now**). ▪ **Run Auto-Discovery with Template**: Open an assistant 221 to start an automatic search with a desired device template.
Create Device Template...	Open an assistant which guides you through creating a new device template. The template is then available in auto-discovery 219. For detailed instructions, please see **Create Device Template** 2747.
Recommend Now	Start an analysis to get sensor recommendations for this device. When PRTG has finished the inspection of the device, you see the sensor recommendations in a table list on the device overview tab 137 where you can add the according sensor types directly. Note: This option is only available if the recommendation engine is enabled 2874.

DEVICE MENU

Sort Alphabetically	Sort the sensors on the selected device in alphabetical order. Note: The ordering is stored in the monitoring configuration and cannot be revoked.
Delete...	Delete the selected device. PRTG will ask for confirmation before anything is actually deleted.
Clone...	Open an assistant which guides you through cloning the selected device. For detailed instructions, please see **Clone Object** 2740.
Move ›	Hover over **Move** to open the **Move** menu. The following actions are available: ▪ **Top**: Move the device to the top of the mother node (here usually a probe or group). ▪ **Up**: Move the device one entry up under the mother node. ▪ **Down**: Move the device one entry down under the mother node. ▪ **Bottom**: Move the device to the bottom of the mother node. ▪ **To Other Group...**: Move the device to another group.
Pause › —or— **Resume**	Hover over **Pause** to open the **Pause** menu. If the device is already in paused or "simulate error" status, **Resume** appears. Click to restart monitoring on this device. You can pause and resume monitoring on the selected device. The monitoring for all sensors on this device will be paused resp. resumed. You can choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date. You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this device. Use the date time picker to enter the date and time.
Priority/Favorite ›	Hover over **Priority/Favorite** to open the **Priority/Favorite** menu. Define the priority of the selected device or add to resp. remove it from the favorite devices list. For details, please see **Priority and Favorites** 182.

DEVICE MENU

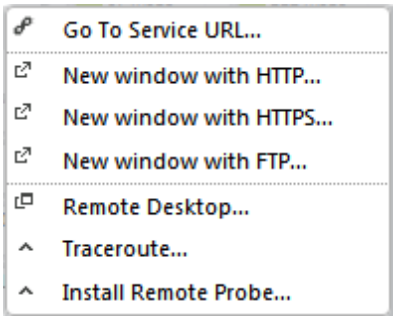
Historic Data ›

Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available:

- Open the historic data report tabs for the specified interval 139: **Last 2 days...**, **Last 30 days...**, or **Last 365 days...**
- **Create Report...**: Open an assistant to add a new report to PRTG. For details, please see **Reports Step by Step** 2790.

Device Tools ›

Hover over **Device Tools** to open the **Device Tools** menu.



Context Menu Device Tools

The following actions are available:

- **Go To Service URL...**
  Open the service page that you have defined in the **Device Settings** 324. If there is no service URL available for this device, you can enter an address in the appearing assistant.
- **New window with HTTP...**
  Open a new browser window with Hypertext Transfer Protocol (HTTP) and the IP address / DNS name of the device.
- **New window with HTTPS...**
  Open a new browser window with Hypertext Transfer Protocol Secure (HTTPS) and the IP address / DNS name of the device.
- **New window with FTP...**
  Open a new browser window with File Transfer Protocol (FTP) and the IP address / DNS name of the device.
- **Remote Desktop...**
  Download an .rdp file. When you execute this file, a remote desktop will start with the IP address / DNS name of the device.
  Note: In Firefox you have to use mstsc.exe (Microsoft Terminal Service) to open the file.

DEVICE MENU

	▪ **Traceroute...** Start a traceroute on the selected device. PRTG will display the route and measure transit delays of packets across the IP network. ▪ **Install Remote Probe...** Open an assistant to install a **Remote Probe** of PRTG on this device. For more details, please see **Remote Probe Quick Install** 3112.
Find Duplicates...	Search in your PRTG configuration for devices with the same IP address or DNS name as the selected device. A window with the results will appear, either showing existing duplicates or a message indicating that there are no duplicates.
Send Link by Email	Send the link to the selected device by email. Click to create a new email using your system's standard email client. It contains a direct link to the overview tab 137 of the selected device.
Open Ticket	Open the **New Ticket** dialog. For details, please see section **Tickets** 174.

Sensor Context Menu

The **Sensor Menu** contains actions for your sensors 92.

SENSOR MENU

Check Now	Perform an immediate scan for the selected sensor.
Details...	Show the overview tab 137 of the selected sensor.
Edit ›	Hover over **Edit** to show the **Edit** menu. The following actions are available: ▪ **Settings...** Open the **Sensor Settings** 347 tab of this sensor. ▪ **Notifications...** Open the **Notifications** 2759 tab of this sensor. ▪ **Access Rights...** Open an assistant to edit **User Access Rights** 101 for this sensor.

SENSOR MENU

- **Rename...**
  Open an assistant to edit the name of this sensor.

Acknowledge Alarm ›

This option is available only in the sensor menu when you select a sensor in a **Down** or **Down (Partial)** status 135.

You can acknowledge an alarm for the selected sensor. An acknowledged alarm will show up in the alarms list as "acknowledged" (see **Sensor States** 135) and will not trigger 2719 any more notifications 2759.

You can choose between: **Acknowledge Indefinitely...**, acknowledge **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Until...**. If you choose **Until...** an assistant appears where you can define a date. Use the date time picker to enter the date and time. If the alarm condition still exists after this date, the sensor will show a **Down** status again.

Note: If the alarm condition clears, the sensor usually returns into an **Up** status immediately with the next sensor scan. For details about acknowledging an alarm, please see **Alarms** 162 section.

Delete...

Delete the selected sensor. PRTG will ask for confirmation before anything is actually deleted.

Clone...

Open an assistant which guides you through cloning the selected sensor. For detailed instructions, please see **Clone Object** 2740.

Move ›

Hover over **Move** to open the **Move** menu. The following actions are available:

- **Top**: Move the sensor to the top of the device on which it runs.
- **Up**: Move the sensor one entry up on the device.
- **Down**: Move the sensor one entry down on the device.
- **Bottom**: Move the sensor to the bottom of the device.

Pause ›

—or—

Resume

Hover over **Pause** to open the **Pause** menu.

If the sensor is already in paused status 135 or in **Simulate Error Status**, **Resume** appears. Click **Resume** to restart monitoring on this sensor.

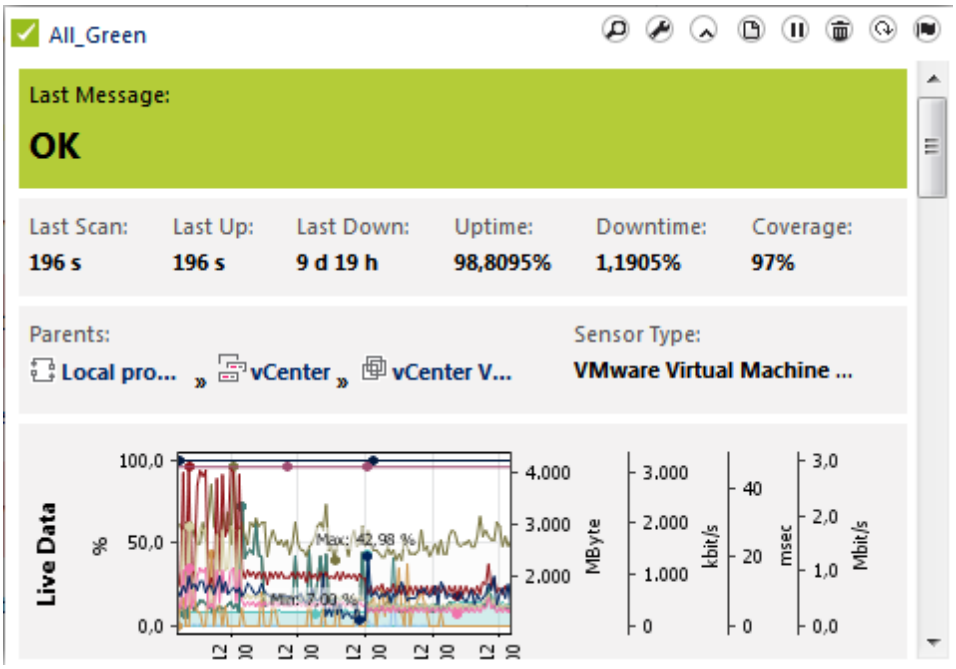
You can pause and resume monitoring of the selected sensor. Choose between: **Pause Indefinitely...**, pause **For 5 Minutes...**, **For 15 Minutes...**, **For 1 Hour...**, **For 3 Hours...**, **For 1 Day...**, or **Pause Until...**. If you choose **Pause Until...**, an assistant appears where you can define a date. Use the date time picker to enter the date and time. PRTG will resume monitoring after this date.

SENSOR MENU

	You can directly add a **One-time maintenance window** to pause monitoring during a planned downtime. In the appearing assistant, define the start and end date of the maintenance window for this sensor. Use the date time picker to enter the date and time.
Simulate Error Status	Set the selected sensor to a **Down** status[135]. Like for the paused status, **Resume** will appear in the context menu if a the selected sensor is already in a simulated error status. Note: "Simulate error status" does not work for sensors that run on a PRTG Mini Probe.
Priority/Favorite ›	Hover over **Priority/Favorite** to open the **Priority/Favorite** menu. Define the priority of the selected sensor or add to resp. remove it from the favorite devices list. For details, please see **Priority and Favorites**[182].
Historic Data ›	Hover over **Historic Data** to open the **Historic Data** menu. The following actions are available: ▪ Open the historic data tab for the specified interval[140]: **Live Data...**, **Last 2 days...**, **Last 30 days...**, or **Last 365 days...** ▪ **Compare...**: Open the **Compare Sensors**[143] assistant with the currently selected sensor. ▪ **View Historic Data**: Open the **Historic Data**[146] tab of this sensor. ▪ **Create Report...**: Open an assistant to add a new report to PRTG. For details, please see **Reports Step by Step**[2790].
Send Link by Email	Send the link to the selected sensor by email. Click to create a new email using your system's standard email client. It contains a direct link to the overview tab[137] of the selected sensor.
Open Ticket	Open the **New Ticket** dialog. For details, please see section **Tickets**[174].

5.21 Hover Popup

Whenever you rest the mouse pointer for a second over an object's icon in the device tree 123, a hover popup window will appear, showing details about this object. It contains information from the object's overview tab 137, as well as several graphs. The exact information provided depends on the kind of object you are hovering over.



Hover Menu Example: VMware Virtual Machine Sensor

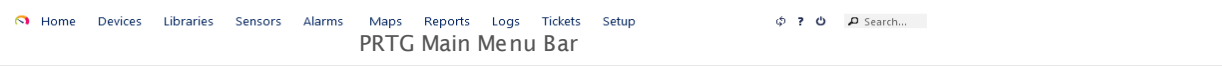
Note: The hover popup does only appear if your browser is the currently focused window on your desktop. It disappears with every (automatic) page refresh.

Menu Icons

At the top of the hover popup window, several icons are shown which enable you to view or edit the current object. These are the most important options from this object's context menu 186 which is shown when right-clicking it.

5.22 Main Menu Structure

You can access all functions of PRTG using the main menu. In this section, you find descriptions about the most important menu items. Often, you can either click on an item directly, or hover over it to show more items.



PRTG Main Menu Bar

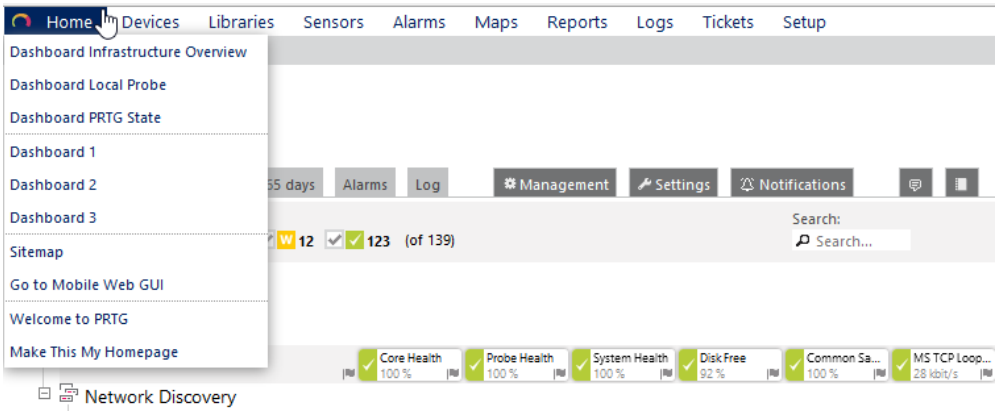
Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

The following menu items are available:

- Home 200
- Devices 202
- Libraries 204
- Sensors 205
- Alarms 208
- Maps 209
- Reports 209
- Logs 210
- Tickets 211
- Setup 212
- Refresh (Arrows Symbol) 214
- Help Center (? Symbol) 214
- Logout (Off Symbol) 215
- Search Box 215

Home

Click to open the user's homepage. The default setting is the PRTG welcome page 123. You can change the homepage in the user account settings 2830. Point to **Home** to show other menu items.



PRTG Main Menu: Home

HOME

Sample Dashboard

Open a preconfigured dashboard to view monitoring data in another layout. Dashboards provide different preset overviews with the status of your sensors. This dashboard is one of the default **Maps** [2810] that PRTG creates automatically with a new installation.

Note: The **Home** menu shows maps that have a 5***** priority [182]. You can include up to 10 map entries in this menu.

Note: You can change the appearance of the default dashboard with the **Map Designer** [2816]. To not show the sample dashboard in the menu, define a priority [182] lower than 5***** for this map.

Dashboard 1 – Dashboard 3

Choose a preconfigured dashboard to view monitoring data in another layout. Dashboards provide different preset overviews with the status of your sensors.

Note: These dashboards are not customizable. You can create your own overview pages using the **Maps** [2810] feature. New installations of PRTG do not include these dashboards anymore.

Switch Cluster Node ›

This option is only available if PRTG runs in **Clustering** [87] mode. Show available cluster nodes. Hover over **Switch Cluster Node** to show other menu items. Follow the menu path (it is specific to your setup) to select another cluster node. The current Master node is shown in bold letters. Click on a node's name to leave the current node and connect to the other, showing the same page there.

Sitemap

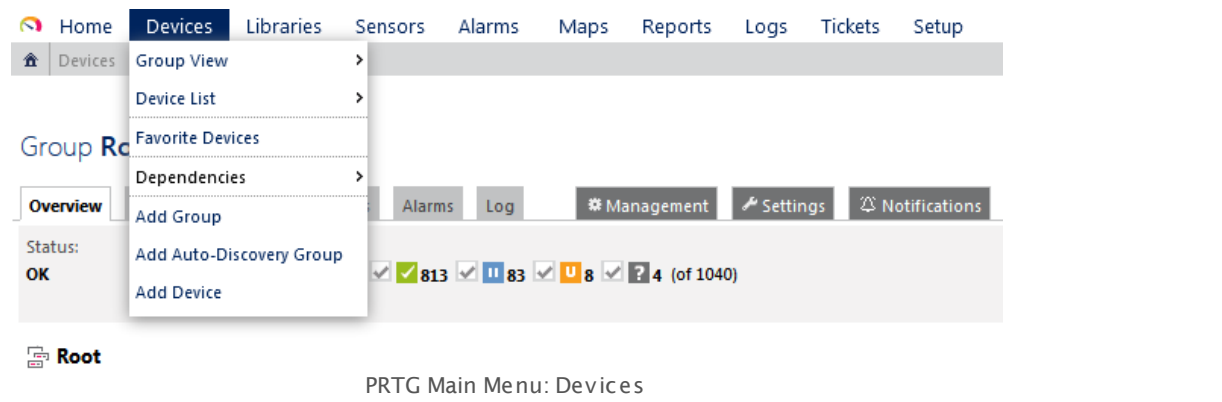
Open the sitemap which contains a flat text view of all menu items. You can easily search for key words using the search function in your browser (usually shortcut CTRL-F).

HOME

Go to Mobile Web GUI	Switch to the **Mobile Web GUI** 2991 which is optimized for low bandwidth and mobile devices. This interface uses less scripting for more compatibility. Note: This is a read-only interface for most parts of PRTG. Note: This user interface is deprecated. We will completely remove it from PRTG soon.
Welcome to PRTG	Open the **Welcome Page** 117 that shows the Paessler news feed and various information about your PRTG installation, and it provides quick links to major sections of the web interface. Note: This is the default homepage of the PRTG web interface.
Make This My Homepage	Change the page that is loaded when you click on the **Home** button in the main menu. Select this command on any page to set its URL as the current user's homepage. This setting is user sensitive. The default homepage is /welcome.htm. You can change this setting any time by clicking on this command again, or by changing the **Homepage URL** in the **My Account** 2830 settings.

Devices

Click to show a group view of all your devices, starting with the **Root** group which contains all other groups of your setup. Hover over **Devices** to show other menu items.



PRTG Main Menu: Devices

DEVICES

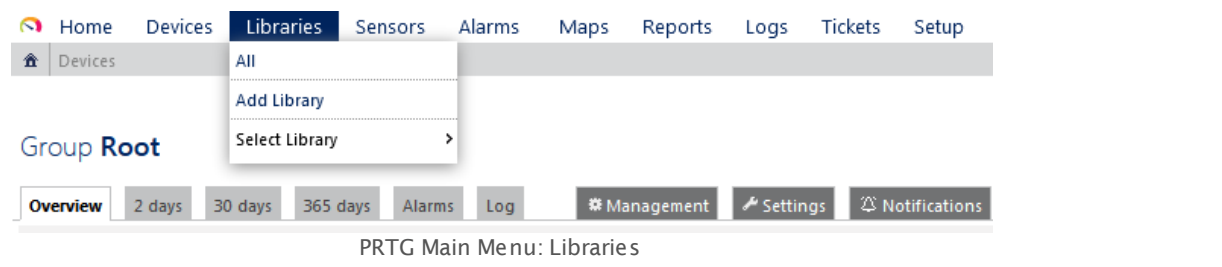
All	Open the **Overview** tab of the **Root** 90 group that shows a group view of all your devices (the device tree).
Group View ›	Open a tree view of all probes and groups in your setup. Click to show a group view of all your devices, starting with the **Root** 90 group which contains all other groups of your setup. Hover over **Group View** to show other menu items. Follow the menu path (it is specific to your setup) to view the devices in a specific probe or group only.
Device List ›	Open a list view of all devices in your setup. Click to show a table list of all devices in your setup. Hover over **Device List** to show other menu items. Choose **Favorite Devices** to show a list of all devices marked as **Favorite** 182. Follow the menu path (it is specific to your setup) to view a table list of the devices in a specific probe or group only. Note: In the table list 178 appearing, you can re-sort the items by clicking on the column's header items. Note: On device lists, you can use the **Print QR-Codes** button to show the QR codes of all devices in this list in a printable layout. You can change the size of these QR codes by changing the values of the according parameters width, height, and margin in the URL.
Favorite Devices	Open a table list of all devices marked as **Favorite** 182. Click on the **Print QR-Codes** button to show a printable list of the QR codes of all your favorite devices. Note: To mark any device as a favorite device, select **Priority / Favorite | Add to Favorites** from its context menu or click on the small flag on a device's details page.
Dependencies ›	Open an overview list of the **Dependencies** 98 configured for the objects in your setup. Hover over the menu item to show other menu items. Choose between **Selected Dependencies** and **Master Dependencies** to view a list of all dependencies or explicit ones. You can select dependencies and define master dependencies in the **Schedules, Dependencies, and Maintenance Windows** settings of a monitoring object 159 (not available for the **Root** group). Click on **Dependencies Graph** 2751 to visualize the dependencies between objects in your configuration. Follow the menu path (it is specific to your setup) to view dependencies of the objects in a specific probe or group only.

DEVICES

Add Group	Start an assistant which guides you through the process of adding a new group to your setup. For more information, please see section Create Objects Manually 236. Note: You can create new groups much faster by choosing **Add Group...** from a probe's or group's context menu.
Add Auto-Discovery Group	Start an assistant which guides you through the process of adding a new auto-discovery group to your setup. PRTG will create a new group and run an auto-discovery in your network to add devices and sensors for these devices automatically. For more information, please see section Using the Auto-Discovery 219 Note: You can create new groups much faster by choosing **Add Auto-Discovery Group...** from a probe's or group's context menu.
Add Device	Start an assistant which guides you through the process of adding a new device to an existing group. During the process, you can choose if PRTG will run an auto-discover for the new device to add sensors automatically. For more information, please see section Create Objects Manually 236. Note: You can create new devices much faster by choosing **Add Device...** from a group's context menu.

Libraries

Click to open the Libraries overview list where you can view or add custom views of your network status and monitoring data. For more information, please see Libraries 2770 section. Hover over **Libraries** to show other menu items.



PRTG Main Menu: Libraries

LIBRARIES

All	Open the Libraries overview list where you can view or add custom device tree views of your network status and monitoring data.

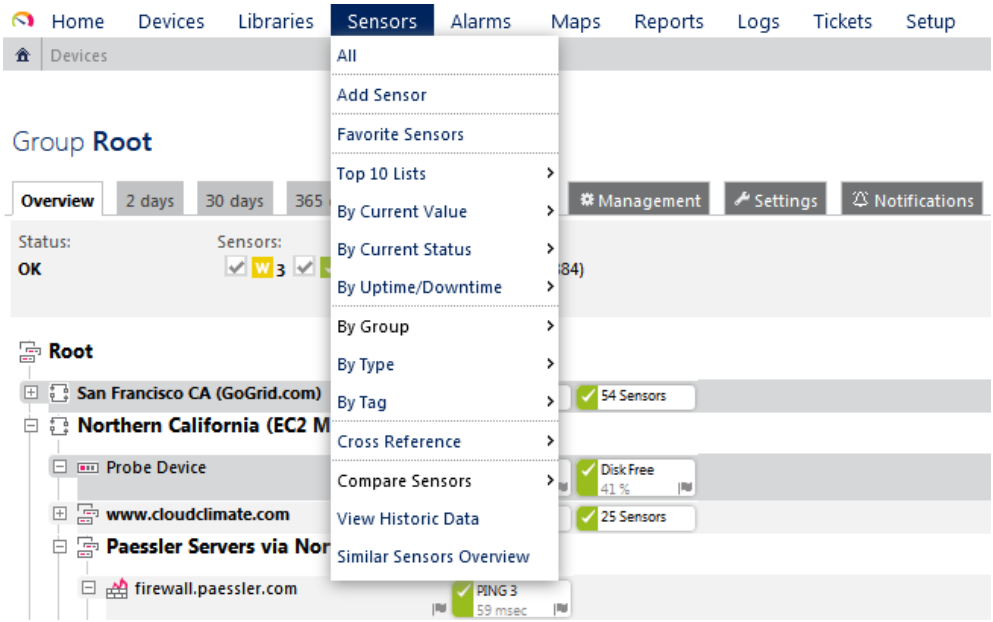
LIBRARIES	
Add Library	Open an assistant to directly create 2773 a new library.
Select Library	Open an existing library. Hover over **Select Library** to show other menu items. Follow the menu path (it is specific to your setup) to select a library and open it.

Sensors

Click to show a table list of all sensors 92. In the table list 178 appearing, you can re-sort the items by clicking on the column's header items, as well as you can filter the list by related object and tag with the inline filter directly above the table. Hover over **Sensors** in the main menu bar to show other menu items.

Note: The column **Last Value** shows only the last value of the sensor's **primary channel**.

Note: For most sensor lists, you can use **Multi-Edit** 2742 to change the settings of more than one sensor at once.



PRTG Main Menu: Sensors

SENSORS

All	Open a table list 178 of all sensors 92. In the table list appearing, you can re-sort the items by clicking on the column's header items. Note: The column **Last Value** shows only the last value of the sensor's **primary channel**.
Add Sensor	Start an assistant which guides you through the process of adding a new sensor to an existing device. For more information, please see section **Add a Sensor** 256. During the process, you can also choose to create a new device via the **Add a Device** 244 assistant (that you can also open from the "Devices" menu 202 directly).
Favorite Sensors	Open a table list of all sensors which you marked as **Favorite** 182. Note: To mark any sensor as a favorite sensor, select **Priority / Favorite	Add to Favorites** from its context menu or click on the small flag on a device's details page.
Top 10 Lists ›	Open a dashboard view with different top 10 lists which show best/worst uptime, Ping, bandwidth usage, website response times, CPU usage, disk usage, memory usage, and system uptime. Click to show top 10 lists for all sensors. Hover over **Top 10 Lists** to show other menu items. Follow the menu path (it is specific to your setup) to view top 10 lists for a specific probe or group only. Note: The shown sensors are selected by default tags.
By Current Value ›	Open a list of sensors filtered by value. Hover over **By Current Value** to show other menu items. Follow the menu path to view table lists 178 of **Fastest** or **Slowest** sensors for ▪ **Ping** ▪ **Port** ▪ **Webpages** ▪ **IMAP/POP3/SMTP** ▪ **FTP** as well as a list of sensors with **Most Used** or **Least Used** ▪ **Bandwidth** ▪ **CPU** ▪ **Disk** ▪ **Memory** Note: The shown sensors are selected by default tags.

SENSORS

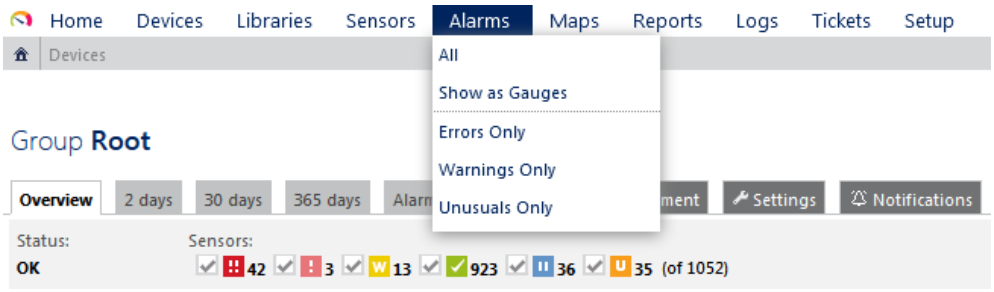
By Current Status ›	Open a list of sensors filtered by status. Hover over **By Current Status** to show other menu items. Follow the menu path to view table lists 178 of all sensors in a certain status. For more information about sensor states, please see **Sensor States** 135 section.
By Uptime/Downtime ›	Open a list of sensors filtered by different parameters. Hover over **By Uptime/Downtime** to show other menu items. Follow the menu path to view table lists 178 of all sensors sorted by ▪ **Best Uptime (%)** ▪ **Highest Uptime (Time)** ▪ **Worst Downtime (%)** ▪ **Highest Downtime (Time)**
By Group ›	Open a list of sensors filtered by their parent group. Hover over **By Group** to show other menu items. Follow the menu path (it is specific to your setup) to view a sensor table list 178 of a specific probe or group only.
By Type ›	Open a list of sensors filtered by sensor type 348. Hover over **By Type** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to view a sensor table list 178 containing only sensors of one specific sensor type.
By Tag ›	Open a list of sensors filtered by tag 96. Hover over **By Tag** to show other menu items. Follow the alphabetical menu path (it is specific to your setup) to see available tags. Select a tag view a table list 178 containing only sensors marked with this tag.
Cross Reference ›	Open the sensor cross reference to show information about all sensors including priority and favorite status 182, scanning interval 272, access rights 101, notification trigger settings 159, schedule 99, and dependency 98. Click to show a sensor cross reference for all sensors. Hover over **Cross Reference** to show other menu items. Follow the menu path (it is specific to your setup) to view cross reference information for sensors in a specific probe or group only, or to view them by type or tag.
Compare Sensors ›	Compare the data graphs of two or more sensors. Hover over **Compare Sensors** to show other menu items. Follow the menu path to open an assistant for comparing several monitoring objects. For more information, please see **Compare Sensors** 143 section.

SENSORS

View Historic Data	Open an assistant for a quick generation of sensor data reports. For more information, please see **Historic Data Reports** 146 section.
Similar Sensors Overview	Open an overview page with a list of "similar sensors". For more information, please see **Similar Sensors** 151 section.

Alarms

Click to show a all sensors that currently show a **Down**, **Down (Partial)**, **Warning**, or **Unusual** status. In the table list 178 appearing, you can re-sort the items by clicking on the column's header items. If you select **Show as Gauges**, this command displays the sensor gauges 137 in a size corresponding to their priority. Hover over **Alarms** to show other menu items.



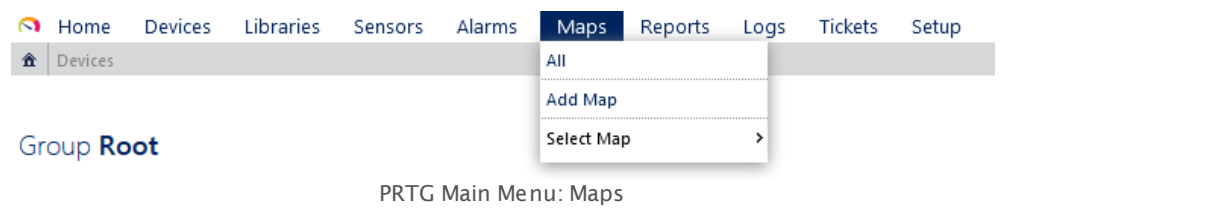
PRTG Main Menu: Alarms

ALARMS

All	Open a list of all sensors which are currently in **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status 135.
Show as Gauges	Open a page with the gauges of all sensors which are currently in **Down**, **Down (Partial)**, **Down (Acknowledged)**, **Warning**, or **Unusual** status. The size of the sensor gauges corresponds to their respective priority.
Errors Only	Open a list of all sensors which are currently in **Down**, **Down (Partial)**, or **Down (Acknowledged)** status.
Warnings Only	Open a list of all sensors which are currently in **Warning** status.
Unusuals Only	Open a list of all sensors which are currently in **Unusual** status.

Maps

Click to open the Maps overview page where you can view or add custom views of your network status and monitoring data. For more information, please see **Maps** 2810 section. Hover over **Maps** to show other menu items.



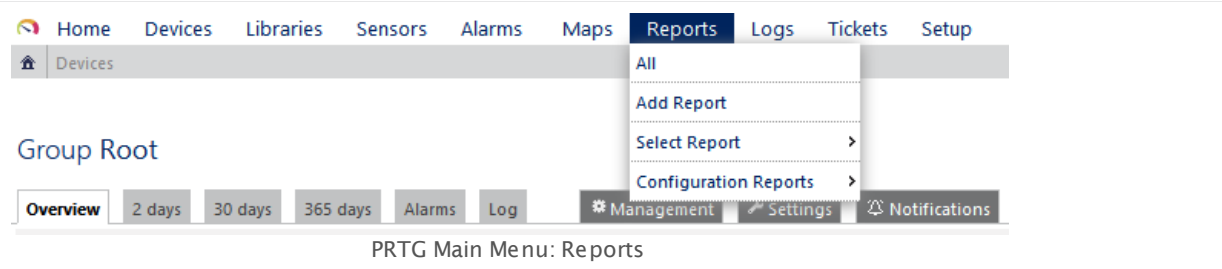
PRTG Main Menu: Maps

MAPS

All	Open the Maps overview page where you can view or add custom views of your network's status and monitoring data.
Add Map	Open an assistant to directly add 2814 a new map.
Select Map ›	Open an existing map. Hover over **Select Map** to show other menu items. Follow the menu path (it is specific to your setup) to select a map.

Reports

Click to open the Reports overview page where you can view or add reports of your monitoring data. For more information, please see **Reports** 2786 section. Hover over **Reports** to show other menu items.



PRTG Main Menu: Reports

REPORTS

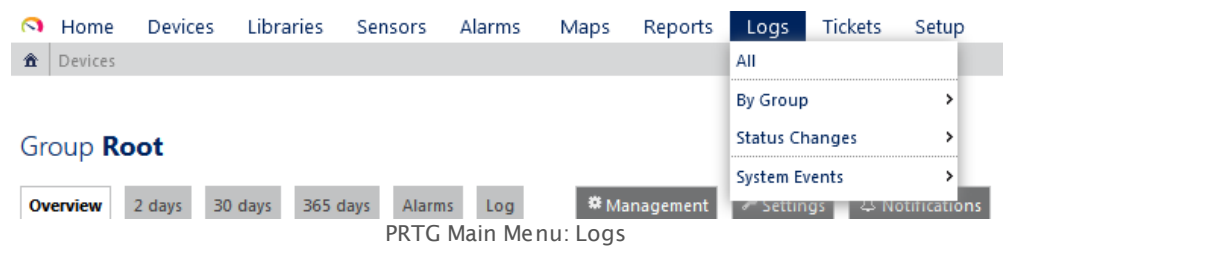
All	Open the Reports overview page where you can view or add reports of your monitoring data.

REPORTS	
Add Report	Open an assistant to directly add 2790 a new report.
Select Report ›	Open an existing report. Point on **Select Report** to show other menu items. Follow the menu path (it is specific to your setup) to select a report.
Configuration Reports ›	Create reports for maps, reports, users & user groups, and system configuration to document changes to the configuration. Point on **Reports	Configuration Reports** to see the available configuration reports 2789.

Logs

Click to show log information for all objects in your configuration, newest first. In the table list 178 appearing, you can filter the items by using the respective options 178. Hover over **Logs** to show other menu items. For more information, please see **Logs** 169 section.

Note: Logs for monitoring objects (for example, sensors) are available as long as you define for **Logfile Records** in the **Historic Data Purging** settings under **System Administration—Core & Probes** 2887.



PRTG Main Menu: Logs

LOGS	
All	Open a table list 178 with log information for all objects in your configuration, newest first.
By Group ›	Open a list with log information for objects in a certain group only, newest first. Hover over **By Group** to show other menu items. Select **All,** or follow the menu path (it is specific to your setup) to select a group you would like to show log information for.

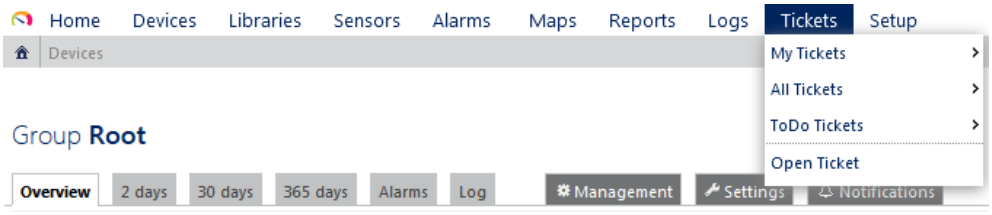
LOGS

Status Changes ›	Open a list with log information for certain status changes only. Hover over **Status Changes** to show other menu items. Follow the menu path to view log entries with a special value in the **Status** field only. Select between **Up & Down** (shows entries with either **Up** or **Down** in the **Status** field), **Down**, **Warning**, **Unusual**, **Up**, **Paused/Resumed** (shows entries with either **Paused** or **Resumed** in the **Status** field), or **Acknowledged Alarms**.
System Events ›	Open a list with log information regarding certain system event types only. Hover over **System Events** to show other menu items. Select between the following event types: **Probe Related**, **Cluster Related**, **Auto-Discovery**, **Notifications**, or **Status Messages**.
Object History	Open a list with log information about changes to the PRTG setup and deletions of subordinate system objects. The object history page has a tab-like interface. Using the tabs you can navigate through various sub-pages in order to view the changes to all related settings and deletions of objects. Select between the following tabs: **My Account**, **System Setup**, **Notifications**, **Schedules**, **User Accounts**, **User Groups**, **Reports**, **Libraries**, or **Maps**. Note: You can open a specific tab directly with the context button **History** in the page header bar 126 on the corresponding pages.

Tickets

Click to show all tickets which are assigned to the current user. In the table list 178 appearing, you can re-sort the items by clicking on the column's header items, as well as you can filter the list with the inline filter directly above the table. Hover over **Tickets** to show other menu items.

Tickets show important system information or action steps to take for the administrator. For best experience with PRTG, check every ticket and conduct appropriate actions. For more information, please see section **Tickets** 171.



PRTG Main Menu: Tickets

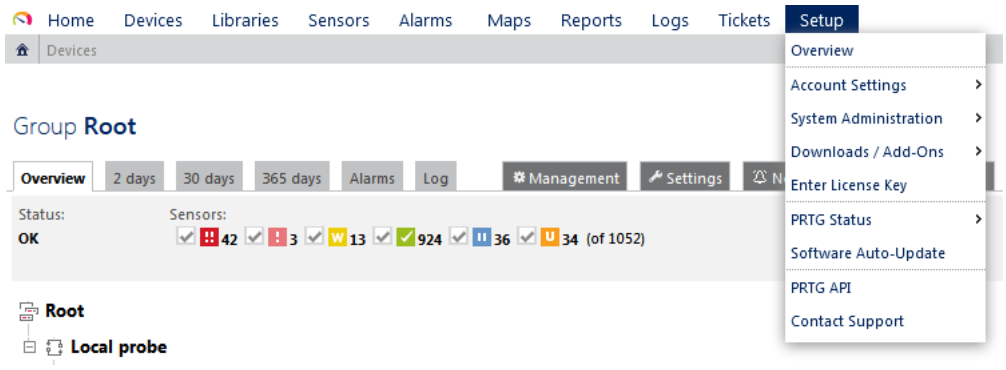
You have several options to display a list of tickets which is filtered to your needs. You can also create a new ticket via the main menu.

TICKETS

All	Open a list of all open tickets which are assigned to the current user.
My Tickets	Open a list of all open tickets which are assigned to the current user. Hover over **My Tickets** to show other menu items for filtering these tickets depending on their status.
All Tickets	Open a list of all open tickets of all PRTG users. Hover over **All Tickets** to show other menu items for filtering these tickets depending on their status.
ToDo Tickets	Open a list of open tickets from the type **ToDo**. Hover over **ToDo Tickets** to show other menu items for filtering these tickets depending on their status.
Open Ticket	Open the **New Ticket** dialog. Provide the needed information and confirm by clicking on **Save** to create a **User Ticket**. For more information about available options, please refer to section **Tickets** 171.

Setup

Click to show the setup page. Hover over **Setup** to show other menu items. For more information, please see **Setup** 2828 section.



PRTG Main Menu: Setup

SETUP

Overview	Open the setup page 2828.

SETUP

Account Settings ›

Open the My Account 2830 settings. Hover over **Account Settings** to show and open the tabs of account settings directly. Choose from:

- My Account 2830
- Notifications 2836
- Notification Contacts 2852
- Schedules 2856

System Administration ›

Open the System Administration 2860 settings. Hover over **System Administration** to show and open the tabs of the system administration settings directly. Choose from:

- User Interface 2860
- Monitoring 2871
- Notification Delivery 2877
- Core & Probes 2883
- Cluster 2905
- User Accounts 2890
- User Groups 2896
- Administrative Tools 2900

PRTG Status

Open the PRTG Status—System Status 2907 page. When running a cluster, hover over **PRTG Status** to show other menu items. Choose from:

- System Status 2907
- Cluster Status 2923

License

Open the license activation status 2925 page. Hover over **License** to show other menu items. Choose from:

- Status 2925 to view information about your license.
- Enter License Key 2926 to enter your license name and key and to show your licensed PRTG edition.

Auto-Update

Open information about the Software Auto-Update 2918 status of your PRTG installation. On this page, you can also download and install available updates. Hover over **Auto-Update** to show other menu items. Choose from:

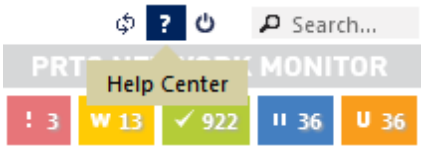
SETUP	
	▪ Status 2918 to view the update status and to manually check for the latest update. ▪ Settings 2920 to define your update settings.
Downloads ›	Open the downloads page 2928 of PRTG for additional downloads. Choose from: ▪ Client App for Windows (Enterprise Console) 2928 ▪ Client Apps for Mobile Devices 2928 ▪ Remote Probe Installer 2928 ▪ PRTG Tools 2928 ▪ Desktop Notifications 2930
PRTG API	Open the documentation of the Application Programming Interface (API) Definition 3086 for your installation.
Contact Support	Open the Contact Paessler Support / Send Your Feedback to Paessler 2932 form.

Refresh (Arrows Symbol)

PRTG Main Menu: Refresh Button

Click this symbol to refresh all elements on the current page to display current data. Unlike the reload function of your browser, this merely refreshes the single page elements, not the whole page.

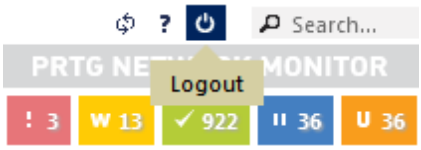
Help Center (? Symbol)



PRTG Main Menu: Help Button

Open the **Help and Support Center** to get help if you have any questions regarding your PRTG setup.

Logout (Off Symbol)



PRTG Main Menu: Logout Button

Log out the current user and return to the login screen 110.

Search Box

Use the search box to find objects and reports, and other items by name or tag, or to search for help. Click into the field to enlarge it.

Context Menu

Additionally, there are **Context Menus** 186 available for all objects. Right-click on an object to open it.

Part 6

Ajax Web Interface—Device and Sensor Setup

6 Ajax Web Interface—Device and Sensor Setup

The Ajax-based web interface is your access to PRTG. Use it to configure devices and sensors, to set up notifications, as well as to review monitoring results and to create reports. This web interface is highly interactive, using Asynchronous Java Script and XML (AJAX) to deliver a powerful and easy-to-use user experience. While you are logged in 110, the PRTG web interface permanently refreshes the data on the screen permanently (via Ajax calls) so it always shows the current monitoring results (you can set 2890 refresh interval and method individually).

Because the web interface works as a Single Page Application (SPA), you rarely see a full page refresh to avoid this performance impact due to redundant processing. Only single page elements are refreshed when necessary. The AJAX web interface shows all object setting dialogs as pop-up layers, so you never lose the current context. This speeds up the user experience appreciably and makes the configuration of objects in PRTG comprehensible. The responsive design of the web interface ensures that it always adjusts to the size of your screen to see more information at a glance.

The following sections introduce device and sensor setup in the Ajax Graphical User Interface (GUI).

6.1 Auto-Discovery

The PRTG auto-discovery is a great way to automatically create a sophisticated and concise set of sensors for your complete network. It is mainly suitable for LAN discovery because it involves a lot of SNMP and WMI. For video instructions, please see the **More** 235 section below.

Note: PRTG already runs a quick initial auto-discovery as soon as you finished the install of PRTG to automatically show you several available devices in your network.

How Auto-Discovery Works

The PRTG auto-discovery process has three stages:

- **Step 1**
  Scanning a network segment for devices using Ping (for groups only).
- **Step 2**
  Assessing the device type for all devices discovered in Step 1 (using SNMP, WMI, and other protocols).
- **Step 3a**
  Creating sensor sets that match the discovered device types of step 2. This is done based on built-in device templates with recommended sensors for many device types.

  Step 3b (optional)
  Creating sensor sets using device templates that PRTG users created (see **Create Device Template** 2747 section).

You can use the auto-discovery on group level for a range of IP addresses, or for individual devices which you have created manually. You can run the auto-discovery just once, on demand via the context menu, or scheduled every hour, day, or week. Running the auto-discovery daily or weekly on group level automatically creates new devices when they are connected to the network and adds according sensors. As soon as PRTG discovers new devices or sensors, it will create notifying **Tickets** 171 (which are mailed to the PRTG system administrator user by default).

Please be aware of the following restrictions of the auto-discovery:

- PRTG cannot discover devices that cannot be pinged, because Step 1 uses pings. If, for example, a firewall blocks echo requests, PRTG cannot discover a device behind it.
- Please define authentication settings for **Windows Systems**, **Linux (SSH/WBEM) Systems**, **VMware/XEN Servers**, **SNMP Devices**, **Database Management Systems**, and **Amazon CloudWatch** to fully benefit from the power of this feature. We recommend that you define these settings in the Root group 260.
- If a device has more than one IP address, it may show up more than once in the discovery results, even though PRTG tries to identify these situations.
- If a device already exists on the same probe, the auto-discovery will skip this device and not create a duplicate.
- Auto-discovery on group level will not create new sensors on devices that already exist in PRTG but only on newly discovered devices. If you want to automatically add sensors to an existing device, please run the auto-discovery on this device.

- Using frequent auto-discoveries of large network segments can lead to performance issues. Because of this we recommend that you only schedule regular auto-discoveries where necessary. For detailed information see the **More** 235 section below.
- PRTG automatically adds suitable device icons to discovered devices. PRTG uses a device's MAC address for this purpose which it determines via ARP (Address Resolution Protocol). This only works via IPv4 and not with IPv6. Usually, ARP works only in the local network unless your router supports ARP and you configure it accordingly.

Run Auto-Discovery Now

You can run an auto-discovery at any time for a group or a device. To do so, right-click the object to analyze and select **Run Auto-Discovery** from the context menu. PRTG immediately starts searching for new objects which can be added to the device tree. If you use it for an auto-discovery group, PRTG will add devices with according sensors, if found. If you use it for a device, PRTG will add new sensors, if found. You can always see in the corresponding page header bar 126 when PRTG run the last auto-discovery on a selected group or device.

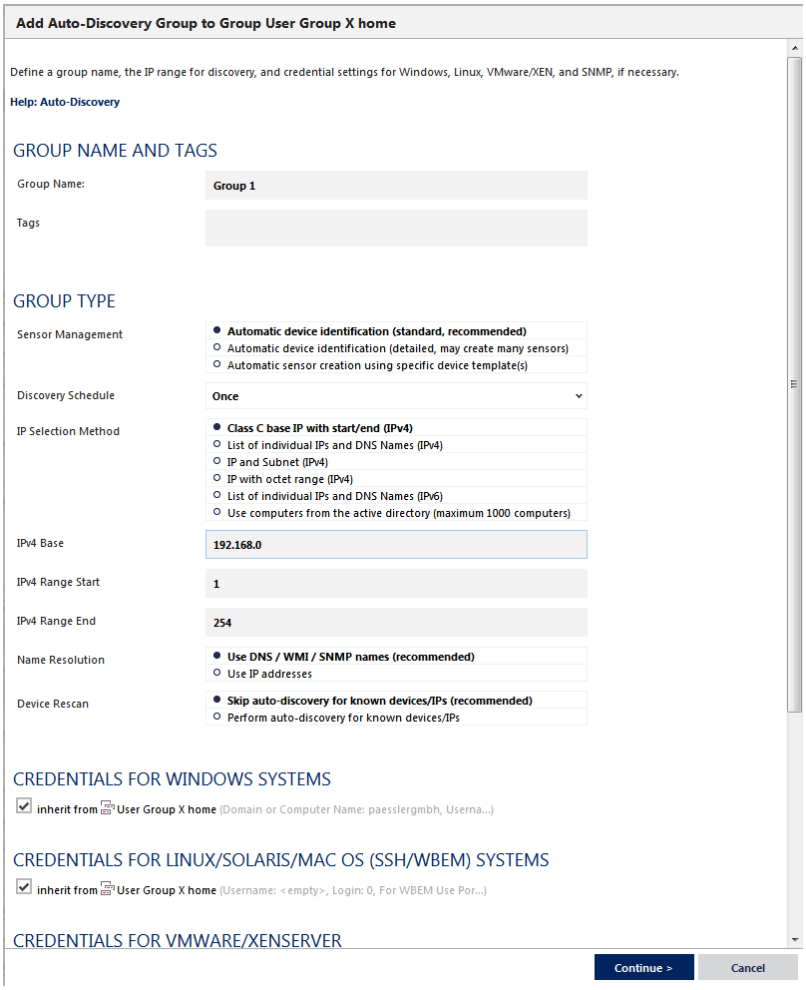
Note: The auto-discovery will also re-add devices or sensors you have manually deleted. If you do not want this, please create objects manually 236 only.

Creating an Auto-Discovery Group

There are several ways to start auto-discovery:

- Select **Devices | Add Auto-Discovery Group** from the main menu. To start an automatic detection of devices and sensors in your network an assistant will appear, leading you through two steps.
- For faster setup, you can select **Add Auto-Discovery Group...** in the context menu 186 of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.



Add Auto-Discovery Group Dialog

- **Step 1**
  Please choose a probe or group you want to add the new group to. Click **Continue**.
- **Step 2**
  Add auto-discovery settings as described below.

Add Auto-Discovery Group Settings

GROUP NAME AND TAGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags. Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically inherited 96.

GROUP TYPE

Sensor Management	Select the method for automatic network discovery. Choose between: ▪ **Automatic device identification (standard, recommended)**: Detect mainly based on Ping, SNMP, and WMI. This option works fine for most installations. ▪ **Automatic device identification (detailed, may create many sensors)**: Detect in a more detailed way and create more sensors. This option uses all standard device templates for auto-discovery. It is suitable for small network segments and whenever you want to monitor the maximum number of sensors available. ▪ **Automatic sensor creation using specific device template (s)**: Manually define the device templates used for auto-discovery. From the list below, select one or more templates.

Device Template(s)	This option is only visible if you enable using specific device templates above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. PRTG will use the selected templates for auto-discovery on the current device. Choose from: ▪ **ADSL** ▪ **Amazon Cloudwatch** ▪ **Cisco ASA VPN** ▪ **Cisco Device (Generic)** ▪ **Dell MDI Disk** ▪ **DNS Server** ▪ **Environment Jacarta** ▪ **Environment Poseidon** ▪ **Fritzbox** ▪ **FTP Server** ▪ **Generic Device (PING only)** ▪ **Generic Device (SNMP-enabled)** ▪ **Generic Device (SNMP-enabled, Detailed)** ▪ **HTTP Web Server** ▪ **Hyper V Host Server**

- Linux/UNIX Device (SNMP or SSH enabled)
- Mail Server (Generic)
- Mail Server (MS Exchange)
- Microsoft Sharepoint 2010
- NAS LenovoEMC
- NAS QNAP
- NAS Synology
- NetApp
- NTP Server
- Printer (HP)
- Printer (Generic)
- RDP Server
- RMON compatible device
- Server (Compaq/HP agents)
- Server (Dell)
- Sever Cisco UCS
- Server IBM
- SonicWALL
- SSL Security Check
- Switch (Cisco Catalyst)
- Switch (Cisco IOS Based)
- Switch (HP Procurve)
- UNIX/Linux Device
- UPS (APC)
- Virtuozzo Server
- VMware ESX / vCenter Server
- Webserver
- Windows (Detailed via WMI)
- Windows (via Remote Powershell)
- Windows (via WMI)
- Windows IIS (via SNMP)
- XEN Hosts

	▪ **XEN Virtual Machines** Once the auto-discovery is finished, PRTG will create a new ticket [171] and list the device templates which it used to create new sensors. The ticket will not show templates which were not applied.
Discovery Schedule	Define when PRTG will run the auto-discovery. Choose between: ▪ **Once**: Perform auto-discovery only once. PRTG will add new devices and sensors once. You can run auto-discovery manually any time using an object's context menu [186]. ▪ **Hourly**: Perform auto-discovery for new devices and sensors every 60 minutes. Note: Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour. ▪ **Daily**: Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the **Auto-Discovery Settings** section of the System Administration—Monitoring [2875] settings. ▪ **Weekly**: Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the **Auto-Discovery Settings** section of the System Administration—Monitoring [2875] settings.
IP Selection Method	Define how you want to define the IP range for auto-discovery. Choose between: ▪ **Class C base IP with start/end (IPv4)**: Define an IPv4 class C address range. ▪ **List of individual IPs and DNS names (IPv4)**: Enter a list of individual IPv4 addresses or DNS names. ▪ **IP and Subnet (IPv4)**: Enter an IPv4 address and subnet mask. ▪ **IP with octet range (IPv4)**: Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges. ▪ **List of individual IPs and DNS names (IPv6)**: Enter a list of individual IPv6 addresses or DNS names. ▪ **Use computers from the active directory (maximum 1000 computers)**: Search in the active directory for computers to perform auto-discovery. Note: Define your active directory domain in advance in the system administration. See System Administration—Core & Probes [2887].

	Note: Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.
IPv4 Base	This field is only visible if you select Class C network detection above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, **192.168.0**
IPv4 Range Start	This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter **1** to discover from **192.168.0.1**.
IPv4 Range End	This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter **254** to discover up to **192.168.0.254**.
IPv4/DNS Name List IPv6/DNS Name List	This field is only visible if you select the IP list option above. Enter a list of IP addresses or DNS names which the auto-discovery will scan. Enter each address in a separate line.
IPv4 and Subnet (IPv4)	This field is only visible if you select the IP and subnet option above. Enter an expression in the format **address/subnet**, for example, 192.168.3.0/255.255.255.0. You can also use the short form like 192.168.3.0/24 in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.
IP with Octet Range	This field is only visible if you select the octet range option above. Enter an expression in the format **a1.a2.a3.a4**, where a1, a2, a3, and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127. All permutations of all ranges are calculated. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG will scan during auto-discovery.
Organizational Unit	This field is only visible if you select active directory above. Enter an organizational unit (OU) to restrict the active directory search to computers which are part of this OU. Just enter the name of the OU without any other term (so without "OU" in front). If you leave this field empty, there will not be any restriction. If you have sub-OUs, consider the correct syntax in the format **Y,OU=X**: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by ,OU= and the name of the parent OU. Examples:

	▪ Assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be Y,OU=X ▪ For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be Z,OU=Y,OU=X Note: The order is important, sub-OUs have to be listed left of their particular parents!
Name Resolution	Define how to monitor newly discovered devices. This affects only new devices. The setting for existing devices will remain unchanged. Depending on your selection the **IP Address/DNS Name** field of an added device 324 shows the DNS name or IP address which PRTG uses to access the target device. Choose between: ▪ **Use DNS names (recommended)**: Monitor newly discovered devices via their DNS names (if available). ▪ **Use IP addresses**: Monitor newly discovered devices via their IP address. We recommend that you use the default value. Note: This setting does not affect how PRTG shows the devices in the device tree.
Device Rescan	Define if you want to add devices that already exist in your PRTG installation also to the currently selected group. Choose between: ▪ **Skip auto-discovery for known devices/IPs (recommended)**: Do not re-scan known devices or IP addresses, but only add devices with new IPs or DNS names when auto-discovering. PRTG will not add devices that are already included elsewhere in your configuration, for example, in other groups. ▪ **Perform auto-discovery for known devices/IPs**: Re-scan devices with known IP addresses with every auto-discovery. This option will add devices that already exist, for example, in other groups also to this group and runs the auto-discovery on the newly added devices. Note: The auto-discovery will not run on devices that already exist. If you want to run the auto-discovery for an existing device, you have to start the auto-discovery on this device. We recommend that you use the default value.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

If you have not set credentials yet, set them now before starting the auto-discovery to fully exploit the power of this feature!

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

	Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.
For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Engine	Select the method you want to use to access data with SSH sensors 3008. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers. ▪ **HTTP**: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between:

CREDENTIALS FOR VMWARE/XENSERVER

- **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.
- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

For Databases Use Port

Define which ports PRTG will use for connections to the monitored databases. Choose between:

- **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.
- **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- Microsoft SQL: 1433
- MySQL: 3306
- Oracle SQL: 1521
- PostgreSQL: 5432

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Port	Enter the number of the port that PRTG will use for database connections. Please enter an integer value. Note: All your database sensors will use this port to connect!
Authentication	Select the authentication method for the connection to the SQL database. Choose between: ▪ **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings 329 for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation. ▪ **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.
User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

CREDENTIALS FOR SNMP DEVICES

SNMP Version	Select the SNMP version for the device connection. Choose between: ▪ **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP. ▪ **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters. ▪ **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption. Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.
Community String	This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.
Authentication Type	This setting is only visible if you select SNMP version v3 above. Choose between: ▪ **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ **SHA**: Use Secure Hash Algorithm (SHA) for authentication. The type you choose must match the authentication type of your device. Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

CREDENTIALS FOR SNMP DEVICES

Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2896 settings.

Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Auto-Discovery in Progress

While auto-discovery is running you may experience a lower system performance as usual, because PRTG works in the background to discover your network. Depending on the IP ranges defined (up to 65,536 addresses), the discovery may run up to several days before complete. You can review the status of the discovery process as follows:

- In the device tree, behind the group or device name, you will see a percentage value showing the progress of auto-discovery.
- During auto-discovery, the web interface will display a box in the lower right corner that shows the number of active auto-discovery tasks.
- To stop a running auto-discovery, right-click the group or device, and select **Pause | For 5 minutes...** from the context menu 186. PRTG will pause 185 monitoring for 5 minutes and stops auto-discovery tasks.

6.2 Create Objects Manually

We recommend using the auto-discovery 219 function to create a basic monitoring setup for your network. Afterwards, you can manually create devices that could not be discovered, or arrange 2739 detected devices in groups.

The procedure depends on the kind of object you want to add. Choose between:

- **Add a Group** 237
- **Add a Device** 244
- **Add a Sensor** 256

Add a Remote Probe

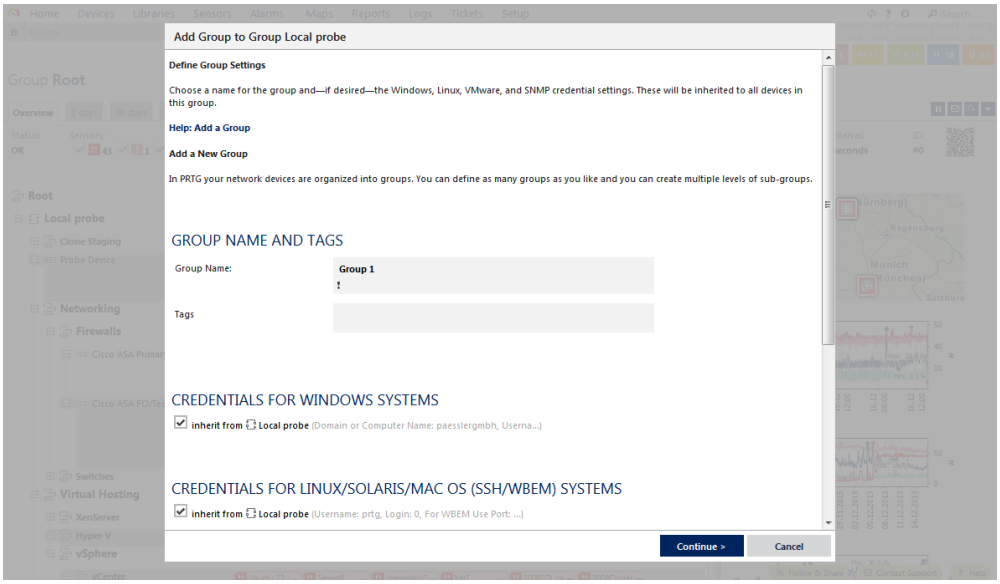
Please see **Multiple Probes and Remote Probes** 3108 section for more information.

6.2.1 Add a Group

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

In order to add a group manually, select **Devices | Add Group** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Group...** in the context menu 186 of a probe or group to which you want to add the new group. This will skip step 1 and lead you directly to step 2.

- **Step 1**
  Please choose a probe or group you want to add the new group to. Click on **Continue**.



Add Group Assistant Step 2

- **Step 2**
  Add group settings as described below.

Add Group Settings

GROUP NAME AND TAGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more tags. Confirm each tag by hitting the space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically inherited 96.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors 3008. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

- **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security.
- **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers. ▪ **HTTP**: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: ▪ **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.

CREDENTIALS FOR VMWARE/XENSERVER

- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
  Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

CREDENTIALS FOR SNMP DEVICES

	Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object that you are editing. A table with user groups and right is shown; it contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object does not show up in lists. ▪ **Read**: Users in this group can see the object and review its settings. ▪ **Write**: Users in this group can see the object, as well as review and edit its settings. However, they cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, as well as review and edit its settings as well as edit access rights. You can create new user groups in the **System Administration—User Groups** 2896 settings.

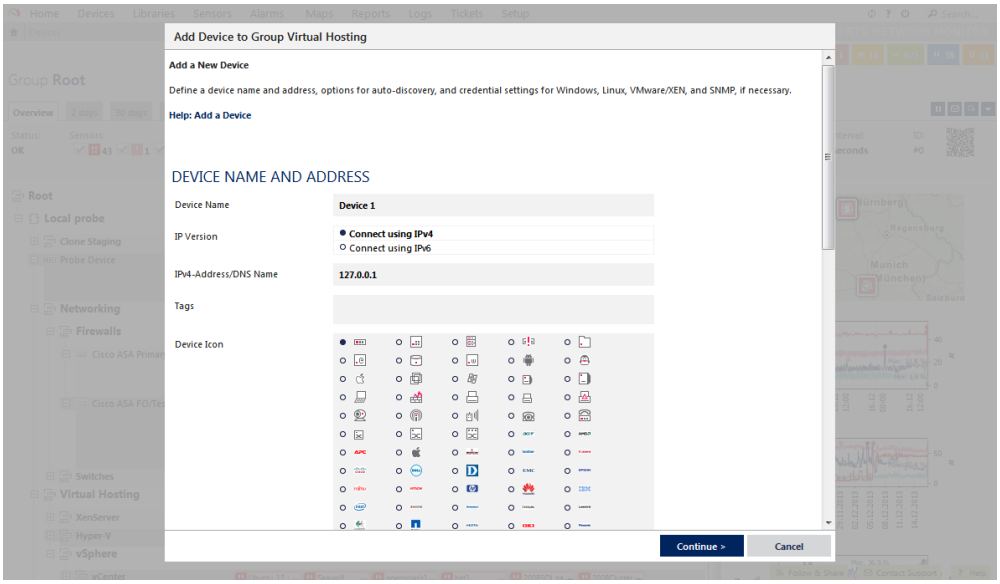
Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

6.2.2 Add a Device

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

To manually add a device, select **Devices | Add Device** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Device...** in the context menu[186] of a group to which you want to add the new device. This will skip step 1 and lead you directly to step 2.

- **Step 1**
  Please choose a group you want to add the new device to. Click on **Continue**.



Add Device Assistant Step 2

- **Step 2**
  Add device settings as described below.

Add Device Settings

DEVICE NAME AND ADDRESS

Device Name	Enter a meaningful name to identify the device. The name will be shown by default in the device tree and in all alarms.
IP Version	Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between: ▪ **Connect using IPv4**: Use IP version 4 for all requests to this device.

DEVICE NAME AND ADDRESS

	▪ **Connect using IPv6**: Use IP version 6 for all requests to this device.
IP Address/DNS Name	Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors created on this device will inherit this setting and they will try to connect to this address for monitoring. Note: There are some sensor types that still have their own setting for IP address/DNS name. Those sensors will use their own settings.
Tags	Enter one or more tags; confirm each tag by hitting space, comma, or enter key. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. Tags are automatically inherited 96.
Device Icon	Choose a device icon from the list. It will be shown in the device tree.

DEVICE TYPE

Sensor Management	Select which type of auto-discovery you would like to perform for this device. Choose between: ▪ **Manual (no auto-discovery)**: Do not auto-discover any sensors, but only add sensors manually. ▪ **Automatic device identification (standard, recommended)**: Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device. ▪ **Automatic device identification (detailed, may create many sensors)**: Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device. ▪ **Automatic sensor creation using specific device templates**: Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.
Discovery Schedule	This option is only visible if one of the auto-discovery options is selected above. Define when the auto-discovery will be run. Choose between: ▪ **Once**: Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device.

DEVICE TYPE

- **Hourly**: Perform auto-discovery for new sensors every hour.
- **Daily**: Perform auto-discovery for new sensors every day.
- **Weekly**: Perform auto-discovery for new sensors every week.

Device Template(s)

This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from:

- **ADSL**
- **Amazon Cloudwatch**
- **Cisco ASA VPN**
- **Cisco Device (Generic)**
- **Dell MDI Disk**
- **DNS Server**
- **Environment Jacarta**
- **Environment Poseidon**
- **Fritzbox**
- **FTP Server**
- **Generic Device (PING only)**
- **Generic Device (SNMP-enabled)**
- **Generic Device (SNMP-enabled, Detailed)**
- **HTTP Web Server**
- **Hyper V Host Server**
- **Linux/UNIX Device (SNMP or SSH enabled)**
- **Mail Server (Generic)**
- **Mail Server (MS Exchange)**
- **Microsoft Sharepoint 2010**
- **NAS LenovoEMC**
- **NAS QNAP**
- **NAS Synology**
- **NetApp**

DEVICE TYPE

- **NTP Server**
- **Printer (HP)**
- **Printer (Generic)**
- **RDP Server**
- **RMON compatible device**
- **Server (Compaq/HP agents)**
- **Server (Dell)**
- **Sever Cisco UCS**
- **Server IBM**
- **SonicWALL**
- **SSL Security Check**
- **Switch (Cisco Catalyst)**
- **Switch (Cisco IOS Based)**
- **Switch (HP Procurve)**
- **UNIX/Linux Device**
- **UPS (APC)**
- **Virtuozzo Server**
- **VMware ESX / vCenter Server**
- **Webserver**
- **Windows (Detailed via WMI)**
- **Windows (via Remote Powershell)**
- **Windows (via WMI)**
- **Windows IIS (via SNMP)**
- **XEN Hosts**
- **XEN Virtual Machines**

Once the auto-discovery is finished, PRTG will create a new ticket 171 and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors 3008. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

- **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security.
- **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers. ▪ **HTTP**: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: ▪ **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.

CREDENTIALS FOR VMWARE/XENSERVER

- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
  Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

CREDENTIALS FOR SNMP DEVICES

	Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

For Databases Use Port	Define which ports PRTG will use for connections to the monitored databases. Choose between: ▪ **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. If you choose the automatic port selection, PRTG uses the following default ports: ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432
Port	Enter the number of the port that PRTG will use for database connections. Please enter an integer value. Note: All your database sensors will use this port to connect!
Authentication	Select the authentication method for the connection to the SQL database. Choose between: ▪ **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings 329 for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

	▪ **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.
User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

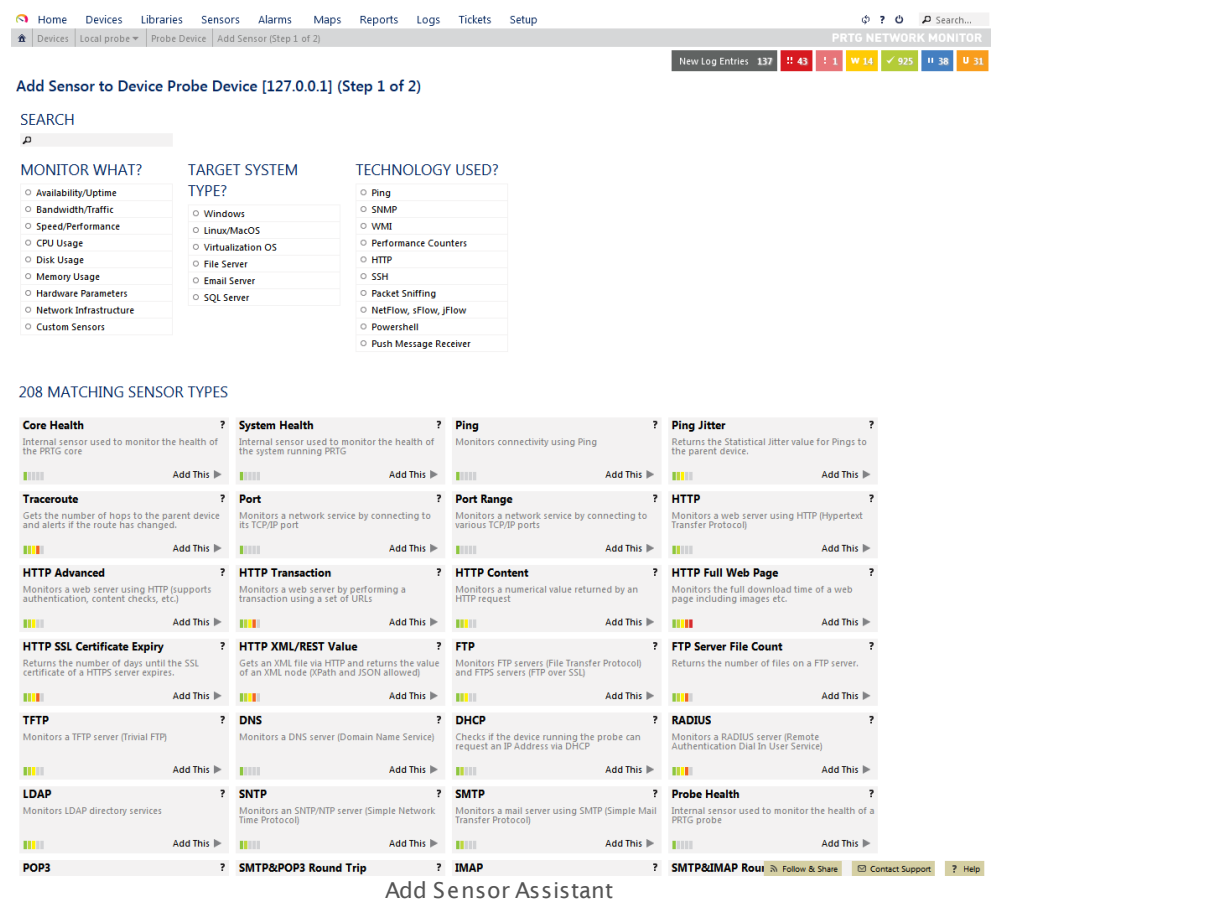
Click the **Continue** button to save your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

6.2.3 Add a Sensor

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

In order to add a sensor manually, select **Sensors | Add Sensor** from the main menu. An assistant will appear, leading you through two steps. For faster setup, you can select **Add Sensor...** in the context menu 186 of a device to which you want to add the new sensor. This will skip step 1 and lead you directly to step 2.

- **Step 1**
  Please select **Add sensor to an existing device** and choose a device you want to add the new sensor to. Click on **Continue**.



Add Sensor Assistant

- **Step 2**
  The **Add Sensor** assistant is shown (see screenshot above). Select a sensor you want to add and enter the needed settings. You can filter the listed sensors by type, by target system, and by the used technology. You can choose one aspect per filter. Alternatively or additionally, you can use the live search by typing in a key term (or a substring) in the **Search** box. PRTG also suggests sensor types to create on the selected device; this recommendation is automatically calculated based on the current user's sensor usage and shows the ten commonest sensor types by default (if enough sensor types are already in use). The chosen filter also applies to the recommendation. See section **More** if you want to adjust the number of most used sensor types which are shown here or to hide this option completely.

  For more information about a sensor type, please see the manual section of the respective sensor. See **List of Available Sensor Types** 348 section to find detailed information about every sensor type.

Knowledge Base: How can I change the number of entries in most used sensor types?

- http://kb.paessler.com/en/topic/59788

6.3 Manage Device Tree

While viewing the device tree (or parts of it), click on the **Management** tab to enter a different tree view which shows your devices and sensors in a less colorful way. While in this view, you can move monitoring objects using drag&drop in your browser window. You can also view and edit object settings by selecting it. Changes take effect immediately. When done, leave the **Management** tab.

In order to arrange objects in the tree, you have the following options:

Drag&Drop a Sensor

You can either move a sensor within the same device, or clone a sensor to another device.

- Within the same device, drag any sensor and drop it to the place where you want to have it. A shade will show the future position. When dropping, the sensor will be moved to this position and existing sensors will be lined up after it. This is a very easy way to reposition your sensors.

- Drag any sensor from one device and drop it on another to clone a sensor. This will create the same sensor type, with the same settings, on the new device, while maintaining the original sensor. A shade will show the future position. Note: Cloned sensors are put to **Pause** status initially to give you the chance to change any settings before monitoring begins. Please check the settings 159 and resume 185 monitoring.

Note: You cannot clone 'fixed' objects, such as the root group or a probe device.

Note: In order to clone entire groups or devices, please use the **Clone Object** 274 functionality accessible via the objects' Context Menu 186.

Drag&Drop a Group or Device

You can change a group's or device's position by using drag&drop.

- Within the same probe or group, drag any group or device and move it up or down in the device tree. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to this position and existing probes, groups, and devices will be lined up underneath. This is a very easy way to reposition your groups or devices.

- Drag any group or device from one probe or group and drop it on another probe or group. A small red arrow will appear, showing the future position. When dropping, the group or device will be moved to the new probe or group. Existing groups and devices will be lined up underneath. This is a very easy way to change the probe a group or device is part of, or to add groups or devices to other groups.

Note: The **Local Probe** and Remote Probes cannot be moved.

Multi-Edit Object Properties

You can use Multi-Edit for object settings:

- Hold down the Ctrl key and select multiple groups, devices, or sensors (one of a kind).
- In the appearing dialog, select the settings you want to edit, change the according values, and click **Save**. The changes will be applied to all selected objects.

The dialog is the same as described in the **Multi-Edit** 2744 (Edit Settings) section.

Related Topics

For other ways to arrange objects, please see

- **Arrange Objects** 2739
- **Create Device Template** 2747
- **Clone Object** 2740

6.4 Root Group Settings

On the **Root** group's overview page, click on the **Settings** tab to change settings.

The Root Group is Special

The **Root** group is the highest instance in the object hierarchy of your PRTG setup and parent to all other objects. Therefore, all objects inherit settings from the **Root** group. If you define important settings on this high level, work will be easier later on. So, before you create your own sensors, it is a good idea to review the **Root** group's settings to ensure they suit your network. There are already reasonable presets made with installation.

Note: If necessary, you can override every setting for every single child object later. To do so, simply disable the respective **Inherit** option of an object.

Root Group Settings

The following settings are available in the **Settings** tab. As you may not need all of these, just regard those settings you really need and ignore the others. All settings you define here can easily be inherited to all other objects in your setup.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

BASIC GROUP SETTINGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	Define if monitoring for this group is started or paused. Choose between: ▪ **Started**: Monitor this group. ▪ **Paused**: Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.

LOCATION

Location (for geo maps)	When you want to use **Geo Maps** 2753, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the sensor status icons 135 (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: 49.452778 11.077778 or enter 49.452778 any 11.077778 text A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following. You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.
For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors 3008. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR VMWARE/XENSERVER

Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.

VMware Protocol

Define the protocol used for the connection to VMware and XenServer. Choose between:

- **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers.
- **HTTP**: Use an unencrypted connection to VMware and XenServers.

Session Pool

Define if you want to use session pooling for VMware sensors. Choose between:

- **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.
- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
  Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

CREDENTIALS FOR SNMP DEVICES

	Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.
Community String	This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.
Authentication Type	This setting is only visible if you select SNMP version v3 above. Choose between: ▪ **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ **SHA**: Use Secure Hash Algorithm (SHA) for authentication. The type you choose must match the authentication type of your device. Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.

CREDENTIALS FOR SNMP DEVICES

Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

For Databases Use Port	Define which ports PRTG will use for connections to the monitored databases. Choose between: ▪ **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

- **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors.

If you choose the automatic port selection, PRTG uses the following default ports:

- Microsoft SQL: 1433
- MySQL: 3306
- Oracle SQL: 1521
- PostgreSQL: 5432

Port

Enter the number of the port that PRTG will use for database connections. Please enter an integer value.

Note: All your database sensors will use this port to connect!

Authentication

Select the authentication method for the connection to the SQL database. Choose between:

- **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings 329 for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.
- **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.

User

This field is only visible if you select SQL server authentication above. Enter the username for the database connection.

Password

This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.

Timeout (Sec.)

Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.

Preferred Data Source	Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between: ▪ **Performance Counters and fallback to WMI (recommended)**: Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality. ▪ **Performance Counters only**: Query data via performance counters only. If this is not possible, a sensor will return no data. ▪ **WMI only**: Query data via WMI only. If this is not possible, a sensor will return no data.
Timeout Method	Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between: ▪ **Use 1.5x scanning interval (recommended)**: Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ **Set manually**: Enter a timeout value manually. We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.

WINDOWS COMPATIBILITY OPTIONS

Timeout Value (Sec.)	This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.
Failed Requests	Define if an SNMP sensor will try again after a request fails. ▪ **Retry (recommended)**: Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures. ▪ **Do not retry**: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks. ▪ **Ignore overflow values (recommended)**: Ignore overflow values and do not include them in the monitoring data. ▪ **Handle overflow values as valid results**: Regard all overflow values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.
Zero Values	Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks. ▪ **Ignore zero values for delta sensors (recommended)**: Ignore zero values and do not include them in the monitoring data.

SNMP COMPATIBILITY OPTIONS

- **Handle zero values as valid results for delta sensors**: Regard all zero values as regular data and include them in the monitoring data.

We recommend that you use the default value. If you experience problems, change this option.

32-bit/64-bit Counters

Define which kind of traffic counters PRTG will search for on a device.

- **Use 64-bit counters if available (recommended)**: The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.
- **Use 32-bit counters only**: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.

We recommend that you use the default value. If you experience problems, change this option.

Request Mode

Define which kind of request method PRTG uses for SNMP sensors.

- **Use multi get (recommended)**: Bundle multiple SNMP requests into one request.
- **Use single get**: Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

Note: PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

Port Name Template

Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as (001) Ethernet1, for example. You can use any field names available at a certain OID of your device, among which are:

- **[port]**: The port number of the monitored interface.
- **[ifalias]**: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.

SNMP COMPATIBILITY OPTIONS

- **[ifname]**: The textual name of the monitored interface as assigned by the local device.
- **[ifdescr]**: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.
- **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]**: The type of the sensor, this is SNMP Traffic or SNMP RMON. This is useful to differentiate between your SNMP Traffic 2071 and SNMP RMON 2010 sensors.

Combine them as you like to obtain suitable sensor names. See the **More** section below for more information about SNMP sensor names.

Port Name Update

Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:

- **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see **More** section below.

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. Note: ifName will not be tried automatically.
- **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. Note: When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName**: You can also use this option if there is no unique ifAlias available. Note: When using this option it is important that your device returns unique interface names in the ifName field.
- **No Port Update**: Use this option to disable automatic port identification.

SNMP COMPATIBILITY OPTIONS

Start Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
End Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
SNMP Debug Log	Define if you want to create an SNMP log file for debugging purposes. We recommend this only for debugging low level SNMP issues. Choose between: ▪ **No log (recommended)**: No SNMP debug log file will be created. ▪ **Enable debug log**: An SNMP log file is written to the Logs (Debug) directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window.
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.

Dependency settings are available only in Probe Settings 278, Group Settings 299, Device Settings 324, and Sensor Settings 347.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Unusual Detection	Define if you want to benefit from unusual detection [2872] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the system settings [2872]. Choose between: ▪ **Enabled**: Activate unusual detection for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. Sensors affected by this setting will turn to orange color (unusual sensor status [135]) if PRTG detects unusual activity. ▪ **Disabled**: Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensor will not show an unusual sensor status.
Similar Sensors Detection	Define if you want to activate **Similar Sensors** [151] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the system settings [2874]. Choose between: ▪ **Enabled**: Activate similar sensors detection for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis. ▪ **Disabled**: Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
System Information	Define if you want to retrieve and show **System Information** [164] for your devices. Choose between: ▪ **Enabled**: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. ▪ **Disabled**: Do not activate system information.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see **Sensor Notifications Settings** [2719] section.

Others

For more general information about settings, please see **Object Settings** 159 section.

6.5 Probe Settings

On a probe's overview page, click on the **Settings** tab to change settings.

Add Remote Probe

You can add additional remote probes to your setup to extend you monitoring to networks that are not directly reachable by your PRTG core installation or cluster.

See **Add Remote Probe** 3108 for more details.

Probe Settings

The following settings are available in the **Settings** tab of every probe. As you may not need all of these for every probe, just regard those settings you really need, ignoring the others.

We recommend that you define as many settings as possible in the **Root** 260 group, so you can inherit them to all other objects further down in the device tree hierarchy 89.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

BASIC PROBE SETTINGS

Probe Name	Enter a meaningful name to identify the probe. The name will be shown by default in the devices tree and in all alarms.
Tags	Enter one or more **Tags** 96. Confirm each tag by hitting space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.
Status	Choose if monitoring for this probe is started or paused. ▪ **Started**: Monitor this probe. ▪ **Paused**: Pause monitoring for this probe. All sensors on all devices on this probe will be paused until this setting is changed again.
Priority	Select a priority for the probe. This setting determines where the probe will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

LOCATION

Location (for geo maps)	When you want to use **Geo Maps** 2753, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the sensor status icons 135 (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: 49.452778 11.077778 or enter 49.452778 any 11.077778 text A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following. You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.
For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

	Note: By default, PRTG uses this setting automatically for all SSH sensors [353], unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors [3008]. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers. ▪ **HTTP**: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: ▪ **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance. ▪ **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version	Select the SNMP version for the device connection. Choose between: ▪ **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.

CREDENTIALS FOR SNMP DEVICES

- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

User

This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

Password

This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type

This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:

- **DES**: Use Data Encryption Standard (DES) as encryption algorithm.

CREDENTIALS FOR SNMP DEVICES

	▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

For Databases Use Port	Define which ports PRTG will use for connections to the monitored databases. Choose between:

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

	▪ **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. If you choose the automatic port selection, PRTG uses the following default ports: ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432
Port	Enter the number of the port that PRTG will use for database connections. Please enter an integer value. Note: All your database sensors will use this port to connect!
Authentication	Select the authentication method for the connection to the SQL database. Choose between: ▪ **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings 329 for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation. ▪ **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.
User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.

Preferred Data Source	Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between: ▪ **Performance Counters and fallback to WMI (recommended)**: Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality. ▪ **Performance Counters only**: Query data via performance counters only. If this is not possible, a sensor will return no data. ▪ **WMI only**: Query data via WMI only. If this is not possible, a sensor will return no data.
Timeout Method	Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between: ▪ **Use 1.5x scanning interval (recommended)**: Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ **Set manually**: Enter a timeout value manually. We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.

WINDOWS COMPATIBILITY OPTIONS

Timeout Value (Sec.)

This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)

Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.

Failed Requests

Define if an SNMP sensor will try again after a request fails.

- **Retry (recommended)**: Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.
- **Do not retry**: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.

Overflow Values

Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks.

- **Ignore overflow values (recommended)**: Ignore overflow values and do not include them in the monitoring data.
- **Handle overflow values as valid results**: Regard all overflow values as regular data and include them in the monitoring data.

We recommend that you use the default value. If you experience problems, change this option.

Zero Values

Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks.

- **Ignore zero values for delta sensors (recommended)**: Ignore zero values and do not include them in the monitoring data.

SNMP COMPATIBILITY OPTIONS

- **Handle zero values as valid results for delta sensors**: Regard all zero values as regular data and include them in the monitoring data.

We recommend that you use the default value. If you experience problems, change this option.

32-bit/64-bit Counters

Define which kind of traffic counters PRTG will search for on a device.

- **Use 64-bit counters if available (recommended)**: The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.
- **Use 32-bit counters only**: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.

We recommend that you use the default value. If you experience problems, change this option.

Request Mode

Define which kind of request method PRTG uses for SNMP sensors.

- **Use multi get (recommended)**: Bundle multiple SNMP requests into one request.
- **Use single get**: Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

Note: PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

Port Name Template

Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as (001) Ethernet1, for example. You can use any field names available at a certain OID of your device, among which are:

- **[port]**: The port number of the monitored interface.
- **[ifalias]**: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.

SNMP COMPATIBILITY OPTIONS

- **[ifname]**: The textual name of the monitored interface as assigned by the local device.
- **[ifdescr]**: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.
- **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]**: The type of the sensor, this is SNMP Traffic or SNMP RMON. This is useful to differentiate between your SNMP Traffic 2071 and SNMP RMON 2010 sensors.

Combine them as you like to obtain suitable sensor names. See the **More** section below for more information about SNMP sensor names.

Port Name Update

Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between:

- **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually.
- **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see **More** section below.

Port Identification

Define which field will be used for SNMP interface identification. Choose between:

- **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. Note: ifName will not be tried automatically.
- **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names.
- **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. Note: When using this option it is important that your device returns unique interface names in the ifDescr field.
- **Use ifName**: You can also use this option if there is no unique ifAlias available. Note: When using this option it is important that your device returns unique interface names in the ifName field.
- **No Port Update**: Use this option to disable automatic port identification.

SNMP COMPATIBILITY OPTIONS

Start Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
End Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
SNMP Debug Log	Define if you want to create an SNMP log file for debugging purposes. We recommend this only for debugging low level SNMP issues. Choose between: ▪ **No log (recommended)**: No SNMP debug log file will be created. ▪ **Enable debug log**: An SNMP log file is written to the Logs (Debug) directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Scanning Distribution	This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will not be included in sensor scans. By default, this setting is inherited 94 to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window.
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Use parent**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. ▪ **Select object**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector 181 to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Unusual Detection	Define if you want to benefit from unusual detection 2872 for sensors. You can configure the behavior of unusual detection (or disable it completely) in the system settings 2872. Choose between: ▪ **Enabled**: Activate unusual detection for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. Sensors affected by this setting will turn to orange color (unusual sensor status 135) if PRTG detects unusual activity. ▪ **Disabled**: Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensor will not show an unusual sensor status.
Similar Sensors Detection	Define if you want to activate **Similar Sensors** 151 analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the system settings 2874. Choose between: ▪ **Enabled**: Activate similar sensors detection for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. PRTG considers all sensors affected by this setting during similarity analysis. ▪ **Disabled**: Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
System Information	Define if you want to retrieve and show **System Information** 164 for your devices. Choose between: ▪ **Enabled**: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. ▪ **Disabled**: Do not activate system information.

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

Define the IP address used for outgoing monitoring requests.

- If there is more than one IP on the current system available, you can specify the IP address that will be used for outgoing monitoring requests of certain sensor types.
- The setting is valid for all monitoring requests sent from this PRTG probe.
- This setting will be used for sensors using the following connection types: HTTP, DNS, FTP, IMAP, POP3, Port, Remote Desktop, SMTP, and SNMP. Note: This feature does not support all sensor types for technical reasons.

ADMINISTRATIVE PROBE SETTINGS / PROBE SETTINGS FOR MONITORING

- This is useful for devices that expect a certain IP address when queried.
- Default setting is **auto**. PRTG will select an IP address automatically.

Note: If you change this setting, some sensors might stop working. For example, sensors might show a **Down** status if the selected IP address is blocked on the way to or directly on the monitored device.

Outgoing IPv4	Define the IP address for outgoing requests using the IPv4 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**.
Outgoing IPv6	Define the IP address for outgoing requests using the IPv6 protocol. The list shows all IP addresses available on the current system. Choose a specific IP address or select **auto**. For details about the basic concept of IPv6 in PRTG, please see **IPv6** 105 section.

Cluster Connectivity	This box is only visible if you run a PRTG cluster. Define if this probe connects to all cluster nodes, including the failover nodes, or only to the primary master node. Choose between: ▪ **Probe sends data only to primary master node**: The probe connects only to the primary master node. You are not able to review monitoring data on failover nodes. Consider to choose this option if you have bandwidth limitations in your network or if the probe cannot access your failover node(s). ▪ **Probe sends data to all cluster nodes**: This is the default option. The probe connects to all nodes in your cluster and sends monitoring data to the failover node(s) in addition to the primary master. The probe is visible on all your nodes as soon as it connects automatically to the correct IP addresses and ports of the failover nodes. If your master node fails, you can still see monitoring data of this probe. Note: PRTG will not notify you if a remote probe is disconnected from a cluster node. Please check explicitly on a cluster node if your remote probes are connected (for example, via the device tree in the PRTG web interface on a cluster node).

SCHEDULED RESTART SETTINGS

Restart Options	For best performance, we recommend that you regularly restart the Windows servers on which PRTG is running. To do this automatically for PRTG, you can schedule an automatic restart. Choose between the following options: ▪ **No scheduled reboot or service restart**: Do not perform any scheduled restart of services automatically. We recommend a manual restart every few weeks. You can initiate a restart of your PRTG core server and probes under **System Administration—Administrative Tools** 2900 in the PRTG web interface. ▪ **Scheduled restart of PRTG services**: Restart all PRTG services on the system where this probe runs on. If you choose this option on the local probe, the PRTG core server will restart as well. Define a schedule below. ▪ **Scheduled system reboot (recommended)**: This is the recommended setting, although not set by default. Enter a schedule below. We recommend restarting Windows servers once a month for best performance.
Restart Schedule	This setting is only visible if you selected a schedule option above. Choose how often you want to restart PRTG services or the Windows server: ▪ **Once per week**: Select a weekday and time below. ▪ **Once per month (recommended)**: Select a day of month and time below.
Specify Day	This setting is only visible if you selected a schedule option above. Select a specific day of a week (Monday to Sunday) resp. month (1st to 30th resp. Last). If you select **Last**, the restart will always be executed on the last day of the month, regardless of how many days the month has. Note: If you select a date that does not exist in every month (for example, the 30th day in February), PRTG will automatically initiate the restart on the last day of this month.
Specify Hour	This setting is only visible if you selected a schedule option above. Select the time of day when PRTG will perform the restart. Note: A Windows warning message will be displayed 10 minutes before restart to inform a logged in user. The actual restart time can differ up to 30 minutes from the settings you enter below!

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see **Object Settings** 159 section.

6.6 Group Settings

On a group's overview page, click on the **Settings** tab to change settings.

Add Group

The **Add Group** dialog appears when adding a new group to a parent group. It only shows the setting fields that are imperative for creating the group. Therefore, you will not see all setting fields in this dialog. For example, the **Group Status** option is not available in this step.

You can change all settings in the group's **Settings** tab later.

Group Settings

The following settings are available in the **Settings** tab of every group. As you may not need all of these for every group, just regard those settings you really need, ignoring the others.

Note: This documentation does not refer to the setting of the special **Root** group. The settings available there differ from those described here.

We recommend that you define as many settings as possible in the **Root** 260 group, so you can inherit them to all other objects further down in the device tree hierarchy 89.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

BASIC GROUP SETTINGS

Group Name	Enter a meaningful name to identify the group. The name will be shown by default in the devices tree and in all alarms.
Status	Choose if monitoring for this group is started or paused. .We recommend that you use the default value. You can add additional tags to it, if you like. ▪ **Started**: Monitor this group. ▪ **Paused**: Pause monitoring for this group. All sensors on all devices in this group will be paused until this setting is changed again.
Parent Tags	Shows **Tags** 96 that this group inherits 96 from its parent probe 89. This setting is shown for your information only and cannot be changed here.

BASIC GROUP SETTINGS

Tags	Enter one or more **Tags** 96. Confirm each tag by hitting space, comma, or enter key. You can use tags to group objects and use tag-filtered views later on. Tags are not case sensitive.
Priority	Select a priority for the group. This setting determines where the group will be placed in list views. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

GROUP TYPE

Sensor Management	Select which type of auto-discovery you would like to perform for this group. Choose between: ▪ **Manual (no auto-discovery)**: Do not auto-discover any sensors, but only add sensors manually. ▪ **Automatic device identification (standard, recommended)**: Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device. ▪ **Automatic device identification (detailed, may create many sensors**: Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device. ▪ **Automatic sensor creation using specific device templates**: Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.
Device Template(s)	This option is only visible if you enable using specific device templates above. Choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. PRTG will use the selected templates for auto-discovery on the current device. Choose from: ▪ **ADSL** ▪ **Amazon Cloudwatch** ▪ **Cisco ASA VPN** ▪ **Cisco Device (Generic)** ▪ **Dell MDI Disk**

- DNS Server
- Environment Jacarta
- Environment Poseidon
- Fritzbox
- FTP Server
- Generic Device (PING only)
- Generic Device (SNMP-enabled)
- Generic Device (SNMP-enabled, Detailed)
- HTTP Web Server
- Hyper V Host Server
- Linux/UNIX Device (SNMP or SSH enabled)
- Mail Server (Generic)
- Mail Server (MS Exchange)
- Microsoft Sharepoint 2010
- NAS LenovoEMC
- NAS QNAP
- NAS Synology
- NetApp
- NTP Server
- Printer (HP)
- Printer (Generic)
- RDP Server
- RMON compatible device
- Server (Compaq/HP agents)
- Server (Dell)
- Sever Cisco UCS
- Server IBM
- SonicWALL
- SSL Security Check
- Switch (Cisco Catalyst)
- Switch (Cisco IOS Based)
- Switch (HP Procurve)
- UNIX/Linux Device

	▪ **UPS (APC)** ▪ **Virtuozzo Server** ▪ **VMware ESX / vCenter Server** ▪ **Webserver** ▪ **Windows (Detailed via WMI)** ▪ **Windows (via Remote Powershell)** ▪ **Windows (via WMI)** ▪ **Windows IIS (via SNMP)** ▪ **XEN Hosts** ▪ **XEN Virtual Machines** Once the auto-discovery is finished, PRTG will create a new ticket [171] and list the device templates which it used to create new sensors. The ticket will not show templates which were not applied.
Discovery Schedule	Define when PRTG will run the auto-discovery. Choose between: ▪ **Once**: Perform auto-discovery only once. PRTG will add new devices and sensors once. You can run auto-discovery manually any time using an object's context menu [186]. ▪ **Hourly**: Perform auto-discovery for new devices and sensors every 60 minutes. Note: Please use this option with caution! Frequently executed auto-discoveries might cause performance issues, especially when large network segments are scanned every hour. ▪ **Daily**: Perform auto-discovery for new devices and sensors every 24 hours. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the **Auto-Discovery Settings** section of the System Administration—Monitoring [2875] settings. ▪ **Weekly**: Perform auto-discovery for new devices and sensors every 7 days. The first auto-discovery will run immediately, all other discoveries will start on the time defined in the **Auto-Discovery Settings** section of the System Administration—Monitoring [2875] settings.
IP Selection Method	Define how you want to define the IP range for auto-discovery. Choose between: ▪ **Class C base IP with start/end (IPv4)**: Define an IPv4 class C address range. ▪ **List of individual IPs and DNS names (IPv4)**: Enter a list of individual IPv4 addresses or DNS names.

	▪ **IP and Subnet (IPv4)**: Enter an IPv4 address and subnet mask. ▪ **IP with octet range (IPv4)**: Enter an IPv4 address range for every IP octet individually. With this, you can define very customizable IP ranges. ▪ **List of individual IPs and DNS names (IPv6)**: Enter a list of individual IPv6 addresses or DNS names. ▪ **Use computers from the active directory (maximum 1000 computers)**: Search in the active directory for computers to perform auto-discovery. Note: Define your active directory domain in advance in the system administration. See **System Administration—Core & Probes** 2887. Note: Only subnets with up to 65,536 IP addresses can be discovered! If you define a range with a higher number of addresses, discovery will stop before it is completed.
IPv4 Base	This field is only visible if you select Class C network detection above. Enter a class C network as IP base for the auto-discovery. Enter the first three octets of an IPv4 IP address, for example, **192.168.0**
IPv4 Range Start	This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above from which PRTG will start the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter **1** to discover from **192.168.0.1**.
IPv4 Range End	This field is only visible if you select Class C network detection above. Enter the IP octet of the class C network specified above at which PRTG will stop the auto-discovery. This will complete the IP base above to an IPv4 address. For example, enter **254** to discover up to **192.168.0.254**.
IPv4/DNS Name List IPv6/DNS Name List	This field is only visible if you select the IP list option above. Enter a list of IP addresses or DNS names which the auto-discovery will scan. Enter each address in a separate line.
IPv4 and Subnet (IPv4)	This field is only visible if you select the IP and subnet option above. Enter an expression in the format **address/subnet**, for example, 192.168.3.0/255.255.255.0. You can also use the short form like 192.168.3.0/24 in this example. PRTG will scan the complete host range (without network and broadcast address) defined by the IP address and the subnet mask.

IP with Octet Range	This field is only visible if you select the octet range option above. Enter an expression in the format **a1.a2.a3.a4**, where a1, a2, a3, and a4 are each a number between 0-255, or a range with two numbers and a hyphen like 1-127. All permutations of all ranges are calculated. For example, 10.0.1-10.1-100 results in 1,000 addresses that PRTG will scan during auto-discovery.
Organizational Unit	This field is only visible if you select active directory above. Enter an organizational unit (OU) to restrict the active directory search to computers which are part of this OU. Just enter the name of the OU without any other term (so without "OU" in front). If you leave this field empty, there will not be any restriction. If you have sub-OUs, consider the correct syntax in the format **Y,OU=X**: OUs that are part of another OU have to be listed together with their parent(s). Enter the sub-OU followed by ,OU= and the name of the parent OU. Examples: ▪ Assuming that the organizational unit 'Y' is part of the OU named 'X'. Then the syntax would be Y,OU=X ▪ For three OUs 'X', 'Y' part of 'X', and 'Z' part of 'Y', the syntax would be Z,OU=Y,OU=X Note: The order is important, sub-OUs have to be listed left of their particular parents!
Name Resolution	Define how to monitor newly discovered devices. This affects only new devices. The setting for existing devices will remain unchanged. Depending on your selection the **IP Address/DNS Name** field of an added device 324 shows the DNS name or IP address which PRTG uses to access the target device. Choose between: ▪ **Use DNS names (recommended)**: Monitor newly discovered devices via their DNS names (if available). ▪ **Use IP addresses**: Monitor newly discovered devices via their IP address. We recommend that you use the default value. Note: This setting does not affect how PRTG shows the devices in the device tree.
Device Rescan	Define if you want to add devices that already exist in your PRTG installation also to the currently selected group. Choose between: ▪ **Skip auto-discovery for known devices/IPs (recommended)**: Do not re-scan known devices or IP addresses, but only add devices with new IPs or DNS names when auto-discovering. PRTG will not add devices that are already included elsewhere in your configuration, for example, in other groups.

- **Perform auto-discovery for known devices/IPs**: Re-scan devices with known IP addresses with every auto-discovery. This option will add devices that already exist, for example, in other groups also to this group and runs the auto-discovery on the newly added devices.
  Note: The auto-discovery will not run on devices that already exist. If you want to run the auto-discovery for an existing device, you have to start the auto-discovery on this device.

We recommend that you use the default value.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

LOCATION

Location (for geo maps)

When you want to use **Geo Maps** 2753, enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the sensor status icons 135 (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: 49.452778 11.077778 or enter 49.452778 any 11.077778 text

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.
Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.
Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors 3008. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between:

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

- **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security.
- **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers. ▪ **HTTP**: Use an unencrypted connection to VMware and XenServers.
Session Pool	Define if you want to use session pooling for VMware sensors. Choose between: ▪ **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.

CREDENTIALS FOR VMWARE/XENSERVER

- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
  Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

CREDENTIALS FOR SNMP DEVICES

	Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- Microsoft SQL v2 Sensor 1075
- MySQL v2 Sensor 1090
- Oracle SQL v2 Sensor 1187
- PostgreSQL Sensor 1297

For Databases Use Port	Define which ports PRTG will use for connections to the monitored databases. Choose between: ▪ **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. If you choose the automatic port selection, PRTG uses the following default ports: ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432
Port	Enter the number of the port that PRTG will use for database connections. Please enter an integer value. Note: All your database sensors will use this port to connect!
Authentication	Select the authentication method for the connection to the SQL database. Choose between: ▪ **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings 329 for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

	▪ **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.
User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor 354 documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.

Preferred Data Source	Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between:

WINDOWS COMPATIBILITY OPTIONS

- **Performance Counters and fallback to WMI (recommended)**: Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality.
- **Performance Counters only**: Query data via performance counters only. If this is not possible, a sensor will return no data.
- **WMI only**: Query data via WMI only. If this is not possible, a sensor will return no data.

Timeout Method

Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between:

- **Use 1.5x scanning interval (recommended)**: Use a default of one and a half times the scanning interval set for the sensor (see below in this settings).
- **Set manually**: Enter a timeout value manually.

We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.

Timeout Value (Sec.)

This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP Delay (ms)

Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.

Failed Requests

Define if an SNMP sensor will try again after a request fails.

- **Retry (recommended)**: Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures.

SNMP COMPATIBILITY OPTIONS

	▪ **Do not retry**: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks. ▪ **Ignore overflow values (recommended)**: Ignore overflow values and do not include them in the monitoring data. ▪ **Handle overflow values as valid results**: Regard all overflow values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.
Zero Values	Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks. ▪ **Ignore zero values for delta sensors (recommended)**: Ignore zero values and do not include them in the monitoring data. ▪ **Handle zero values as valid results for delta sensors**: Regard all zero values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.
32-bit/64-bit Counters	Define which kind of traffic counters PRTG will search for on a device. ▪ **Use 64-bit counters if available (recommended)**: The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices. ▪ **Use 32-bit counters only**: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices. We recommend that you use the default value. If you experience problems, change this option.
Request Mode	Define which kind of request method PRTG uses for SNMP sensors. ▪ **Use multi get (recommended)**: Bundle multiple SNMP requests into one request. ▪ **Use single get**: Use one request for each SNMP value. This can increase compatibility with older devices.

SNMP COMPATIBILITY OPTIONS

	We recommend that you use the default value. If you experience problems, change this option. Note: PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.
Port Name Template	Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as (001) Ethernet1, for example. You can use any field names available at a certain OID of your device, among which are: ▪ **[port]**: The port number of the monitored interface. ▪ **[ifalias]**: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling. ▪ **[ifname]**: The textual name of the monitored interface as assigned by the local device. ▪ **[ifdescr]**: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version. ▪ **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s). ▪ **[ifsensor]**: The type of the sensor, this is SNMP Traffic or SNMP RMON. This is useful to differentiate between your SNMP Traffic 2071 and SNMP RMON 2010 sensors. Combine them as you like to obtain suitable sensor names. See the **More** section below for more information about SNMP sensor names.
Port Name Update	Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between: ▪ **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually. ▪ **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see **More** section below.

SNMP COMPATIBILITY OPTIONS

Port Identification	Define which field will be used for SNMP interface identification. Choose between: ▪ **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. Note: ifName will not be tried automatically. ▪ **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names. ▪ **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. Note: When using this option it is important that your device returns unique interface names in the ifDescr field. ▪ **Use ifName**: You can also use this option if there is no unique ifAlias available. Note: When using this option it is important that your device returns unique interface names in the ifName field. ▪ **No Port Update**: Use this option to disable automatic port identification.
Start Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
End Interface Index	For SNMP Traffic sensors 2071, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
SNMP Debug Log	Define if you want to create an SNMP log file for debugging purposes. We recommend this only for debugging low level SNMP issues. Choose between: ▪ **No log (recommended)**: No SNMP debug log file will be created. ▪ **Enable debug log**: An SNMP log file is written to the Logs (Debug) directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Scanning Distribution	This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will not be included in sensor scans. By default, this setting is inherited 94 to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window.
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Use parent**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. ▪ **Select object**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector 181 to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Unusual Detection	Define if you want to benefit from unusual detection 2872 for sensors. You can configure the behavior of unusual detection (or disable it completely) in the system settings 2872. Choose between: ▪ **Enabled**: Activate unusual detection for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. Sensors affected by this setting will turn to orange color (unusual sensor status 135) if PRTG detects unusual activity. ▪ **Disabled**: Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensor will not show an unusual sensor status.
Similar Sensors Detection	Define if you want to activate **Similar Sensors** 151 analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the system settings 2874. Choose between: ▪ **Enabled**: Activate similar sensors detection for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. PRTG considers all sensors affected by this setting during similarity analysis. ▪ **Disabled**: Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
System Information	Define if you want to retrieve and show **System Information** 164 for your devices. Choose between: ▪ **Enabled**: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy 89 of the device tree. ▪ **Disabled**: Do not activate system information.

NUMBER OF SENSORS LIMITATION

Sensor Limit	This setting allows the administrator to set a limit for the maximum number of sensors in this group. Subgroups are also included. If sensors exceed this limitation, they will be paused. This is of special interest for a Managed Service Provider (MSP). Choose between: ▪ **Allow unlimited number of sensors**: Disable a limitation of the number of sensors for this group. Any number of sensors can be added to this group.

NUMBER OF SENSORS LIMITATION

	▪ **Limit number of sensors in this group**: Enables a limitation of the number of sensors for this group. Only a limited number of sensors can be added to this group.
Maximum Number of Sensors	This field is only visible if limitation is enabled above. Define how many sensors can be added to this group. Please enter an integer value.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see **Object Settings** 159 section.

6.7 Device Settings

On the details page of a device, click on the **Settings** tab to change settings.

Add Device

The **Add Device** dialog appears when you add a new device to a group. It only shows the setting fields that are imperative for creating the device in PRTG. Because of this, you will not see all setting fields in this dialog. For example, the **Device Status** option is not available in this step.

You can change all settings in the **Settings** tab of the device later.

Device Settings

The following settings are available in the **Settings** tab of every device. Because you do not need all of these for every device, depending on the device type, just define the settings you really need and ignore the others.

We recommend that you define as many settings as possible in the **Root** 260 group, so you can inherit them to all other objects further down in the device tree hierarchy 89.

For device settings, there is also multi-edit available. This enables you to change properties of many devices at a time. For more details, please see **Multi-Edit Lists** 2742 section.

Note: This documentation refers to the **PRTG System Administrator** user accessing the Ajax interface on a master node. For other user accounts, interfaces, or nodes, not all of the options might be visible in the way described here. When using a cluster installation, failover nodes are read-only by default.

BASIC DEVICE SETTINGS

Device Name	Enter a meaningful name to identify the device. PRTG shows this name by default in the device tree 123 and in all **Alarms** 161 and **Notifications** 2759.
Status	Define the activity status of the device. Choose between: ▪ **Started**: Monitor this device. ▪ **Paused**: Pause monitoring for this device. All sensors on it are in status 135 **Paused** until you change this setting again.
IP Version	Define which IP protocol PRTG will use to connect to this device. The setting is valid for all sensors created on this device. Choose between:

BASIC DEVICE SETTINGS

	▪ **IPv4 device**: Use IP version 4 for all requests to this device. ▪ **IPv6 device**: Use IP version 6 for all requests to this device.
IP Address/DNS Name	Enter the IP address (either v4 or v6, depending on your selection above) or DNS name for the device. Most sensors you create on this device will inherit this setting and try connecting to this address for monitoring. Note: Some sensor types have their own setting for IP address/ DNS name to which they connect.
Parent Tags	Shows **Tags** 96 that this device inherits 96 from its parent group and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96. Confirm each tag by with space, comma, or enter key. Sensors on this device inherit these tags. You can use tags to group sensors and tag-filtered views, for example, in **Libraries** 2770. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like.
Priority	Select a priority 182 for the device. This setting determines in which order your devices are displayed when you view table lists. Top priority will be at the top of a list. You can choose from one star (low priority) to five stars (top priority).

ADDITIONAL DEVICE INFORMATION

Device Icon	Choose a device icon from the list. PRTG shows it in the device tree. For information on how to add your custom icons, please see the link in the **More** 346 section below.
Service URL	Specify a URL you would like to open directly when you select **Device Tools	Go To Service URL** from the context menu 192 of the device. For example, you can configure this option to call the address http://www.example.com/service.html. Enter a valid URL or leave the field empty.

DEVICE TYPE

Sensor Management	Select which type of auto-discovery you would like to perform for this device. Choose between: ▪ **Manual (no auto-discovery)**: Do not auto-discover any sensors, but only add sensors manually. ▪ **Automatic device identification (standard, recommended)**: Use a small set of auto-discovery templates. This will scan your LAN and usually create a view standard sensors on your device. ▪ **Automatic device identification (detailed, may create many sensors)**: Use an extended set of auto-discovery templates. This will scan your LAN and usually create many sensors on your device. ▪ **Automatic sensor creation using specific device templates**: Use specific auto-discovery templates only. Please select templates below. This will scan your LAN and add sensors defined in the template.
Discovery Schedule	This option is only visible if one of the auto-discovery options is selected above. Define when the auto-discovery will be run. Choose between: ▪ **Once**: Perform auto-discovery only once. For existing devices, this will initiate a one-time sensor update for the current device. ▪ **Hourly**: Perform auto-discovery for new sensors every hour. ▪ **Daily**: Perform auto-discovery for new sensors every day. ▪ **Weekly**: Perform auto-discovery for new sensors every week.
Device Template(s)	This option is only visible if using specific device templates (last option) is enabled above. Please choose one or more templates by adding a check mark in front of the respective template name. You can also select and deselect all items by using the check box in the table head. These will be used for auto-discovery on the current device. Choose from: ▪ **ADSL** ▪ **Amazon Cloudwatch** ▪ **Cisco ASA VPN** ▪ **Cisco Device (Generic)** ▪ **Dell MDI Disk** ▪ **DNS Server** ▪ **Environment Jacarta** ▪ **Environment Poseidon**

DEVICE TYPE

- Fritzbox
- FTP Server
- Generic Device (PING only)
- Generic Device (SNMP-enabled)
- Generic Device (SNMP-enabled, Detailed)
- HTTP Web Server
- Hyper V Host Server
- Linux/UNIX Device (SNMP or SSH enabled)
- Mail Server (Generic)
- Mail Server (MS Exchange)
- Microsoft Sharepoint 2010
- NAS LenovoEMC
- NAS QNAP
- NAS Synology
- NetApp
- NTP Server
- Printer (HP)
- Printer (Generic)
- RDP Server
- RMON compatible device
- Server (Compaq/HP agents)
- Server (Dell)
- Sever Cisco UCS
- Server IBM
- SonicWALL
- SSL Security Check
- Switch (Cisco Catalyst)
- Switch (Cisco IOS Based)
- Switch (HP Procurve)
- UNIX/Linux Device
- UPS (APC)

DEVICE TYPE

- **Virtuozzo Server**
- **VMware ESX / vCenter Server**
- **Webserver**
- **Windows (Detailed via WMI)**
- **Windows (via Remote Powershell)**
- **Windows (via WMI)**
- **Windows IIS (via SNMP)**
- **XEN Hosts**
- **XEN Virtual Machines**

Once the auto-discovery is finished, PRTG will create a new ticket [171] and list the device templates which were actually used to create new sensors. Templates which were not applied will not be shown in the ticket.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** [260] group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

LOCATION

Location (for geo maps)

When you want to use **Geo Maps** [2753], enter a location in the first line. Geographical maps will display objects (devices, groups) then with a flag, showing the current status using a color code similar to the sensor status icons [135] (green - yellow - orange - red). You can enter a full postal address, city and country only, or latitude and longitude. It is possible to enter any text before, between, and after the coordinates, PRTG will parse latitude and longitude automatically, for example: 49.452778 11.077778 or enter 49.452778 any 11.077778 text

A minus sign (-) in the first line will hide an object from geo maps. In this case you can enter location information in line two and following.

LOCATION

You can define a specific label for each location: enter a string denoting the label in the first line and provide geo coordinates in the second line. This geo marker will show then the object with the label in the PRTG geo map.

CREDENTIALS FOR WINDOWS SYSTEMS

Domain or Computer Name	Define the authority for Windows access. This is used for Windows Management Instrumentation (WMI) and other Windows sensors. If you want to use a Windows local user account on the target device, please enter the computer name here. If you want to use a Windows domain user account (recommended), please enter the (Active Directory) domain name here. If not explicitly defined, PRTG will automatically add a prefix in order to use the NT LAN Manager (NTLM) protocol. Please do not leave this field empty.
User	Enter the username for Windows access. Usually, you will use credentials with administrator privileges.
Password	Enter the password for Windows access. Usually, you will use credentials with administrator privileges.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

User	Enter a login name for the access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Login	Define the authentication method to use for login. Choose between: ▪ **Login via Password**: Provide a password for login. Enter below. ▪ **Login via Private Key**: Provide a private key for authentication. Note: PRTG can only handle keys in OpenSSH format which are not encrypted. You cannot use password protected keys here. In the text field, paste the entire private key, including the "BEGIN" and "END" lines. Please make sure the according public key is provided on the target machine. For details, please see **Monitoring via SSH** 3008.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Password	This field is only visible if you select password login above. Enter a password for the Linux access via SSH and WBEM. Usually, you will use credentials with administrator privileges.
Private Key	This field is only visible if you select private key login above. Paste a private key into the field (OpenSSH format, unencrypted). Usually, you will use credentials with administrator privileges. Note: If you do not insert a private key for the first time, but change the private key, you need to restart your PRTG core server service 2901 in order for the private key change to take effect! For details, please see **Monitoring via SSH** 3008.
For WBEM Use Protocol	Define the protocol to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **HTTP**: Use an unencrypted connection for WBEM. ▪ **HTTPS**: Use an SSL-encrypted connection for WBEM.
For WBEM Use Port	Define the port to use for WBEM. This setting is only relevant if you use WBEM sensors. Choose between: ▪ **Set automatically (port 5988 or 5989)**: Use one of the standard ports, depending on whether you choose unencrypted or encrypted connection above. ▪ **Set manually**: Use a custom port. Define below.
WBEM Port	This setting is only visible if you enable manual port selection above. Enter the WBEM port number.
SSH Port	Enter the port number to use for SSH connections. Note: By default, PRTG uses this setting automatically for all SSH sensors 353, unless you define a different port number in the sensor settings.
SSH Rights Elevation	Define the rights with which you want to execute the command on the target system. Choose between: ▪ **Run the command as the user connecting (default)**: Use the rights of the user who establishes the SSH connection. ▪ **Run the command as another user using 'sudo'**: Use the rights of another user, for example, the administrator. ▪ **Run the command as another user using 'su'**: Use the rights of another target user.

CREDENTIALS FOR LINUX/SOLARIS/MAC OS (SSH/WBEM) SYSTEMS

Target User	This field is only visible if you choose sudo or su above. Enter a username to run the specified command as another user than root. If you leave this field empty, you will run the command as root. Ensure that you set the Linux password even if you use a public/private key for authentication. This is not necessary if the user is allowed to execute the command without a password.
Password Target User	This field is only visible if you choose su above. Enter the password for the specified target user.
SSH Engine	Select the method you want to use to access data with SSH sensors 3006. We strongly recommend that you keep the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Default (recommended)**: This is the default monitoring method for SSH sensors. It provides best performance and security. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: You can also individually select the SSH engine for each SSH sensor in the sensor settings.

CREDENTIALS FOR VMWARE/XENSERVER

User	Enter a login name for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges.
Password	Enter a password for access to VMware and XEN servers. Usually, you will use credentials with administrator privileges. Note: Single Sign-On (SSO) passwords for vSphere do not support special characters. Please see the manual sections for VMware sensors for details.
VMware Protocol	Define the protocol used for the connection to VMware and XenServer. Choose between: ▪ **HTTPS (recommended)**: Use an SSL-encrypted connection to VMware and XenServers.

CREDENTIALS FOR VMWARE/XENSERVER

- **HTTP**: Use an unencrypted connection to VMware and XenServers.

Session Pool

Define if you want to use session pooling for VMware sensors. Choose between:

- **Reuse session for for multiple scans (recommended)**: Select this option to use session pooling. With session pooling, a VMware sensor uses the same session as created in advance to query data and needs not to log in and out for each sensor scan. We recommend that you choose this option because it reduces network load and log entries on the target device, resulting in better performance.
- **Create a new session for each scan**: If you select this option and disable session pooling, a VMware sensor has to log in and out for each sensor scan. We recommend that you use the session pooling option above for better performance.

CREDENTIALS FOR SNMP DEVICES

SNMP Version

Select the SNMP version for the device connection. Choose between:

- **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices.
  Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.
- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

CREDENTIALS FOR SNMP DEVICES

Community String	This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.
Authentication Type	This setting is only visible if you select SNMP version v3 above. Choose between: ▪ **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication. ▪ **SHA**: Use Secure Hash Algorithm (SHA) for authentication. The type you choose must match the authentication type of your device. Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.
User	This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.
Password	This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.
Encryption Type	This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between: ▪ **DES**: Use Data Encryption Standard (DES) as encryption algorithm. ▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.

CREDENTIALS FOR SNMP DEVICES

Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

The settings you define in this section apply to the following sensors:

- **Microsoft SQL v2 Sensor** 1075
- **MySQL v2 Sensor** 1090
- **Oracle SQL v2 Sensor** 1187
- **PostgreSQL Sensor** 1297

For Databases Use Port	Define which ports PRTG will use for connections to the monitored databases. Choose between: ▪ **Set automatically (default port, recommended)**: PRTG automatically determines the type of the monitored database and uses the corresponding default port to connect. See below for a list of default ports. ▪ **Define one custom port valid for all database sensors**: Choose this option if your database management systems do not use the default ports. Define the port for database connections manually below. If you choose this option, PRTG will use the custom port for all database sensors. If you choose the automatic port selection, PRTG uses the following default ports: ▪ Microsoft SQL: 1433 ▪ MySQL: 3306 ▪ Oracle SQL: 1521 ▪ PostgreSQL: 5432

CREDENTIALS FOR DATABASE MANAGEMENT SYSTEMS

Port	Enter the number of the port that PRTG will use for database connections. Please enter an integer value. Note: All your database sensors will use this port to connect!
Authentication	Select the authentication method for the connection to the SQL database. Choose between: ▪ **Windows authentication with impersonation**: If you select this option, PRTG uses the Windows credentials as defined in the particular device settings [329] for the database connection. Note: The user whose credentials are used needs to have permissions to log on to the system on which the PRTG probe with a database sensor runs. This is required for the impersonation. ▪ **SQL server authentication**: Choose this option if you want to use explicit credentials for database connections.
User	This field is only visible if you select SQL server authentication above. Enter the username for the database connection.
Password	This field is only visible if you selected SQL server authentication above. Enter the password for the database connection.
Timeout (Sec.)	Enter a timeout in seconds for the request. Please enter an integer value. If the reply takes longer than this value defines, the sensor cancels the request and triggers an error message. The maximum timeout value is 300 seconds (5 minutes).

CREDENTIALS FOR AMAZON CLOUDWATCH

Access Key	Enter your Amazon Web Services (AWS) Access Key. Please see the corresponding Amazon CloudWatch sensor [354] documentation to know more about the rights that are required for querying AWS CloudWatch metrics.
Secret Key	Enter your Amazon Web Services (AWS) Secret Key. Please see the corresponding Amazon CloudWatch sensor [354] documentation to know more about the rights that are required for querying AWS CloudWatch metrics.

WINDOWS COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Windows sensors, you can set some compatibility options for trouble shooting.

Preferred Data Source	Define the method Windows sensors will use to query data. This setting is valid only for hybrid sensors offering performance counter and Windows Management Instrumentation (WMI) technology. The setting will be ignored for all other sensors! Choose between: ▪ **Performance Counters and fallback to WMI (recommended)**: Try to query data via performance counters. If this is not possible, establish a connection via WMI. This is the recommended setting to best balance resource usage and functionality. ▪ **Performance Counters only**: Query data via performance counters only. If this is not possible, a sensor will return no data. ▪ **WMI only**: Query data via WMI only. If this is not possible, a sensor will return no data.
Timeout Method	Specify the time the sensor will wait for the return of its WMI query before aborting it with an error message. Choose between: ▪ **Use 1.5x scanning interval (recommended)**: Use a default of one and a half times the scanning interval set for the sensor (see below in this settings). ▪ **Set manually**: Enter a timeout value manually. We recommend that you use the default value. Only if you experience ongoing timeout errors, try increasing the timeout value.
Timeout Value (Sec.)	This field is only visible if the manual timeout method is selected above. Specify the time the sensor will wait for the return of its WMI query before aborting with an error message. Please enter an integer value.

SNMP COMPATIBILITY OPTIONS

When experiencing problems while monitoring via Simple Network Management Protocol (SNMP) sensors, you can set some compatibility options for trouble shooting.

SNMP COMPATIBILITY OPTIONS

SNMP Delay (ms)	Add a time in milliseconds that will be waited between two SNMP requests. This can help increase device compatibility. Please enter an integer value. We recommend that you use the default value. If you experience SNMP connection failures, please increase it. You can define a delay between 0 and 100, higher delays are not supported and will be discarded.
Failed Requests	Define if an SNMP sensor will try again after a request fails. ▪ **Retry (recommended)**: Try again if an SNMP request fails. This can help prevent false error messages due to temporary timeout failures. ▪ **Do not retry**: Do not retry if an SNMP request fails. With this setting enabled an SNMP sensor will be set to error status earlier.
Overflow Values	Define how PRTG will handle overflow values. Some devices do not handle internal buffer overflows correctly. This can cause false peaks. ▪ **Ignore overflow values (recommended)**: Ignore overflow values and do not include them in the monitoring data. ▪ **Handle overflow values as valid results**: Regard all overflow values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.
Zero Values	Define how PRTG will handle zero values. Some devices send incorrect zero values. This can cause false peaks. ▪ **Ignore zero values for delta sensors (recommended)**: Ignore zero values and do not include them in the monitoring data. ▪ **Handle zero values as valid results for delta sensors**: Regard all zero values as regular data and include them in the monitoring data. We recommend that you use the default value. If you experience problems, change this option.
32-bit/64-bit Counters	Define which kind of traffic counters PRTG will search for on a device. ▪ **Use 64-bit counters if available (recommended)**: The interface scan will use 64-bit traffic counters, if available. This can avoid buffer overflows in the devices.

SNMP COMPATIBILITY OPTIONS

- **Use 32-bit counters only**: The interface scan will always use 32-bit traffic counters, even if 64-bit counters are available. This can lead to more reliable monitoring for some devices.

We recommend that you use the default value. If you experience problems, change this option.

Request Mode

Define which kind of request method PRTG uses for SNMP sensors.

- **Use multi get (recommended)**: Bundle multiple SNMP requests into one request.
- **Use single get**: Use one request for each SNMP value. This can increase compatibility with older devices.

We recommend that you use the default value. If you experience problems, change this option.

Note: PRTG uses paging for SNMP requests. This means that if a sensor has to query more than 20 OIDs, it will automatically poll the OIDs in packages of 20 OIDs each per request.

Port Name Template

Define how the name of SNMP sensors created on a device will be put together. Enter a template using several variables. When adding new sensors, PRTG scans the interface for available counters at certain OIDs. At each OID usually several fields are available with interface descriptions. They are different for every device/OID. PRTG will use the information in these fields to name the sensors. If a field is empty or not available, an empty string is added to the name. As default, **([port]) [ifalias]** is set as port name template, which will create a name such as (001) Ethernet1, for example. You can use any field names available at a certain OID of your device, among which are:

- **[port]**: The port number of the monitored interface.
- **[ifalias]**: The 'alias' name for the monitored interface as specified by a network manager, providing a non-volatile handling.
- **[ifname]**: The textual name of the monitored interface as assigned by the local device.
- **[ifdescr]**: A textual string containing information about the monitored device or interface, for example, manufacturer, product name, version.
- **[ifspeed]**: An estimate of the monitored interface's current bandwidth (KBit/s).
- **[ifsensor]**: The type of the sensor, this is SNMP Traffic or SNMP RMON. This is useful to differentiate between your SNMP Traffic 2071 and SNMP RMON 2010 sensors.

SNMP COMPATIBILITY OPTIONS

	Combine them as you like to obtain suitable sensor names. See the **More** section below for more information about SNMP sensor names.
Port Name Update	Define how PRTG will react if you change port names in your physical device (e.g. a switch or router). Choose between: ▪ **Keep port names (use this if you edit the names in PRTG)**: Do not automatically adjust sensor names. This is the best option if you want to change names in PRTG manually. ▪ **Automatic sensor name update if name changes in device**: If PRTG detects changes of port names in your physical device, it will try to automatically adjust sensor names accordingly. For detailed information please see **More** section below.
Port Identification	Define which field will be used for SNMP interface identification. Choose between: ▪ **Automatic (recommended)**: Tries the ifAlias field first to identify an SNMP interface and then ifDescr. Note: ifName will not be tried automatically. ▪ **Use ifAlias**: For most devices ifAlias is the best field to get unique interface names. ▪ **Use ifDescr**: Use this option if the port order of your device changes after a reboot, and there is no ifAlias field available. For example, this is the best option for Cisco ASA devices. Note: When using this option it is important that your device returns unique interface names in the ifDescr field. ▪ **Use ifName**: You can also use this option if there is no unique ifAlias available. Note: When using this option it is important that your device returns unique interface names in the ifName field. ▪ **No Port Update**: Use this option to disable automatic port identification.
Start Interface Index	For SNMP Traffic sensors, define at which index PRTG will start to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
End Interface Index	For SNMP Traffic sensors, define at which index PRTG will stop to query the interface range during sensor creation. Use 0 for automatic mode. We recommend that you use the default value.
SNMP Debug Log	Define if you want to create an SNMP log file for debugging purposes. We recommend this only for debugging low level SNMP issues. Choose between:

SNMP COMPATIBILITY OPTIONS

- **No log (recommended)**: No SNMP debug log file will be created.
- **Enable debug log**: An SNMP log file is written to the Logs (Debug) directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

CLUSTER USAGE

Scanning Distribution	This box is only visible if you run a PRTG cluster. Sometimes you want to exclude a certain node from monitoring the sensors running on this probe, group, or device, for example, if a device is not reachable from every node configured in your cluster. In the list of cluster nodes, please select the nodes that will not be included in sensor scans. By default, this setting is inherited 94 to all objects underneath.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted; the according settings from the parent objects will always be active. However, you can define additional settings here. They will be active in parallel to the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to pause monitoring for a certain time span (days, hours) throughout the week. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a maintenance window this object and all child objects will not be monitored. They will enter a paused state then. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window.
Maintenance Begins At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance Ends At	This field is only visible if maintenance window is enabled above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between:

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Use parent**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. ▪ **Select object**: Pause the current object if its parent object is in a **Down** status, or if it is paused by another dependency. Additionally, pause the current object if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the select object option is enabled above. Click on the reading-glass symbol and use the object selector 181 to choose an object on which the current object will be dependent on.
Dependency Delay (Sec.)	This field is only visible if you select another object than the parent as dependency type. Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, monitoring of the depending objects will be additionally delayed by the defined time span. This can help avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

ADVANCED NETWORK ANALYSIS

Unusual Detection	Define if you want to benefit from unusual detection [2872] for sensors. You can configure the behavior of unusual detection (or disable it completely) in the system settings [2872]. Choose between: ▪ **Enabled**: Activate unusual detection for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. Sensors affected by this setting will turn to orange color (unusual sensor status [135]) if PRTG detects unusual activity. ▪ **Disabled**: Do not activate unusual detection. PRTG will ignore unusual values for sensors affected by this setting. These sensor will not show an unusual sensor status.
Similar Sensors Detection	Define if you want to activate **Similar Sensors** [151] analysis. You can configure the depth of analysis of similar sensors detection (or disable it completely) in the system settings [2874]. Choose between: ▪ **Enabled**: Activate similar sensors detection for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. PRTG considers all sensors affected by this setting during similarity analysis. ▪ **Disabled**: Do not activate similar sensors detection. PRTG will not consider sensors affected by this setting during similarity analysis.
System Information	Define if you want to retrieve and show **System Information** [164] for your devices. Choose between: ▪ **Enabled**: Activate the system information feature for this object and, by default, for all objects underneath in the hierarchy [89] of the device tree. ▪ **Disabled**: Do not activate system information.

Click **Save** to store your settings. If you change tabs or use the main menu, all changes to the settings will be lost!

Notifications

The status or the data of a sensor can trigger notifications. Using this mechanism, you can configure external alerting tailored to you needs. In an object's detail page, click on the **Notifications** tab to change sensor notification triggers. The defined triggers will be inherited down to sensor level. For detailed information, please see **Sensor Notifications Settings** [2719] section.

Others

For more general information about settings, please see **Object Settings** 159 section.

6.8 Sensor Settings

There are more than 200 different sensor types available. In the **Add Sensor** dialog, all sensors are categorized into groups to help you quickly find what you need. Once you are familiar with the interface, you will probably enter the first letters of a sensor type's name into the **Search** field in the upper left corner and get to a sensor even faster.

Available Sensor Types

There is a dedicated manual section for every sensor type with details about the available settings. For more information, please see the **List of Available Sensors** 348.

For sensor settings, there is also multi-edit available. This enables you to change properties of many sensors at a time. For more details, please see the **Multi-Edit Lists** 2742 section.

In order to detect unexpected correlations between your network components, PRTG provides a **Similar Sensors** 151 analysis.

Sensor Settings Overview

For information about sensor settings, please see the following sections:

- **Sensor Settings—** 347 **List of Available Sensor Types** 348
- **Additional Sensor Types (Custom Sensors)** 2707
- **Sensor Channels Settings** 2711
- **Sensor Notifications Settings** 2719

6.8.1 List of Available Sensor Types

This chapter lists all available sensors, arranged both by different categories and in alphabetical order. Note: In the **Add a Sensor** 256 assistant, PRTG offers you various options to filter for fitting sensor types easily.

Common Sensors

Bandwidth Monitoring Sensors

- IPFIX Sensor 1003
- IPFIX (Custom) Sensor 1015
- jFlow V5 Sensor 1035
- jFlow V5 (Custom) Sensor 1047
- NetFlow V5 Sensor 1141
- NetFlow V5 (Custom) Sensor 1153
- NetFlow V9 Sensor 1164
- NetFlow V9 (Custom) Sensor 1176
- Packet Sniffer Sensor 1211
- Packet Sniffer (Custom) Sensor 1222
- sFlow Sensor 1393
- sFlow (Custom) Sensor 1405
- SNMP Cisco ADSL Sensor 1476
- SNMP Cisco ASA VPN Traffic Sensor 1494
- SNMP Library Sensor 1845
- SNMP NetApp Network Interface Sensor 1948
- SNMP RMON Sensor 2010
- SNMP Traffic Sensor 2071
- Windows Network Card Sensor 2378

Web Servers (HTTP) Sensors

- Cloud HTTP Sensor 523
- Common SaaS Sensor 547
- HTTP Sensor 790
- HTTP Advanced Sensor 800
- HTTP Apache ModStatus PerfStats Sensor 816
- HTTP Apache ModStatus Totals Sensor 826
- HTTP Content Sensor 836
- HTTP Data Advanced Sensor 848
- HTTP Full Web Page Sensor 859
- HTTP Push Count Sensor 870
- HTTP Push Data Sensor 879
- HTTP Push Data Advanced Sensor 890

- HTTP Transaction Sensor 901
- HTTP XML/REST Value Sensor 915
- SSL Certificate Sensor 2228
- SSL Security Check Sensor 2237
- Windows IIS Application Sensor 2357

SNMP Sensors

- SNMP APC Hardware Sensor 1467
- SNMP Cisco ADSL Sensor 1476
- SNMP Cisco ASA VPN Connections Sensor 1484
- SNMP Cisco ASA VPN Traffic Sensor 1494
- SNMP Cisco ASA VPN Users Sensor 1505
- SNMP Cisco CBQoS Sensor 1515
- SNMP Cisco System Health Sensor 1524
- SNMP Cisco UCS Blade Sensor 1533
- SNMP Cisco UCS Chassis Sensor 1542
- SNMP Cisco UCS Physical Disk Sensor 1551
- SNMP Cisco UCS System Health Sensor 1560
- SNMP CPU Load Sensor 1569
- SNMP Custom Sensor 1577
- SNMP Custom Advanced Sensor 1586
- SNMP Custom String Sensor 1596
- SNMP Custom String Lookup Sensor 1607
- SNMP Custom Table Sensor 1617
- SNMP Dell EqualLogic Logical Disk Sensor 1629
- SNMP Dell EqualLogic Member Health Sensor 1638
- SNMP Dell EqualLogic Physical Disk Sensor 1648
- SNMP Dell Hardware Sensor 1657
- SNMP Dell PowerEdge Physical Disk Sensor 1666
- SNMP Dell PowerEdge System Health Sensor 1675
- SNMP Disk Free Sensor 1685
- SNMP Hardware Status Sensor 1694
- SNMP HP BladeSystem Server Blade Sensor 1703
- SNMP HP BladeSystem System Health Sensor 1712

- SNMP HP LaserJet Hardware Sensor 1720
- SNMP HP ProLiant Logical Disk Sensor 1729
- SNMP HP ProLiant Memory Controller Sensor 1738
- SNMP HP ProLiant Network Interface Sensor 1747
- SNMP HP ProLiant Physical Disk Sensor 1756
- SNMP HP ProLiant System Health Sensor 1765
- SNMP IBM System X Logical Disk Sensor 1775
- SNMP IBM System X Physical Disk Sensor 1784
- SNMP IBM System X Physical Memory Sensor 1793
- SNMP IBM System X System Health Sensor 1802
- SNMP interSeptor Pro Environment Sensor 1811
- SNMP Juniper System Health Sensor 1819
- SNMP LenovoEMC Physical Disk Sensor 1828
- SNMP LenovoEMC System Health Sensor 1837
- SNMP Library Sensor 1845
- SNMP Linux Disk Free Sensor 1857
- SNMP Linux Load Average Sensor 1869
- SNMP Linux Meminfo Sensor 1877
- SNMP Linux Physical Disk Sensor 1885
- SNMP Memory Sensor 1894
- SNMP NetApp Disk Free Sensor 1903
- SNMP NetApp Enclosure Sensor 1912
- SNMP NetApp I/O Sensor 1922
- SNMP NetApp License Sensor 1931
- SNMP NetApp Logical Unit Sensor 1939
- SNMP NetApp Network Interface Sensor 1948
- SNMP NetApp System Health Sensor 1957
- SNMP Poseidon Environment Sensor 1966
- SNMP Printer Sensor 1975
- SNMP QNAP Logical Disk Sensor 1983
- SNMP QNAP Physical Disk Sensor 1992
- SNMP QNAP System Health Sensor 2001
- SNMP RMON Sensor 2010
- SNMP SonicWALL System Health Sensor 2020

- SNMP SonicWALL VPN Traffic Sensor 2028
- SNMP Synology Logical Disk Sensor 2037
- SNMP Synology Physical Disk Sensor 2045
- SNMP Synology System Health Sensor 2054
- SNMP System Uptime Sensor 2063
- SNMP Traffic Sensor 2071
- SNMP Trap Receiver Sensor 2082
- SNMP Windows Service Sensor 2094

Windows WMI/Performance Counters Sensors

- Active Directory Replication Errors Sensor 367
- Event Log (Windows API) Sensor 629
- PerfCounter Custom Sensor 1232
- PerfCounter IIS Application Pool Sensor 1242
- Windows IIS 6.0 SMTP Received Sensor 2339
- Windows IIS 6.0 SMTP Sent Sensor 2348
- Windows IIS Application Pool Sensor 1242
- Windows CPU Load Sensor 2329
- Windows MSMQ Queue Length Sensor 2367
- Windows Network Card Sensor 2378
- Windows Pagefile Sensor 2389
-
- Windows Print Queue Sensor 2408
- Windows Process Sensor 2419
- Windows System Uptime Sensor 2429
- Windows Updates Status (Powershell) Sensor 2438
- WMI Custom Sensor 2448
- WMI Custom String Sensor 2458
- WMI Event Log Sensor 2469
- WMI Exchange Server Sensor 2480
- WMI Exchange Transport Queue Sensor 2490
- WMI File Sensor 2500
- WMI Free Disk Space (Multi Disk) Sensor 2509
- WMI HDD Health Sensor 2521

- WMI Logical Disk I/O Sensor 2533
- WMI Memory Sensor 2543
- WMI Microsoft SQL Server 2005 Sensor 2552
- WMI Microsoft SQL Server 2008 Sensor 2565
- WMI Microsoft SQL Server 2012 Sensor 2577
- WMI Microsoft SQL Server 2014 Sensor 2589
- WMI Remote Ping Sensor 2601
- WMI Security Center Sensor 2610
- WMI Service Sensor 2620
- WMI Share Sensor 2630
- WMI SharePoint Process Sensor 2640
- WMI Terminal Services (Windows 2008+) Sensor 2649
- WMI Terminal Services (Windows XP/Vista/2003) Sensor 2658
- WMI UTC Time Sensor 2667
- WMI Vital System Data (V2) Sensor 2676
- WMI Volume Sensor 2686
- WSUS Statistics Sensor 2696

Linux/Unix/OS X Sensors

- Python Script Advanced Sensor 1318
- SNMP Linux Disk Free Sensor 1857
- SNMP Linux Load Average Sensor 1869
- SNMP Linux Meminfo Sensor 1877
- SNMP Linux Physical Disk Sensor 1885
- SSH Disk Free Sensor 2109
- SSH INodes Free Sensor 2122
- SSH Load Average Sensor 2132
- SSH Meminfo Sensor 2142
- SSH Remote Ping Sensor 2152
- SSH Script Sensor 2205
- SSH Script Advanced Sensor 2217
- SSH SAN Enclosure Sensor 2162
- SSH SAN Logical Disk Sensor 2172
- SSH SAN Physical Disk Sensor 2183

- SSH SAN System Health Sensor 2194

Virtual Servers Sensors

- Amazon CloudWatch Alarm Sensor 392
- Amazon CloudWatch EBS Sensor 402
- Amazon CloudWatch EC2 Sensor 413
- Amazon CloudWatch ElastiCache Sensor 425
- Amazon CloudWatch ELB Sensor 436
- Amazon CloudWatch RDS Sensor 447
- Amazon CloudWatch SNS Sensor 459
- Amazon CloudWatch SQS Sensor 470
- Citrix XenServer Host Sensor 502
- Citrix XenServer Virtual Machine Sensor 513
- Common SaaS Sensor 547
- Docker Container Status Sensor 599
- Dropbox Sensor 609
- Enterprise Virtual Array Sensor 619
- Google Drive Sensor 780
- Hyper-V Cluster Shared Volume Disk Free Sensor 930
- Hyper-V Host Server Sensor 940
- Hyper-V Virtual Machine Sensor 949
- Hyper-V Virtual Network Adapter Sensor 960
- Hyper-V Virtual Storage Device Sensor 971
- Microsoft OneDrive Sensor 1065
- Virtuozzo Container Disk Sensor
- Virtuozzo Container Network Sensor
- VMware Datastore (SOAP) Sensor 2280
- VMware Host Hardware (WBEM) Sensor 2290
- VMware Host Hardware Status (SOAP) Sensor 2298
- VMware Host Performance (SOAP) Sensor 2308
- VMware Virtual Machine (SOAP) Sensor 2318

Mail Servers Sensors

- Exchange Backup (Powershell) Sensor 639
- Exchange Database (Powershell) Sensor 649

- Exchange Database DAG (Powershell) Sensor 659
- Exchange Mail Queue (Powershell) Sensor 669
- Exchange Mailbox (Powershell) Sensor 679
- Exchange Public Folder (Powershell) Sensor 689
- IMAP Sensor 980
- IP on DNS Blacklist Sensor 994
- POP3 Sensor 1270
- SMTP Sensor 1434
- SMTP&IMAP Round Trip Sensor 1443
- SMTP&POP3 Round Trip Sensor 1455
- SSL Security Check Sensor 2237
- WMI Exchange Server Sensor 2480
- WMI Exchange Transport Queue Sensor 2490
- Windows IIS 6.0 SMTP Received Sensor 2339
- Windows IIS 6.0 SMTP Sent Sensor 2348

Database Servers Sensors

- ADO SQL v2 Sensor 378
- Microsoft SQL v2 Sensor 1075
- MySQL v2 Sensor 1090
- Oracle SQL v2 Sensor 1187
- Oracle Tablespace Sensor 1201
- PostgreSQL Sensor 1297
- WMI Microsoft SQL Server 2005 Sensor 2552
- WMI Microsoft SQL Server 2008 Sensor 2565
- WMI Microsoft SQL Server 2012 Sensor 2577
- WMI Microsoft SQL Server 2014 Sensor 2589

File Servers Sensors

- Dell PowerVault MDi Logical Disk Sensor 562
- Dell PowerVault MDi Physical Disk Sensor 571
- File Sensor 722
- File Content Sensor 731
- Folder Sensor 741
- FTP Sensor 750

- FTP Server File Count Sensor 758
- SFTP Secure File Transfer Protocol Sensor 1416
- Share Disk Free Sensor 1366
- SNMP NetApp Disk Free Sensor 1903
- SNMP NetApp Enclosure Sensor 1912
- SNMP NetApp I/O Sensor 1922
- SNMP NetApp License Sensor 1931
- SNMP NetApp Network Interface Sensor 1948
- SNMP NetApp System Health Sensor 1957
- TFTP Sensor 2263
- WMI File Sensor 2500
- WMI Free Disk Space (Multi Drive) Sensor 2509
- WMI Volume Sensor 2686

Various Servers Sensors

- DHCP Sensor 581
- DNS Sensor 591
- IPMI System Health Sensor 1025
- LDAP Sensor 1058
- Ping Sensor 1252
- Ping Jitter Sensor 1261
- Port Sensor 1279
- Port Range Sensor 1289
- RADIUS v2 Sensor 1348
- RDP (Remote Desktop) Sensor 1358
- SNMP Trap Receiver Sensor 2082
- SNTP Sensor 2102
- Syslog Receiver Sensor 2245
- SSL Security Check Sensor 2237
- Traceroute Hop Count Sensor 2271

VoIP and QoS Sensors

- Cisco IP SLA Sensor 492
- SIP Options Ping Sensor 1425
- QoS (Quality of Service) One Way Sensor 1329

- QoS (Quality of Service) Round Trip Sensor 1338
- SNMP Cisco CBQoS Sensor 1515

Hardware Parameter Sensors

- Dell PowerVault MDi Logical Disk Sensor 562
- Dell PowerVault MDi Physical Disk Sensor 571
- Enterprise Virtual Array Sensor 619
- NetApp cDOT Aggregate (SOAP) Sensor 1104
- NetApp cDOT I/O (SOAP) Sensor 1113
- NetApp cDOT Physical Disk (SOAP) Sensor 1123
- NetApp cDOT System Health (SOAP) Sensor 1132
- SNMP APC Hardware Sensor 1467
- SNMP Cisco System Health Sensor 1524
- SNMP Cisco UCS Blade Sensor 1533
- SNMP Cisco UCS Chassis Sensor 1542
- SNMP Cisco UCS Physical Disk Sensor 1551
- SNMP Cisco UCS System Health Sensor 1560
- SNMP CPU Load Sensor 1569
- SNMP Dell EqualLogic Logical Disk Sensor 1629
- SNMP Dell EqualLogic Member Health Sensor 1638
- SNMP Dell EqualLogic Physical Disk Sensor 1648
- SNMP Dell Hardware Sensor 1657
- SNMP Dell PowerEdge Physical Disk Sensor 1666
- SNMP Dell PowerEdge System Health Sensor 1675
- SNMP Disk Free Sensor 1685
- SNMP Hardware Status Sensor 1694
- SNMP HP BladeSystem Blade Sensor 1703
- SNMP HP BladeSystem Enclosure System Health Sensor 1712
- SNMP HP LaserJet Hardware Sensor 1720
- SNMP HP ProLiant Memory Controller Sensor 1738
- SNMP HP ProLiant Network Interface Sensor 1747
- SNMP HP ProLiant Physical Disk Sensor 1756
- SNMP HP ProLiant System Health Sensor 1765
- SNMP IBM System X Physical Disk Sensor 1784

- SNMP IBM System X Physical Memory Sensor 1793
- SNMP IBM System X System Health Sensor 1802
- SNMP Juniper NS System Health Sensor 1819
- SNMP LenovoEMC Physical Disk Sensor 1828
- SNMP LenovoEMC System Health Sensor 1837
- SNMP Library Sensor 1845
- SNMP Memory Sensor 1894
- SNMP NetApp I/O Sensor 1922
- SNMP NetApp Enclosure Sensor 1912
- SNMP NetApp Logical Unit Sensor 1939
- SNMP NetApp Network Interface Sensor 1948
- SNMP NetApp System Health Sensor 1957
- SNMP QNAP Physical Disk Sensor 1992
- SNMP QNAP System Health Sensor 2001
- SNMP SonicWALL System Health Sensor 2020
- SNMP SonicWALL VPN Traffic Sensor 2028
- SNMP Synology Physical Disk Sensor 2045
- SNMP Synology System Health Sensor 2054
- SSH SAN Enclosure Sensor 2162
- SSH SAN Logical Disk Sensor 2172
- SSH SAN Physical Disk Sensor 2183
- SSH SAN System Health Sensor 2194
- WMI HDD Health Sensor 2521

Custom Sensors

- EXE/Script Sensor 699
- EXE/Script Advanced Sensor 711
- IPFIX (Custom) Sensor 1015
- jFlow V5 (Custom) Sensor 1047
- NetFlow V5 (Custom) Sensor 1153
- NetFlow V9 (Custom) Sensor 1176
- Packet Sniffer (Custom) Sensor 1222
- Python Script Advanced Sensor 1318
- Sensor Factory Sensor 1374

- sFlow (Custom) Sensor 1405
- SNMP Custom Sensor 1577
- SNMP Custom Advanced Sensor 1586
- SNMP Custom Lookup Sensor 1607
- SNMP Custom String Sensor 1596
- SNMP Custom Table Sensor 1617
- SSH Script Sensor 2205
- WMI Custom Sensor 2448
- WMI Custom String Sensor 2458

PRTG Internal Sensors

- ClusterState Sensor 542
- Core Health Sensor 555
- Probe Health Sensor 1311
- System Health Sensor 2257

All Sensors in Alphabetical Order

The version numbers show when the respective sensor type was originally introduced to PRTG.

- Active Directory Replication Errors Sensor 367 (v8.3.0)
- ADO SQL v2 Sensor 378 (v16.x.24)
- Amazon CloudWatch Alarm Sensor 392 (v16.x.22)
- Amazon CloudWatch EBS Sensor 402 (v15.x.19)
- Amazon CloudWatch EC2 Sensor 413 (v15.x.19)
- Amazon CloudWatch ElastiCache Sensor 425 (v15.x.19)
- Amazon CloudWatch ELB Sensor 436 (v15.x.19)
- Amazon CloudWatch RDS Sensor 447 (v15.x.19)
- Amazon CloudWatch SNS Sensor 459 (v15.x.19)
- Amazon CloudWatch SQS Sensor 470 (v15.x.19)
- Business Process Sensor 481 (v15.x.20)
- Cisco IP SLA Sensor 492 (v7)
- Citrix XenServer Host Sensor 502 (v12.x.1)
- Citrix XenServer Virtual Machine Sensor 513 (v8.1.0)
- Cloud HTTP Sensor 523 (v14.x.14)
- Cloud Ping Sensor 533 (v14.x.14)

- ClusterState Sensor 542 (v9.1.0)
- Common SaaS Sensor 547 (v15.x.19)
- Core Health Sensor 555 (v9.1.0)
- Dell PowerVault MDi Logical Disk Sensor 562 (v12.x.1)
- Dell PowerVault MDi Physical Disk Sensor 571 (v14.x.13)
- DHCP Sensor 581 (v8.2.0)
- DNS Sensor 591 (v7)
- Docker Container Status Sensor 599 (v16.x.22)
- Dropbox Sensor 609 (v15.x.19)
- Enterprise Virtual Array Sensor 619 (v13.x.6)
- Event Log (Windows API) Sensor 629 (v7)
- Exchange Backup (Powershell) Sensor 639 (v13.x.5)
- Exchange Database (Powershell) Sensor 649 (v13.x.5)
- Exchange Database DAG (Powershell) Sensor 659 (v15.x.18)
- Exchange Mail Queue (Powershell) Sensor 669 (v13.x.5)
- Exchange Mailbox (Powershell) Sensor 679 (v13.x.5)
- Exchange Public Folder (Powershell) Sensor 689 (v13.x.5)
- EXE/Script Sensor 699 (v7)
- EXE/Script Advanced Sensor 711 (v7)
- File Sensor 722 (v7)
- File Content Sensor 731 (v7)
- Folder Sensor 741 (v7)
- FTP Sensor 750 (v7)
- FTP Server File Count Sensor 758 (v8.3.0)
- Google Analytics Sensor 768 (v15.x19)
- Google Drive Sensor 780 (v15.x.19)
- HTTP Sensor 790 (v7)
- HTTP Advanced Sensor 800 (v7)
- HTTP Apache ModStatus PerfStats Sensor 816 (v12.x.3)
- HTTP Apache ModStatus Totals Sensor 826 (v12.x.3)
- HTTP Content Sensor 836 (v7)
- HTTP Data Advanced Sensor 848 (v15.x.16)
- HTTP Full Web Page Sensor 859 (v7)
- HTTP Push Count Sensor 870 (v13.4.8)

- HTTP Push Data Sensor 879 (v14.1.9)
- HTTP Push Data Advanced Sensor 890 (14.1.10)
- HTTP Transaction Sensor 901 (v7)
- HTTP XML/REST Value Sensor 915 (v8.3.0)
- Hyper-V Cluster Shared Volume Disk Free Sensor 930 (v12.3.4)
- Hyper-V Host Server Sensor 940 (v7)
- Hyper-V Virtual Machine Sensor 949 (v7)
- Hyper-V Virtual Network Adapter Sensor 960 (v9.1.0)
- Hyper-V Virtual Storage Device Sensor 971 (v12.4.4)
- IMAP Sensor 980 (v7)
- IP on DNS Blacklist Sensor 994 (v8.3.0)
- IPFIX Sensor 1003 (v13.x.7)
- IPFIX (Custom) Sensor 1015 (v13.x.7)
- IPMI System Health Sensor 1025 (v14.x.11)
- jFlow V5 Sensor 1035 (v8.2.0)
- jFlow V5 (Custom) Sensor 1047 (v8.2.0)
- LDAP Sensor 1058 (v8.1.0)
- Microsoft OneDrive Sensor 1065 (v15.x.19)
- Microsoft SQL v2 Sensor 1075 (v14.x.12)
- MySQL v2 Sensor 1090 (v14.x.12)
- NetApp cDOT Aggregate (SOAP) Sensor 1104 (v15.4.21)
- NetApp cDOT I/O (SOAP) Sensor 1113 (v15.4.21)
- NetApp cDOT Physical Disk (SOAP) Sensor 1123 (v15.4.21)
- NetApp cDOT System Health (SOAP) Sensor 1132 (v15.4.21)
- NetFlow V5 Sensor 1141 (v7)
- NetFlow V5 (Custom) Sensor 1153 (v7)
- NetFlow V9 Sensor 1164 (v7)
- NetFlow V9 (Custom) Sensor 1176 (v7)
- Oracle SQL v2 Sensor 1187 (v14.x.13)
- Oracle Tablespace Sensor 1201 (v15.x.18)
- Packet Sniffer Sensor 1211 (v7)
- Packet Sniffer (Custom) Sensor 1222 (v7)
- PerfCounter Custom Sensor 1232 (v12.x.3)
- PerfCounter IIS Application Pool Sensor 1242 (v12.x.6)

- Ping Sensor 1252 (v7)
- Ping Jitter Sensor 1261 (v8.3.0)
- POP3 Sensor 1270 (v7)
- Port Sensor 1279 (v7)
- Port Range Sensor 1289 (v12.x.4)
- PostgreSQL Sensor 1297 (v14.x.12)
- Probe Health Sensor 1311 (v9.1.0)
- Python Script Advanced Sensor 1318 (v15.x.19)
- QoS (Quality of Service) One Way Sensor 1329 (v7)
- QoS (Quality of Service) Round Trip Sensor 1338 (v9.1.0)
- RADIUS v2 Sensor 1348 (v14.x.13)
- RDP (Remote Desktop) Sensor 1358 (v7)
- Sensor Factory Sensor 1374 (v7)
- sFlow Sensor 1393 (v7)
- sFlow (Custom) Sensor 1405 (v7)
- SFTP Secure File Transfer Protocol Sensor 1416 (v12.x.6)
- Share Disk Free Sensor 1366 (v7)
- SIP Options Ping Sensor 1425 (v12.x.1)
- SMTP Sensor 1434 (v7)

More

Did not find what you were looking for? Have a look at the Additional Sensor Types (Custom Sensors) 2707 section.

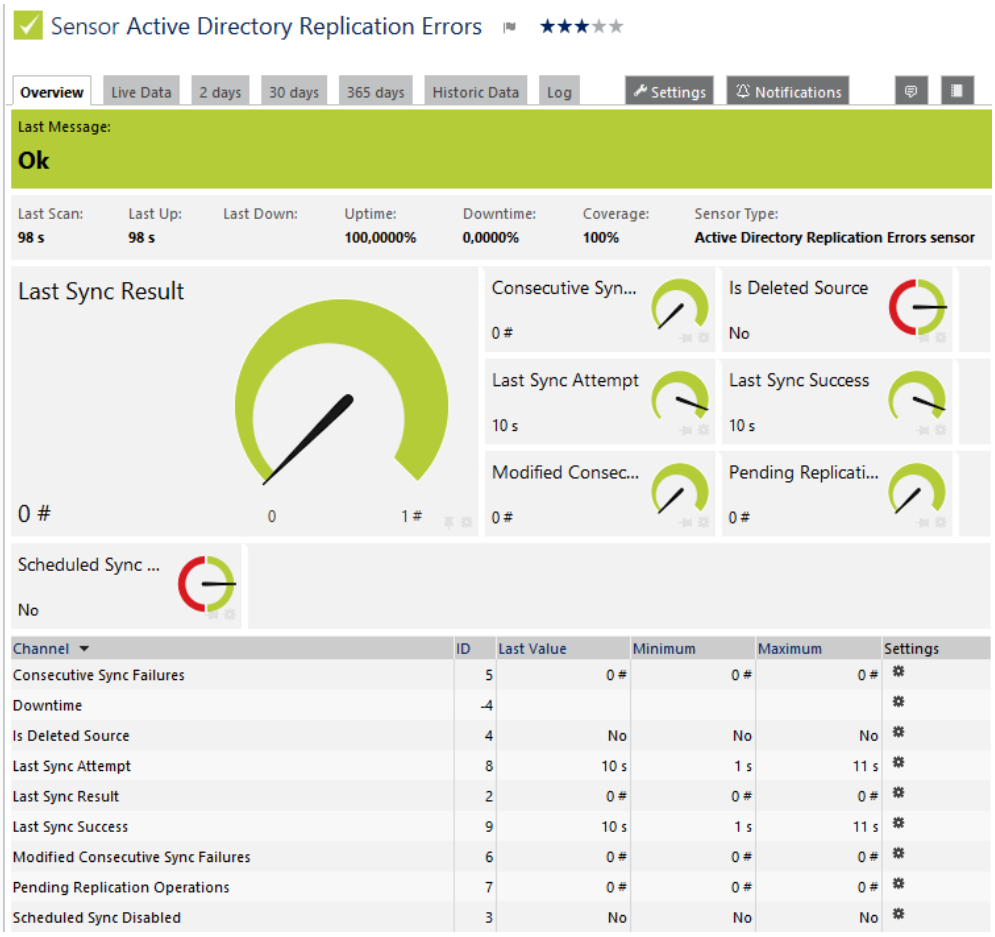
6.8.2 Active Directory Replication Errors Sensor

The Active Directory Replication Errors sensor uses the Windows credentials of its parent device to check domain controllers for replication errors.

It can show the following:

- Number of consecutive sync failures
- If the source is deleted
- If the scheduled sync is disabled
- Time of the last sync attempt
- Result of the last sync
- Time of the last sync success
- Number of modified consecutive sync failures
- Number of pending replication operations

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Active Directory Replictaion Errors Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/active_directory_replication_errors.png

Remarks

- Requires 369 valid Windows domain credentials in the settings of the parent device 329.
- Requires 369 the probe system to be part of the domain whose AD you monitor.
- Requires 369 .NET 4.0 or higher on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Member of Windows Domain

This sensor only works if the computer running the PRTG probe is part of the domain whose Active Directory you want to monitor. The probe runs either on the local system (on every node, if on a cluster probe), or on another system as remote probe 3109. If this requirement is not met, the sensor will not work.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure that the same Windows user accounts (with the same username and password) exist on both the system running the PRTG probe and the target computer. Otherwise the sensor cannot connect correctly.

Note: Your Windows credentials may not contain any double quotation marks ("). If they do, this sensor will not work!

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the replications you want to monitor. PRTG creates one sensor for each replication neighbor you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS	
Replication Neighbor	Select the replication neighbor whose replication you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS	
Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Replication Neighbor	Shows the replication neighbor whose replication this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

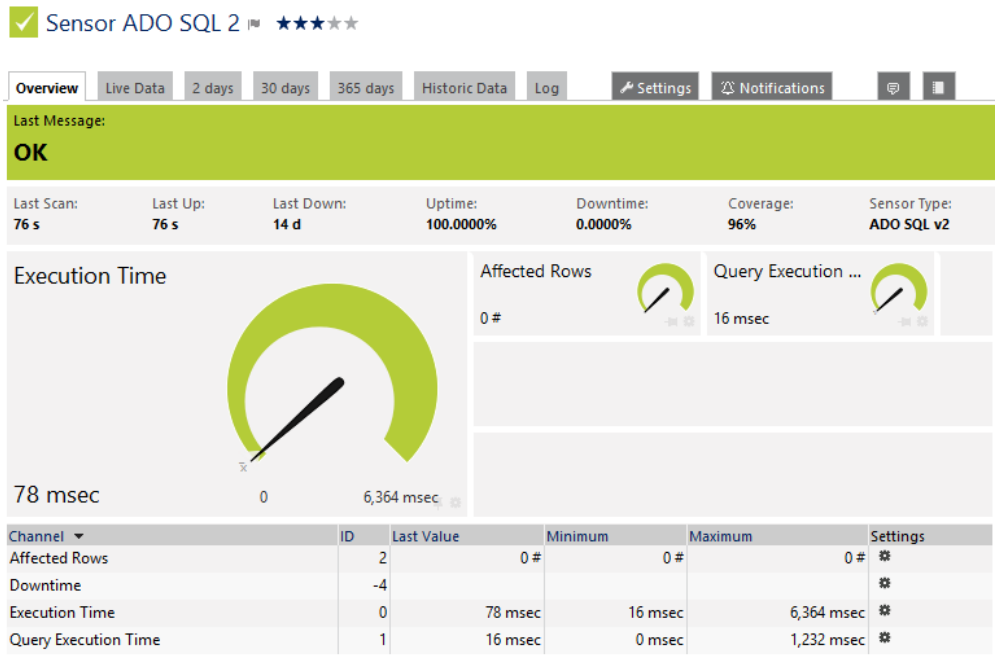
For more general information about settings, please see the **Object Settings** 159 section.

6.8.3 ADO SQL v2 Sensor

The ADO SQL v2 sensor monitors a database using an ActiveX Data Objects (ADO) connection and executes a Structured Query Language (SQL) query. It can monitor any data source that is available via OLE DB (Object Linking and Embedding, Database) or ODBC (Open Database Connectivity).

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of the given query
- Number of rows which were addressed by the query (including select statements if you process data tables)
- It can also process the data table and show defined values in individual channels.



ADO SQL v2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ado-sql-v2.png

Remarks

- Requires 379 .NET 4.0 on the probe system.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on: If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- Save the SQL script with the query into the **\Custom Sensors\sql\adosql** subfolder of your PRTG installation. See manual section **Data Storage** 3135 for more information about how to find this path.
- If you use an ODCB connection, you have to define the ODCB connection in the Windows ODCB Connection Manager first. If it is a 64-bit Windows, you need to define the ODCB connection as an ODCB 32-bit connection.
- This sensor type supersedes the outdated ADO SQL sensor.
- PRTG Manual: **Monitoring Databases** 3033 (includes an example 3034 for channel value selection)
- Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Connection String	Enter the string that the sensor will use to connect to the database. For example, a connection string can look like this: Provider=SQLOLEDB.1;Data Source=10.0.0.200\SQLEXPRESS;User ID=user;Password=userpass;Initial Catalog=Northwind For more information on how to build connection strings, please see **More** 391 section below. Note: For ODBC connections, you need to enter MSDASQL as provider, for example Provider=MSDASQL;DSN=_my_odbc_sqlserver. Note: You can use the placeholders %dbloginuser and %dbloginpassword here. PRTG will replace them with the **Credentials for Database Management Systems** 334 of the parent device.

DATA

SQL Query File	Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see **Data Storage** 3135 section. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server. For example, a correct expression in the file could be: SELECT AVG (UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";". Note: Please be aware that with each request the full result set will be transferred, so use filters and limits in your query.
Use Transaction	Define if you want to use transactions and if they will affect the database content. Choose between: ▪ **Don't use transaction (default)**: No transactions will be executed. ▪ **Use transaction and always rollback**: Choose this option to ensure that no data in the database will be changed by the query. In the **SQL Query** field above, separate the single steps of the transaction with semicolons. ▪ **Use transaction and commit on success**: Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.
Data Processing	Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Just execute the query**: If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are only rows which were changed somehow with the query (for example, created, deleted, edited).

DATA

	▪ **Count table rows:** Choose this option if you perform a SELECT statement and want to monitor how many rows of the data table this statement returns. ▪ **Process data table**: Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with SELECT statements as well.
Handle DBNull in Channel Values as	This setting is only visible if you selected the process data table option above. Define the sensor behavior if DBNull is returned by the query. Choose between: ▪ **Error**: The sensor will show a **Down** status if DBNull is reported. ▪ **Number 0**: The sensor will recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	This setting is only visible if you selected the process data table option above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells which will be used in the sensor channels. Choose between: ▪ **Column number**: The channel value will be determined by using the value in row 0 of the column whose number you specify below. ▪ **Column name**: The channel value will be determined by using the value in row 0 of the column whose name you specify below. ▪ **Row number**: The channel value will be determined by using the value in column 0 of the row whose number you specify below. ▪ **Key value pair**: The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found. Please see manual section **Monitoring Databases** 3033 for an example 3034 for channel value selection.
Sensor Channel #x	This setting is only visible if you selected the process data table option above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for Channel #1 without enabling it manually. For all other possible channels, choose between: ▪ **Disable**: This channel will not be added to the sensor. ▪ **Enable**: This channel will be added to the sensor. Define the settings as described above.

DATA

	Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Name	This setting is only visible if you selected the process data table option above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Column Number	This setting is only visible if you selected the column number option above. Provide the number of the column which will be used to determine the channel value in row 0. Please enter an integer value.
Sensor Channel #x Column Name	This setting is only visible if you selected the column name option above. Provide the name of the column which will be used to determine the channel value in row 0. Please enter a string.
Sensor Channel #x Row Number	This setting is only visible if you selected the row number option above. Provide the number of the row which will be used to determine the channel value in column 0. Please enter an integer value.
Sensor Channel #x Key	This setting is only visible if you selected the key value pair option above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.
Sensor Channel #x Mode	This setting is only visible if you selected the process data table option above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from the data table. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from the data table.
Sensor Channel #x Unit	This setting is only visible if you have selected the process data table option above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

DATA

	▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you selected the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This settings is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Use Data Table Value in Sensor Message	This setting is only visible if you selected the process data table option above. Define if the sensor message will show a value from the data table. Choose between: ▪ **Disable**: Do not use a custom sensor message. ▪ **Enable**: Define a custom sensor message with the value of a defined channel.

DATA

Sensor Message Column Number	This setting is only visible if you selected the column number and sensor message options above. Specify the number of the column whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Column Name	This setting is only visible if you selected the column name and sensor message options above. Specify the name of the column whose value will be shown in the sensor message. Please enter a string.
Sensor Message Row Number	This setting is only visible if you selected the row number and sensor message options above. Specify the number of the row whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Key	This setting is only visible if you selected the key value pair and sensor message options above. Specify the key for the value which will be shown in the sensor message. Please enter a string.
Sensor Message	This setting is only visible if you selected the sensor message option above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a

SENSOR DISPLAY	
	channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

- https://kb.paessler.com/en/topic/2053

Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

- https://kb.paessler.com/en/topic/63259

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

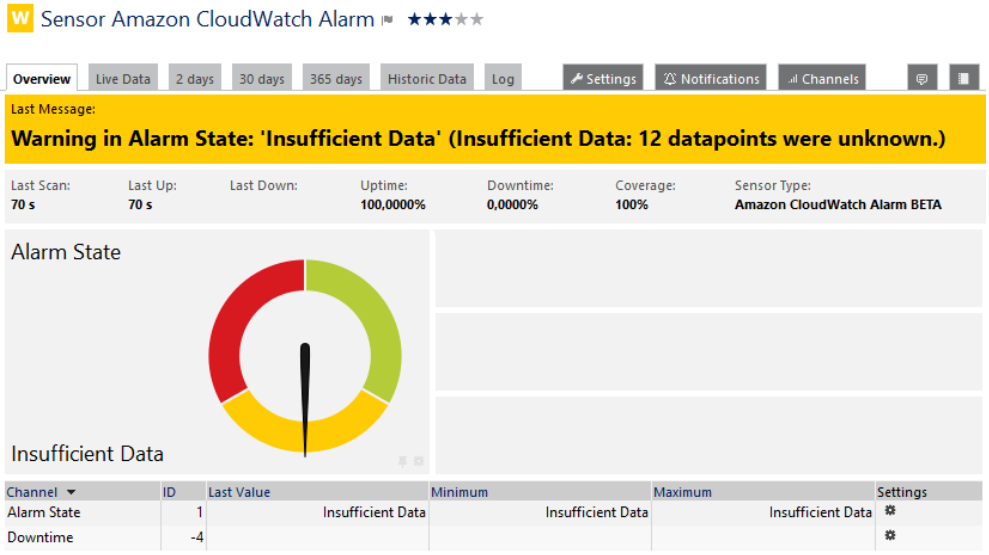
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.4 Amazon CloudWatch Alarm Sensor

The Amazon CloudWatch Alarm sensor monitors the status of an Amazon CloudWatch alarm. It reads the data via the AWS CloudWatch Application Programming Interface (API).

- This sensor can show the status of a configured alarm for a CloudWatch service.



Amazon CloudWatch Alarm Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_alarm.png

Remarks

- The data you see in the sensor message is not necessarily the current data. It merely shows the reason for the current status [135] and why the sensor changed to it. This means for the **Up** status, for example, that this data is as old as time has past since the last alarm disappeared.
- Requires [393] access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires [393] .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** [335] in settings that are higher in the **Object Hierarchy** [89], for example, in the parent device settings [324].
- Note: Names of configured alarms that you want to monitor must not contain double spaces.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** [3095].

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see the Knowledge Base article http://kb.paessler.com/en/topic/38083

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for configured alarms on CloudWatch. This can take up to several minutes.

Select which alarm(s) you want to monitor. PRTG creates one sensor for each alarm you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the alarms you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California)

AMAZON CLOUDWATCH SPECIFIC

- EU (Ireland)
- EU (Frankfurt)
- Asia Pacific (Singapore)
- Asia Pacific (Tokyo)
- Asia Pacific (Sydney)
- Asia Pacific (Seoul)
- South America (Sao Paulo)

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Description

Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

ID

Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

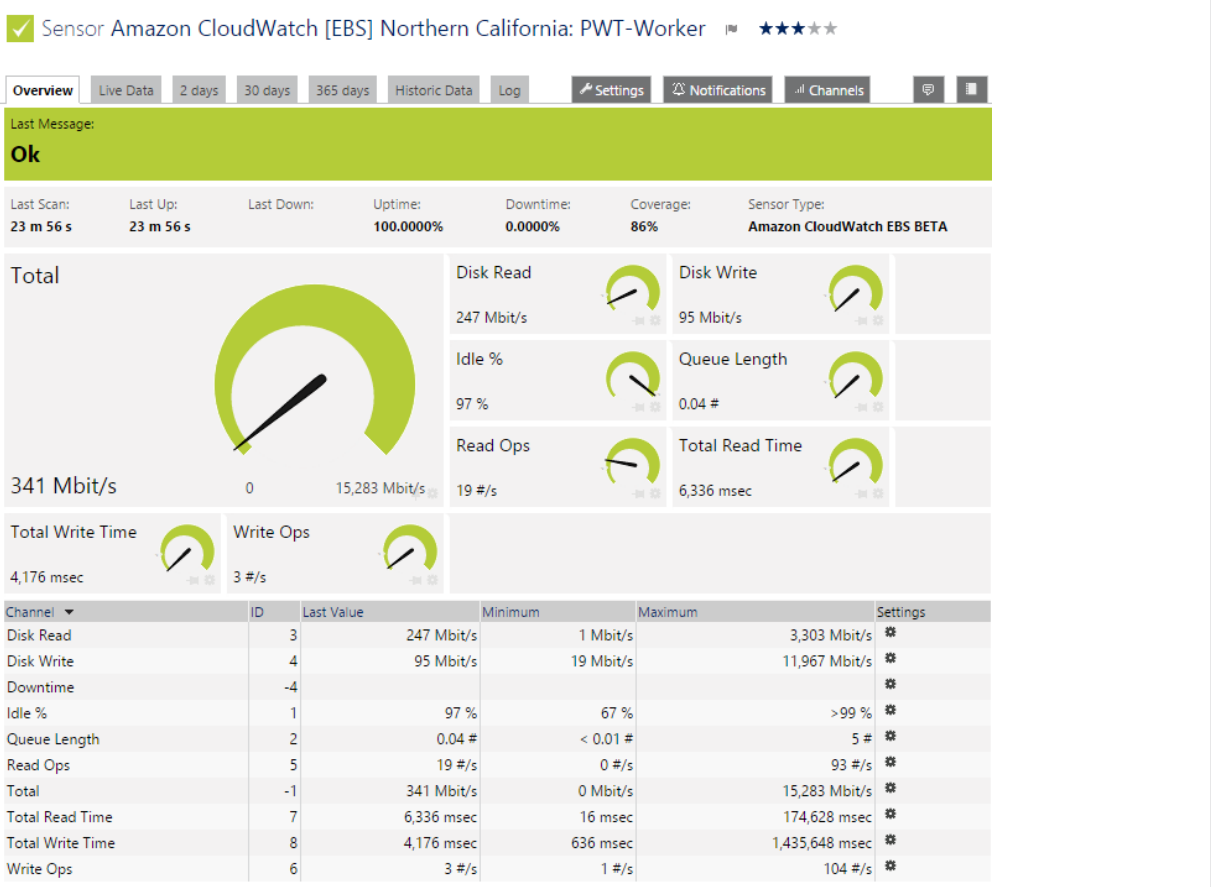
6.8.5 Amazon CloudWatch EBS Sensor

The Amazon CloudWatch EBS sensor monitors the performance of the Amazon Cloud service Elastic Block Store (EBS).

The sensor can show the following:

- Total volume of I/O operations
- Total disk read and write time
- Disk read and write speed
- Number of disk read and write operations per second
- Idle time with no submitted operations
- Number of read and write operations waiting to be completed

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Amazon CloudWatch EBS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_ebs_sensor.png

Remarks

- Requires 403 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 403 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 411. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 411
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 411.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Volume you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices**	**Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Supported Metrics

AMAZON CLOUDWATCH METRICS

Elastic Block Store (EBS)	▪ VolumeTotalReadTime (Sum) ▪ VolumeTotalWriteTime (Sum) ▪ VolumeReadBytes (Sum) ▪ VolumeWriteOps (Sum) ▪ VolumeReadOps (Sum) ▪ VolumeWriteBytes (Sum) ▪ VolumeConsumedReadWriteOps (Sum) ▪ VolumeQueueLength (Average) ▪ VolumeIdleTime (Sum)

Supported Dimensions

AMAZON CLOUDWATCH DIMENSIONS

Elastic Block Store (EBS)	▪ Volume

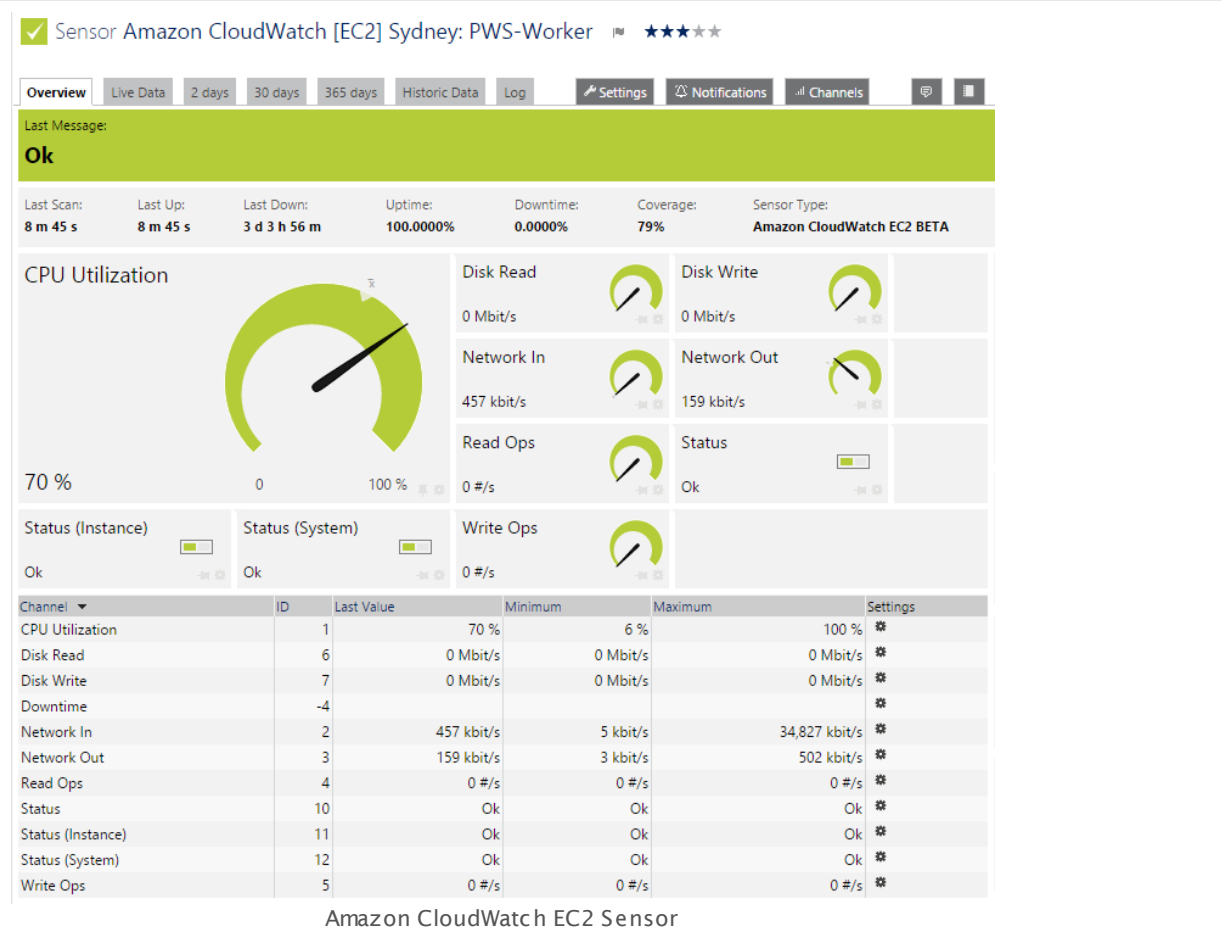
6.8.6 Amazon CloudWatch EC2 Sensor

The Amazon CloudWatch EC2 sensor monitors the performance of the Amazon Cloud service Elastic Cloud Computing (EC2).

The sensor can show the following:

- CPU utilization
- Network load in and out
- Disk I/O:
  - Read and write speed
  - Number of disk read and write operations per second
- CPU credit usage and balance
- EC2 status checks

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value	Minimum	Maximum	Settings
CPU Utilization	1	70 %	6 %	100 %	
Disk Read	6	0 Mbit/s	0 Mbit/s	0 Mbit/s	
Disk Write	7	0 Mbit/s	0 Mbit/s	0 Mbit/s	
Downtime	-4				
Network In	2	457 kbit/s	5 kbit/s	34,827 kbit/s	
Network Out	3	159 kbit/s	3 kbit/s	502 kbit/s	
Read Ops	4	0 #/s	0 #/s	0 #/s	
Status	10	Ok	Ok	Ok	
Status (Instance)	11	Ok	Ok	Ok	
Status (System)	12	Ok	Ok	Ok	
Write Ops	5	0 #/s	0 #/s	0 #/s	

Amazon CloudWatch EC2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_ec2_sensor.png

Remarks

- Requires 414 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 414 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 423. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 423.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 423.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Instances or Auto Scaling Groups you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Detailed Monitoring	Choose whether you would like to import more or less detailed monitoring data from the AWS API. Choose between ▪ **Enabled:** You get 1 dataset per minute. ▪ **Disabled (default):** You get 1 dataset per 5 minutes. Note: To use detailed monitoring in PRTG, you must also activate it for your monitored instance in the AWS web console.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Supported Metrics

AMAZON CLOUDWATCH METRICS

Elastic Compute Cloud (EC2)	▪ CPUUtilization (Average) ▪ NetworkIn (Sum) ▪ NetworkOut (Sum) ▪ DiskReadBytes (Sum) ▪ DiskReadOps (Sum) ▪ DiskWriteBytes (Sum) ▪ DiskWriteOps (Sum) ▪ CPUCreditUsage (Average) ▪ CPUCreditBalance (Average) ▪ StatusCheckFailed (Maximum) ▪ StatusCheckFailed_Instance (Maximum) ▪ StatusCheckFailed_System (Maximum)

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.7 Amazon CloudWatch ElastiCache Sensor

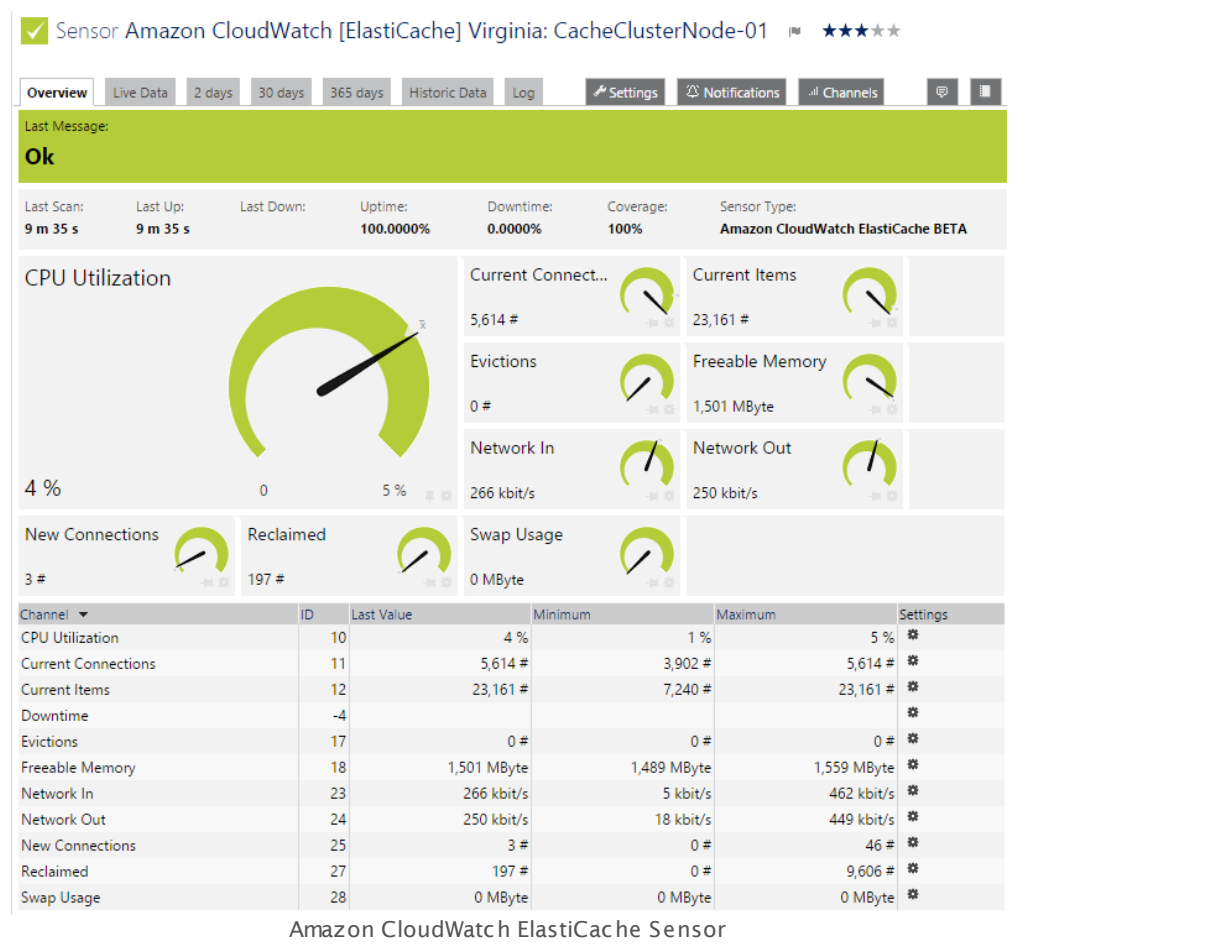
The Amazon CloudWatch ElastiCache sensor monitors the performance of the Amazon Cloud service ElastiCache.

The sensor can show the following:

- CPU utilization
- Memory
- Cache I/O
- Network I/O
- Cache Statistics

See **Supported Metrics** 434 for a list of data that this sensor potentially can show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value	Minimum	Maximum	Settings
CPU Utilization	10	4 %	1 %	5 %	
Current Connections	11	5,614 #	3,902 #	5,614 #	
Current Items	12	23,161 #	7,240 #	23,161 #	
Downtime	-4				
Evictions	17	0 #	0 #	0 #	
Freeable Memory	18	1,501 MByte	1,489 MByte	1,559 MByte	
Network In	23	266 kbit/s	5 kbit/s	462 kbit/s	
Network Out	24	250 kbit/s	18 kbit/s	449 kbit/s	
New Connections	25	3 #	0 #	46 #	
Reclaimed	27	197 #	0 #	9,606 #	
Swap Usage	28	0 MByte	0 MByte	0 MByte	

Amazon CloudWatch ElastiCache Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_elasticache_sensor.png

Remarks

- Requires 426 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 426 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 434. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 435.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 435.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Cache Clusters or Cache Cluster Nodes you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices**	**Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Supported Metrics

AMAZON CLOUDWATCH METRICS

ElastiCache	▪ CPUUtilization (Average) ▪ CurrConnections (Average) ▪ CurrItems (Average) ▪ NewItems (Sum) ▪ NewConnections (Sum) ▪ FreeableMemory (Average) ▪ UnusedMemory (Average) ▪ SwapUsage (Average) ▪ BytesUsedForCacheItems (Average) ▪ BytesReadIntoMemcached (Sum) ▪ BytesWrittenOutFromMemcached (Sum) ▪ NetworkBytesIn (Sum) ▪ NetworkBytesOut (Sum) ▪ Evictions (Sum) ▪ Reclaimed (Sum) ▪ CasBadval (Sum) ▪ CasHits (Sum) ▪ CasMisses (Sum) ▪ CmdFlush (Sum) ▪ Cmdget (Sum) ▪ Cmdset (Sum) ▪ DecrMisses (Sum) ▪ DecrHits (Sum) ▪ DeleteHits (Sum) ▪ DeleteMisses (Sum) ▪ GetHits (Sum) ▪ GetMisses (Sum) ▪ IncrHits (Sum) ▪ IncrMisses (Sum)

6.8.8 Amazon CloudWatch ELB Sensor

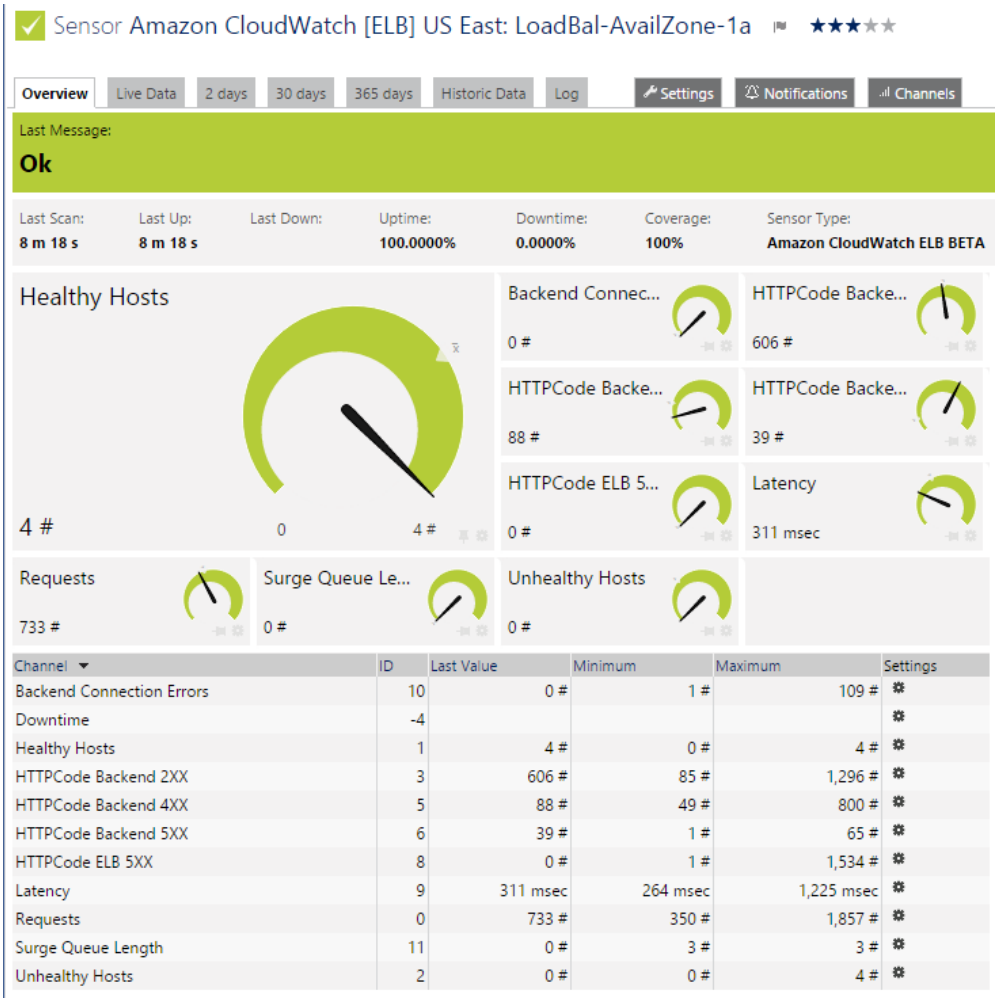
The Amazon CloudWatch ELB sensor monitors the performance of the Amazon Cloud service Elastic Load Balancing (ELB).

The sensor can show the following:

- Host Count
- HTTP Result Count (2xx, 3xx, 4xx, 5xx)
- Latency
- Queue

See **Supported Metrics** 445 for a list of data that this sensor potentially can show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Amazon CloudWatch ELB Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_elb_sensor.png

Remarks

- Requires 437 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 437 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 445. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 445.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 445.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Load Balancers or Availability Zones you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

AMAZON CLOUDWATCH SPECIFIC

Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency. ▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices**	**Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Supported Metrics

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.9 Amazon CloudWatch RDS Sensor

The Amazon CloudWatch RDS sensor monitors the performance of the Amazon Cloud service Relational Database Service (RDS).

The sensor can show the following:

- CPU Utilization
- CPU Credit Usage and CPU Credit Balance
- Memory Usage
- Database I/O
- Network I/O
- Storage information

See **Supported Metrics** 457 for a list of data that this sensor potentially can show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
CPU Utilization	1	37 %	30 %	45 %	
Database Connections	2	0 #	0 #	0 #	
DB Read	9	5 KByte	1 KByte	615 KByte	
DB Write	10	61 KByte	53 KByte	116 KByte	
Disk Queue Depth	13	0 #	0 #	0 #	
Downtime	-4				
Free Storage Space	4	101,650 MByte	101,645 MByte	101,665 MByte	
Freeable Memory	3	310 MByte	306 MByte	476 MByte	
Network In	14	4 kbit/s	3 kbit/s	4 kbit/s	
Network Out	15	27 kbit/s	23 kbit/s	28 kbit/s	
Read Latency	7	0 msec	0 msec	2 msec	
Read OPS	5	1 #/s	1 #/s	35 #/s	
Write Latency	8	2 msec	1 msec	5 msec	
Write OPS	6	9 #/s	6 #/s	21 #/s	

Amazon CloudWatch RDS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_rds_sensor.png

Remarks

- Requires 449 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 449 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 457. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.

- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 457.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 457.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Engines or Database Instances you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY	
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

6.8.10 Amazon CloudWatch SNS Sensor

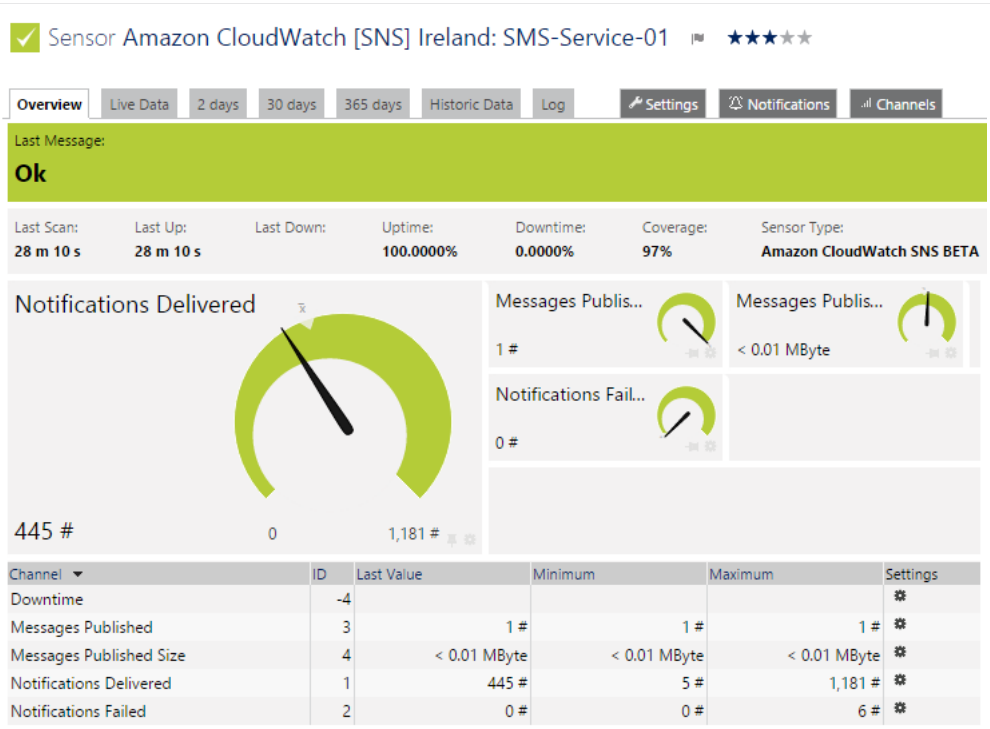
The Amazon CloudWatch SNS sensor monitors the performance of the Amazon Cloud service Simple Notification Service (SNS).

The sensor can show the following:

- Message Counting
- Error Counting

See **Supported Metrics** 468 for a list of data that this sensor potentially can show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Amazon CloudWatch SNS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_sns_sensor.png

Remarks

- Requires 460 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?
- Requires 460 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.

- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 468. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 468.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 468.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Applications, Platforms or Topics you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.11 Amazon CloudWatch SQS Sensor

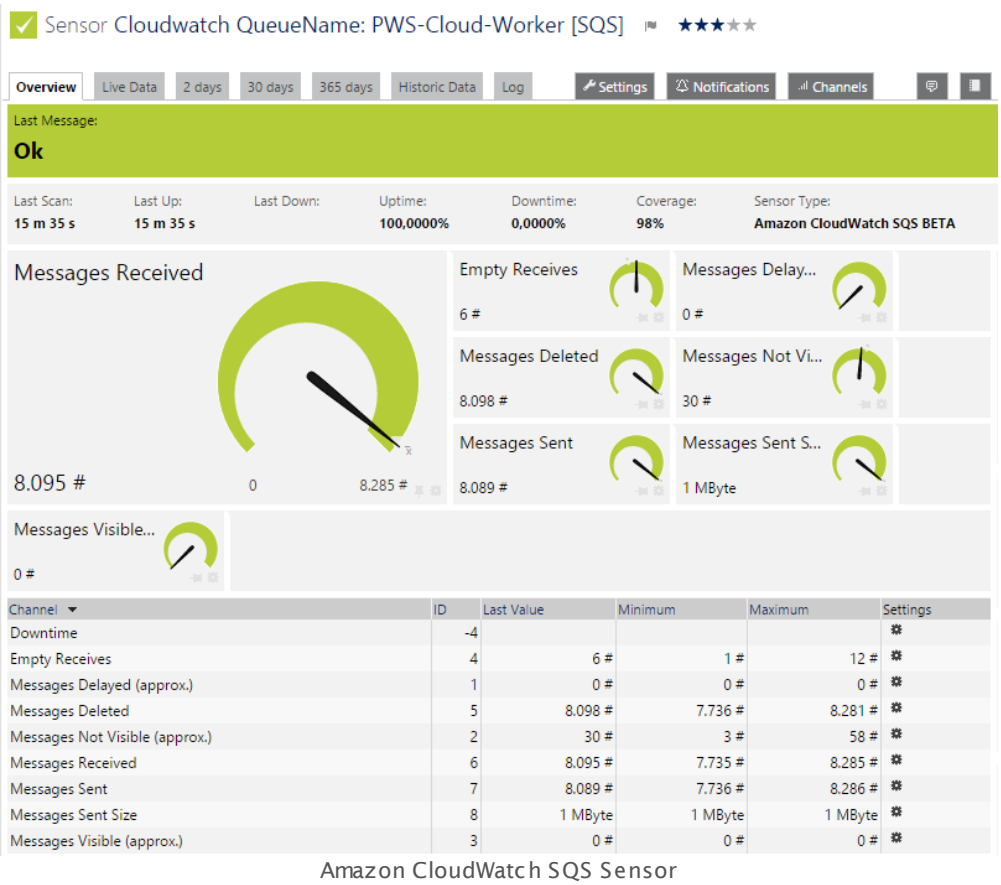
The Amazon CloudWatch SQS sensor monitors the performance of the Amazon Cloud service Simple Queue Service (SQS).

The sensor can show the following:

- Message Counting
- Error Counting
- Delay

See **Supported Metrics** 479 for a list of data that this sensor potentially can show in dedicated channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Amazon CloudWatch SQS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/amazon_cloudwatch_sqs_sensor.png

Remarks

- Requires 471 access rights for CloudWatch queries. For details, please see the Knowledge Base: How do I define access rights for Amazon CloudWatch queries?

- Requires 471 .NET 4.0 or higher on the probe system.
- Define **Credentials for Amazon CloudWatch** 335 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- The minimum scanning interval for this sensor is **15 minutes**.
- Note: This sensor will only show those channels for which it receives data from Amazon. You can check the availability of data in your CloudWatch Console on the AWS website. To know which channels are possible for the various services of this Amazon CloudWatch sensor, see the manual section **Supported Metrics** 479. If the sensor does not receive data from Amazon for more than 6 hours, it will go into error status.
- To know which dimensions you can monitor, see the manual section **Supported Dimensions** 479.
- Note: Amazon will charge you (a small amount) for each "Amazon CloudWatch API Request" query the sensor sends to the Amazon servers. Depending on the service, each Amazon CloudWatch sensor sends about 10 to 30 requests with each scanning interval. Last time we checked the Amazon price list, they charged max. US$ 0.014 per 1,000 requests (depending on your region).
  For details, please see the Knowledge Base: How much does Amazon charge for using the CloudWatch API?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Access Rights for Amazon CloudWatch Queries

The AWS Identity and Access Management (IAM) account that you use with the Amazon CloudWatch sensor needs specific rights to query any metrics. For details, see section **More** 479.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG looks for available instances. Note: This can take up to several minutes.

Select which service instance(s) you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

AMAZON CLOUDWATCH SPECIFIC

Services	Select the Queues you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

AMAZON CLOUDWATCH SPECIFIC

Region	Shows the region in which the monitored AWS instance runs. It is one of the following regions: ▪ US East (Northern Virginia) ▪ US West (Oregon) ▪ US West (Northern California) ▪ EU (Ireland) ▪ EU (Frankfurt) ▪ Asia Pacific (Singapore) ▪ Asia Pacific (Tokyo) ▪ Asia Pacific (Sydney) ▪ Asia Pacific (Seoul) ▪ South America (Sao Paulo) Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows the description of the AWS service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
ID	Shows the ID of the AWS instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Amazon CloudWatch sensors, the minimum scanning interval is **15 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

6.8.12 Business Process Sensor

The Business Process sensor is a powerful and very flexible sensor that allows you to give a summary status of whole business processes while monitoring several process components.

This means that you can create your very own and individual sensor with channels based on data from other sensors ("source sensors") that are specific to your network.

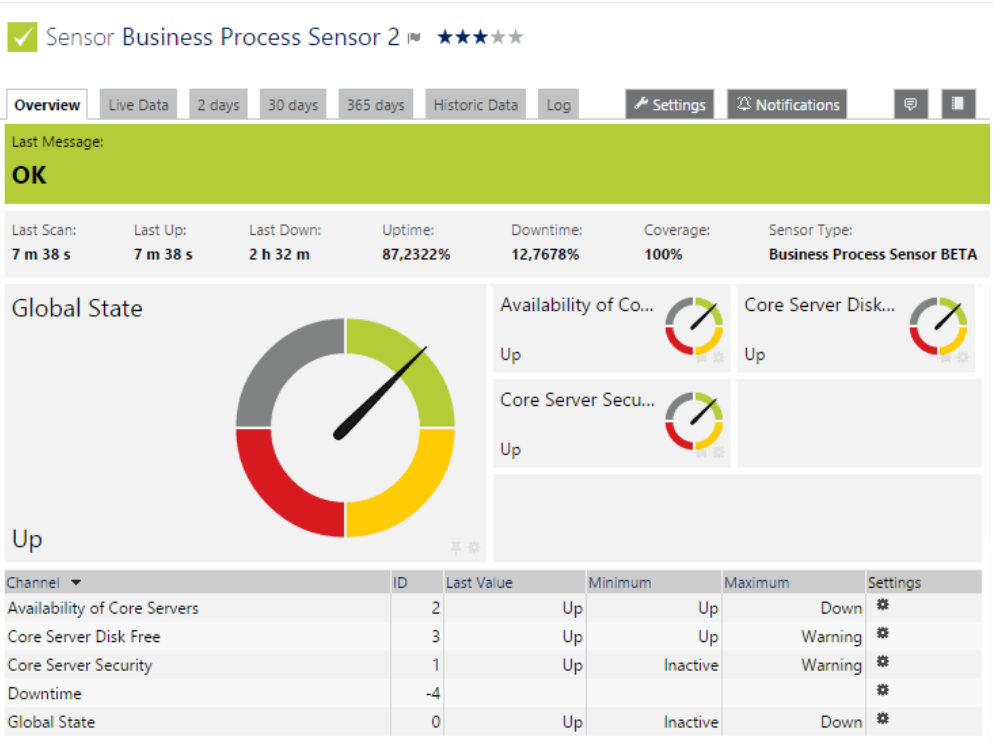
The sensor can show the following:

- The summarized status of the objects contained in each channel according to the individually defined error and warning thresholds
- The overall and summarized status of all channels in the Global State channel

Note: The Business Process sensor does not show values in the "Downtime" channel because they cannot be calculated for this sensor type.

Note: If you want to process values from other sensors and you want to perform calculations with these values, for example, please use the **Sensor Factory Sensor** 1374 instead.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Business Process Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/business_process_sensor.png

Remarks

- Knowledge Base: How does the Business Process sensor calculate summarized sensor states?
- This sensor does not support more than 50 channels 482 officially.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

BUSINESS PROCESS SPECIFIC SETTINGS

Channel Name	Enter a meaningful name to identify the channel. To add a new channel to the sensor, click the **Enter Channel Name** field, enter a name for the channel, and confirm with the enter or tab key.
Error Threshold %	Set a percentage limit to define when the sensor channel displays a **Down** status. Please enter an integer value. Default is 50%. Note: This value depends on how many objects you feed into a business process channel. If a channel contains less source objects in "up" condition than the error threshold defines, this channel and the **Global State** channel of the Business Process sensor will show a **Down** status (and so the sensor status is **Down**). The **Sensor States** 135 which allow for the "up" condition of a Business Process channel are the following: ▪ Up ▪ Warning ▪ Unusual ▪ Partial Down All other sensor states will support the "down" condition.

BUSINESS PROCESS SPECIFIC SETTINGS

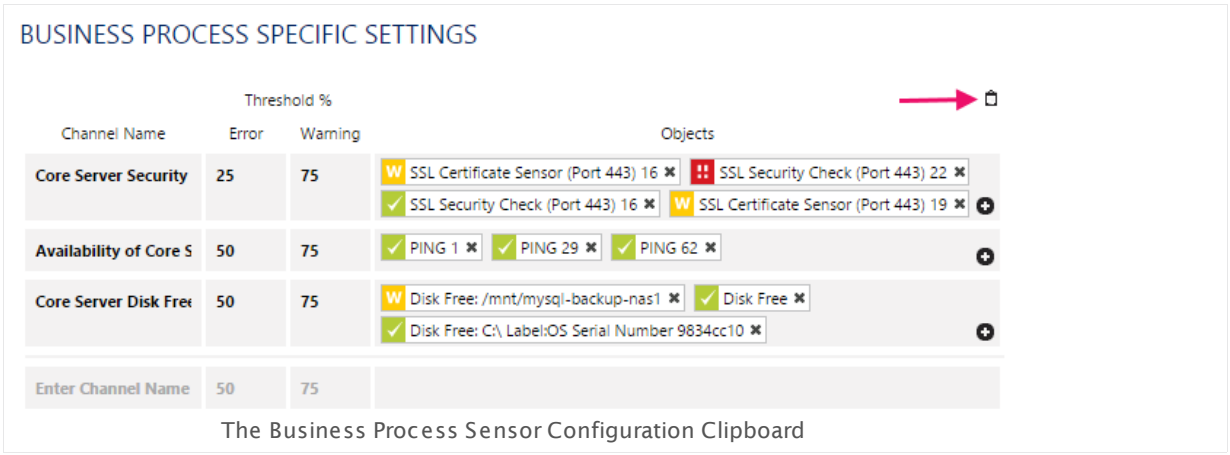
	For example, if you define 4 source sensors for a channel, an error threshold of 50% means that 3 source sensors have to be in "down" condition to set this channel to a **Down** status. So, 50% means that more than half of the source sensors must not be in "up" condition to set the sensor to **Down**. To get more information, an illustration of the business process mechanisms and some use cases of the Business Process sensor, see the **More** 490 section below.
Warning Threshold %	Set a percentage limit to define when the sensor channel displays a **Warning** status. Please enter an integer value. Default is 75%. Note: This value depends on how many objects you feed into a business process channel. If a channel contains less source objects in "up" condition than the threshold defines, this channel and the **Global State** channel of the Business Process sensor will show a **Warning** status (and so the sensor status is **Warning**). The **Sensor States** 135 which allow for the "up" condition of a Business Process channel are the following: ▪ Up ▪ Warning ▪ Unusual ▪ Partial Down All other sensor states will support the "down" condition. For example, if you define 4 source sensors for a channel, a warning threshold of 75% means that all 4 source sensors have to be in "down" condition to set this channel to a **Warning** status. So, 75% means that more than three out of four of the source sensors must not be in "up" condition to set the sensor to **Warning**. To get more information, an illustration of the business process mechanisms and some use cases of the Business Process sensor, see the **More** 490 section below.
Objects	Enter the objects you want to have in a channel using the + sign. This way, you can choose the desired objects from the device tree with the **Object Selector** 181. You can also start typing the object's ID, name, or a tag. PRTG then suggests the possible objects to be selected.

BUSINESS PROCESS SPECIFIC SETTINGS

You can add sensors, devices, groups, and probes to a channel. Each object you add is weighted equally, no matter if it is a single sensor or a whole device with many sensors. To give more weight to a specific object, add it several times. For example, add it twice to give double weight to an object, add it three times to give triple weight to it.

Note: A probe, group, or device is as long in "up" condition as it does not contain any sensors in "down" condition.

Note: If you encounter issues with your Business Process sensor and want to contact our support team, please send us your exact configuration. It helps us find the cause more easily and quickly. Click the little clipboard icon in the upper right of the **Business Process Specific Settings** table to copy your configuration:



The Business Process Sensor Configuration Clipboard

Click here to enlarge: http://media.paessler.com/prtg-screenshots/business_process_sensor_clipboard-m.png

You find your configuration in the window that opens. Copy the marked text and paste it into the support form to send it our support team.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY	
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: How does the Business Process sensor calculate summarized sensor states?

Knowledge Base: How can I use the Business Process sensor?

- http://kb.paessler.com/en/topic/67109

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.13 Cisco IP SLA Sensor

The Cisco IP SLA sensor monitors Voice over IP (VoIP) network parameters using IP Service Level Agreement (SLA) from Cisco via Simple Network Management Protocol (SNMP).

It shows different aspects provided by the queried device:

- Average, maximum, and minimum Round Trip Time (RTT)
- Average jitter
- Average jitter from source to destination and vice versa
- Average latency from source to destination and vice versa
- Impairment Calculated Planning Impairment Factor (ICPIF)
- Late packets in percent
- Average, maximum, and minimum latency from source to destination and vice versa
- Mean Opinion Score (MOS)
- Number of lost packets and in percent
- Packets out of sequence in percent

Cisco IP SLA Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/cisco_ip_sla.png

Remarks

- For a general introduction to the technology behind Quality of Service monitoring, please see manual section **Monitoring Quality of Service** 3017.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which SLAs you want to monitor. PRTG creates one sensor for each SLA you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IP SLA SPECIFIC

IP SLAs

Select the IP SLAs you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

The list options depend on the configuration of the queried device. If you miss a type here, please check the configuration of your target device. PRTG can support the following operations with the given type IDs:

- **echo** (1)
- **pathEcho** (2)
- **fileIO** (3)
- **script** (4)
- **udpEcho** (5)
- **tcpConnect** (6)
- **http** (7)
- **dns** (8)
- **jitter** (9)
- **dlsw** (10)
- **dhcp** (11)
- **ftp** (12)
- **icmp-jitter** (16)

IP SLA SPECIFIC

- **path-jitter** (23)

Note: The numbers above are the IDs of the SLA types as reported by the target device. PRTG translates them into the corresponding strings. These IDs are independent from the IDs which you see in the first column of the list. If the target device returns other values than given above, the sensor will show an error message that it cannot find the type.

Note: Packet Loss values are summarized, but have no explicit channel for Source—Destination or Destination—Source values

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IP SLA SPECIFIC

ID	These fields show SLA specific settings which the queried SLA device provides. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Type	
Name (Tag)	
Owner	
Frequency	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.14 Citrix XenServer Host Sensor

The Citrix XenServer Host Sensor monitors a Xen host server via Hypertext Transfer Protocol (HTTP).

It can show the following:

- CPU usage
- Memory usage (free, used, allocation)
- Network usage
- Number of running virtual machines
- Load average

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
CPU _avg Usage	2	5 %	3 %	13 %	
CPU 0 Usage	3	5 %	3 %	14 %	
CPU 1 Usage	4	5 %	3 %	13 %	
Downtime	-4				
Load Average	5	0,23 #	0 #	0,47 #	
Memory allocation XAPI daemon	14	0,46 MByte	0,38 MByte	1 MByte	
Memory free XAPI daemon	15	1 MByte	0,29 MByte	1 MByte	
Memory live XAPI daemon	16	0,18 MByte	0,14 MByte	0,36 MByte	
Network aggr receive	8	26 KByte/s	23 KByte/s	862 KByte/s	
Network aggr send	9	12 KByte/s	7 KByte/s	557 KByte/s	
Network eth0 receive	10	24 KByte/s	22 KByte/s	860 KByte/s	
Network eth0 send	11	10 KByte/s	7 KByte/s	555 KByte/s	
Network lo receive	12	1 KByte/s	1 KByte/s	3 KByte/s	
Network lo send	13	1 KByte/s	1 KByte/s	3 KByte/s	
Total Memory free	6	155 MByte	155 MByte	155 MByte	
Total Memory used	7	3.070 MByte	3.070 MByte	3.070 MByte	
Total Memory XAPI	17	1 MByte	0,48 MByte	1 MByte	
VMs running	18	1 #	1 #	1 #	

Citrix XenServer Host Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/citrix_xenserver_host.png

Remarks

- The parent device must be a Citrix XenServer version 5.0 or later.
- The parent device has to represent one host server of your XenServer pool 504.
- Requires credentials for Xen servers to be defined for the device you want to use the sensor on.

- Requires 504 .NET 4.0 or higher on the probe system.
- Knowledge Base: Does PRTG impair my Citrix environment?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents one host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host. Note: In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which XenServer hosts you want to monitor. PRTG creates one sensor for each host you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HOST SETTINGS

Host	Select the hosts you want to add a sensor for, including the ones that are not running. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HOST SETTINGS

UUID	Shows the Universally Unique Identifier (UUID) of the host that this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so for debugging. Wrong usage can result in incorrect monitoring data!
Name	Shows the name of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

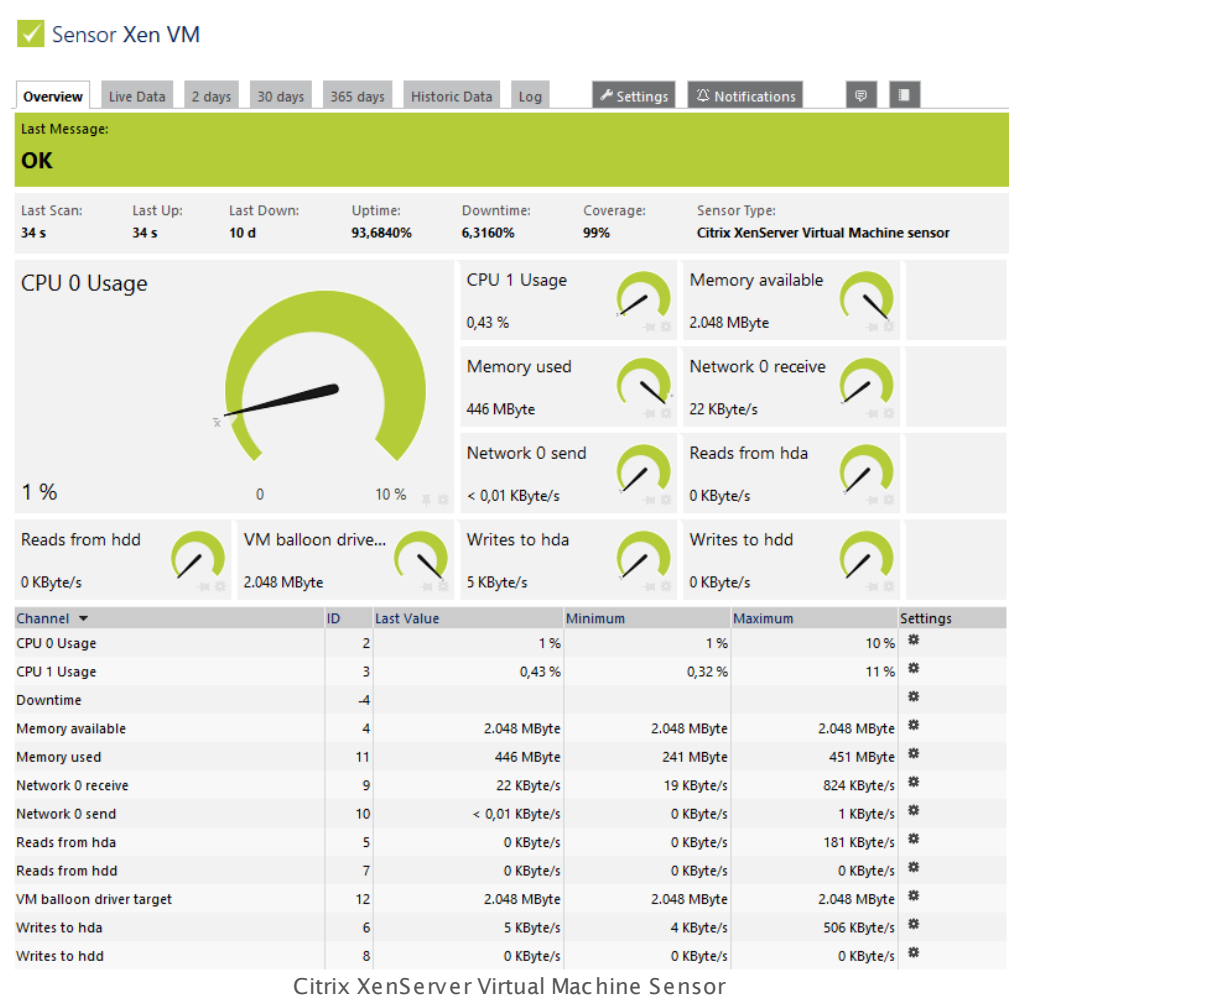
6.8.15 Citrix XenServer Virtual Machine Sensor

The Citrix XenServer Virtual Machine Sensor monitors a virtual machine on a Xen server via Hypertext Transfer Protocol (HTTP).

It can show the following:

- CPU usage
- Memory usage (available, used)
- Disk usage (reads and writes per second)
- Network usage (bytes received and sent)
- Balloon driver target size

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Citrix XenServer Virtual Machine Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/citrix_xenserver_virtual_machine.png

Remarks

- The parent device must be a Citrix XenServer (version 5.0 or later).
- The parent device has to represent one host server of your XenServer pool 514.
- Requires credentials for Xen servers to be defined for the device you want to use the sensor on.
- Requires 514 .NET 4.0 or higher on the probe system.
- Knowledge Base: Does PRTG impair my Citrix environment?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Monitoring a XenServer Pool

In a XenServer pool there is one "pool master" that manages the pool. Incoming queries on any host are automatically forwarded to the pool master. If you want to monitor your virtual machines, or host servers, simply create respective sensors on a device that represents one host server of your pool. Internal processes will make sure that monitoring will take place and continue independently from the physical host. Note: In PRTG's device tree, the sensors for virtual machines will always remain on the host you originally created it on, also if it is currently running on a different host.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Note: PRTG requests a full list of all virtual machines configured on the Xen server. Therefore, it may take a few seconds before the dialog is loaded.

Select which virtual machines you want to monitor. PRTG creates one sensor for each virtual machine you select in the **Add Sensor** dialog. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VIRTUAL MACHINE SETTINGS

Virtual Machine	Select the Virtual Machines (VM) you want to add a sensor for, including the ones that are not running. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VIRTUAL MACHINE SETTINGS

UUID	Shows the Universally Unique Identifier (UUID) of the virtual machine. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so for debugging. Wrong usage can result in incorrect monitoring data!
Name	Shows the name of the virtual machine. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

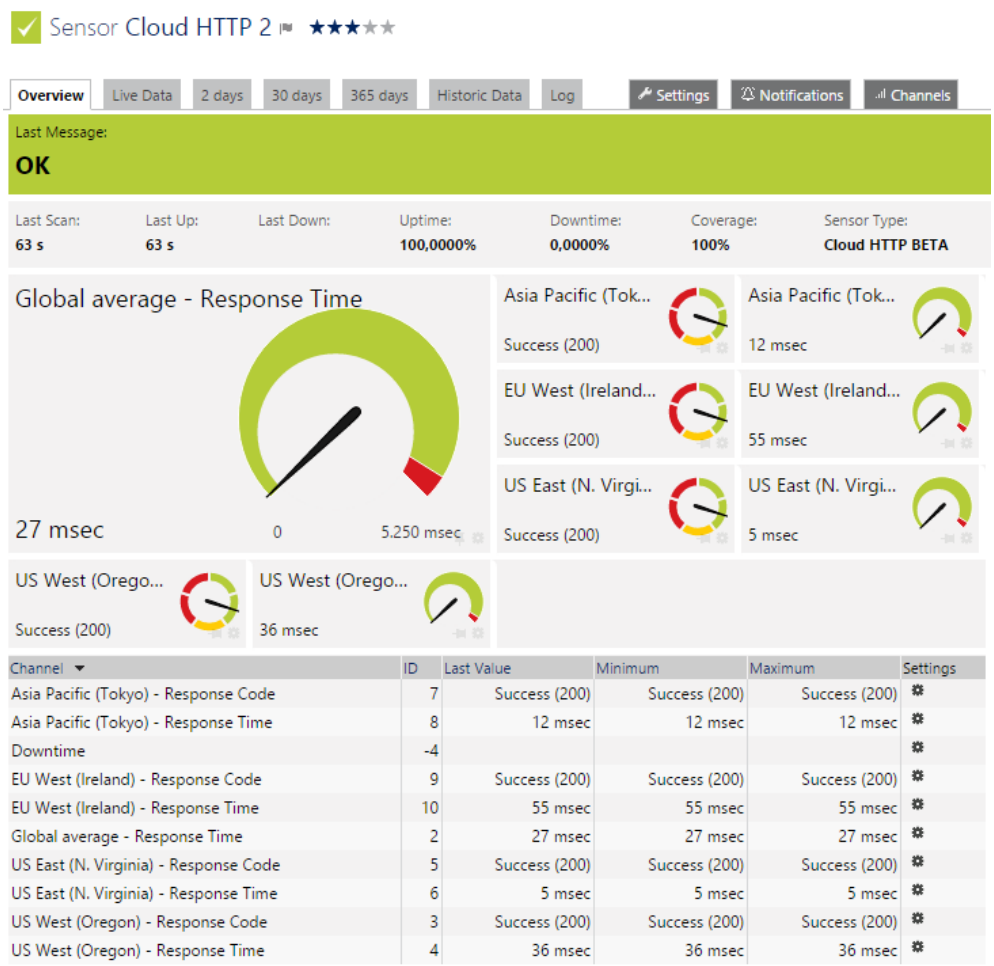
6.8.16 Cloud HTTP Sensor

The Cloud HTTP sensor monitors the loading time of a web server via Hypertext Transfer Protocol (HTTP) from different locations worldwide using the PRTG Cloud. The locations are distributed over three continents around the globe.

The sensor can show **response time** and **response code** of the target server monitored from the following locations:

- Asia Pacific: Tokyo
- EU West: Ireland
- US East: Northern Virginia
- US West: Oregon
- Global average response time



Channel	ID	Last Value	Minimum	Maximum	Settings
Asia Pacific (Tokyo) - Response Code	7	Success (200)	Success (200)	Success (200)	
Asia Pacific (Tokyo) - Response Time	8	12 msec	12 msec	12 msec	
Downtime	-4				
EU West (Ireland) - Response Code	9	Success (200)	Success (200)	Success (200)	
EU West (Ireland) - Response Time	10	55 msec	55 msec	55 msec	
Global average - Response Time	2	27 msec	27 msec	27 msec	
US East (N. Virginia) - Response Code	5	Success (200)	Success (200)	Success (200)	
US East (N. Virginia) - Response Time	6	5 msec	5 msec	5 msec	
US West (Oregon) - Response Code	3	Success (200)	Success (200)	Success (200)	
US West (Oregon) - Response Time	4	36 msec	36 msec	36 msec	

Cloud HTTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/cloud_http.png

Remarks

- The server on which the PRTG probe with this sensor runs must have access to the internet. The probe system needs to be able to reach **https://api.prtgcloud.com:443** to communicate with the PRTG Cloud.
- The URL you monitor must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor type supports proxy server usage 2883.
- Knowledge Base: Are there any limits for using Cloud Ping and Cloud HTTP sensors?
- Knowledge Base: What is the PRTG Cloud Bot?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SETTINGS

URL	Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the **IP address/DNS name** setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Request Method	Choose an HTTP request method to determine how the sensor will request the given URL. ▪ **GET**: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page. ▪ **POST**: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below.

HTTP SETTINGS

- **HEAD**: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.

Postdata	This field is only visible when you select the POST **Request Method** setting above. Enter the data part for the POST request here. Note: No XML is allowed here!
Timeout (Sec.)	Enter a timeout in seconds for the server request. If the reply takes longer than this value defines, the PRTG will cancel the request and shows an error message. The maximum timeout value is 5 seconds.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Cloud HTTP sensors, the minimum scanning interval is **10 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

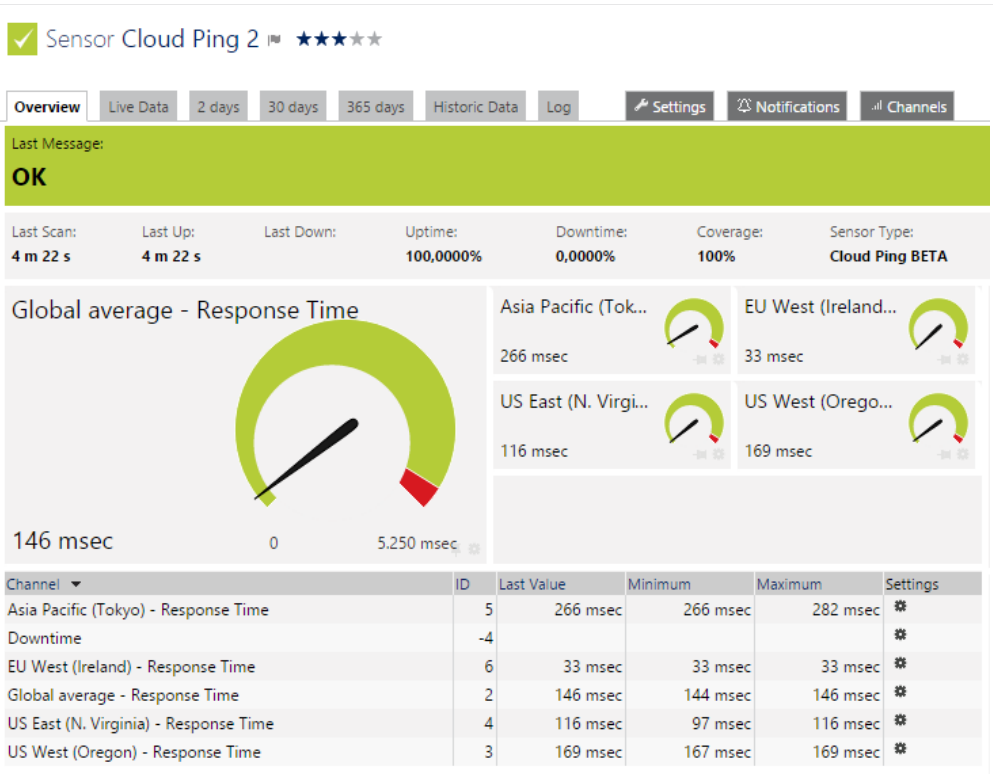
For more general information about settings, please see the **Object Settings** 159 section.

6.8.17 Cloud Ping Sensor

The Cloud Ping sensor monitors the Transport Control Protocol (TCP) ping times to its parent device from different locations worldwide using the PRTG Cloud. These locations are distributed over three continents around the globe.

The sensor can show the **response times** of the target server pinged from the following locations:

- Asia Pacific: Tokyo
- EU West: Ireland
- US East: Northern Virginia
- US West: Oregon
- Global average response time



Cloud Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/cloud_ping.png

Remarks

- The server on which the PRTG probe 90 with this sensor runs must have access to the internet. The probe system needs to be able to reach **https://api.prtgcloud.com:443** to communicate with the PRTG Cloud.

- The address you define in the parent device settings 324 must be reachable over the internet. You cannot use this sensor to monitor localhost (127.0.0.1) or other target devices that are only reachable within your private network.
- This sensor type supports proxy server usage 2883.
- Knowledge Base: Are there any limits for using Cloud Ping and Cloud HTTP sensors?
- Knowledge Base: What is the PRTG Cloud Bot?
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PING SETTINGS

Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. We recommend that you use the default value.
Ping Count	Enter the number of Pings to be sent in a row to the parent device with one scan. Please enter an integer value. The default value is 1, the maximum supported ping count is 5.
Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the PRTG will cancel the request and shows an error message. The maximum timeout value is 5 seconds.
Port	Enter the number of the port that the sensor uses for TCP ping. The default port is **80**.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

For Cloud Ping sensors, the minimum scanning interval is **10 minutes**.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

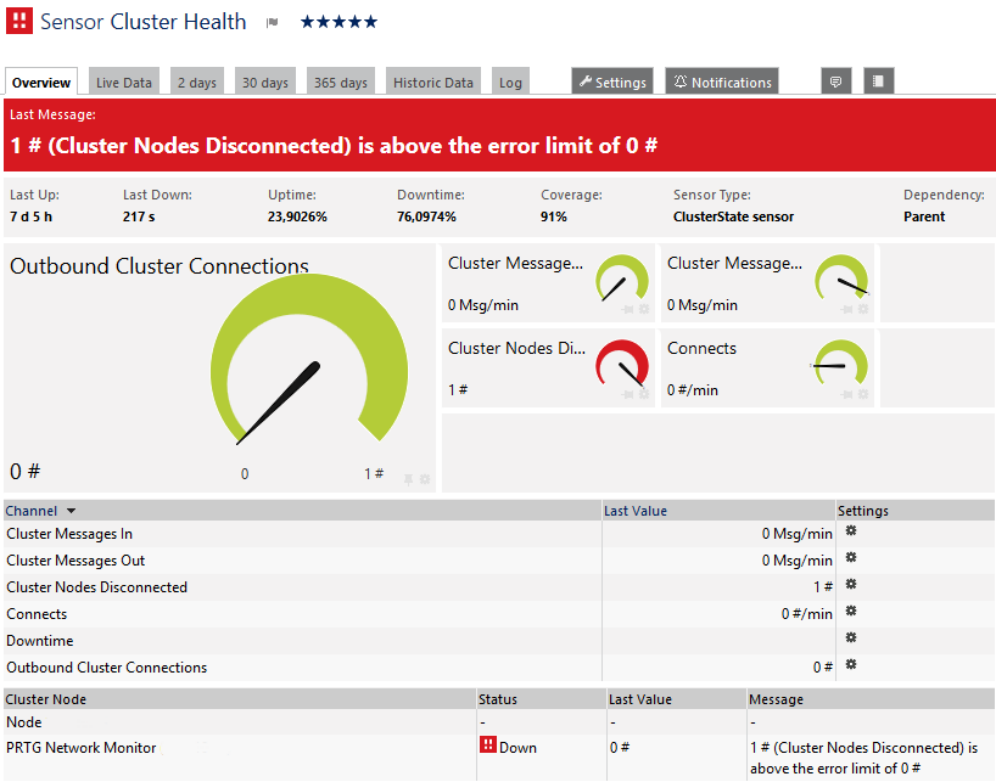
6.8.18 Cluster Health Sensor

The Cluster Health sensor monitors the health of a PRTG cluster [87] and indicates PRTG's own system health status.

It measures various internal system parameters of the cluster system:

- Number of connects per minute
- Cluster in- and outgoing messages per minute
- Number of connected and disconnected cluster nodes.



ClusterState Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/clusterstate.png

Remarks

- PRTG creates this sensor automatically with a cluster installation. You cannot delete or add it manually.
- If at least one cluster node is disconnected, this sensor shows a **Down** status by default.
- On the sensor's **Overview** tab you can review the states of each cluster node.
- On the monitoring data review tabs [140] you can choose the cluster member of which you want to show data (or of all nodes).

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

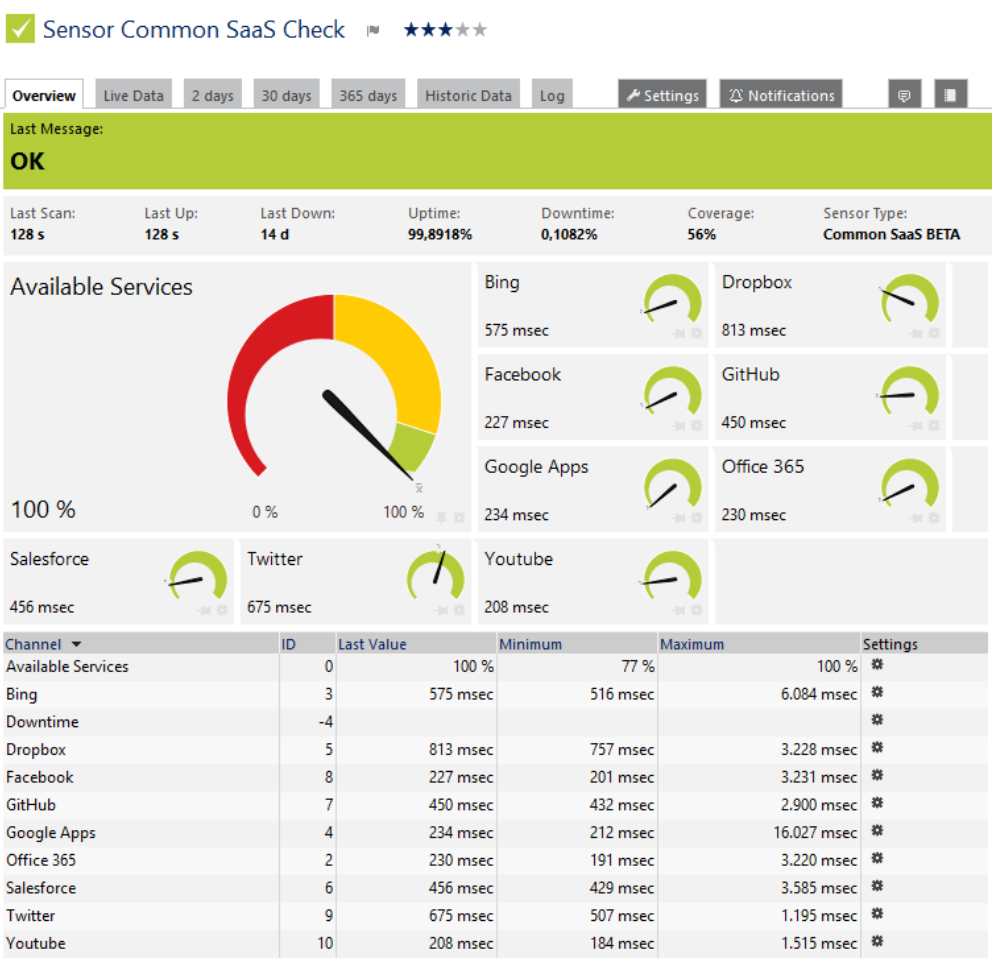
For more general information about settings, please see the **Object Settings** 159 section.

6.8.19 Common SaaS Sensor

The Common SaaS Sensor monitors the availability of several Software as a Service (SaaS) providers. Because your business processes more and more depend on cloud hosts, this sensor type is an important pillar for unified monitoring. With this sensor you can get alarms if your cloud services are not reachable anymore.

This sensor shows the following:

- Available services in percent
- Response times of the following SaaS providers:
  - Bing
  - Dropbox
  - Facebook
  - GitHub
  - Google Apps
  - Office 365
  - Salesforce
  - Twitter
  - Youtube



Channel	ID	Last Value	Minimum	Maximum	Settings
Available Services	0	100 %	77 %	100 %	
Bing	3	575 msec	516 msec	6.084 msec	
Downtime	-4				
Dropbox	5	813 msec	757 msec	3.228 msec	
Facebook	8	227 msec	201 msec	3.231 msec	
GitHub	7	450 msec	432 msec	2.900 msec	
Google Apps	4	234 msec	212 msec	16.027 msec	
Office 365	2	230 msec	191 msec	3.220 msec	
Salesforce	6	456 msec	429 msec	3.585 msec	
Twitter	9	675 msec	507 msec	1.195 msec	
Youtube	10	208 msec	184 msec	1.515 msec	

Common SaaS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/common_saas.png

Remarks

- The server on which the PRTG probe with this sensor runs must have access to the internet.
- PRTG creates this sensor automatically on every new probe device. If the system running the probe has no connection to the internet, please pause 185 or delete 196 this sensor manually to avoid error messages.
- This sensor type supports proxy server usage 2883.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which SaaS providers you want to monitor. The sensor creates one channel for each service you choose in the **Add Sensor** dialog.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

COMMON SAAS SPECIFIC

SaaS Checklist	Select the services you want to monitor with this sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. The sensor creates on channel for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

COMMON SAAS SPECIFIC

Period (Interval)	Define the scanning interval of this sensor. The period you choose here specifies how often the sensor requests the target services. Choose between: ▪ **15 minutes** ▪ **30 minutes** ▪ **1 hour** ▪ **4 hours** ▪ **6 hours** ▪ **12 hours** ▪ **24 hours** Note: This sensor cannot inherit scanning intervals nor use other intervals than given here.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.20 Core Health Sensor

The Core Health sensor monitors internal PRTG parameters. It shows the status of the PRTG core server.

This sensor type checks various parameters of your PRTG core which have an impact on the stability of the system:

- Health: This index value sums up the core state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- Age of Code: This channel shows the passed time since the last update of your PRTG installation. Please update regularly to get best security and stability for PRTG, as well as the latest features. We recommend that you use the PRTG **Auto-Update** 2918 to get new versions automatically.
- CPU Load: This channel shows the current percentage CPU load. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.
- Handles: This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- Committed Memory: This channel shows the amount of memory committed to the PRTG core server as reported by the memory manager.
- Free Page File Memory: This channel shows the amount of free page file memory currently available on the system. Page file memory is aggregated RAM and the size of page file. It is the maximum amount of memory that is available on the system to be used for all currently running processes. If it gets too low the system can crash, at least some applications will throw "Out of memory" errors.
- Free Physical Memory: This channel shows the amount of free physical memory currently available on the system. This is the RAM that is physically built-in in the computer. If it gets too low the system will become very slow and PRTG is not usable in a reasonable way anymore. It can happen that some sensors will not be displayed correctly in that case, they will appear disabled (grayed out).
- Free Virtual Memory: This channel shows the accessible address space on the system for PRTG. PRTG cannot use more memory than reported here, independently from free page file and physical memory. On a 32bit OS (operating system) the maximum is 2 GB (3 GB with special settings under Windows); on a 64bit OS it is 4 GB if PRTG is running as 32bit version, and unlimited as 64bit version (only Core). If free virtual memory gets too low, PRTG will throw "Out of memory" errors or the message "not enough storage to process this command" (visible in the Core log).
- Maintenance Days: This channel shows the remaining maintenance days of your PRTG license. Please renew your maintenance on time to be sure to get your PRTG updates.
- Threads: This channel shows the number of program parts which are currently running simultaneously. This number can increase with heavy load. The number should not exceed 100 in normal operation.
- Raw Data Buffer: This channel shows how much raw data is temporarily stored on the physical memory while I/O operations on the disk. Usually, this value should be 0 (or very low). Investigate increasing values.

Channel	ID	Last Value	Minimum	Maximum	Settings
Age of Code	10	36 h 46 m	4 h 36 m	7 d 9 h	
Committed Memory	4	230 MByte	0 MByte	639 MByte	
CPU Load	5	1 %	0 %	49 %	
Downtime	-4				
Free Page File Memory	2	1.653 MByte	0,07 MByte	15.212.752 MByte	
Free Physical Memory	3	1.653 MByte	0 MByte	1.747 MByte	
Free Virtual Memory	1	3.724 MByte	2.245 MByte	3.772 MByte	
Handles	6	7.175 #	0 #	12.293 #	
Health	0	100 %	0 %	100 %	
Maintenance Days	9	711 #	711 #	712 #	
Raw Data Buffer	8	0 #	0 #	9.999 #	
Threads	7	51 #	0 #	91 #	

Core Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/core_health.png

Remarks

- PRTG creates this sensor automatically and you cannot delete it.
- You can set up this sensor only on a Local Probe device!

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.21 Dell PowerVault MDi Logical Disk Sensor

The Dell PowerVault MDi Logical Disk sensor monitors a virtual disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i. It might work with other models, too.

It can show the following:

- Total number of I/O operations
- Number of current and maximum I/O operations per second
- Current and maximum disk speed
- Read and cache hit percentages

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Dell PowerVault MDi Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/dell_powervault_mdi_logical_disk.png

Remarks

- Works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.

- Requires 563 Dell Modular Disk Storage Manager on the probe system. Please see the Knowledge Base: Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?
- Needs the IP address of the Storage Area Network (SAN) defined in the parent device settings.

Requirement: Dell Modular Disk Storage Manager

This sensor requires an installation of the Dell "Modular Disk Storage Manager" program. You have to install it on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. For details about setup, please see **More** section below.

Note: Please create this sensor on a device which has the SAN's IP address configured in the "IP address/DNS name" field.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select which virtual disks you want to monitor. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS	
Virtual Disks	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Virtual Disk	Shows the name of the virtual disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?

- http://kb.paessler.com/en/topic/38743

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.22 Dell PowerVault MDi Physical Disk Sensor

The Dell PowerVault MDi Physical Disk sensor monitors a physical disk on a Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, or MD3620f. It might work with other models, too.

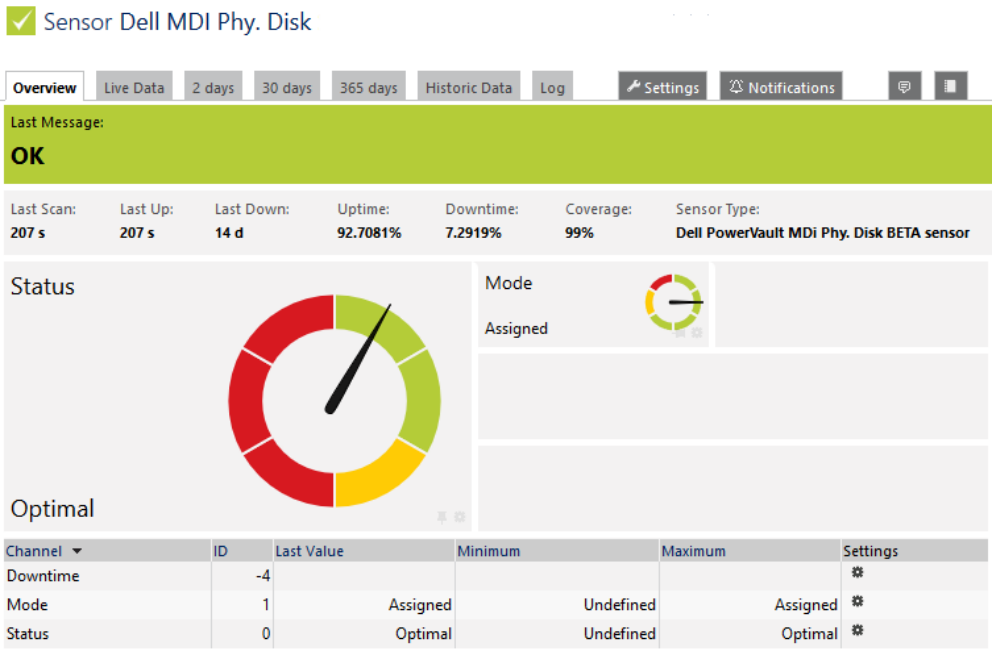
It can show following:

- Mode of the physical disk
- Status of the physical disk

The sensor shows these channels as reported in the Modular Disk Storage Manager. Status and mode combined indicate the particular status of a RAID controller physical disk. The table below provides you the status description according to the Dell documentation:

"Status" Channel	"Mode" Channel	Description
Optimal (status: up)	Unassigned (status: up)	The physical disk in the indicated slot is unused and available to be configured.
	Assigned (status: up)	The physical disk in the indicated slot is configured as part of a disk group.
	Hot Spare Standby (status: up)	The physical disk in the indicated slot is configured as a hot spare.
	Hot Spare In Use (status: up)	The physical disk in the indicated slot is in use as a hot spare within a disk group.
Failed (status: down)	▪ Assigned ▪ Unassigned ▪ Hot Spare In Use ▪ Hot Spare Standby	The physical disk in the indicated slot has been failed because of an unrecoverable error, an incorrect drive type or drive size, or by its operational state being set to failed.
Replaced (status: up)	Assigned	The physical disk in the indicated slot has been replaced and is ready to be, or is actively being, configured into a disk group.
Pending Failure (status: down)	▪ Assigned ▪ Unassigned ▪ Hot Spare In Use ▪ Hot Spare Standby	A SMART error has been detected on the physical disk in the indicated slot.
None (status: warning)	None (status: warning)	The indicated slot is empty, or the array cannot detect the physical disk.

"Status" Channel	"Mode" Channel	Description
Undefined (status: down)		



Dell PowerVault MDi Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/dell_powervault_mdi_physical_disk.png

Remarks

- Works with Dell PowerVault MD3000i, MD3420, MD3620i, MD3000f, MD3620f, or MD3820i, and might support other models.
- Requires 571 Dell Modular Disk Storage Manager on the probe system. Please see the Knowledge Base: Where do I find the Dell PowerVault Modular Disk Storage Manager for use with my MDi SAN?
- Needs the IP address of the Storage Area Network (SAN) defined in the parent device settings.
- This sensor supports devices with one drawer of hard-drives only. Multiple drawers are not supported and prevent sensor creation.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Dell Modular Disk Storage Manager

This sensor requires an installation of the Dell "Modular Disk Storage Manager" program. You have to install it on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. For details about setup, please see **More** section below.

Note: Please create this sensor on a device which has the SAN's IP address configured in the "IP address/DNS name" field.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks you want to monitor. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Physical Disks	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Physical Disks	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

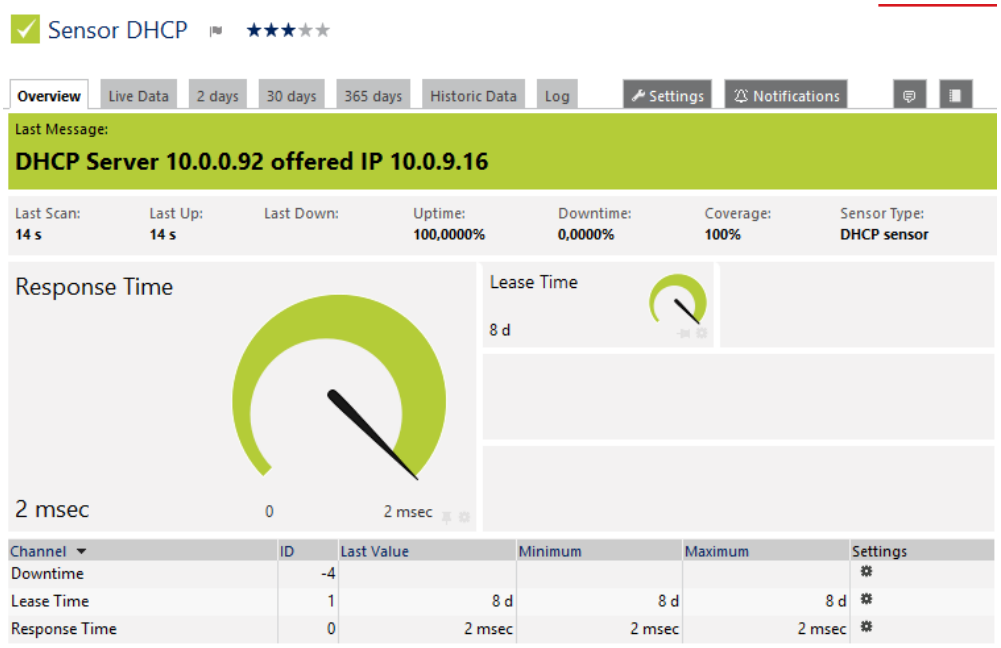
6.8.23 DHCP Sensor

The DHCP sensor monitors a Dynamic Host Configuration Protocol (DHCP) server. It sends a broadcast message to the network and waits for a DHCP server to respond. On sensor creation, choose the network card on the probe system which will be used to send the broadcast message.

If a server responds, the sensor shows the following:

- Address of the server and the offered IP in the sensor message. You can check the server's response using **Regular Expressions** 3105.
- Response time (msec)
- Lease time given by the server (in days)



DHCP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/dhcp.png

Remarks

- You can create this sensor only on a probe device (either local probe, a remote probe, or a cluster probe).
- Note: The probe device on which you create a DHCP sensor must have a static IP address. It must not get its IP address from DHCP because this can cause a DHCP failure which will result in a severe issue for the probe device and you risk losing monitoring data.
- Note: Do not use more than 2 DHCP sensors per device. Otherwise your DHCP sensors will show a timeout error.
- Knowledge Base: How can I monitor a DHCP server in a specific network if there are several DHCP networks?

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the desired network interfaces to monitor DHCP servers. PRTG creates one sensor for each network interface you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DHCP SPECIFIC

Specify Network Interface	Select the network adapters you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DHCP SPECIFIC

MAC	Shows the MAC address of the network adapter that is used to send the broadcast message to the network. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Client IP	Specify if you want to check the returned client IP with a regular expression. Choose between: ▪ **Don't check**: The IP will only appear in the sensor message without further processes. ▪ **Check**: Enter the regular expression you want to use below.
Client IP Must Include	This field is only visible if you chose to check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP does not contain the defined string, the sensor shows a **Down** status [135]. For example, enter 10\.0\.5\..* to make sure any answering DHCP server returns an client IP address starting with "10.0.5.". If it does not, the sensor will show an error. For more details, see **Regular Expressions** [3105] section. Leave empty to not use this field.
Client IP Must Not Include	This field is only visible if you choose to check the client IP above. In the response of the DHCP server, search using a regular expression. If the answer for the client IP contains the defined string, the sensor shows a **Down** status.

DHCP SPECIFIC

	See example above. For more details, see **Regular Expressions** 3105 section. Leave empty to not use this field.
Server IP	Specify if you want to check the returned server IP with a regular expression. Choose between: ▪ **Don't check**: The IP only appears in the sensor message without further processes. ▪ **Check**: Enter the regular expression you want to use below.
Server IP Must Include	This field is only visible if you choose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP does not contain the defined string, the sensor shows a **Down** status. See example above. For more details, see **Regular Expressions** 3105 section. Leave empty to not use this field.
Server IP Must Not Include	This field is only visible if you choose to check the server IP above. In the response of the DHCP server, search using a regular expression. If the answer for the server IP contains the defined string, the sensor shows a **Down** status. See example above. For more details, see **Regular Expressions** 3105 section. Leave empty to not use this field.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
DHCP Server Change	If there is more than one DHCP server in the network that may answer to the broadcast message, the sensor can receive an answer from a different DHCP server, compared to the last scan of the sensor. In this case, PRTG can write an entry to the system Logs 169. Choose between: ▪ **Ignore**: Do not write a log entry if the DHCP server changes. ▪ **Write log entry**: Write an entry to the system **Logs** whenever the DHCP server changes between two sensor scans. Note: Regardless of this setting, those entries will always be added to the sensor **Log**.
Offered IP Change	If the IP address offered by the DHCP server changes between two sensor scans, PRTG can write an entry to the system Logs 169. Choose between:

DHCP SPECIFIC

- **Ignore**: Do not write a log entry if the offered IP address changes.
- **Write log entry**: Write an entry to the system **Logs** whenever the DHCP server offers a different IP address compared to the last sensor scan.

Note: Regardless of this setting, those entries will always be added to the sensor **Log**.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: How can I monitor a DHCP server in a specific network if there are several DHCP networks?

- http://kb.paessler.com/en/topic/64601

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

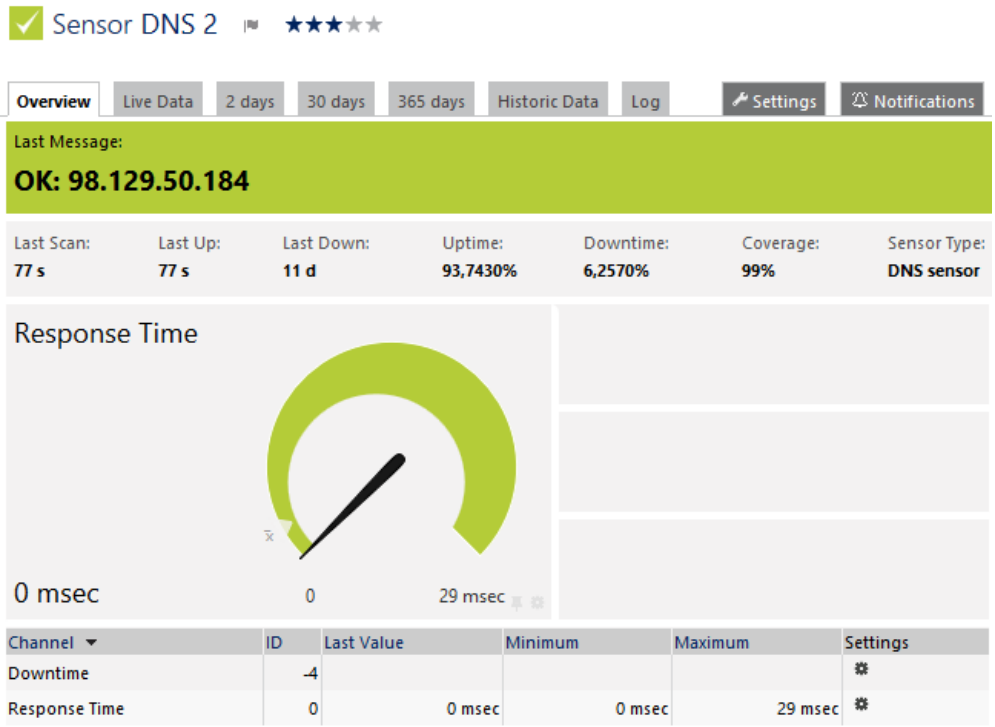
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.24 DNS Sensor

The DNS sensor monitors a Domain Name Service (DNS) server. It resolves a domain name and compares it to a given IP address.

- The sensor shows the response time of the DNS server.
- It turns to a **Down** status if the DNS server does not resolve a given domain name correctly.



DNS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/dns.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DNS SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which the sensor tries to connect. This must be the port the sensor's parent device is running the DNS service on. Usually you will use port **53**. We recommend that you use the default value. Note: The sensor connects to the **IP Address** or **DNS Name** value of the device 324 on which you create it.

DNS SPECIFIC

Domain	Enter the domain name that the sensor resolves using the Domain Name Service (DNS) server specified in the sensor's parent device settings 324. You can enter an internet domain name here (for example, example.com) or a DNS name in your internal network (such as computer-xyz), depending on the type of DNS server you monitor. You can also enter an IP address here, but there might occur an error with certain query types.
Query Type	Select the type of query that the sensor sends to the DNS server. Choose between: ▪ **Host address IPv4 (A)** ▪ **Host address IPv6 (AAAA)** ▪ **Authoritative name server (NS)** ▪ **Start of a zone of authority marker (SOA)** ▪ **Domain name pointer (PTR)** ▪ **Mail exchange (MX)** ▪ **Canonical name for an alias (CNAME)**
Check Result	Define if the sensor checks the result from the DNS server. Choose between: ▪ **Ignore result**: Accept any valid answer of the DNS server. ▪ **Check result**: Check if the response contains certain strings. Define below.
Value	This field is only visible if you enable result checking above. Enter elements that the response of the DNS server must contain. Enter each entry in one line. The received result must contain at least one of the elements. If none of the element matches the response, the sensor will show a red **Down** status. For example, you can enter an IP address here if your **Domain** field contains a host name. Only if the host name is resolved to the correct IP address, your sensor will show a green **Up** status.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DNS SPECIFIC

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

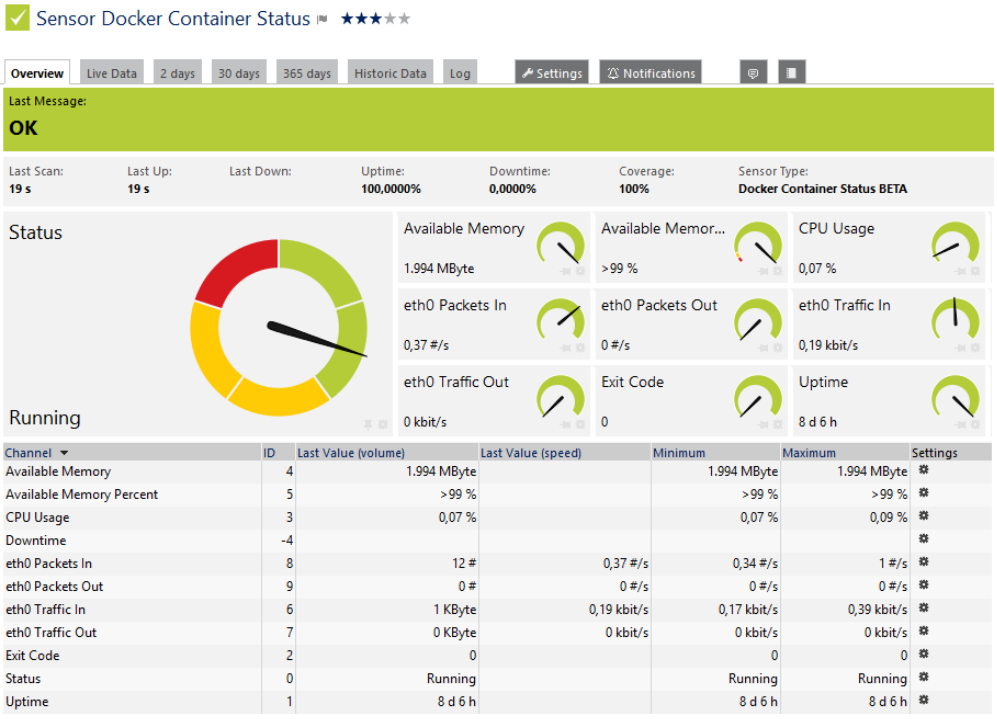
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.25 Docker Container Status Sensor

The Docker Container Status sensor monitors the status of a Docker container. It can show the following:

- Overall status of the container (create, running, paused, restarting, exited)
- Uptime
- Exit code
- CPU usage
- Available memory in bytes and percent



Docker Container Status Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/docker_container_status.png

Remarks

- The parent device for this sensor must be the Docker machine on which the container runs that you want to monitor.
- You need to provide certificates and private keys to monitor Docker with this sensor. For details, see the Knowledge Base: How can I create private key and certificate for the Docker sensor?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires an authentication with certificate and private key before you can actually add this sensor. Provide **Port** (usually **2375**), **Private Key**, and **Certificate** in the appearing dialog window and click **OK**. PRTG can now scan Docker for existing containers.

Select which Docker containers you want to monitor. PRTG creates one sensor for each container you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DOCKER SPECIFIC

Container	Select the containers you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DOCKER CREDENTIALS

Port	Enter the number of the port to which this sensor connects. The default port on which Docker over TLS runs is **2376**.
Private Key	Provide the private key for the connection to Docker. If you have already created a key, you can use it here. Otherwise, please create a certificate on Docker first. See section **More** 608 for a link to the Knowledge Base article about how to create a Docker certificate. Open the key with a text editor, copy everything that the file includes, and paste it here. Usually, the key starts with -----BEGIN RSA PRIVATE KEY----- and ends with -----END RSA PRIVATE KEY-----
Certificate	Provide the certificate for the connection to Docker. If you have already created a certificate, you can use it here. Otherwise, please create a certificate on Docker first. See section **More** 608 for a link to the Knowledge Base article about how to create a Docker certificate. Open the certificate with a text editor, copy everything that the file includes, and paste it here. Usually, the certificate starts with -----BEGIN CERTIFICATE----- and ends with -----END CERTIFICATE-----

DOCKER SPECIFIC

Container ID	Shows the ID of the container that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Container Name	Shows the name of the container that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Image	Shows the name of the image that was used to create the monitored Docker container. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: How can I create private key and certificate for the Docker sensor?

- http://kb.paessler.com/en/topic/67250

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

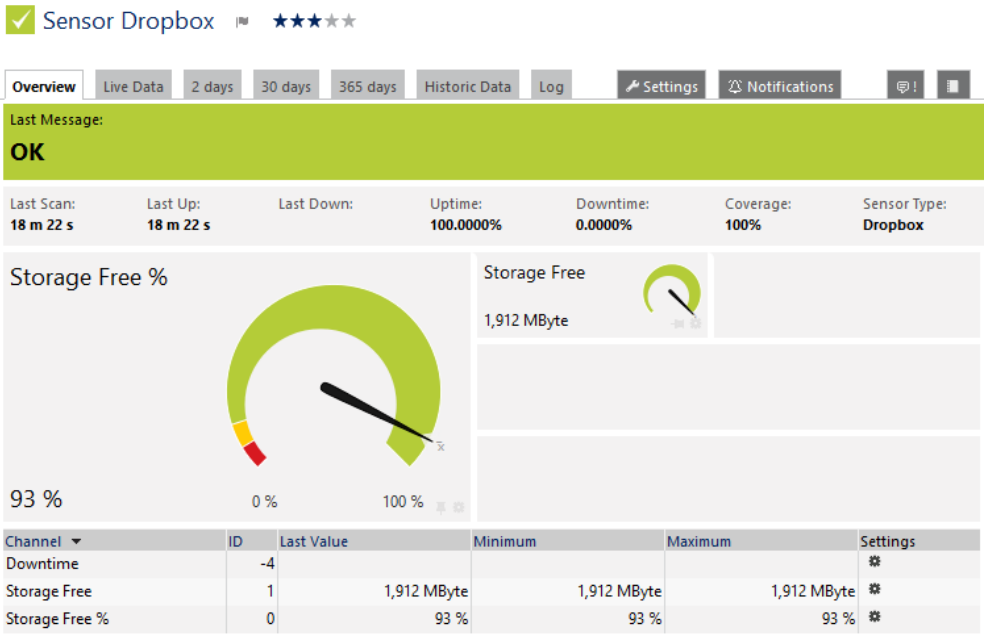
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.26 Dropbox Sensor

The Dropbox sensor monitors a Dropbox account using the Dropbox Application Programming Interface (API) and OAuth2. It shows the following:

- Free storage in bytes and percent



Dropbox Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/dropbox.png

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, please see manual section **Authentication Using OAuth2** 617.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DROPBOX CREDENTIALS

This sensor type uses OAuth2 authentication to get access to your Dropbox account. For details about the authentication approach, please see section **Authentication Using OAuth2** 617.

OAuth URL	Click the button **Get Access Code** to connect this sensor to your Dropbox account using OAuth2. This is necessary to allow the sensor to query data from Dropbox. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your Dropbox account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.
OAuth Code	Paste the access code that you receive after completing the authorization process for PRTG at your Dropbox account. Click **OK** to define the sensor settings 781. Note: It is mandatory to connect this sensor to your Dropbox account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DROPBOX CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your Dropbox account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Authentication Using OAuth2

This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. In general, the authorization approach of PRTG using OAuth2 works like this:

1. **Authorization Request**
   First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. This opens a new browser window on the authorization server of the target service.

2. **Verifying Identity**
   This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.
   Note: If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. **Authorizing PRTG**
   Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. **Getting Authorization Code**
   Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.
   Note: The code is valid only a short period of time and expires after a few minutes. You can use a particular code only once.

5. **Providing Authorization Code**
   Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. **Requesting Access Token**
   After getting the authorization code, PRTG requests an access token from the API of the target service. For this purpose PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access token are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. **Retrieving Data**
   The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate at your account. It is not necessary to use the original account credentials anew. The used tokens are refreshed automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.27 Enterprise Virtual Array Sensor

The Enterprise Virtual Array sensor monitors an HP StorageWorks Enterprise Virtual Array (EVA) using the sssu.exe from HP Command View EVA Software.

It can show the status of several EVA modules, depending on the available measurement components:

- System controllers
- Enclosures
- Disks
- Disk groups
- Folders
- Hosts
- Snapshots
- Data replication
- Cabinets
- If the devices have measuring tools for fans and temperature, the sensor displays corresponding data as well.

For these EVA components, this sensor type can show the following:

- Operational status
- Predicted failures
- Accessible media
- Allocation in percent
- Availability for VRaids in bytes
- Exaggerated bytes
- Group host access
- Number of grouped and ungrouped disks
- Age of snapshots
- License status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- You have to explicitly specify the credentials of the EVA in the sensor settings.

- Requires 620 the HP Command View EVA Software on the probe system (or the alternative below).
- Knowledge Base: Do I really have to install the whole Command View on the probe to use the EVA sensor?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: Command View

The EVA sensor needs the HP Command View EVA Software to be installed on the probe system. If you do not want to install the whole command view tool, you can alternatively use another approach. For details, please see section **More** 628.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

EVA CREDENTIALS

Scanning Mode	Specify the depth of the meta scan. Choose between: ▪ **Basic**: We recommend using this scanning mode. Various modules of your EVA will be available for monitoring. ▪ **Full Detail**: PRTG will scan for each disk of your EVA. Every disk will be listed in the module selection.

Select which modules you want to monitor. PRTG will create one sensor for each module you choose. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

EVA SETTINGS

Modules	Select the modules you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EVA CREDENTIALS

Username	Enter the username for the EVA.
Password	Enter the password for the EVA.

EVA SETTINGS

Module	Shows the monitored module. You can adjust this setting if the module was renamed or moved to another folder. This way, PRTG can find the module again and the monitoring history will not be lost.
System Module Type	Shows further information about the monitored module. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Sensor Result	Define what will be done with the results the sensor receives. Choose between: ▪ **Discard sensor result**: Do not store the results. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Do I really have to install the whole Command View on the probe to use the EVA sensor?

- http://kb.paessler.com/en/topic/55983

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

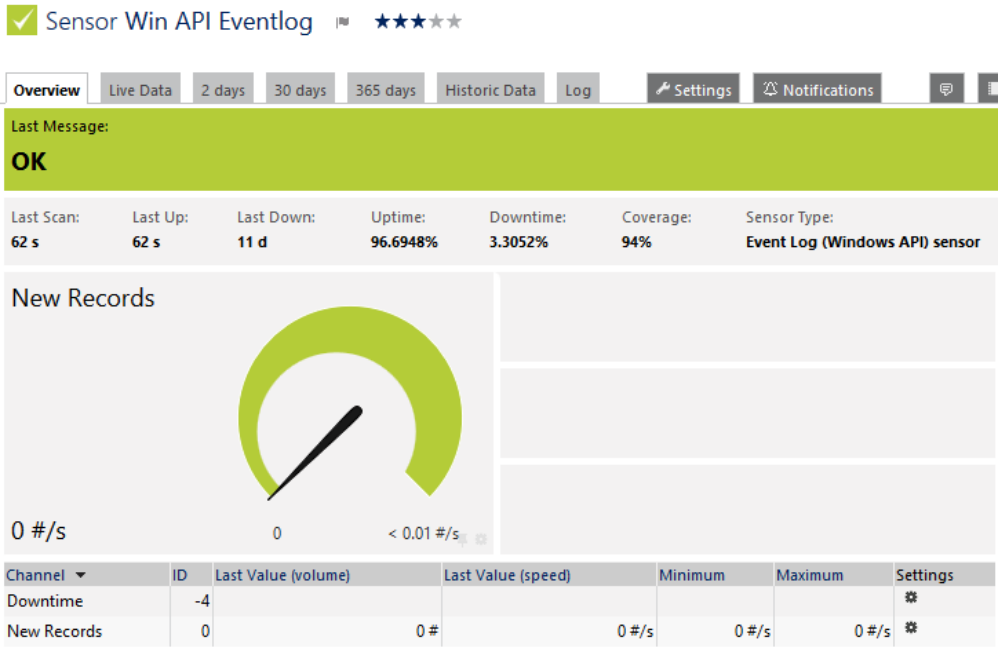
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.28 Event Log (Windows API) Sensor

The Event Log (Windows API) sensor monitors Event Log entries using Windows Application Programming Interface (API).

- It shows the number of new records per second (speed).



Event Log (Windows API) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/event_log_windows_api.png

Remarks

- Knowledge Base: My Event Log sensor ignores changes in the event log. What can I do?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WINDOWS API EVENT LOG SPECIFIC

Log File	Specify the log file that this sensor monitors. The Windows event log provides several different log files which PRTG shows here. Choose between: ▪ **Application** ▪ **System** ▪ **Security** ▪ **Directory Service** ▪ **DNS Server**

WINDOWS API EVENT LOG SPECIFIC

- **File Replication Service**

FILTER EVENT LOG ENTRIES

Event Type	Specify the type of event that this sensor processes. Other event type cannot be processed. Choose between the following event types: ▪ **Any** ▪ **Error** ▪ **Warning** ▪ **Information** ▪ **Security Audit Success** ▪ **Security Audit Failure**
Filter by Source	Filter all received events for a certain event source. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event source. • **On**: Enable filtering by event source.
Match String (Event Source)	This field is only visible if you enable source filtering above. Enter a source from which the events come from. Only events from a source matching this string are regarded, other events are ignored. Please enter a string.
Filter by ID	Filter all received events for a certain event ID. If you enable this option, this sensor processes only messages that match the defined value(s). Choose between: • **Off**: Do not filter by event ID. • **On**: Enable filtering by event ID.
Match Value (Event ID)	This field is only visible if you enable ID filtering above. Enter an event ID which the events must have. Only events with an ID that matches this value are regarded. Note: The **Event Log (Windows API) Sensor** 629 supports more than one event ID. Using this sensor type, you can enter a comma separated list of event IDs to filter for more than one ID.

FILTER EVENT LOG ENTRIES

	Note: The **WMI Event Log Sensor** 2469 supports filtering for only one ID.
Filter by Category	Filter all received events for a certain event category. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event category. • **On**: Enable filtering by event category.
Match String (Event Category)	This field is only visible if you enable category filtering above. Enter a category which the events must have. Only events with a category that matches this string are regarded. Please enter a string.
Filter by User	Filter all received events for a certain event user. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event user. • **On**: Enable filtering by event user.
Match String (Event User)	This field is only visible if you enable user filtering above. Enter a username that the events must to be assigned to. Only events with a username that matches this string are regarded. Please enter a string.
Filter by Computer	Filter all received events for a certain event computer. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event computer. • **On**: Enable filtering by event computer.
Match String (Event Computer)	This field is only visible if you enable computer filtering above. Enter a computer name which the events must be assigned to. Only events with a computer name that matches this string are regarded. Please enter a string.
Filter by Message	Filter all received events for a certain event message. If you enable this option, this sensor processes only messages that match the defined value. Choose between: • **Off**: Do not filter by event message. • **On**: Enable filtering by event message.

FILTER EVENT LOG ENTRIES

Match String (Event Message)	This field is only visible if you enable message filtering above. Enter a message that the event must contain. Only events with a message matching this string are regarded. Please enter a string.

Note: The **Event Log (Windows API) Sensor** always performs a substring match. Please do not use any placeholder character. For example, enter **RAS** for any event source containing this string in partial or whole form.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

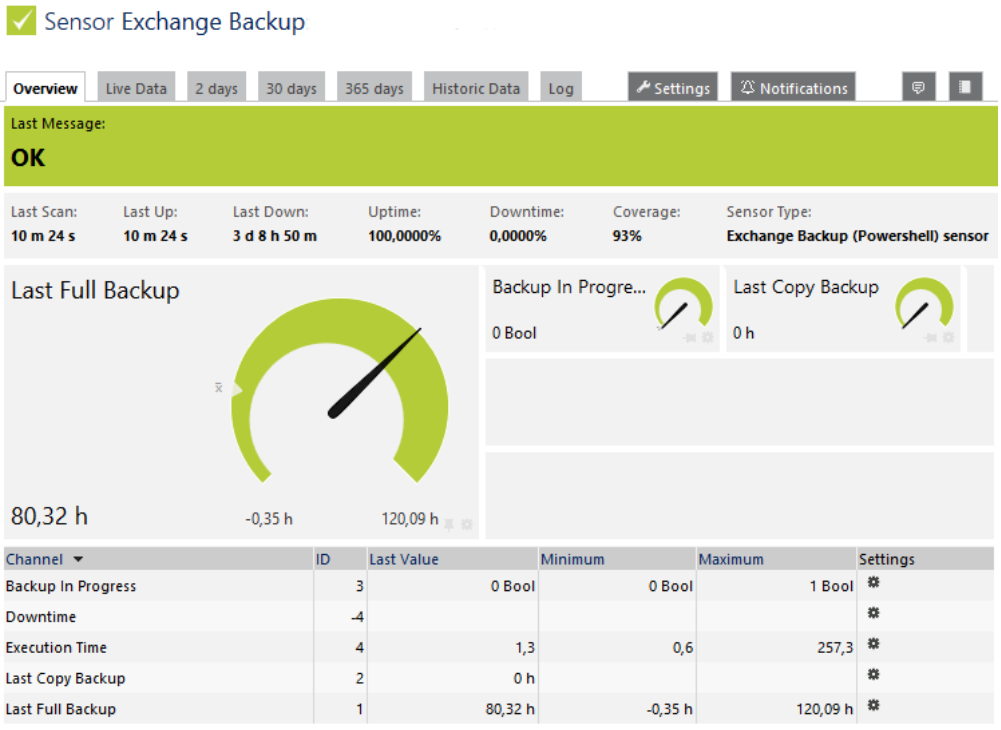
6.8.29 Exchange Backup (Powershell) Sensor

The Exchange Backup (Powershell) sensor monitors backups of an Exchange server using Remote PowerShell.

It can show several states of an Exchange database backup, for example:

- Past time since the last full backup
- Past time since the last copy backup
- If a backup is currently running

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Exchange Backup (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_backup.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Requires 640 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- Requires 640 the FQDN of the Exchange server in the parent device settings 324.
- Requires 640 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Exchange Databases	Select the databases you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Database	Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

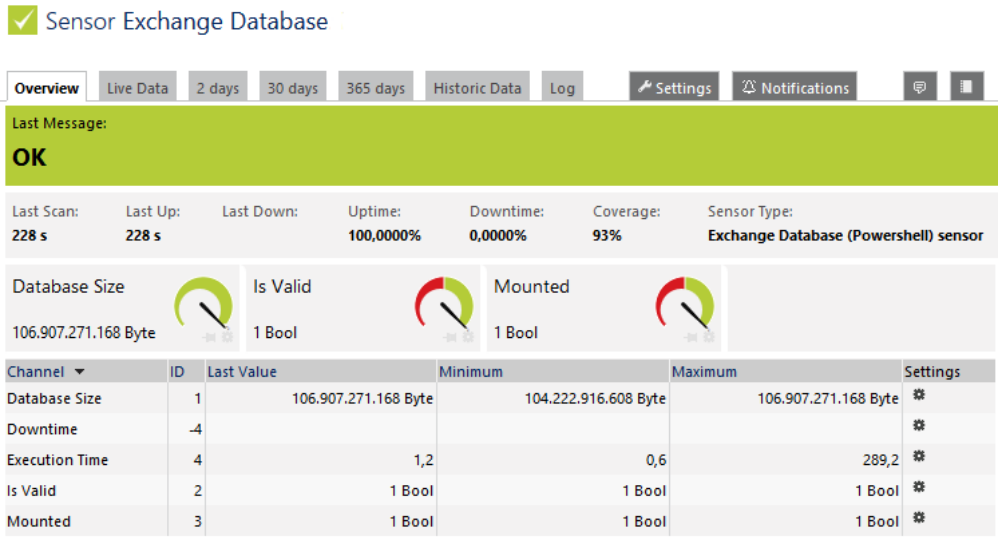
6.8.30 Exchange Database (Powershell) Sensor

The Exchange Database (Powershell) sensor monitors database information of an Exchange server using Remote PowerShell.

It shows several states of an Exchange database, for example:

- Database size
- If the database is mounted
- If the database is recognized as valid

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Exchange Database (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_database.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 650 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- Requires 650 the FQDN of the Exchange server in the parent device settings 324.
- Requires 650 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ
- Knowledge Base: How can I monitor additional values of Exchange databases?

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Exchange Databases	Select the databases you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Database	Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
AutoRemount Database	Define if you want the sensor to try to remount the database automatically if it is unmounted. Choose between: ▪ **Try to remount** ▪ **Just report the current reading and keep unmounted**
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

6.8.31 Exchange Database DAG (Powershell) Sensor

The Exchange Database DAG (Powershell) sensor monitors the Database Availability Group (DAG) status of a database on an Exchange server using Remote PowerShell.

It can show the following:

- Overall DAG status (for example, if it is mounted, failed, suspended)
- Copy status (active, not active)
- Content index status (healthy, crawling, error)
- If activation is suspended
- If log copy queue is increasing
- If replay queue is increasing
- Length of copy queue
- Length of Replay queue
- Number of single page restores

Exchange Database DAG (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_database_dag.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 660 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- Requires 660 the FQDN of the Exchange server in the parent device settings 324.
- Requires 660 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ
- Knowledge Base: How can I monitor additional values of Exchange databases?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server databases you want to monitor. PRTG creates one sensor for each database you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Exchange Databases	Select the databases you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Database	Shows the name of the monitored database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

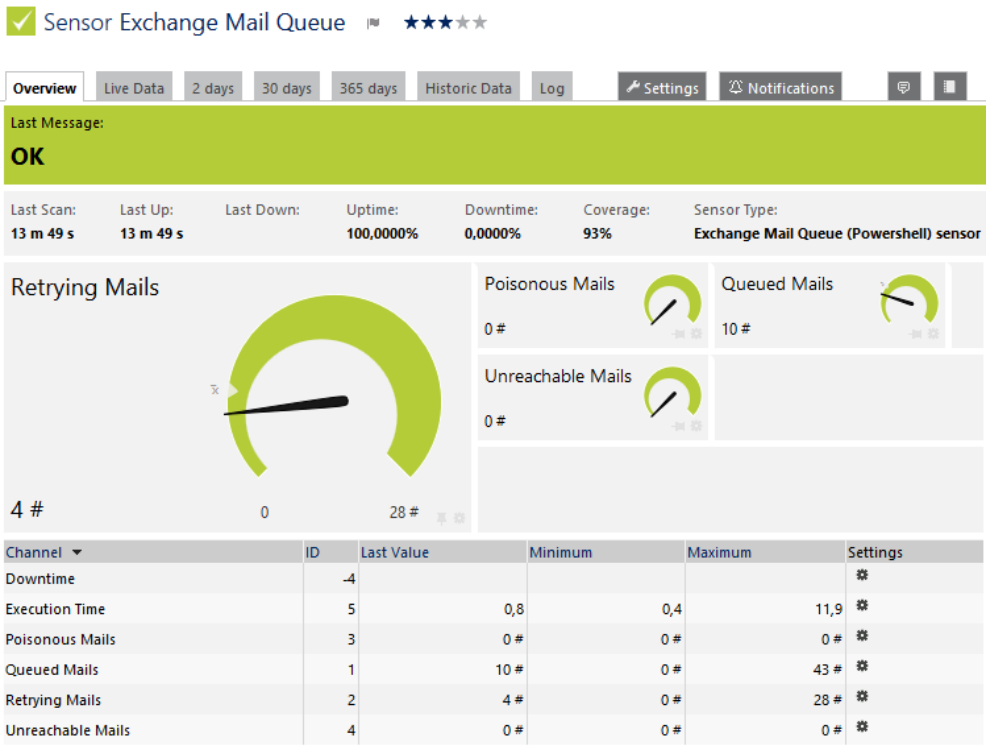
6.8.32 Exchange Mail Queue (Powershell) Sensor

The Exchange Mail Queue (Powershell) sensor monitors the number of items in the outgoing mail queue of an Exchange server using Remote PowerShell.

It can show, for example:

- Number of queued mails
- Number of retrying mails
- Number of unreachable mails
- Number of poisonous mails

See section **More** 677 below for a link to an explanation of the transport queue types. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Exchange Mail Queue (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_mail_queue.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.

- Requires 670 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- Requires 670 the FQDN of the Exchange server in the parent device settings 324.
- Requires 670 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the roles you want to monitor. PRTG creates one sensor for each role you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Hub-Transport or Edge-Server	Select the roles you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

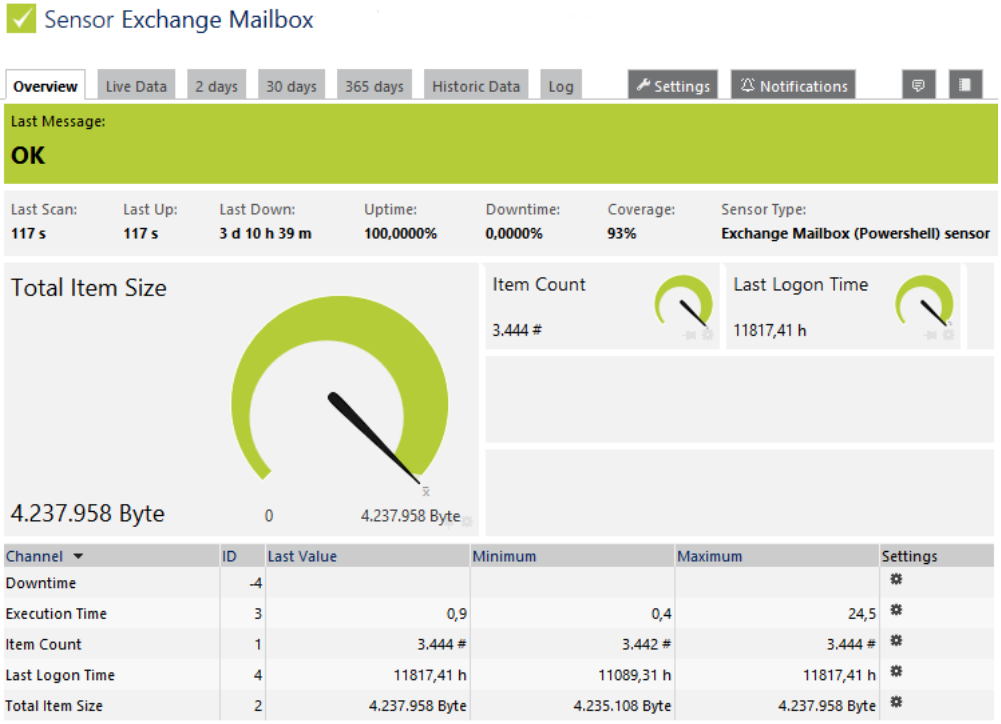
6.8.33 Exchange Mailbox (Powershell) Sensor

The Exchange Mailbox (Powershell) sensor monitors mailboxes of an Exchange server using Remote PowerShell.

It shows several states of a mailbox, for example:

- Total size of items in place
- Number of items in place
- Past time since the last mailbox logon

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Exchange Mailbox (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_mailbox.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 680 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.

- Requires 680 the FQDN of the Exchange server in the parent device settings 324.
- Requires elevated rights for the user of this sensor on the Exchange system. It is not sufficient to have administrator rights. For details, please see the Knowledge Base: I have problems with the PowerShell Exchange sensors, what can I do? (solution (2) in the reply)
- Requires 680 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server mailboxes you want to monitor. PRTG creates one sensor for each mailbox you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Mailboxes	Select the mailboxes you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Mailbox Name	Shows the name of the monitored mailbox. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

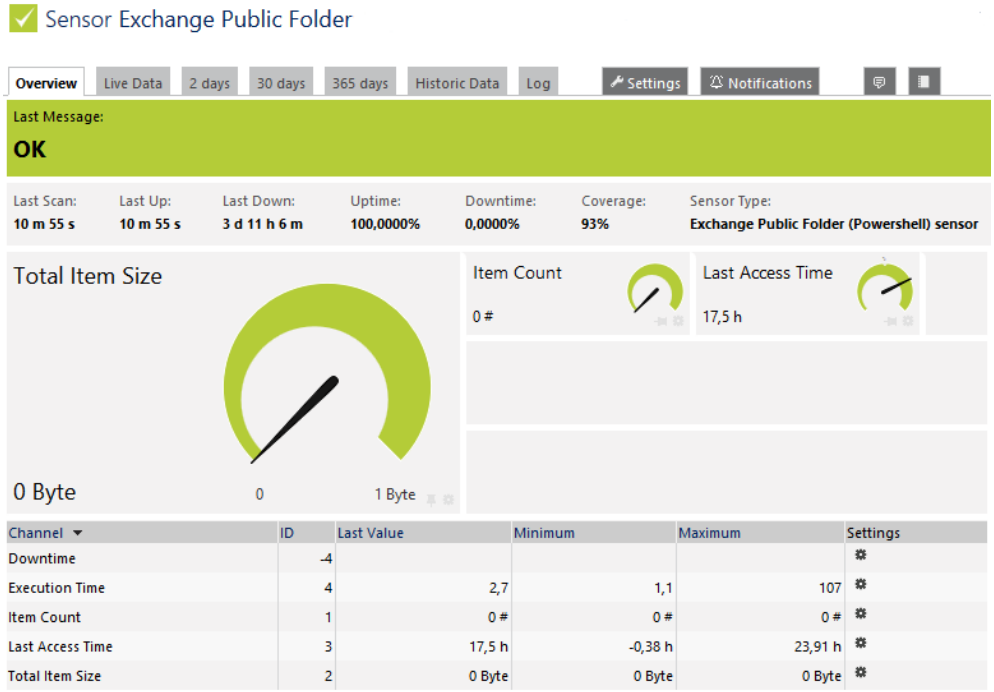
6.8.34 Exchange Public Folder (Powershell) Sensor

The Exchange Public Folder (Powershell) sensor monitors public folders of an Exchange server using Remote PowerShell.

It can show several states of a public folder, for example:

- Total size of items in place
- Number of items in place
- Past time since the last access

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Exchange Public Folder (Powershell) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exchange_public_folder.png

Remarks

- The parent device for this sensor must be the Exchange server (version 2010 or higher) that hosts the database you want to monitor.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 690 Remote PowerShell and Remote Exchange Management Shell on the target servers and PowerShell 2.0 on the probe system.
- Requires 690 the FQDN of the Exchange server in the parent device settings 324.

- Requires 690 .NET 4.0 or higher on the probe system.
- Knowledge Base: PowerShell Sensors: FAQ

Requirement: Remote PowerShell and Remote Exchange Management Shell

This sensor type uses PowerShell commands. To monitor Exchange servers with this sensor, you have to enable **Remote PowerShell** and **Remote Exchange Management Shell** on the target servers which you want to monitor. Also ensure you have installed **PowerShell 2.0** or later on your probe machine.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/44453 (see also section **More** below).

Requirement: Fully Qualified Domain Name (FQDN)

To connect to Exchange servers, this sensor type needs the **fully qualified domain name (FQDN)**. In PRTG's device settings of the Exchange server, provide the FQDN instead of the IP address. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/54353 (see also section **More** below).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Exchange server mailboxes you want to monitor. PRTG creates one sensor for each mailbox you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Public Folder	Select the folders you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Public Folder	Shows the name of the monitored folder. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

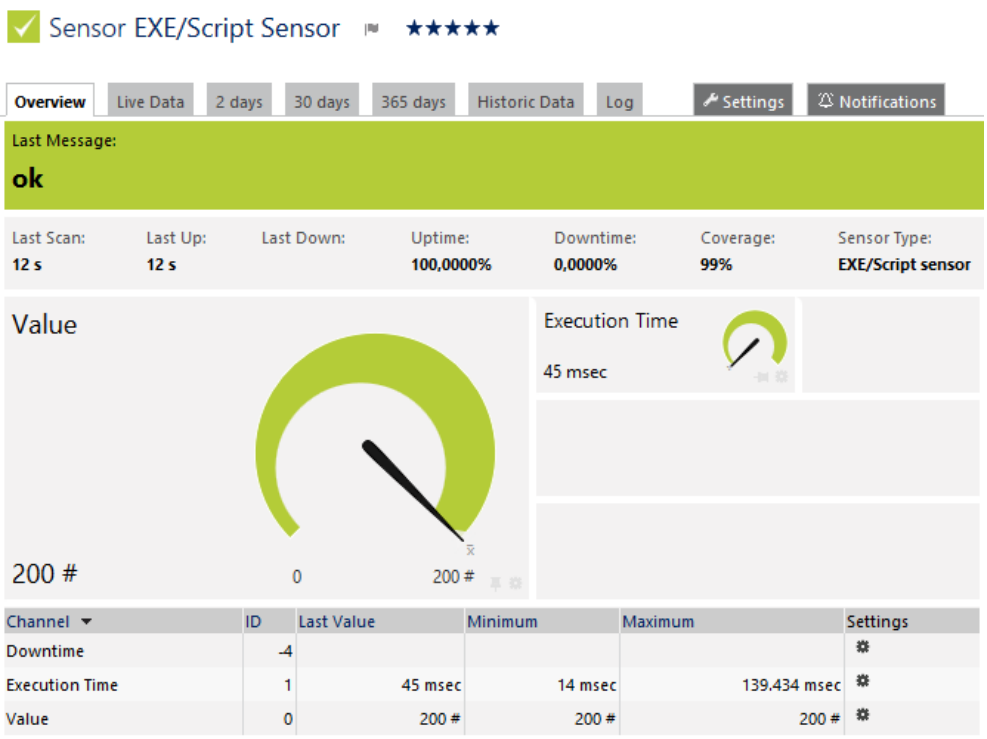
For more general information about settings, please see the **Object Settings** 159 section.

6.8.35 EXE/Script Sensor

The EXE/Script sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, Powershell) on the computer running the local or remote probe. This option is provided as part of PRTG's Application Programming Interface (API). For details about the return value format please see the **Application Programming Interface (API) Definition** 3086.

The sensor can show the following:

- One value returned by the executable file or script (in one channel only)
- Execution time



EXE/Script Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exe_script.png

Remarks

- Note: The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the **WMI Custom Sensor** 2448.
- Knowledge Base: What is the Mutex Name in PRTG's EXE/Script Sensor's settings?

- Knowledge Base: How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?
- Knowledge Base: How can I show special characters with EXE/Script sensors?

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Script	Select an executable file from the list. The sensor will execute it with every scanning interval. In this list, files in the corresponding **\Custom Sensors\EXE** sub-directory of the probe system's PRTG program directory are shown (see **Data Storage** 3135). In order for the files to appear in this list, store them into this folder ending in BAT, CMD, DLL, EXE, PS1, or VBS. To show the expected values and sensor status, your files must use the right format for the returned values (in this case, value:message to standard output). The exit code of the file determines the sensor status 135. For detailed information on how to build custom sensors and for the expected return format, please see the API documentation (**Application Programming Interface (API) Definition** 3086). There, find detailed information the the "Custom Sensors" tab. Note: Please do not use the folder \Custom Sensors\Powershell Scripts to store your files. This remnant from previous software versions is not used any more and may usually be deleted. Note: When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.
Value Type	Define what kind of values your executable or script file gives back. Choose between: ▪ **Integer**: An integer is expected as return value. If the script gives back a float, PRTG will display the value **0**. ▪ **Float:** A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they produce a buffer overflow. ▪ **Counter:** Your script returns an integer which increases. PRTG will show the difference between the values of two sensor scans. Note: A counter must return an integer, float is not supported here!
Channel Name	Enter a name for the channel in which the sensor shows returned values. This is for display purposes only. Please enter a string.
Unit String	Enter a string that describes the unit of the returned values. This is for display purposes only. Please enter a string.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

EXE/Script	Shows the executable or script file that the sensor executes with each sensor scan as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	If your executable or script file catches command line parameters, you can define them here. You can use placeholders as well. For a full list of all placeholders please see the API documentation (**Application Programming Interface (API) Definition** 3086).

SENSOR SETTINGS

	Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks '' with PowerShell scripts, and double quotes "" with all others. Please enter a string or leave the field empty.
Environment	Choose if PRTG's command line parameters will also be available as environment parameters. ▪ **Default Environment**: Do not provide PRTG placeholders' values in the environment. Choose this secure option if you are not sure. ▪ **Set placeholders as environment values**: From within your executable or script, the values of PRTG's command line parameters will be available via environment variables. For example, you can then read and use the current host value of the PRTG device this EXE/script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables. For a full list of all available variables please see the API documentation (**Application Programming Interface (API) Definition** 3086).
Security Context	Define the Windows user account that the sensor uses to run the executable or script file. Choose between: ▪ **Use security context of probe service**: Run the selected file under the same Windows user account the probe runs on. By default, this is the Windows system user account (if not manually changed). ▪ **Use Windows credentials of parent device**: Use the Windows user account defined in the settings of the parent device this sensor is created on. Please go to parent device settings 324 of this sensor to change these Windows credentials.
Mutex Name	Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the **More** 709 section below. Please enter a string or leave the field empty.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

SENSOR SETTINGS

Value Type	Shows the expected value type that you chose on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Note: The sensor cannot handle string values.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
EXE Result	Define what this sensor will do with the result that the executable file gives back. Choose between: ▪ **Discard EXE result**: Do not store the requested web page. ▪ **Write EXE result to disk**: Store the last result received from the script with the file name "Result of Sensor [ID].txt" to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section. ▪ **Write EXE result to disk in case of error**: Store the last result received from the script only if the sensor is in a down status. The file name is "Result of Sensor [ID].txt" in the "Logs (Sensors)" directory. Enable this option if you do not want failures to be overwritten by a following success of the script.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

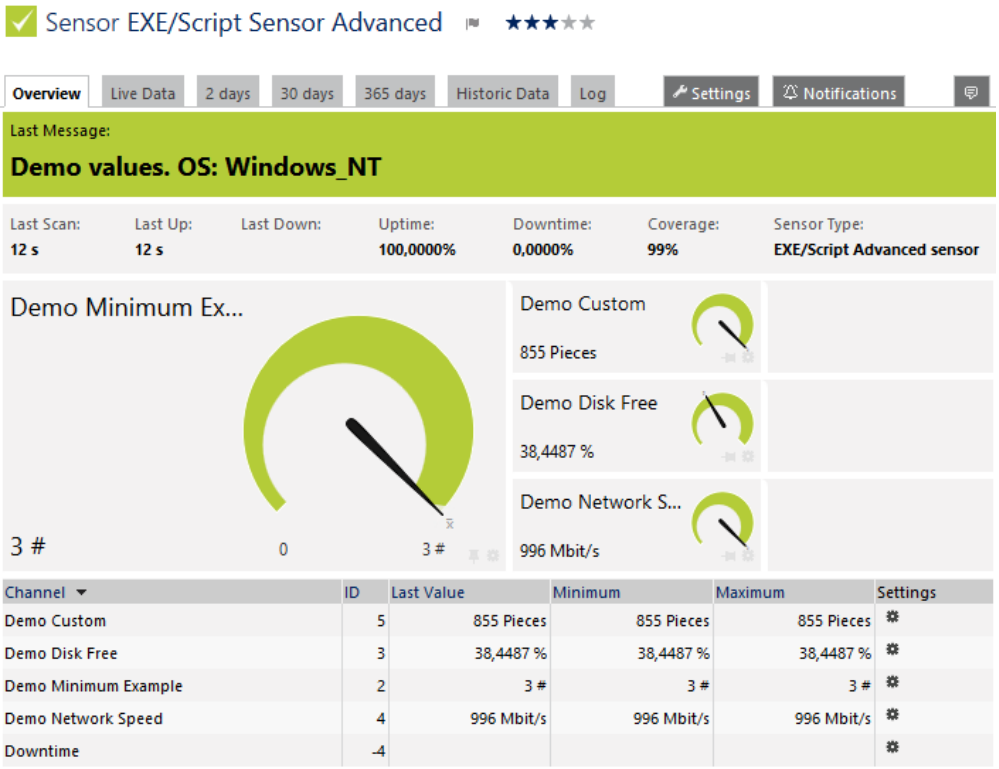
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.36 EXE/Script Advanced Sensor

The EXE/Script Advanced sensor runs an executable file (EXE, DLL) or a script (batch file, VBScript, Powershell) on the computer running the local or remote probe. This option is provided as part of the PRTG Application Programming Interface (API). The return value of this sensor must be valid XML or JSON. For details about the return value format please see the **Application Programming Interface (API) Definition** 3086.

- The sensor can show values returned by the executable file or script in multiple channels.



EXE/Script Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/exe_script_advanced.png

Remarks

- This sensor does not support more than 50 channels 712 officially.
- Note: The executable or script file must be stored on the system of the probe the sensor is created on: If used on a remote probe, the file must be stored on the system running the remote probe. In a cluster setup, please copy the file to every cluster node.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: If you want to execute a custom Windows Management Instrumentation Query Language (WQL) script, please use the **WMI Custom Sensor** 2448.
- Knowledge Base: What is the Mutex Name in PRTG's EXE/Script Sensor's settings?

- Knowledge Base: How can I test if parameters are correctly transmitted to my script when using an EXE/Script sensor?
- Knowledge Base: How can I show special characters with EXE/Script sensors?
- Knowledge Base: How can I use meta-scans for custom EXE/Script sensors?

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

EXE/Script	Select an executable file from the list. The sensor will execute it with every scanning interval. This list shows all files available in the corresponding **\Custom Sensors\EXEXML** sub-directory of the probe system's PRTG program directory (see **Data Storage** 3135). To appear in this list, please store the files into this folder ending in BAT, CMD, DLL, EXE, PS1, or VBS. To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON. For detailed information on how to build custom sensors and for the expected return format, please see the API documentation (**Application Programming Interface (API) Definition** 3086). There, find detailed information on the **Custom Sensors** tab. Note: Please do not use the folder \Custom Sensors\Powershell Scripts to store your files. This remnant from previous software versions is not used any more and may usually be deleted. Note: When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

EXE/Script	Shows the executable or script file that the sensor executes with each scan as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR SETTINGS

Parameters	If your executable or script file catches command line parameters, you can define them here. You can use placeholders as well. For a full list of all placeholders please see the API documentation (**Application Programming Interface (API) Definition** 3086). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks '' with PowerShell scripts, and double quotes "" with all others. Please enter a string or leave the field empty.
Environment	Choose if PRTG's command line parameters will also be available as environment parameters. ▪ **Default Environment**: Do not provide PRTG placeholders' values in the environment. Choose this secure option if you are not sure. ▪ **Set placeholders as environment values**: From within your executable or script, the values of PRTG's command line parameters will be available via environment variables. For example, you can then read and use the current host value of the PRTG device this EXE/Script sensor is created on from within your script. This option can mean a security risk, because also credentials are provided in several variables. For a full list of all available variables please see the API documentation (**Application Programming Interface (API) Definition** 3086).
Security Context	Define the Windows user account that the sensor uses to run the executable or script file. Choose between: ▪ **Use security context of probe service**: Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed). ▪ **Use Windows credentials of parent device**: Use the Windows user account defined in the settings of the parent device this sensor is created on. Please navigate to parent device settings 324 of this sensor to change these Windows credentials.
Mutex Name	Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the **More** 721 section below. Please enter a string or leave the field empty.

SENSOR SETTINGS

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
EXE Result	Define what the sensor will do with the results the executable file gives back. Choose between: ▪ **Discard EXE result**: Do not store the requested web page. ▪ **Write EXE result to disk**: Store the last result received from the script with the file name "Result of Sensor [ID].txt" to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section. ▪ **Write EXE result to disk in case of error**: Store the last result received from the script only if the sensor is in a down status. The file name is "Result of Sensor [ID].txt" in the "Logs (Sensors)" directory. Enable this option if you do not want failures to be overwritten by a following success of the script.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Note: The **Stack Unit** option for stacking graphs will only work if you explicitly define the same <unit> for at least two channels. For detailed information about sensor settings please see the API documentation (**Application Programming Interface (API) Definition** 3086).

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

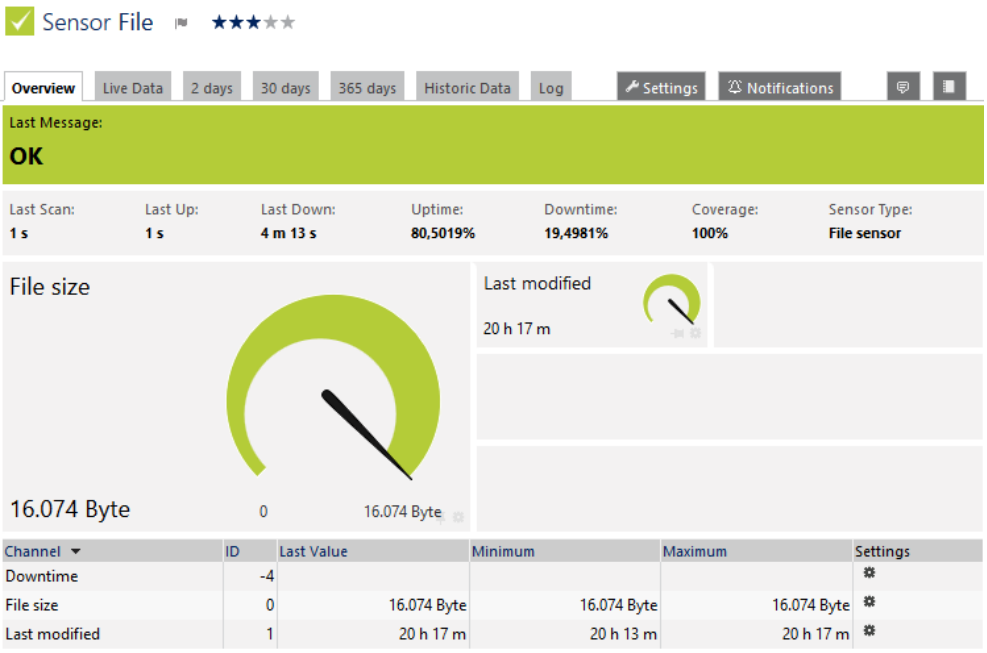
For more general information about settings, please see the **Object Settings** 159 section.

6.8.37 File Sensor

The File sensor monitors a file located on the local disk on the parent probe system, parent device, or a file accessible via Server Message Block (SMB). You can monitor changes to the file content and file time stamp.

It can show the following:

- File size
- Past time since the file was modified the last time (in days, hours, and minutes, depending on the elapsed time)
- In contrast to the Folder sensor[741], you can also monitor if the actual content of a specific file has changed.



File Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/file.png

Remarks

- To monitor files on a share, the "LanmanServer" Windows service must run on the target computer.
- Try using the Fully Qualified Domain Name (FQDN) of the target device if the sensor does not get a connection with the IP address.
- Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

File Name	Enter the full path to the file that this sensor will monitor. For example, enter C:\Windows\file.txt to monitor a file on the parent probe system. If you use a local path, the sensor looks for the target file only on the system on which the parent probe runs, not on the parent device! To monitor a file on the parent device, use the dollar sign ($) like C$\User\johnqpublic\file.txt. If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part (only enter share \folder\file.txt). The server part (\\server\) is taken from the parent device settings 324 of this sensor. Enter a valid path and file name. Note: To provide any shares, the LanmanServer "Server" Windows service must be running on the target computer.
Sensor Behavior	Specify when the sensor shows a **Down** status 135. Choose between: ▪ **Show 'Down' status if file does not exist**: The sensor switches into an error status if the file does not exist. ▪ **Show 'Down' status if file exists**: The sensor switches into an error status if the file does exist.
Monitor File Content	Specify if the sensor will send a change notification when the content of the file changes (based on a checksum). Choose between: ▪ **Ignore changes**: No action will be taken on change. ▪ **Trigger 'change' notification**: The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
Monitor File Time Stamp	Specify if the sensor will send a change notification when the content of the file's time stamp changes. Choose between: ▪ **Ignore changes**: No action will be taken on change. ▪ **Trigger 'change' notification**: The sensor will send an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

- https://kb.paessler.com/en/topic/67965

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

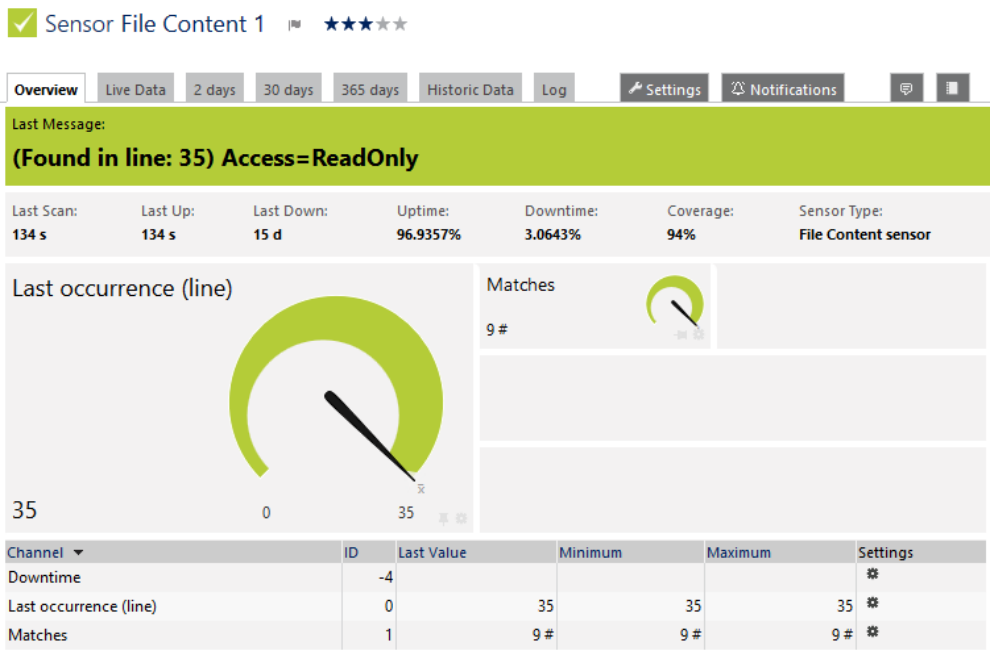
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.38 File Content Sensor

The File Content sensor checks a text file (for example, log files) for certain strings and returns the following:

- Line number of the last match
- Number of total matches.
- Additionally, the sensor quotes matching lines in the sensor message field.



File Content Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/file_content.png

Remarks

- This sensor does not support UTF-16 encoded files! In this case, please try use a custom sensor like the EXE/Script Sensor 699 or the EXE/Script Advanced Sensor 711.
- This sensor does not support binary files officially! If you would still like to monitor binary files contrary to our recommendation, then please choose the option **Always transmit to PRTG the entire file** in section **Network Usage** in the sensor settings.
- This sensor supports Unix line feeds.
- To monitor files on a Windows share, the "LanmanServer" Windows service must run on the target computer.
- To monitor files on a Linux system, the folder has to be accessible via SMB.
- Try using the Fully Qualified Domain Name (FQDN) of the target device if the sensor does not get a connection with the IP address.

- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

File Name	Enter the full path to the file that this sensor will monitor. For example, enter C:\Windows\file.txt. to monitor a file on the parent probe system. If you use a local path, the sensor looks for the target file only on the system on which the parent probe runs, not on the parent device! To monitor a file on the parent device, use the dollar sign ($) like C$\User\johnqpublic\file.txt. If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part (only enter share \folder\file.txt). The server part (\\server\) is taken from the parent device settings 324 of this sensor. Enter a valid path and file name. Note: To provide any Windows shares, the LanmanServer "Server" Windows service must run on the target computer. Note: To monitor any Linux files, the folder with these files has to be accessible via Server Message Block (SMB). Note: If you define a file on your network here, please be aware that this might produce high network traffic if you define PRTG to query the entire file with every scanning interval below.
Search String	Define the string inside the log file you want to check for. The input is not case-sensitive. Please enter a string.
Network Usage	Define in which way the sensor will transmit the target file to PRTG. Choose between: ▪ **Only transmit to PRTG new lines at the end of the file (default)**: This option improves the performance of the sensor. It sends the whole file only with the first scan to PRTG. With the following sensor scans, the sensor will only transmit lines which were appended since the last scan. All other lines (which already existed in the previous scan) are not sent. The sensor assumes that they are unchanged and still counts them. Note: This option is currently in beta status. Please do not expect that it will work as expected in every usage scenario! ▪ **Always transmit to PRTG the entire file**: The sensor sends the whole file with every sensor scanning interval to PRTG. If this results in too much traffic on the target system, we recommend that you choose the new lines option. Note: The sensor can transmit only newly added lines in the following cases: ▪ The file is bigger than at the previous scan, and ▪ the last line in the file at the previous scan still has to be at the same place in the file.

SENSOR SPECIFIC

Note: The sensor supports Windows and Linux line endings (CRLF resp. LF).

Search Method

Define the method you want to provide the search string with. The pattern must be in one line and only the last matching line will be given back. Choose between:

- **Simple string search**: Search for a simple plain text expression.
- **Regular Expression**: Search using a regular expression. For more details, see **Regular Expressions** 3105 section.

File Encoding

Specify the encoding of the file that this sensor monitors. Choose between:

- **Windows-1252**
- **UTF-8**
- **UTF-16**

Warning Behavior

Define under which condition the sensor will show a **Warning** status. Choose between:

- **Go into warning status when string is not found**: The sensor will show a **Warning** status if there is no match. Otherwise it will remain in **Up** status.
- **Go into warning status when string is found**: The sensor will show a **Warning** status if there is a match. Otherwise it will remain in **Up** status.

If Value Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default)**: The sensor takes no action on change.
- **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

Note: The change notification for this sensor is triggered if the value of the channel **Last occurrence (line)** changes. It is not triggered when the number of **Matches** changes.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

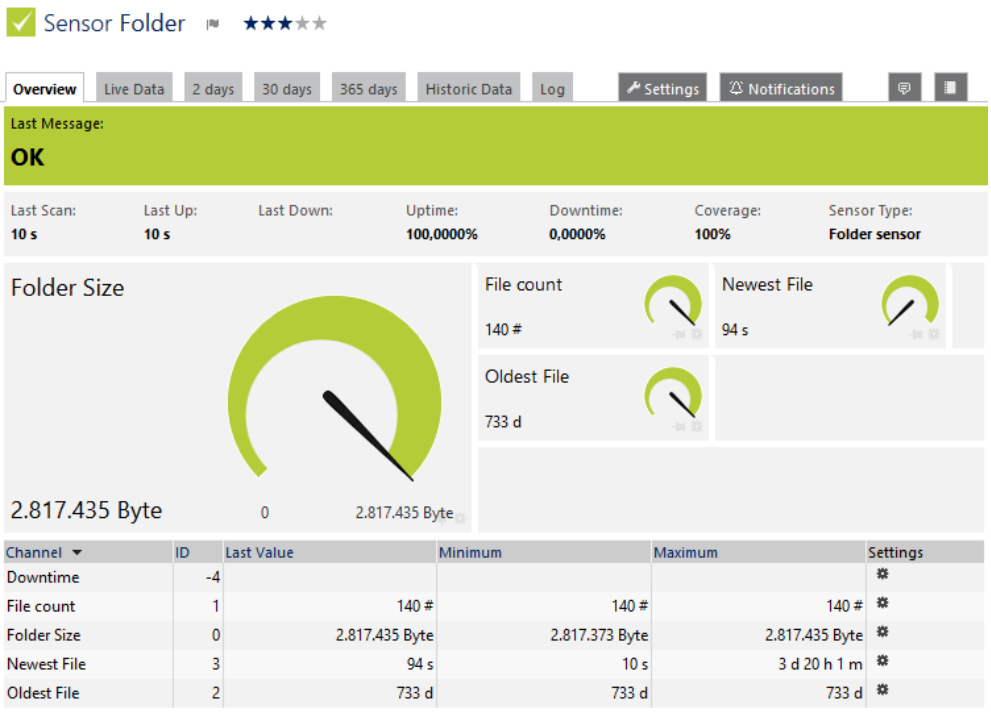
6.8.39 Folder Sensor

The Folder sensor monitors a folder using Server Message Block (SMB). You can monitor file changes and file ages.

It can show the following:

- Folder size in bytes
- Number of files in the folder
- Past time since the last change to a file in the folder ("newest file")
- Past time since the oldest modification of a file in the folder ("oldest file")

Note: The Folder sensor counts all files in a folder, including hidden files.



Folder Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/folder.png

Remarks

- This sensor counts all files in a folder, including hidden files.
- To monitor files on a share, the "LanmanServer" Windows service must run on the target computer.
- Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

FOLDER MONITOR

Folder Name	Enter the full path to the folder this sensor will monitor. For example, enter C:\Windows. If the file is located on a network device, use the Uniform Naming Convention (UNC) path without the server part (you would only enter share\folder). The server part (\\server\) is taken from parent device settings 324 of this sensor. Please enter a valid path name. Note: To monitor shares, the LanmanServer "Server" Windows service must be running on the target computer.
Sub-Folder Recursion	Specify if the sensor will include subfolders in the folder monitoring. Choose between: • **Do not recurse sub-folders**: Only monitor the folder specified above and do not monitor its subfolders. • **Monitor the folder and its sub-folders (use with caution!)**: Monitor the folder specified above and all of its subfolders. Note: Recursing subfolders in large directories with a high number of branches may evoke timeout errors or performance issues.
Monitor Folder Changes	Specify if the sensor will send a change notification when the content of the folder changes. Choose between: • **Ignore changes**: Changes to the folder will not trigger a change notification. • **Trigger 'On Change' notification**: The sensor will trigger a change notification if a file changes its timestamp or filename, or if there are new or deleted files.
Check of File Ages	Specify if the sensor will monitor the folder for certain file ages and show a corresponding status 135. Choose between: • **Don't check**: Do not check for the age of the files in the specified folder(s). • **Show Warning if older**: Set the sensor to **Warning** status if one of the files in the specified folder is older than a specific time unit. • **Show Error if older**: Set the sensor to **Down** status if one of the files in the specified folder is older than a specific time unit. • **Show Warning if younger**: Set the sensor to **Warning** status if one of the files in the specified folder is younger than a specific time unit. • **Show Error if younger**: Set the sensor to **Down** status if one of the files in the specified folder is younger than a specific time unit.
File Age Limit	This field is only visible if you enable a file age check above. Enter the age of a file in the folder that will trigger the sensor's status change if the defined age is undercut respectively exceeded. Please enter an integer value. The value will be interpreted as days, hours, or minutes, according

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

- http://kb.paessler.com/en/topic/513

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

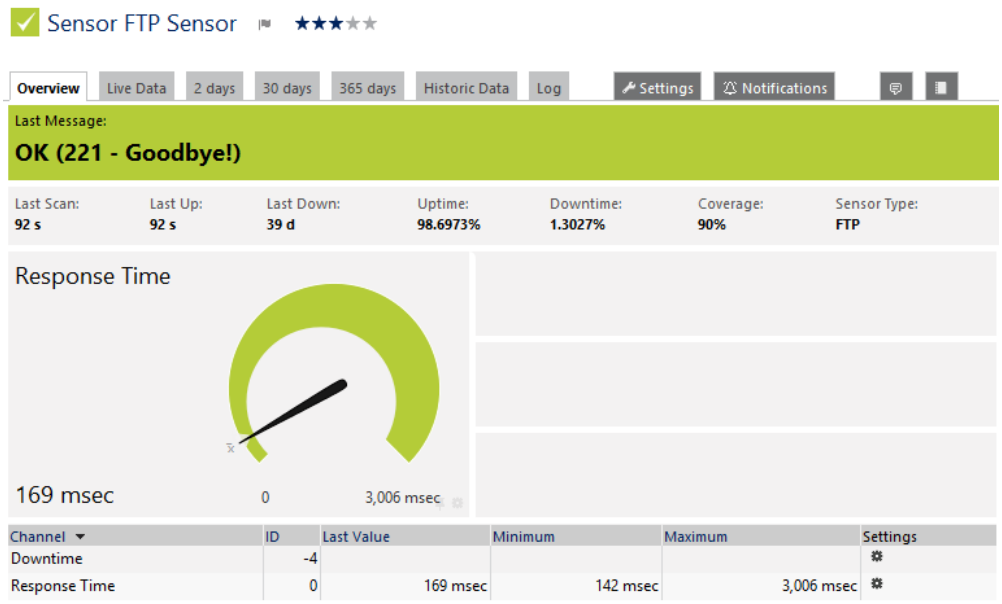
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.40 FTP Sensor

The FTP sensor monitors file servers using File Transfer Protocol (FTP) and FTP over SSL (FTPS). It can show the following:

- Response time of the server
- Response message of the server



FTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ftp.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port the sensor tries to connect to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.
FTP Mode	Specify which FTP mode the sensor uses for the connection. Choose between: ▪ **Use active mode** ▪ **Use passive mode** We recommend that you use the default value. If you do not get a connection, please try the passive mode.

TRANSPORT-LEVEL SECURITY

FTP Specific	Specify if the sensor uses an encryption for the connection. Choose between: ▪ **Use Transport-Level Security if available**: The sensor tries to connect via TLS. It determines automatically whether to connect via explicit or implicit mode. If TLS is not supported by the server, the sensor tries connect without encryption and is in **Up** status if this works. ▪ **Enforce Transport-Level Security**: The connection must be established using TLS (explicit or implicit mode). Otherwise, the sensor goes into **Down** status. ▪ **Do not use Transport-Level-Security**: The sensor connects to the FTP server without encryption. Note: You can see in the sensor logs which method the sensor used previously to connect to the FTP server.

AUTHENTICATION

Username	Enter a username for the FTP login. Please enter a string or leave the field empty. Note: Default username is "anonymous". If the sensor cannot log onto the FTP server with this username (or another one that you define), the sensor message shows that the credentials are incorrect but the sensor status remains **Up**.
Password	Enter a password for the FTP login. Please enter a string or leave the field empty. Note: If the sensor cannot log onto the FTP server with this password, the sensor message shows that the credentials are incorrect but the sensor status remains **Up**.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between:

DEBUG OPTIONS

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

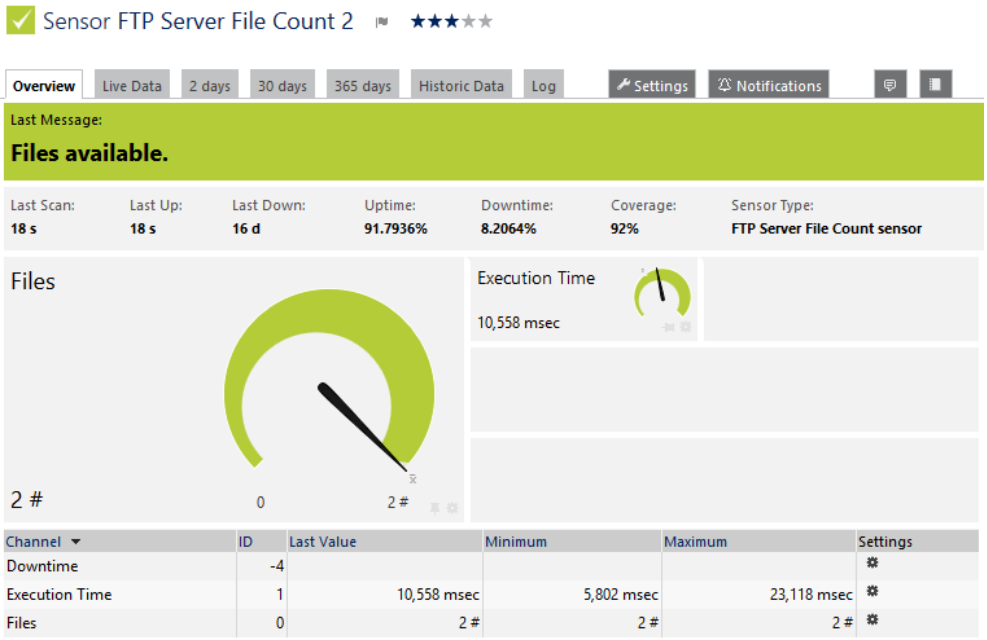
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.41 FTP Server File Count Sensor

The FTP Server File Count sensor logs on to an FTP server and can monitor changes to files.

- It can show the number of files available in the directory listing.



FTP Server File Count Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ftp_server_file_count.png

Remarks

- Requires 758 .NET 4.0 or higher on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Check Method	Define how to access the FTP server directory that this sensor monitors. Choose between: ▪ **Check URL**: The sensor uses an explicitly defined URL of an FTP server to access the target directory. ▪ **Check folder on parent device**: The sensor uses the IP address or DNS name of the parent device where you add this sensor to and monitors a defined folder on this device.
FTP URL	This field is only visible if you select the URL method above. Enter the URL that this sensor checks. The URL can look like this: ftp://10.0.0.1/upload Note: When you use this method, this sensor does not use the **IP Address/DNS value** of the parent device. Note: You can add a port number to the URL by using a colon, for example, ftp://10.0.0.1/upload:21
FTP Port	This field is only visible if you select the parent device method above. Enter the number of the port to which this sensor connects. Default port is **21**.
FTP Folder	This field is only visible if you select the parent device method above. Enter the name of the folder on the parent device that this sensor monitors, for example, upload
Subfolder Recursion	This field is only visible if your select the parent device method above. Define if the sensor additionally monitors the subfolders of the FTP folder you specify above. Choose between: ▪ **Do not recurse subfolders**: The sensor monitors only the folder that you define above and ignores its subfolders. ▪ **Monitor the folder and its subfolders (use with caution!)**: The sensor recursively checks all subfolders in addition to the folder that you define above. Note: Recursing subfolders in large directories with a high number of branches may evoke timeout errors or performance issues.
Username	Enter the username for the logon to the FTP server. Please enter a string.
Password	Define the password for the logon to the FTP server. Please enter a string.
File Count	Define which file the sensor counts. Choose between:

SENSOR SETTINGS

- **Count the total number of files**: The sensor always shows the total number of all files in the defined folder.
- **Count only new files**: The sensor shows only the number of new files since the last sensor scan. You can define the frequency of sensor scans in section **Scanning Interval** 762.
  Note: With the every sensor scan, any new files from the previous scan will be regarded as old.

Security

Define the the encryption of the connection. Choose between:

- **Do not use an encryption**: The sensor connects without encryption.
- **Use explicit SSL**: The sensor establishes the connection to the FTP server via SSL.
  Note: This sensor type supports only explicit SSL.

If Value Changes

Define what this sensor will do when the sensor value changes. You can choose between:

- **Ignore changes (default)**: The sensor takes no action on change.
- **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

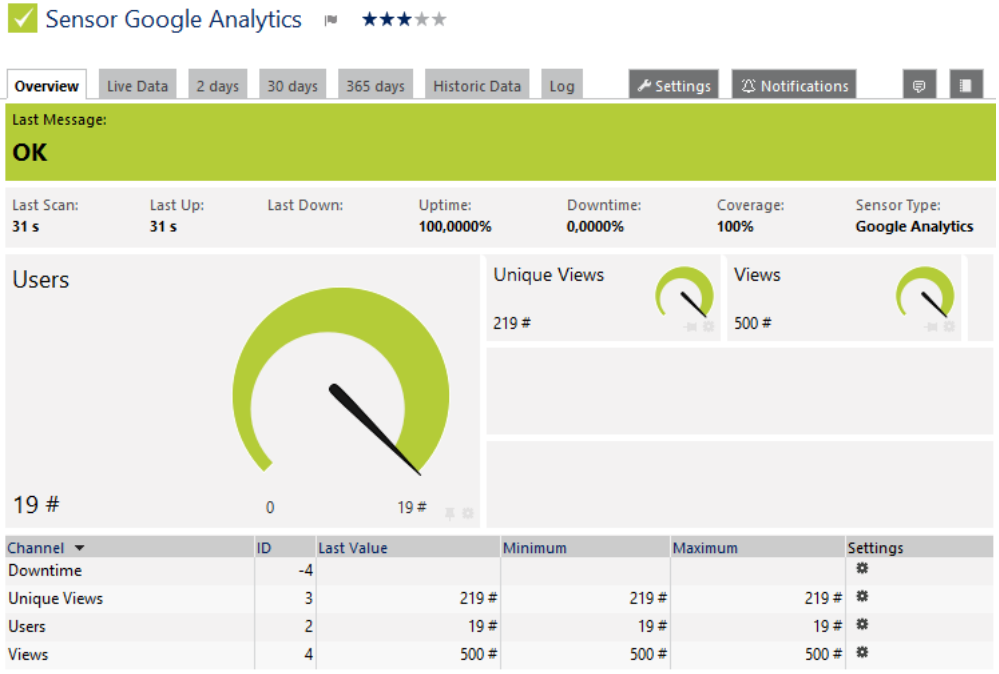
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.42 Google Analytics Sensor

The Google Analytics sensor queries and monitors several metrics from a Google Analytics account using the Google Application Programming Interface (API) and OAuth2.

- It can show the values for all available Google Analytics metrics in different sensor channels.



Google Analytics Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/google_analytics_v2.png

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, please see manual section **Authentication Using OAuth2** 778.
- Knowledge Base: Where do I find available Google Analytics metrics?

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

GOOGLE CREDENTIALS

This sensor type uses OAuth2 authentication to get access to your Google account. For details about the authentication approach, please see section **Authentication Using OAuth2** 778.

OAuth URL	Click the button **Get Access Code** to connect this sensor to your Google Analytics account using OAuth2. This is necessary to allow the sensor to query data from Google Analytics. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your Google Analytics account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.
OAuth Code	Paste the access code that you receive after completing the authorization process for PRTG at your Google Analytics account. Click **OK** to define the sensor settings 770. Note: It is mandatory to connect this sensor to your Google Analytics account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

GOOGLE ANALYTICS SPECIFIC

Profile	Choose the Google Analytics profile that you want to monitor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #2 – #10	You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for Sensor Channel #1 without enabling it manually. Additionally you can define Sensor Channel #2 up to Sensor Channel #10. To do so, choose between: ▪ **Disable:** The sensor will not create this channel. ▪ **Enable:** Create an additional channel and define all its characteristics below (name, metric, mode, and unit). Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. It is not possible to enable or disable sensor channels after the creation of this sensor!

GOOGLE ANALYTICS SPECIFIC

Channel #x Mode	Define how to display the retrieved value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from Google Analytics. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from Google Analytics.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

GOOGLE CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your Google Analytics account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

GOOGLE ANALYTICS SPECIFIC

Profile	Shows the Google Analytics profile that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Time Span	Define the time that the queried monitoring covers. Choose between: ▪ **Last week (default)** ▪ **Yesterday** ▪ **Today**
Sensor Channel #x Name	Enter a name for the channel in which the sensor shows the results for the metric you choose below. Please enter a string.
Sensor Channel #x Metric	Select a metric that you want to monitor. You can choose between available Google Analytics. If your desired metric is not listed, choose **Custom Metric** and specify below.
Sensor Channel #x Custom Metric	This field is only visible if you choose custom metric above. Enter the identifier of the metric that you want to monitor. Type it exactly as shown in Google Analytics. Metric identifiers always start with ga: Please enter a string.

GOOGLE ANALYTICS SPECIFIC

Sensor Channel #x Mode	Shows how the sensor displays the retrieved value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Unit	Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you select the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This setting is only visible if you select the **Value Lookup** option above. Choose a lookup 3095 file that you want to use with this channel.

GOOGLE ANALYTICS SPECIFIC

Sensor Channel #x	Shows if you enabled or disabled a channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. You can define up to 10 different sensor channels per sensor.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Authentication Using OAuth2

This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. In general, the authorization approach of PRTG using OAuth2 works like this:

1. **Authorization Request**
   First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. This opens a new browser window on the authorization server of the target service.

2. **Verifying Identity**
   This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.
   Note: If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. **Authorizing PRTG**
   Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. **Getting Authorization Code**
   Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.
   Note: The code is valid only a short period of time and expires after a few minutes. You can use a particular code only once.

5. **Providing Authorization Code**
   Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. **Requesting Access Token**
   After getting the authorization code, PRTG requests an access token from the API of the target service. For this purpose PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access token are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. **Retrieving Data**
   The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate at your account. It is not necessary to use the original account credentials anew. The used tokens are refreshed automatically from time to time.

More

Knowledge Base: Where do I find available Google Analytics metrics?

- http://kb.paessler.com/en/topic/35373

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

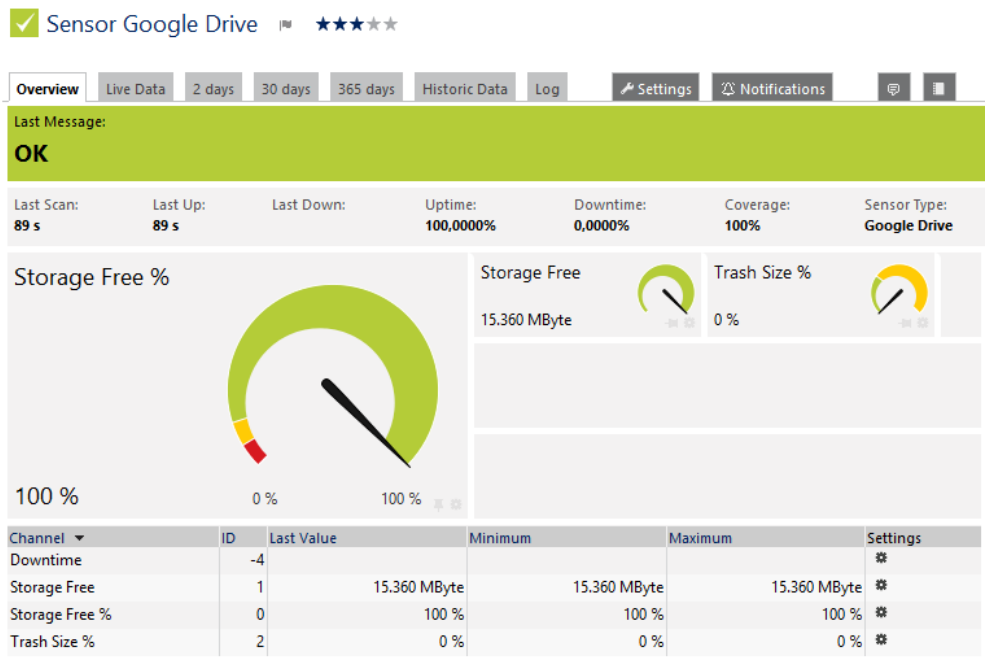
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.43 Google Drive Sensor

The Google Drive sensor monitors a Google Drive account using the Google Application Programming Interface (API) and OAuth2. It shows the following:

- Free storage in bytes and percent
- Trash size in percent



Google Drive Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/google_drive.png

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, please see manual section **Authentication Using OAuth2** 788.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

GOOGLE CREDENTIALS

This sensor type uses OAuth2 authentication to get access to your Google account. For details about the authentication approach, please see section **Authentication Using OAuth2** 788.

OAuth URL	Click the button **Get Access Code** to connect this sensor to your Google Drive account using OAuth2. This is necessary to allow the sensor to query data from Google Drive. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your Google Drive account. Copy the OAuth code you get and paste it into the **OAuth Code** field below.
OAuth Code	Paste the access code that you receive after completing the authorization process for PRTG at your Google Drive account. Click **OK** to define the sensor settings 781. Note: It is mandatory to connect this sensor to your Google Drive account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

GOOGLE CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your Google Drive account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Authentication Using OAuth2

This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. In general, the authorization approach of PRTG using OAuth2 works like this:

1. **Authorization Request**
   First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. This opens a new browser window on the authorization server of the target service.

2. **Verifying Identity**
   This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.
   Note: If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. **Authorizing PRTG**
   Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. **Getting Authorization Code**
   Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.
   Note: The code is valid only a short period of time and expires after a few minutes. You can use a particular code only once.

5. **Providing Authorization Code**
   Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. **Requesting Access Token**
   After getting the authorization code, PRTG requests an access token from the API of the target service. For this purpose PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access token are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. **Retrieving Data**
   The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate at your account. It is not necessary to use the original account credentials anew. The used tokens are refreshed automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

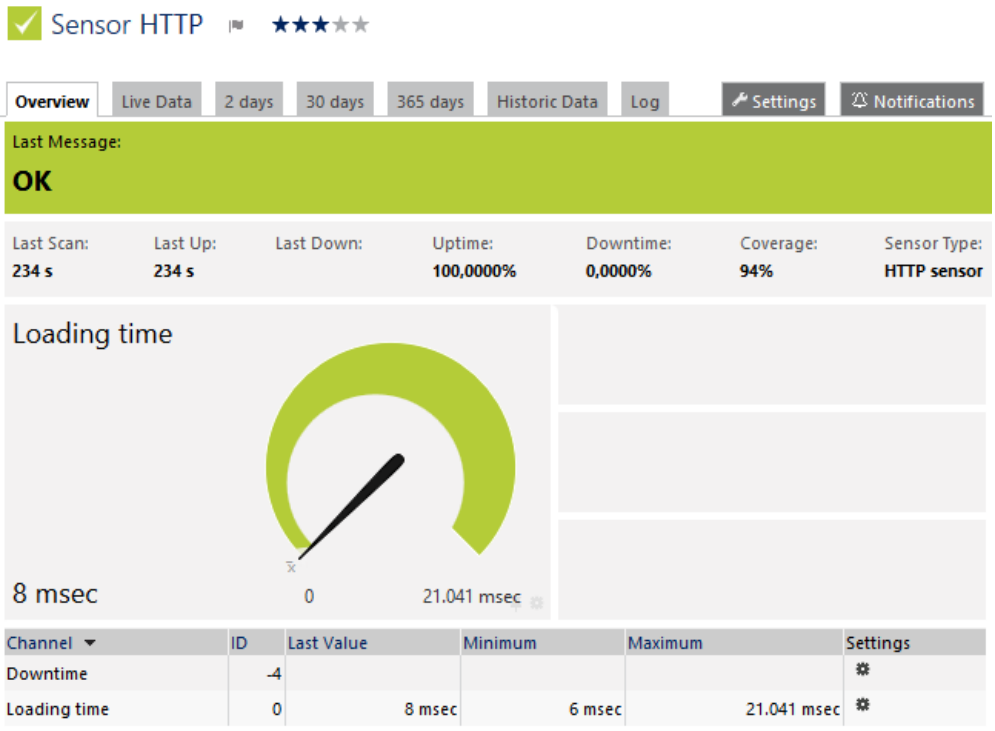
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.44 HTTP Sensor

The HTTP sensor monitors a web server using Hypertext Transfer Protocol (HTTP). This is the easiest way to monitor if a website (or a specific website element) is reachable.

- It shows the loading time of a web page or element.



HTTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http.png

Remarks

- Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

HTTP SPECIFIC

URL	Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the **IP address/DNS name** setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Request Method	Choose an HTTP request method to determine how the sensor will request the given URL. ▪ **GET**: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page. ▪ **POST**: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below. ▪ **HEAD**: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.
Postdata	This field is only visible when you select the POST **Request Method** setting above. Enter the data part for the POST request here. Note: No XML is allowed here!
Content Type	This setting is only visible when you select the POST **Request Method** setting above. Define the content type of a POST request. Choose between: ▪ **Default (application/x-www-form-urlencoded)**: This is the default content type used to encode the form data set for submission to the server. ▪ **Custom**: If you need another content type than default, enter this content type below.
Custom Content Type	This field is only visible when you select **Custom** above. Define the content type which is needed, for example, XML, JSON, HTTP.

HTTP SPECIFIC

Server Name Indication	Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the parent device 324 or the target URL of the sensor. SNI has to be a Fully Qualified Domain Name (FQDN). Please ensure it matches the configuration of the target server. For details, please see section **More** for a link to the Knowledge Base article **My HTTP sensors fail to monitor websites which use SNI. What can I do?**
SNI Inheritance	Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the **Server Name Indication** setting above which SNI is determined. Choose between: ▪ **Inherit SNI from parent device**: The sensor determines the SNI from the host address of the parent device. ▪ **Do not inherit SNI from parent device**: The sensor determines the SNI from the target **URL** as defined in the settings of this sensor.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

More

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?

- http://kb.paessler.com/en/topic/67398

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

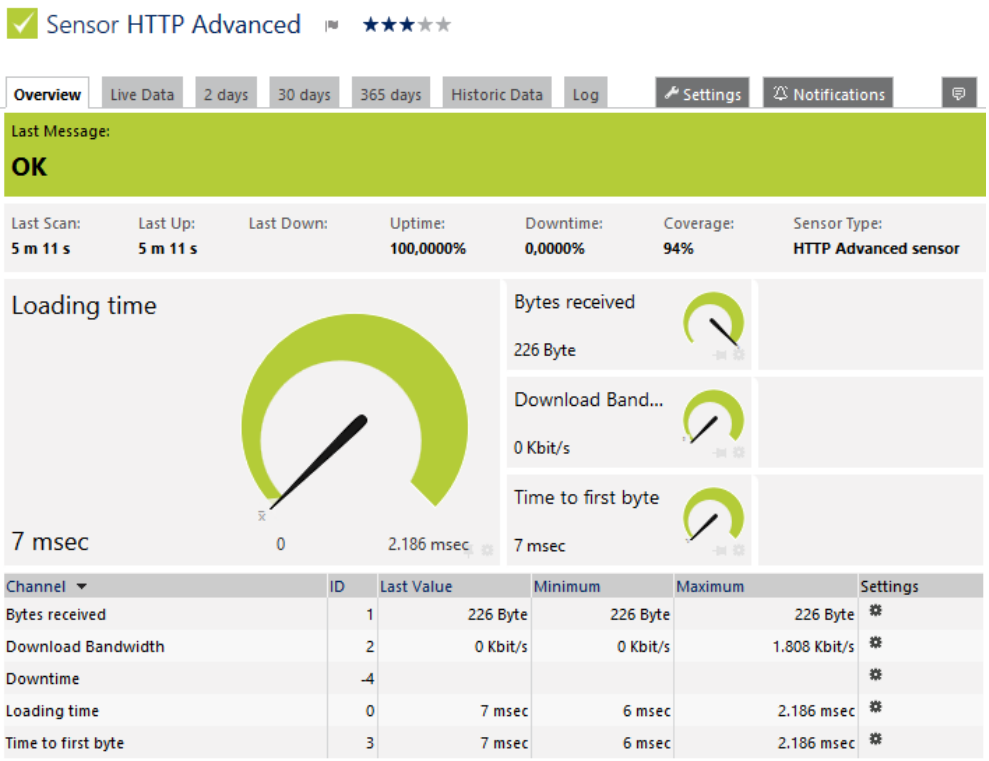
For more general information about settings, please see the **Object Settings** 159 section.

6.8.45 HTTP Advanced Sensor

The HTTP Advanced sensor monitors the source code of a web page using Hypertext Transfer Protocol (HTTP). It supports authentication, content checks, and other advanced parameters.

The sensor can show the following:

- Loading time
- Bytes received
- Download bandwidth (speed)
- Time to first byte



HTTP Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_advanced.png

Remarks

- Supports Smart URL Replacement 814.
- Knowledge Base: Which user agent should I use in the HTTP Advanced sensor's settings?
- Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

If you need to use SRP ciphers, please choose the "compatibility mode" in the sensor settings below.

- Note: Bandwidth monitoring of fast internet connections may be inaccurate.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the **IP address/DNS name** setting of the device on which you create this sensor. You can enter an URL leading to a webpage (to measure the page source code's loading time), or enter the URL of an image or of another page asset to measure this element's availability and loading time. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Request Method	Choose an HTTP request method to determine how the sensor will request the given URL. ▪ **GET**: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page. ▪ **POST**: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below. ▪ **HEAD**: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.
Postdata	This field is only visible when you select the POST **Request Method** setting above. Enter the data part for the POST request here. Note: No XML is allowed here!
Content Type	This setting is only visible when you select the POST **Request Method** setting above. Define the content type of a POST request. Choose between: ▪ **Default (application/x-www-form-urlencoded)**: This is the default content type used to encode the form data set for submission to the server. ▪ **Custom**: If you need another content type than default, enter this content type below.
Custom Content Type	This field is only visible when you select **Custom** above. Define the content type which is needed, for example, XML, JSON, HTTP.

HTTP SPECIFIC

Server Name Indication	Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the parent device 324 or the target URL of the sensor. SNI has to be a Fully Qualified Domain Name (FQDN). Please ensure it matches the configuration of the target server. For details, please see section **More** for a link to the Knowledge Base article **My HTTP sensors fail to monitor websites which use SNI. What can I do?**
SNI Inheritance	Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the **Server Name Indication** setting above which SNI is determined. Choose between: ▪ **Inherit SNI from parent device**: The sensor determines the SNI from the host address of the parent device. ▪ **Do not inherit SNI from parent device**: The sensor determines the SNI from the target **URL** as defined in the settings of this sensor.

HTTP ENGINE

Monitoring Engine	If you encounter unexpected errors with the standard method that is used to monitor an URL, try to use the compatibility mode which is based on .NET. Choose between: ▪ **Default/High Performance (recommended)**: This is the default monitoring method for this sensor type. ▪ **Alternate/Compatibility Mode**: Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor executes an external exe. Because of this, this method needs more resources, but it can be helpful in particular cases. Note: If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below. Note: When using the Compatibility Mode, **Smart URL Replacement** will not work, so this sensor will not use the **IP Address/DNS value** of the parent device automatically then.

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

SSL Method	When using the compatibility mode, the SSL specific settings are a bit different to the default (automatically used) SSL settings. You can choose between: ▪ **SSL V3** ▪ **TLS V1** ▪ **SSL V3 or TLS V1**: This is the default setting.
Check SSL Certificates	Specify if the sensor will check the certificate of the monitored URL. Choose between: ▪ **Do not check used certificates**: Do not consider the certificates of the monitored web pages. This the default setting. ▪ **Check if the used certificates are trusted**: Inspect the certificates. If the certificate of the server is not trusted, the sensor shows a **Down** status and displays a corresponding message.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

Protocol Version	Define the HTTP protocol version that the sensor uses when connecting to the URL. Choose between: ▪ **HTTP 1.0** ▪ **HTTP 1.1**: This is the default setting.
User Agent	Choose which user agent string will be sent by this sensor when connecting to the URL defined above. Choose between: ▪ **Use PRTG's default string**: Do not enter a specific user agent, use default setting. Usually, this is: Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows) ▪ **Use a custom string**: Use a custom user agent. Define below.
Custom User Agent	This field is only visible if you enable custom user agent above. Enter a string which will be used as user agent when connecting to the URL specified above.

ADVANCED SENSOR DATA

Use Custom HTTP Headers	Define if you want to send custom HTTP headers to the target URL. Choose between: ▪ **Do not use custom HTTP headers** ▪ **Use custom HTTP headers**
Custom HTTP Headers	This field is only available if you select using custom headers above. Enter a list of custom HTTP headers with theirs respective values that you want to transmit to the URL you define above, each pair in one line. The syntax of a header-value pair is header1:value1 Note: The sensor does not accept the header field names user-agent, content-length, host. Note: Ensure that the HTTP header statement is valid! Otherwise, the sensor request will not be successful.
Content Changes	Define what the sensor will do if the content of the monitored web page (element) changes. You can choose between: • **Ignore changes**: No action will be taken on change. • **Trigger 'change' notification**: The sensor will send an internal message indicating that the web page content has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the web page content changes.
Require Keyword	Define if the sensor will check the result at the configured URL for keywords. Choose between: ▪ **Do not check for keyword (default)**: Do not search for keywords in the result returned at the URL. ▪ **Set sensor to warning if keyword is missing**: Check if a keyword exists in the result and set the sensor to a **Warning** status 135 if yes. ▪ **Set sensor to error if keyword is missing**: Check if a keyword exists in the result and set the sensor to a **Down** status 135 if yes. Note: The content check is only intended for html websites and might not work with other target URLs. For example, binary files are not supported.

ADVANCED SENSOR DATA

Response Must Include	This field is only visible if you enable keyword checking above (include). Define which string must be part of the source code at the given URL. You can either enter plain text or a **Regular Expression** 3105. Specify below. If the data does not include the search pattern, the sensor will show the status defined above. Please enter a string.
Check Method	Define in which format you have entered the search expression in the field above. ▪ **String search (default)**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. You can also search for HTML tags. ▪ **Regular Expression**: Use the search pattern as a **Regular Expression** 3105.
Exclude Keyword	Define if the sensor will check the result at the configured URL for keywords. Choose between: ▪ **Do not check for keyword (default)**: Do not search for keywords in the result returned at the URL. ▪ **Set sensor to warning if keyword is found**: Check if a keyword exists in the result and set the sensor to a **Warning** status 135 if yes. ▪ **Set sensor to error if keyword is found**: Check if a keyword exists in the result and set the sensor to a **Down** status 135 if yes. Note: The content check is only intended for html websites and might not work with other target URLs. For example, binary files are not supported.
Response Must Not include	This field is only visible if you enable keyword checking (exclude) above. Define which string must not be part of the source code at the given URL. You can either enter plain text or a **Regular Expression** 3105. If the data does include this string, the sensor will show the status defined above. Please enter a string.
Check Method	Define in which format you have entered the search expression in the field above.

ADVANCED SENSOR DATA

	▪ **String Search (default)**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. You can also search for HTML tags. ▪ **Regular Expression**: Use the search pattern as a **Regular Expression** 3105.
Limit Download (kb)	Enter a maximum amount of data that the sensor can transfer per every single request. If you set content checks, please be aware that only the content downloaded up to this limit can be checked for search expressions.
Result Handling	Define what the sensor will do with the web page loaded at the given URL. Choose between: • **Discard HTML result**: Do not store the requested web page. • **Store latest HTML result**: Store the last result of the requested web page to the "Logs (Sensors)" directory (on the Master node, if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

Note: This sensor loads the source code at the given URL. If you set up a content check, only this source code is checked for the keywords. The code is not necessarily identical to the one used to display the page when opening the same URL in a web browser, as there may be a reload configured or certain information may be inserted after loading, for example, via Javascript. PRTG does not follow links to embedded objects nor does it execute scripts. Only the first page at the given URL is loaded and checked against the expressions configured. For debugging, please use the **Result Handling** option to write the source code file to disk and look up what exactly PRTG gets when calling the URL. If the URL configured does not point to a web page, but to a binary file, for example, to an image, you usually will not check for content.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed**

AUTHENTICATION

	▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: ▪ **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases. Note: This authentication method transmits credentials as plain text. ▪ **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on. ▪ **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication. We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

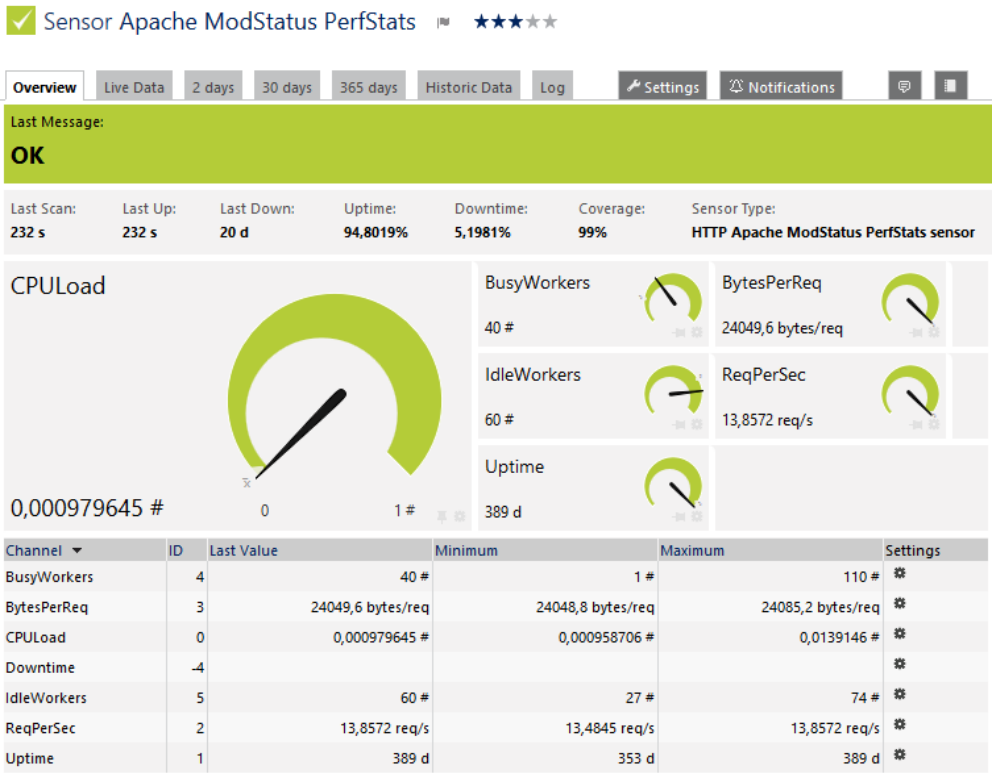
6.8.46 HTTP Apache ModStatus PerfStats Sensor

The HTTP Apache ModStatus PerfStats sensor monitors performance statistics of an Apache web server using mod_status over Hypertext Transfer Protocol (HTTP).

It can show the following about the Apache at scan time:

- CPU load
- Server uptime
- Requests per second
- Bytes per request
- Number of current busy workers threads
- Number of idle worker threads

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



HTTP Apache ModStatus PerfStats Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_apache_modstatus_perfstats.png

Remarks

- Supports Smart URL Replacement 824.

- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	Enter the URL to the mod_status module on your Apache server. PRTG will append a "/server_status?auto" part automatically. If you enter an absolute URL, this address will be independent from the **IP address/DNS name** setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed** ▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: ▪ **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases. Note: This authentication method transmits credentials as plain text.

AUTHENTICATION

- **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
- **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication.

We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

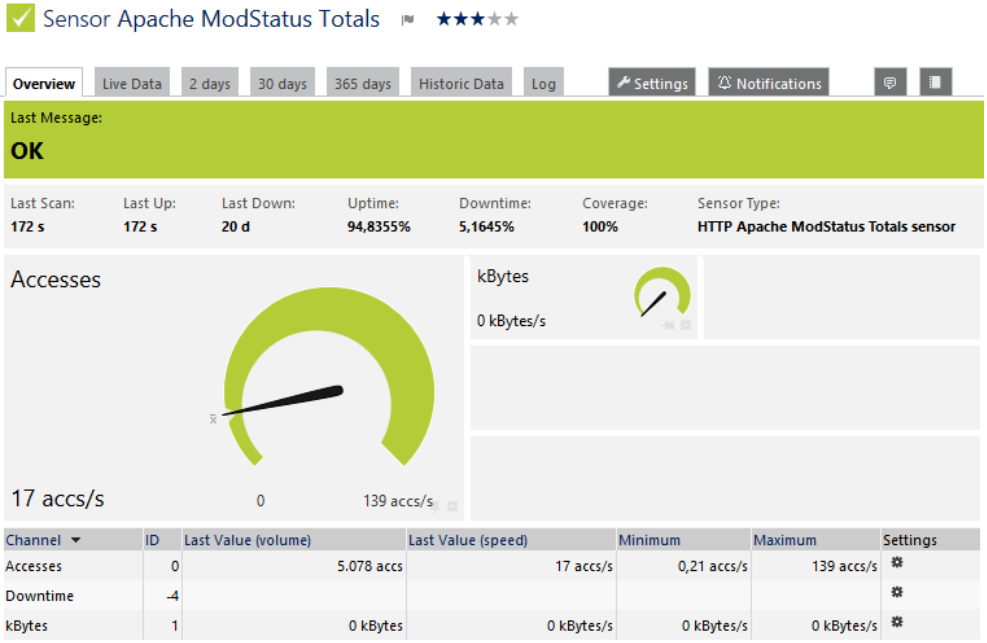
6.8.47 HTTP Apache ModStatus Totals Sensor

The HTTP Apache ModStatus Totals sensor monitors the activity of an Apache web server using mod_status over Hypertext Transfer Protocol (HTTP).

It can show the following:

- Number of accesses
- Transferred data in kBytes per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



HTTP Apache ModStatus Totals Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_apache_modstatus_totals.png

Remarks

- Supports Smart URL Replacement 834.
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	Enter the URL to the mod_status module on your Apache server. PRTG will append a "/server_status?auto" part automatically. If you enter an absolute URL, this address will be independent from the **IP address/DNS name** setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed** ▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: ▪ **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases. Note: This authentication method transmits credentials as plain text.

AUTHENTICATION

- **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
- **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication.

We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

More

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

- http://kb.paessler.com/en/topic/65731

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

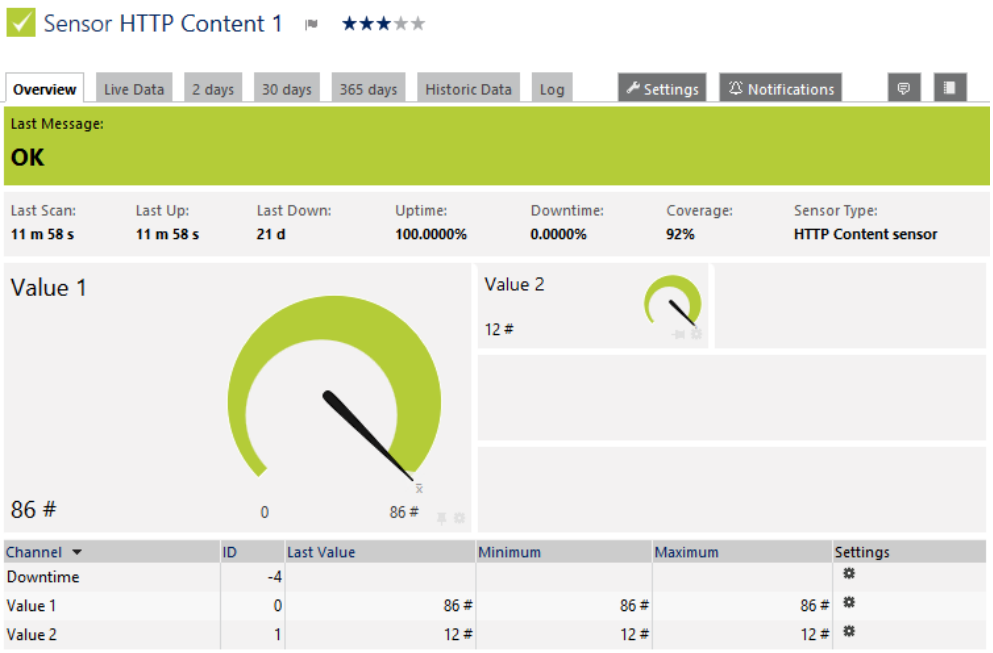
For more general information about settings, please see the **Object Settings** 159 section.

6.8.48 HTTP Content Sensor

The HTTP Content sensor monitors a numerical value returned by a Hypertext Transfer Protocol (HTTP) request. In the returned HTML page, each value must be placed between square brackets [ ]. See the example 845 below.

- It shows the returned numbers in dedicated channels, one channel for each value.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



HTTP Content Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_content.png

Remarks

- This sensor does not support more than 50 channels 837 officially.
- Supports Smart URL Replacement 846.
- Knowledge Base: How can I monitor internal values of a web application with PRTG
- See also the PRTG manual: **HTTP Content Sensor—Example** 845
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HTTP SPECIFIC

Value Type	Define what kind of values your HTML file gives back. Choose between: ▪ **Integer**: An integer is expected as return value. ▪ **Float:** A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow. Note: The sensor cannot handle string values.
Number of Channels	Define how many values your HTML file gives back. The sensor handles each value in its own sensor channel 92. Each value must be placed between square brackets [ ]. Enter the number of bracket-value pairs that the defined URL will return. Note: Do not enter a number less than the number of values returned. Otherwise you will get an error message.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Script URL	Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, this address will be independent from the **IP address/DNS name** setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Value Type	Shows the kind of values the HTML file gives back. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

Content Changes	Define what the sensor will do if the content of the monitored web page changes. Choose between: • **Ignore changes**: No action will be taken on change. • **Trigger 'change' notification**: The sensor will send an internal message indicating that the web page content has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the web page content changes.
Sensor Result	Define what the sensor will do with the results the sensor receives. Choose between: ▪ **Discard sensor result**: Do not store the results. ▪ **Write sensor result to disk (Filename: "Result of Sensor (ID].txt")**: Store the last result received to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed** ▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between:

AUTHENTICATION

- **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases.
  Note: This authentication method transmits credentials as plain text.
- **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on.
- **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication.

We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Example

For example, consider a URL http://www.example.com/status.html that returns a PHP script with the current system status in a simple HTML page as follows:

```
<html>
 <body>
  Description: Script gives back current status of disk free (%) and CPU usage (%).
  [85.5][12.0]
 </body>
</html>
```

You would configure the HTTP Content sensor using the mentioned script **URL**, value type **Float**, and number of channels **2**. The sensor calls the URL with every scanning interval and only regard the two values in square brackets [ ], handling each of them in one sensor channel. The additional description text and HTML tags are not necessary; in this example they are added in case a human calls the URL.

Note: If you define the number of channels as **1**, the sensor will read only the first value. The second value will be ignored. Using **3** as number of channels will result in a sensor error message.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

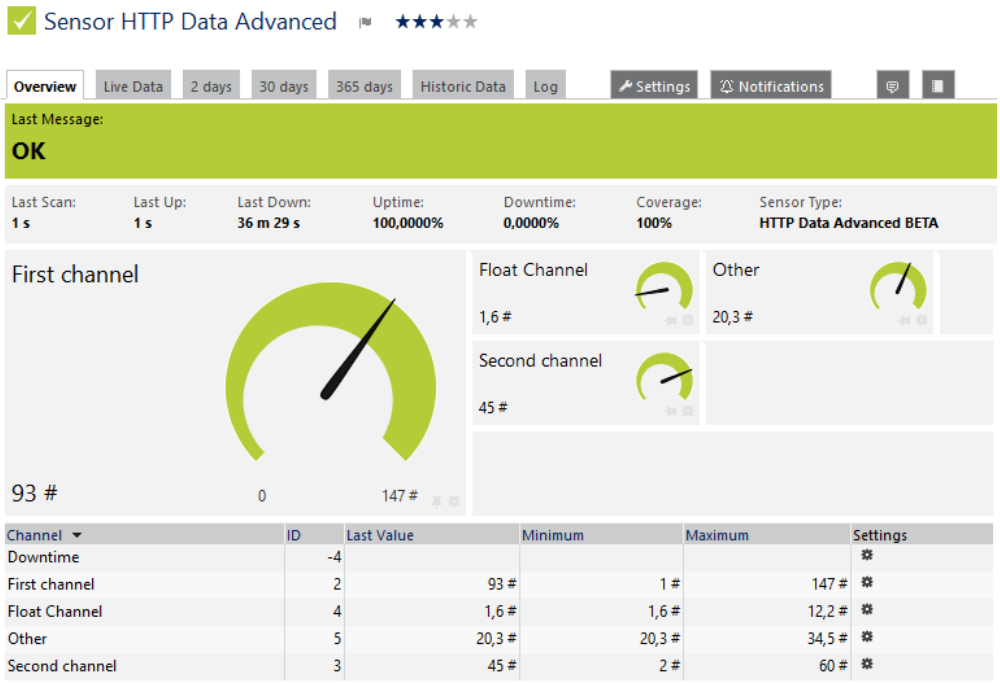
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.49 HTTP Data Advanced Sensor

The HTTP Data Advanced sensor accesses a web server and retrieves XML or JSON encoded data. For details about the return value format, please see the Application Programming Interface (API) Definition 3086.

- The sensor can show values returned by the web server in multiple channels.



HTTP Data Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_data_advanced.png

Remarks

- The requested web server must return XML or JSON encoded data that matches the format as defined in the API documentation 3086 in section **Custom Sensors—Advanced EXE/Script Sensor, Advanced SSH Script Sensor, and Advanced HTTP Push Data Sensor**.
- For best sensor performance, we recommend that you specify the content type on the target server, which is application/xml or application/json.
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	Enter the URL the sensor connects to. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the **IP address/DNS name** setting of the device on which you create this sensor. PRTG uses a smart URL replacement which allows you to use the parent device's **IP Address/DNS Name** setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Request Method	Choose an HTTP request method to determine how the sensor will request the given URL. ▪ **GET**: Request the target URL with the GET method. ▪ **POST**: Send post form data to the URL. If you choose this setting, you must enter the data that will be sent in the **Postdata** field below. ▪ **HEAD**: Only request the HTTP header from the target server.
Postdata	This field is only visible if you select the **POST** method above. Enter the data part for the POST request here. Note: No XML is allowed here!
Server Name Indication	Shows the Server Name Identification (SNI) that the sensor automatically determined from the host address of the parent device 324 or the target URL of the sensor. SNI has to be a Fully Qualified Domain Name (FQDN). Please ensure it matches the configuration of the target server. For details, please see section **More** for a link to the Knowledge Base article **My HTTP sensors fail to monitor websites which use SNI. What can I do?**
SNI Inheritance	Define if you want to inherit the Server Name Identification (SNI) from the parent device. See the **Server Name Indication** setting above which SNI is determined. Choose between: ▪ **Inherit SNI from parent device**: The sensor determines the SNI from the host address of the parent device. ▪ **Do not inherit SNI from parent device**: The sensor determines the SNI from the target **URL** as defined in the settings of this sensor.

HTTP SPECIFIC

Result Handling	Define what the sensor will do with the data loaded at the given URL. Choose between: • **Discard HTML result**: Do not store the requested data. • **Store latest HTML result**: Store the last result of the requested dta to the "Logs (Sensors)" directory (on the Master node, if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed** ▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: ▪ **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases. Note: This authentication method transmits credentials as plain text. ▪ **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on. ▪ **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication. We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Knowledge Base: My HTTP sensors fail to monitor websites which use SNI. What can I do?

- https://kb.paessler.com/en/topic/67398

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

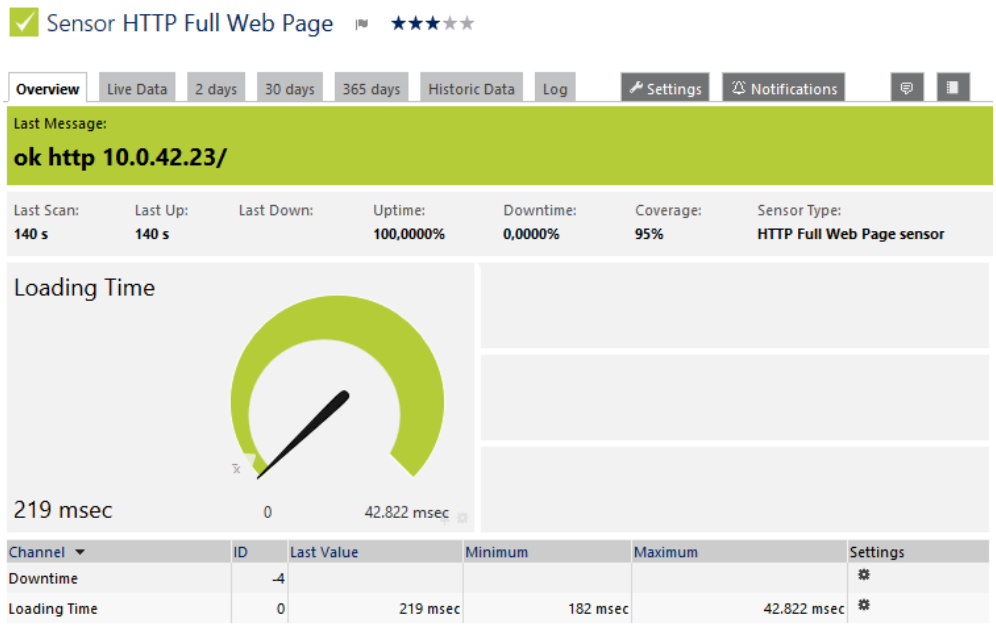
For more general information about settings, please see the **Object Settings** 159 section.

6.8.50 HTTP Full Web Page Sensor

The HTTP Full Web Page sensor monitors the full download time of a web page including assets such as images etc. In the background, it opens the web page in a browser instance to perform the measurement. Links are not followed.

- This sensor shows the loading time of the full web page.

Note: Be careful with this sensor, because it can generate considerable internet traffic if you use it with a low scanning interval!



HTTP Full Web Page Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_full_web_page.png

Remarks

- Supports Smart URL Replacement 868.
- Knowledge Base: What to do when I see a CreateUniqueTempDir() error message for my HTTP Full Webpage Sensor?
- Knowledge Base: HTTP Full Web Page sensor is unable to navigate. What can I do?
- Knowledge Base: How can I change the size of PhantomJS full web page screenshots?
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

FULL PAGE DOWNLOAD SETTINGS

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
URL	Enter the address of the web page that the sensor loads. It has to be URL encoded! If you enter an absolute URL, this address will be independent from the **IP address/DNS name** setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Browser Engine	Define which browser the sensor uses to load the web page. Choose between: ▪ **Chromium (recommended)**: Use the "WebKit" engine that is delivered with PRTG to perform the loading test. With each scanning interval, PRTG will load the URL defined above in an instance of "Chromium" and measure the time until the page is fully loaded. This is the recommended setting. ▪ **PhantomJS (Headless Webkit)**: Use the "PhantomJS" engine. This engine can have a high impact on your probe system's CPU and memory load, but there are additional options for result handling available (see below). ▪ **Internet Explorer**: With each scanning interval, the URL defined above is loaded in the background in an instance of Internet Explorer. PRTG uses the Internet Explorer of the system running the PRTG probe. Note: For full functionality we strongly recommend that you install Internet Explorer 11 or higher on the system running the PRTG probe. The probe machine is either the local system (on every node, if on a cluster probe), or the system running the remote probe 3109 on which the sensor is created on. Note: For all browser engines, the same proxy settings are used that are configured for the Windows user account the PRTG probe is running on (this is usually the Windows local "system" user account, if not changed). Those settings are accessible via the Internet Explorer of this system. If you want to e.g. use a proxy for this full web page sensor test, please adjust the Internet Explorer's settings accordingly (on the computer running the probe; on all nodes, if in a cluster).
Security Context	Define the Windows user account that the sensor uses to run the browser engine. Choose between:

FULL PAGE DOWNLOAD SETTINGS

- **Use security context of probe service (default)**: Run the browser engine under the same Windows user account the PRTG probe is running on. By default, this is the local Windows "system" user account (if not manually changed).
- **Use Windows credentials of parent device**: Use the Windows user account defined in the settings of the parent device this sensor is created on. Please go to the sensor's parent device's settings to change the Windows credentials.
  Note: When using the Chromium browser engine above, we recommended this setting here.

Result Handling

This setting is only visible if you select the PhantomJS engine above. This browser engine can render and store screenshots of the loaded web page. Choose between:

- **Discard loaded web page (recommended)**: Do not store the requested web page.
- **Store latest screenshot of the web page**: Render and store the last result of the web page to the "Logs (Sensors)" directory (on the remote system, when used on a remote probe; on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. It will be named after the pattern "Fullpage of Sensor (ID).jpg". For information on how to find the folder used for storage, please see Data Storage 3135 section.
- **Store ongoing screenshots of the web page (use with caution!)**: Render and store one new screenshot of the web page with each sensor scan, and store the pictures in the **Screenshots (Fullpage Sensor)** directory (on the remote system, when used on a remote probe). For information on how to find the folder used for storage, please see Data Storage 3135 section. This option can be used to create a visual history of the web page.
  Note: Depending on the monitored website and the scanning interval of the sensor, this option can create a very high amount of data! Use with care and make sure you set appropriate data purging limits in the System Administration—Core & Probes 2887 settings.

Note: If necessary, you can change the window size of the rendered screenshots. See section More 869 for details.

Note: Depending on the result handling method you choose, the sensor does not only store files in the screenshot directory, but there will also be files in an extra cache directory. If your disk on the probe system runs full, please also check this path (you might have to set folder options appropriately to see this directory):

FULL PAGE DOWNLOAD SETTINGS

C:\Windows\System32\config\systemprofile\AppData\Local\Microsoft\Windows\Temporary Internet Files\Content.IE5

Authentication

This setting is only visible if you select the PhantomJS engine above. Define if the monitored web page needs authentication for access. Choose between:

- **No authentication needed**: Access to the web page is granted without authentication.
- **Web page needs authentication**: PRTG automatically tries using HTTP Basic authentication (BA) or Windows NT LAN Manager (NTLM) to access the web page with authentication. Enter the credentials below.
  Note: Basic access authentication forwards the credentials in plain text!

User

This setting is only visible if you select the PhantomJS engine with authentication above. Enter the username for the web page.

Password

This setting is only visible if you select the PhantomJS engine with authentication above. Enter the password for the web page.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

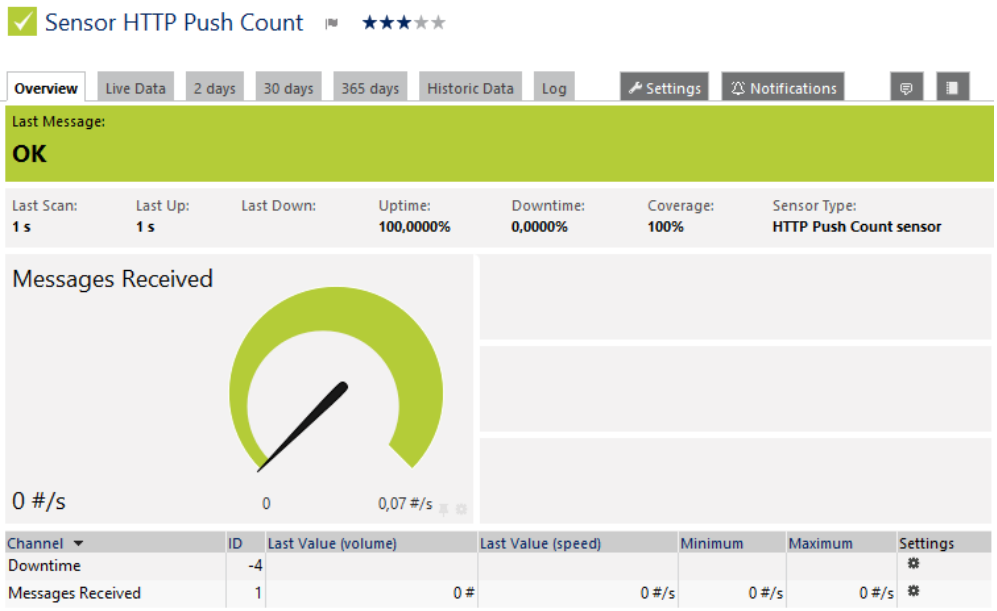
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.51 HTTP Push Count Sensor

The HTTP Push Count sensor counts received messages which are pushed via a Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP.

- It shows the number of received messages per second.



HTTP Push Count Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_push_count.png

Remarks

- For details about the usage, please see manual section **HTTP Push Count Sensor—How to Use** 870.
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

How to Use

This function is known as webhook. Basically, a webhook works like a push notification: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Count sensor then displays the number of pushed and received messages.

Use the following URL to receive the HTTP requests of the webhook:

http://<probe_ip>**:**<port_number>**/**<token>

Replace the parameters <probe_ip>, <port_number>, and <token> with the corresponding values. You can define port number and identification token in the sensor settings. The "probe IP" is the IP address of the system your PRTG probe with the sensor is running on.

Example: `http://127.0.0.1:5050/XYZ123`

Note: You can use several sensors with the same port and identification token. In this case, the number of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP PUSH

Request Method	Select the request method of your webhook: ▪ **ANY**: Do not use any filter for the request method. ▪ **GET**: Choose this method if your webhook uses GET. ▪ **POST**: Choose this method if your webhook sends post form data. Postdata has to be **application/x-www-form-urlencoded** with the same parameters as for GET requests.
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is **5050**.
Identification Token	This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is {__guid__}. It is replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. Note: The token will not be replaced automatically if you change it already during sensor creation.
Incoming Request	Define what PRTG will do with the incoming messages. Choose between: ▪ **Discard request**: Do not store the pushed messages. ▪ **Write request to disk (Filename: "Result of Sensor [ID].txt")**: Store the last message received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: Request for Sensor [ID].txt. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

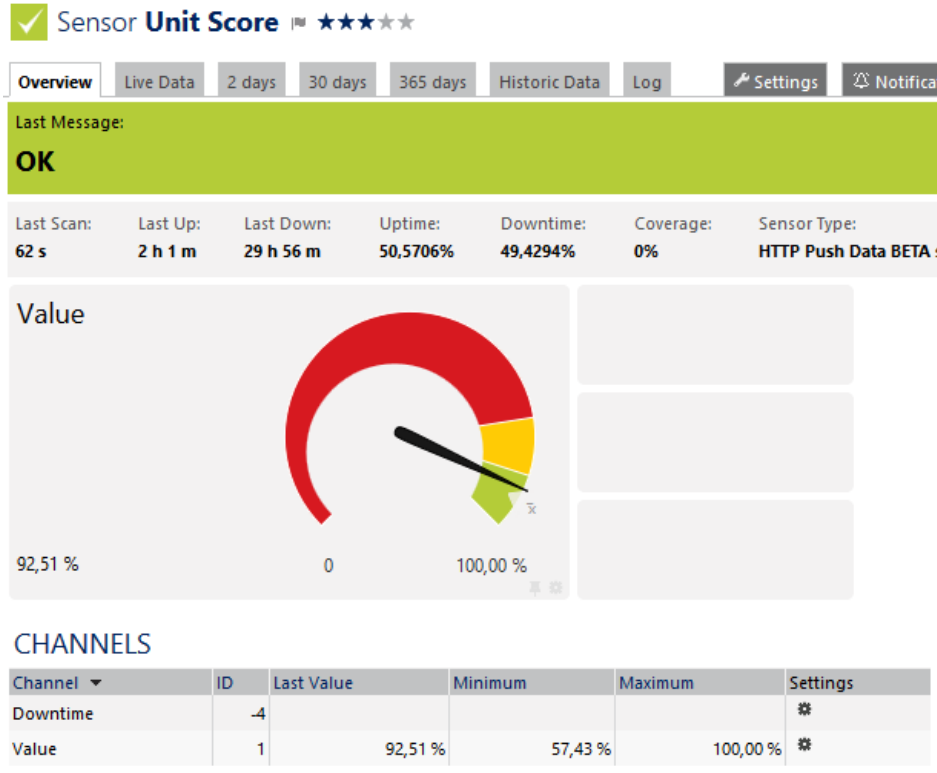
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.52 HTTP Push Data Sensor

The HTTP Push Data sensor displays numerical values from received messages which are pushed via a Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP.

- The sensor shows the received value and an optional message in one channel.



HTTP Push Data Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_push_data.png

Remarks

- For details about the usage, please see manual section **HTTP Push Data Sensor—How to Use** 880.
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

How to Use

This function is known as webhook. Basically, a webhook works like a push notification: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data sensor then displays the data of pushed and received messages.

Use the following URL to receive the HTTP requests of the webhook:

http://<probe_ip>**:**<port_number>**/**<token>**?value=**<integer_or_float>**&text=**<text message>

Replace the parameters <probe_ip>, <port_number>, <token>, and <integer_or_float> with the corresponding values. The **&text** parameter is optional: You can omit it.

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running on.
- The **value** can be an integer or a float value, depending on the data of your application; you have to set the value type accordingly in the sensor settings. This parameter will be the sensor value.
  Note: If this parameter is missing, the sensor status will be set into a **down** status.
- You can **optionally** add a custom text message by replacing the parameter <text message> with it. The text will be shown as sensor message. If there is no value but only a text, the text will be shown as error message.
  Note: This text message has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Example:

```
http://127.0.0.1:5050/XYZ123?value=0&text=this%20is%20a%20message
```

Note: You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP PUSH

Request Method	Select the request method of your webhook: ▪ **ANY**: Do not use any filter for the request method. ▪ **GET**: Choose this method if your webhook uses GET. ▪ **POST**: Choose this method if your webhook sends post form data. Postdata has to be **application/x-www-form-urlencoded** with the same parameters as for GET requests.
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is **5050**.
Identification Token	This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is {__guid__}. It is replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. Note: The token will not be replaced automatically if you change it already during sensor creation.
Incoming Request	Define what PRTG will do with the incoming messages. Choose between: ▪ **Discard request**: Do not store the pushed messages. ▪ **Write request to disk (Filename: "Result of Sensor [ID].txt")**: Store the last message received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: Request for Sensor [ID].txt. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

HTTP PUSH DATA

No Incoming Data	Define which status the sensor will attain if no push message has been received for at least two sensor scans. Choose between: ▪ **Ignore and keep last status (default)**: The sensor will remain in the status as defined by the last message received. ▪ **Switch to "Unknown" status**: The sensor will turn into the **Unknown** status if it has not received any message for at least two sensor scans. ▪ **Switch to "Error" after x minutes**: The sensor will turn into the **Error** status if it has not received any message within a defined time span. Define the time threshold below.
Time Threshold (Minutes)	This field will only be visible if you selected the error option above. Enter the time threshold in minutes after which the sensor status will switch into an **Error** status if no push message has been received within this time span. Please enter an integer value.
Value Type	Define which type the value of the received data has. If this setting does not match, the sensor will go into an **Error** status. Choose between: ▪ **Integer** ▪ **Float** (with dot "." as delimiter)

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Knowledge Base: Which HTTP status code leads to which HTTP sensor status?

- http://kb.paessler.com/en/topic/65731

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

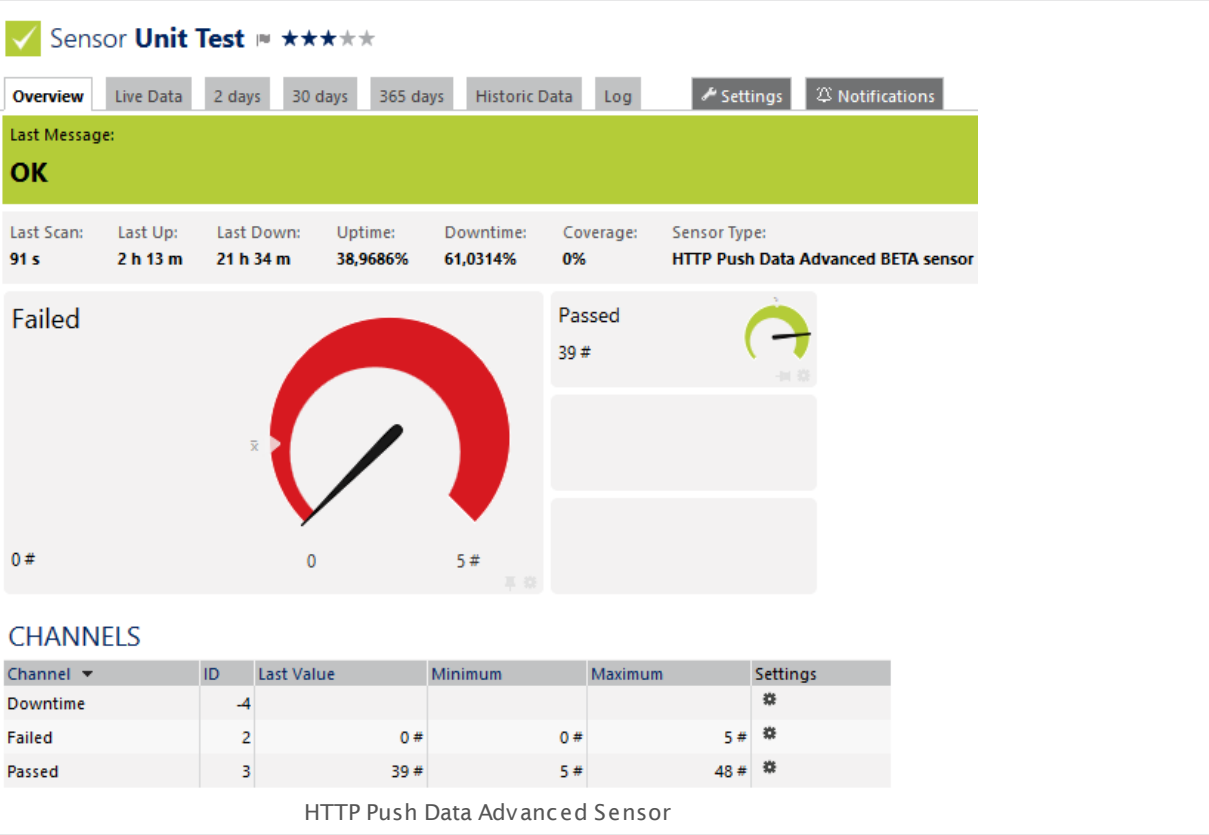
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.53 HTTP Push Data Advanced Sensor

The HTTP Push Data Advanced sensor displays data from received messages which are pushed via a Hypertext Transfer Protocol (HTTP) request to the PRTG server. It provides a URL that can be used to push messages to the PRTG server using HTTP.

- This sensor can show received values and a message encoded in valid XML or JSON in multiple channels.



HTTP Push Data Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_push_data_advanced.png

Remarks

- For details about the usage, please see manual section **HTTP Push Data Advanced Sensor—How to Use** 891.
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

How to Use

This function is known as webhook. Basically, a webhook works like a push notification: Webhooks are usually triggered by some event (for example, a new comment to a blog post) and send according information to a specified URL. The HTTP Push Data Advanced sensor then displays the data of pushed and received messages.

The data which is pushed to this sensor must be valid XML or JSON. For details about the return value format please see the **Application Programming Interface (API) Definition**.

Use the following URLs to receive the HTTP requests of the webhook:

- **GET** requests: **http://**<probe_ip>**:**<port_number>**/**<token>**?content=**<valid XML_or_JSON>

  The XML encoded value of the content parameter has to match the format as defined in the API documentation in section **Custom Sensors—Advanced EXE/Script Sensor, Advanced SSH Script Sensor, and Advanced HTTP Push Data Sensor**.

- **POST** requests: **http://**<probe_ip>**:**<port_number>**/**<token>

  This HTTP request method sends the XML or JSON encoded HTTP body as POST data. The body has to match the format as defined in the API documentation in section **Custom Sensors—Advanced EXE/Script Sensor, Advanced SSH Script Sensor, and Advanced HTTP Push Data Sensor**. We strongly recommend the HTTP content type application/xml or application/json.

Replace the parameters <probe_ip>, <port_number>, <token> and <valid XML_or_JSON> (for GET requests) with the corresponding values:

- You can define **port number** and **identification token** in the sensor settings.
- The **probe IP** is the IP address of the system on which your PRTG probe with this sensor is running on.
- The content of GET requests has to be valid XML or JSON in the PRTG API format.
  Note: The content has to be URL encoded (for example, the whitespaces in the sample URL below); most browsers achieve this automatically.

Minimum example for the GET method which returns one static channel value:

```
http://127.0.0.1:5050/XYZ123?content=<prtg><result><channel>MyChannel</channel><value>10</value></result><
```

Note: You can use several sensors with the same port and identification token. In this case, the data of push messages will be shown in each of these sensors.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP PUSH

Request Method	Select the request method of your webhook: ▪ **ANY**: Do not use any filter for the request method. ▪ **GET**: Choose this method if your webhook uses GET. ▪ **POST**: Choose this method if your webhook sends post form data. Postdata has to be **application/x-www-form-urlencoded** with the same parameters as for GET requests.
Port	Enter the port number on which this sensor listens for incoming HTTP requests. Default is **5050**.
Identification Token	This is the token that is used to find the matching sensor for the incoming message. While you create the sensor, this token is {__guid__}. It is replaced with an automatically generated token after you have completed the sensor creation. If you want to use another identification token, you can edit it while or after sensor creation. Note: The token will not be replaced automatically if you change it already during sensor creation.
Incoming Request	Define what PRTG will do with the incoming messages. Choose between: ▪ **Discard request**: Do not store the pushed messages. ▪ **Write request to disk (Filename: "Result of Sensor [ID].txt")**: Store the last message received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File name: Request for Sensor [ID].txt. This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

HTTP PUSH DATA

No Incoming Data	Define which status the sensor shows if it did not receive a push message for at least two sensor scans. Choose between: ▪ **Ignore and keep last status (default)**: The sensor remains in the status as defined by the last message that the sensor received. Note: The probe on which this sensor runs must be connected to keep the last status. If the probe is disconnected, the sensor turns into the **Unknown** status. If the probe is connected again, the sensor does not automatically return from **Unknown** to the last status before the probe disconnect. ▪ **Switch to "Unknown" status**: The sensor turns into the **Unknown** status if it did not receive any message for at least two sensor scans. ▪ **Switch to "Error" after x minutes**: The sensor turns into the **Down** status if it has not received any message within a defined time span. Define the time threshold below.
Threshold (Minutes)	This field is only visible if you select the error option above. Enter the time threshold in minutes after which the sensor switches into an **Down** status if it did not receive a push message within this time span. Please enter an integer value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/65731

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

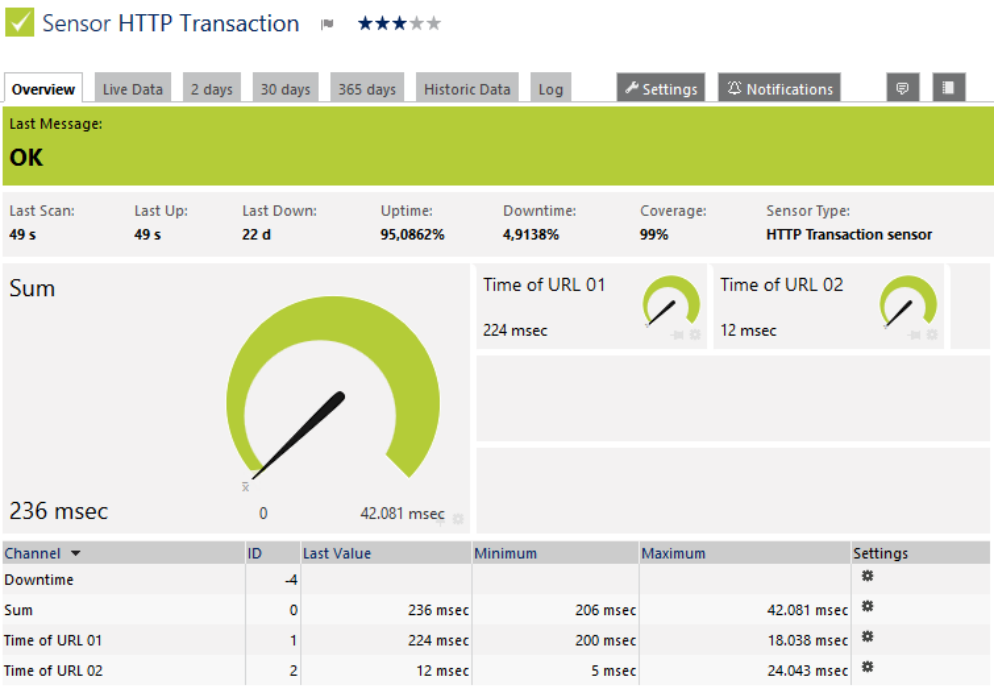
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.54 HTTP Transaction Sensor

The HTTP Transaction sensor monitors an interactive website, such as a web shop, by performing a transaction using a set of Hypertext Transfer Protocol (HTTP) URLs. The sensor monitors whether logins or shopping carts work properly.

- It shows the loading time of single URLs and of the complete transaction.



HTTP Transaction Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_transaction.png

Remarks

- Supports Smart URL Replacement 913.
- Knowledge Base: Configuration Tips for HTTP Transaction Sensors
- Knowledge Base: Which user agent should I use in the HTTP Advanced sensor's settings?
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

If you need to use SRP ciphers, please choose the "compatibility mode" in the sensor settings below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HTTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for all HTTP requests. If the complete transaction takes longer than this value defines, the sensor cancels the request and shows an according error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Single URL Timeout (Sec.)	Enter a timeout in seconds for one single HTTP request. If the reply of any single request takes longer than this value defines, the sensor cancels the transaction and shows an according error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

HTTP ENGINE

Monitoring Engine	If you encounter unexpected errors with the standard method that is used to monitor an URL, try to use the compatibility mode which is based on .NET. Choose between: ▪ **Default/High Performance (recommended)**: This is the default monitoring method for this sensor type. ▪ **Alternate/Compatibility Mode**: Try this method as an alternative for websites that do not work with the default approach. Using the compatibility mode, this sensor executes an external exe. Because of this, this method needs more resources, but it can be helpful in particular cases. Note: If you select the compatibility mode, the options for the SSL method will be slightly different. You can also check for trusted certificates. Please see below. Note: When using the Compatibility Mode, **Smart URL Replacement** will not work, so this sensor will not use the **IP Address/DNS value** of the parent device automatically then.

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

SSL Method	When using the compatibility mode, the SSL specific settings are a bit different to the default (automatically used) SSL settings. You can choose between: ▪ **SSL V3** ▪ **TLS V1**

SSL SPECIFIC (WHEN USING COMPATIBILITY MODE)

	▪ **SSL V3 or TLS V1**: This is the default setting.
Check SSL Certificates	Specify if the sensor will check the certificate of the monitored URL. Choose between: ▪ **Do not check used certificates**: Do not consider the certificates of the monitored web pages. This the default setting. ▪ **Check if the used certificates are trusted**: Inspect the certificates. If the certificate of the server is not trusted, the sensor shows a **Down** status and displays a corresponding message.

Note: This sensor type implicitly supports Server Name Identification (SNI), an extension to the TLS protocol.

ADVANCED SENSOR DATA

Limit Download (kb)	Enter a maximum amount of data that is transferred per every single request. If you set content checks below, please be aware that the sensor can only check the content downloaded within this limit for certain search expressions.
Cookie Management	Select if cookies are used for the transaction. Choose between: • **Use cookies (recommended)**: Allow cookies to be set and read during the transaction cycle. • **Ignore cookies**: Do not allow cookies. Use this option if you want to test the transaction without the use of cookies. We recommend that you use the default value.
User Agent	Choose which user agent string the sensor sends when connecting to the defined URLs. Choose between: ▪ **Use PRTG's Default String**: Do not enter a specific user agent, use the default setting. Usually, this is: Mozilla/5.0 (compatible; PRTG Network Monitor (www.paessler.com); Windows) ▪ **Use a Custom String**: Use a custom user agent. Define below.
Custom User Agent	This field is only visible if you enable the custom user agent option above. Enter a string that the sensor uses as user agent when connecting to the URL specified above.

ADVANCED SENSOR DATA

Result Handling	Define what PRTG will do with the web page loaded at the given URL. Choose between: • **Discard HTML result**: Do not store the requested web page. • **Store latest HTML result**: Store the last result of the requested web page to the "Logs (Sensors)" directory (on the Master node, if in a cluster). File name: Result of Sensor [ID].txt. This is for debugging purposes, especially in combination with content checks. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

AUTHENTICATION

Authentication	Define if the web page at the configured URL needs authentication. Choose between: ▪ **No authentication needed** ▪ **Web page needs authentication**
User	This field is only visible if you enable authentication above. Enter a username. Please enter a string.
Password	This field is only visible if you enable authentication above. Enter a password. Please enter a string.
Authentication Method	This field is only visible if enable authentication above. Select the authentication method the given URL is protected with. Choose between: ▪ **Basic access authentication (HTTP)**: Use simple HTTP authentication. This is the default setting and suitable for most cases. Note: This authentication method transmits credentials as plain text. ▪ **Windows NT LAN Manager (NTLM)**: Use the Microsoft NTLM protocol for authentication. This is sometimes used in intranets for single sign-on. ▪ **Digest Access Authentication**: Use digest access authentication that applies a hash function to the password which is safer than basic access authentication. We recommend that you use the default value.

TRANSACTION URL

You can define up to 10 different transaction URLs which will all be called in a row. Only if the complete transaction can be completed, the sensor will be in an **Up** status 135. Using this mechanism you can set up an extended monitoring with multiple URLs. Please enter settings for at least one transaction URL. You can use as many steps as needed and disable the other steps.

Transaction Step #x	This setting is available for URL #2 through #10. Define if you want to use this step for your transaction check. Choose between: ▪ **Disable step #x**: Do not use this step. Choose this option if you do not need all 10 steps for your transaction check. ▪ **Enable step #x**: Enable this step. Further options will be viewed, as described below.
URL	Please enter the URL the sensor will connect to. It has to be URL encoded! If you enter an absolute URL, this address will be independent from the **IP address/DNS name** setting of the device this sensor is created on. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** below.
Request Method	The request method determines how the given URL is requested. • **GET**: Request the website directly, like browsing the web. We recommend using this setting for a simple check of a web page. • **POST**: Send post form data to the URL. If this setting is chosen, you must enter the data that will be sent in the **Postdata** field below. • **HEAD**: Only request the HTTP header from the server; without the actual web page. Although this saves bandwidth since less data is transferred, it is not recommended because the measured request time is not the one experienced by your users and you might not be notified for slow results or timeouts.
Postdata	This field is only active when POST is selected in the **Request Method** setting above. Please enter the data part for the post request here. Note: No XML is allowed here!
Check For Existing Key Words (Positive)	Define whether the result at the configured URL will be checked for keywords. Choose between: ▪ **Disable**: Do not search for keywords.

TRANSACTION URL

	▪ **Enable key word check (positive)**: In the result returned at the URL, check if a key word exists. Note: The content check is only intended for HTML websites and might not work with other target URLs.
Response Must Include	Define which string must be part of the web at the given URL. If the data does not include this string, the sensor will show an error status and display this string along with the affected URL in the sensor message. Please enter a string. Note: Only simple text search is available here. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.
Check For Existing Key Words (Negative)	Define whether the the result at the configured URL will be checked for keywords. Choose between: ▪ **Disable**: Do not search for keywords. ▪ **Enable key word check (negative)**: In the result returned at the URL, check if a key word does not exist. Note: The content check is only intended for HTML websites and might not work with other target URLs.
Response Must Not Include	Define which string must not be part of the web at the given URL. If the data does include this string, the sensor will show an error status and display this string along with the affected URL in the sensor message. Please enter a string. Note: Only simple text search is available here. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

PROXY SETTINGS FOR HTTP SENSORS

HTTP Proxy Settings	The proxy settings determine how a sensor connects to a given URL. You can enter data for a proxy server that will be used when connecting via HTTP or HTTPS. Note: This setting is valid for the monitoring only and determines the behavior of sensors. In order to change proxy settings for the core server, please see **System Administration—Core & Probes** 2883.
Name	Enter the IP address or DNS name of the proxy server to use. If you leave this field empty, no proxy will be used.
Port	Enter the port number of the proxy. Often, port 8080 is used. Please enter an integer value.
User	If the proxy requires authentication, enter the username for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.
Password	If the proxy requires authentication, enter the password for the proxy login. Note: Only basic authentication is available! Please enter a string or leave the field empty.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.
- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

- http://kb.paessler.com/en/topic/443

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

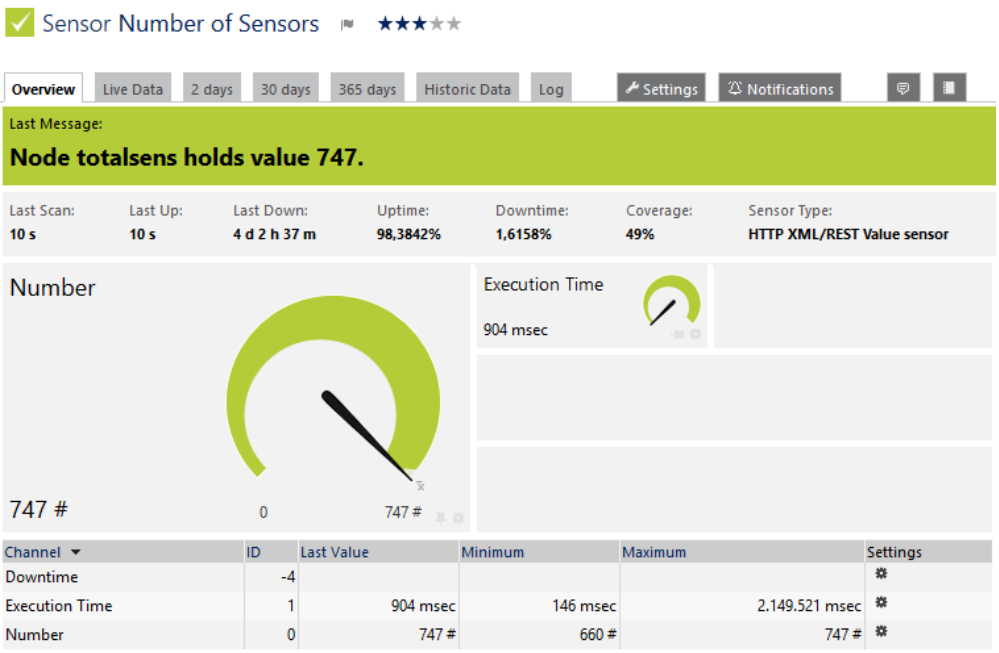
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.55 HTTP XML/REST Value Sensor

The HTTP XML/REST Value sensor retrieves an XML file from a given URL and parses it.

- It can show the value of one defined XML node.



HTTP XML/REST Value Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/http_xmlrest_value.png

Remarks

- Requires 916 .NET 4.0 or higher on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- This sensor can monitor only one single node in an XML file and shows the value in one channel. If you need to monitor more than one node of an XML document, please add the sensor for each target node anew.
- Supports Smart URL Replacement 927.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: HTTP XML/REST Value Sensor: FAQ
- Note: You do not have to define the sensor behavior for HTTP result codes. For details, see this Knowledge Base article: Which HTTP status code leads to which HTTP sensor status?
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Channel Name	Enter a name for the channel which will display the value at the given URL. You can change the name later in the **Sensor Channels Settings** 2711.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

URL	Enter the URL that returns the XML file. It has to be URL encoded! If you enter an absolute URL, the sensor uses this address independently from the **IP Address/DNS Name** setting of the device on which you create this sensor. PRTG uses a smart URL replacement which allows you to use the parent device's IP address/DNS name setting as part of the URL. For more information, please see section **Smart URL Replacement** 927 below.
XML Node (and optional property)	Enter the name of the node that this sensor checks, or enter a node name and a property name to check a property value. To obtain a value from nested tags, enter the tag names separated by a slash symbol, for example, use myTag/myTagInside as XML node value. Note: You can also check values in JavaScript Object Notation (JSON) notation. Please see **Checking JSON** 926 section below.

SENSOR SETTINGS

	Note: You can try using XPath syntax here but it does not work in all cases and we do not provide any technical support for XPath issues. For further documentation about XPath, please see **More** [915] section below.
HTTP Username	If the URL requires authentication, enter the username. Please enter a string or leave the field empty.
HTTP Password	If the URL requires authentication, enter the password. Please enter a string or leave the field empty.
Sensor Value	Define what value this sensor shows. Choose between: ▪ **Use the value of the selected XML node**: Return the value that the sensor finds at the specified XML node. If this is non-numeric, the sensor shows 0. ▪ **Use the number of occurrences of the selected XML node or its children/siblings**: Return the number of occurrences found. Define further below.
Count XML Nodes	This setting is only visible if you enable the return number option above. Define which count the sensor shows. Choose between: ▪ **Occurrences of the selected XML node**: Return how often the defined XML node occurs at the defined URL. ▪ **Child nodes of the selected XML node**: Return the number of child nodes that exist below the node at the defined URL. ▪ **Sibling nodes of the selected XML node**: Return the number of sibling nodes that exist next to the node at the defined URL.
Namespaces	Define whether namespaces in the XML document are used or not. Choose between: ▪ **Use Namespaces**: Process the value you enter in the "XML Node (and optional property)" field including possibly existing namespace information. ▪ **Remove Namespaces**: Ignore namespace information in the XML document and process the value you enter in the "XML Node (and optional property)" field as node names only. For more information see **About Namespaces** [927] section below.
Content Type in Header	Define what to include in the header of the request sent to the URL defined above. Choose between: ▪ **Enable (recommended)**: This works for most web servers and is the recommended setting.

SENSOR SETTINGS

	▪ **Disable**: Only very few web servers cannot handle this content-type and need this setting. Try this if you get an error message with the enabled option. ▪ **Custom**: You can use a custom content type.
Custom Content Type	This field is only visible when you enable the custom option above. Enter a custom content type like text/xml or text/html.
HTTP Headers	Optionally enter a list of custom HTTP headers with theirs respective values that you want to transmit to the URL you define above. The syntax of a list with header-value pairs is header1:value1|header2:value2|...|headerx:valuex Note: The sensor does not accept header field names that include a dash (-) character. If you want to use such a HTTP header, please leave out the dash of the name. For example, enter ContentType:value instead of Content-Type:value. Example: From:johnqpublic@example.com|AcceptLanguage:en-us Note: Ensure that the HTTP header statement is valid! Otherwise, the sensor request will not be successful.
Characters to Remove	This field is only visible if you enable the "use value of XML node" option above. Optionally enter a string that the sensor removes from the returned XML value. Use this to remove any unwanted characters from the result, for example, a thousands separator from numeric values. Please enter a string or leave the field empty.
Decimal Delimiter	This setting is only visible if you enable the "use value" option above. If the sensor value of the selected XML node is of the type float, you can define any character here which is handled as the decimal delimiter. Enter one character or leave the field empty.
Custom Message	Optionally enter a custom sensor message. Use %1 as a placeholder to automatically fill in the returned XML value. Please enter a string or leave the field empty.
SSLv3 Connection	Define if you want to allow SSLv3 only for connections to the URL configured above. Choose between: ▪ **Use SSLv3 if available** ▪ **Force usage of SSLv3** Note: The force method does not work when the requested URL uses forward secrecy. See section **More** 928.

SENSOR SETTINGS

If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.
Unit String	Enter a string that the sensor will add to the retrieved values as a unit description. This is for display purposes only.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Checking JSON

With the **XML Node (and optional property)** field you can also check values that are returned in JavaScript Object Notation (JSON) notation under the defined URL.

Example

A JSON notated section may look like the following:

```
{
  "test": "Hello World",
  "object": {
    "value": "content",
    "AnotherValue": "AnotherContent"
  },
  "arraytest": [
    "one",
    "two"
  ]
}
```

Depending on your entries in the **XML Node** field, the sensor will process the respective values:

Entry in Sensor's "XML Node" Field (from Example Above)	Processed Value (from Example Above)
test	Hello World
object/value	content
object/AnotherValue	AnotherContent
object	contentAnotherContent
arraytest[1]	one
arraytest[2]	two

Note: The sensor converts whitespaces in JSON keys into underscores (_). So, for example, if you look for the node "some node" in the JSON, you need to enter "some_node" into the node field.

Note: If you count the number of nodes (for example, "some_node"), both "some node" and "some_node" would be counted if they appear in the JSON.

Note: If a key exists more than once in the JSON, the value of the first appearance is returned (no difference between whitespace and underscore).

About Namespaces

In an XML document, tags may use namespaces.

Example

A namespace notated section may look like the following:

```
<myNamespace:myNode>
  some information
</myNamespace:myNode>
```

If you set this sensor to **Use Namespaces** (this is the default setting), it will expect the full node name, including the namespace information, in the **XML Node (and optional property)** field. In the example above, this would be myNamespace:myNode.

If your node names are unique even without the namespace information, you can simplify the settings by setting this sensor to **Remove Namespaces**. The sensor will then expect the node name only in the **XML Node (and optional property)** field. In the example above, this would be myNode.

Smart URL Replacement

Instead of entering a complete address in the URL field of an HTTP sensor, you can merely enter the protocol followed by colon and three slashes (that means you can enter either http:/// or https:/// or even a simple slash / as equivalent for http:///). PRTG will then fill in the parent device's **IP address** or **DNS name** in front of the third slash automatically. Whether this results in a valid URL or not, depends on the IP address or DNS name of the device where this HTTP sensor is created on. In combination with cloning devices, the smart URL replacement makes it easy to create many like devices.

For example, if you create a device with **DNS name** www.example.com and you put an HTTP sensor on it, you can provide values the following ways:

- Providing the value https:/// in the URL field, PRTG will automatically create the URL https://www.example.com/ from that.

- Using the value /help in the URL field, PRTG will automatically create and monitor the URL http://www.example.com/help
- It is also possible to provide a port number in the URL field which will be taken over by the device's DNS name and internally added, for example, http://:8080/

Note: Smart URL replacement does not work for sensors running on the "Probe Device".

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

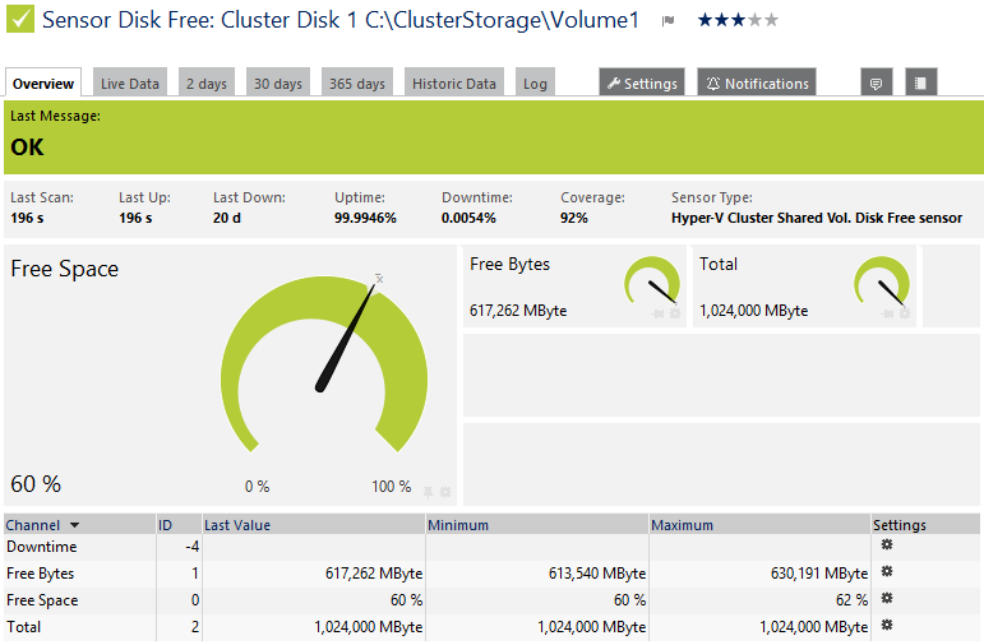
For more general information about settings, please see the **Object Settings** 159 section.

6.8.56 Hyper-V Cluster Shared Volume Disk Free Sensor

The Hyper-V Cluster Shared Volume Disk Free sensor monitors a Microsoft Hyper-V cluster shared volume via PowerShell.

It can show the following:

- Available disk space in percent
- Available disk space in bytes
- Total disk space



Hyper-V Cluster Shared Volume Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/Hyper_V_Cluster_Shared_Volume_Disk_Free.png

Remarks

- Requires 931 Remote PowerShell on the target device.
- Requires 931 WSFC PowerShell Interface on the target device.
- Requires 931 .NET 4.0 or higher on the probe system.
- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Note: The parent device for this sensor must be a Windows server running Hyper-V.
- Knowledge Base: Why don't my Hyper-V sensors work after changing names?
- Knowledge Base: PowerShell Sensors: FAQ

- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: Remote PowerShell

The Hyper-V Cluster Shared Volume Disk Free sensor uses PowerShell commands. In order to monitor devices with this sensor **Remote PowerShell** has to be enabled.

Note: In larger environments, the default memory limit for the remote shell might be insufficient and you might see the error message "The WSMan provider host process did not return a proper response". In this case, increase the memory limit for Remote PowerShell.

For detailed information, please see **More** 939 section below.

Requirement: WSFC PowerShell Interface

This sensor type needs the WSFC (Windows Server Failover Clustering) PowerShell Interface to be installed on the target machine. You can list all modules in the PowerShell console with the command **Get-Module -ListAvailable**. Here **FailoverClusters** has to appear. Under Windows 2008 and 2012 the interface is part of the VMM Administrator Console, or the VMM 2012 Management Console, respectively.

The interface is everywhere available where the WSFC feature is installed: Windows Server 2008 R2 (SP1) Full and Core (not installed by default); Microsoft Hyper-V Server 2008 R2 (SP1); Remote Server Administration Tools (RSAT) for Windows 7 (SP1).

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DISK FREE SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Ensure the resource name of your disks do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename resource disk name once you have set up monitoring. For detailed information, please see **More** 958 section below.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DISK FREE SETTINGS

Disk	Shows the name of the disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

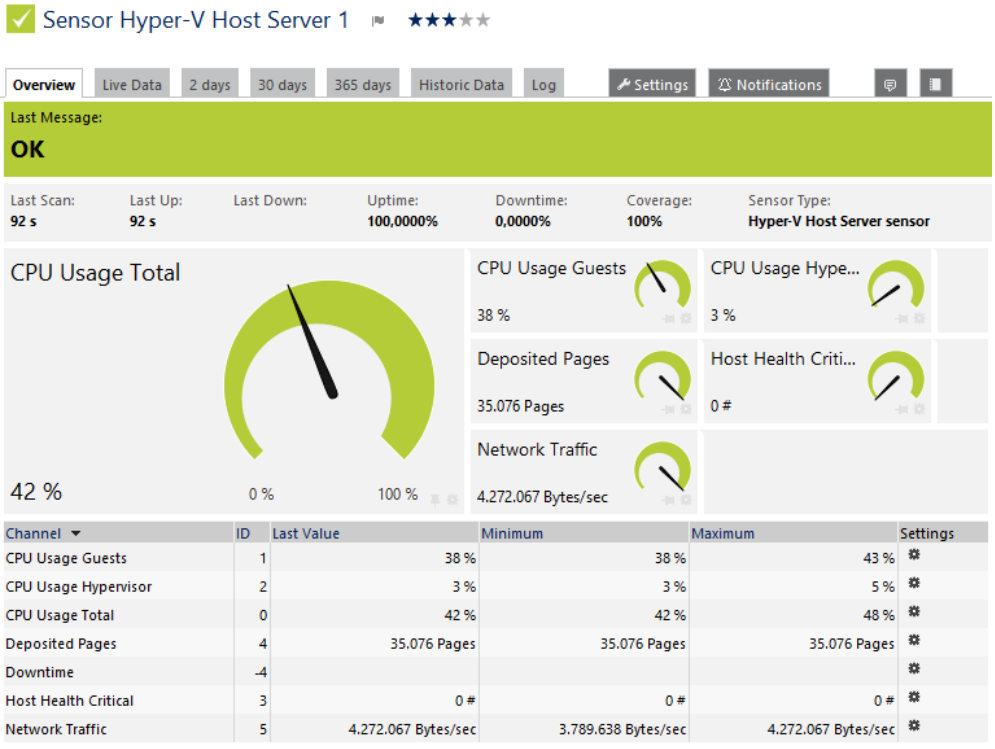
For more general information about settings, please see the **Object Settings** 159 section.

6.8.57 Hyper-V Host Server Sensor

The Hyper-V Host Server sensor monitors a Microsoft Hyper-V host server via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- CPU usage in percent of guests, hypervisor, and total
- Number of host health critical values
- Number of deposited pages
- Network traffic: Sums up the total bytes per second (received and sent) on all ports of your virtual switch.



Hyper-V Host Server Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hyper_v_host_server.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 941 Windows Server 2008 or later on the probe system.
- Requires 941 the Remote Registry Windows service to be running on the target computer.

- Uses a hybrid approach 941 with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
- Note: The parent device for this sensor must be a Windows server running Hyper-V.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose

DEBUG OPTIONS

between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

Stack Unit

This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

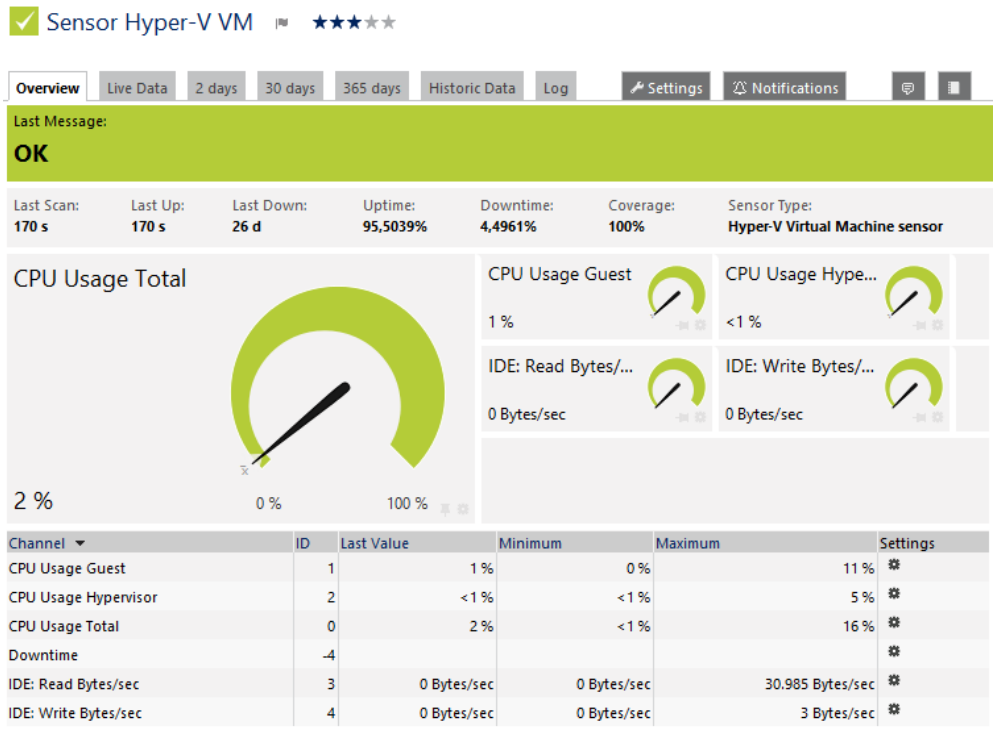
6.8.58 Hyper-V Virtual Machine Sensor

The Hyper-V Virtual Machine sensor monitors a virtual machine running on a Microsoft Hyper-V host server via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- CPU usage in percent of guests, hypervisor, and total
- IDE disk read speed (bytes per second)
- IDE disk write speed (bytes per second)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Hyper-V Virtual Machine Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hyper_v_virtual_machine.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 950 Windows Server 2008 or later on the probe system.
- Requires 951 the Remote Registry Windows service to be running on the target computer.

- Uses a hybrid approach 950 with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
- Note: The parent device for this sensor must be a Hyper-V server or a System Center Virtual Machine Manager (SCVMM).
- Note: We recommend using System Center Virtual Machine Manager (SCVMM) as parent device, because this way PRTG will continue to monitor your virtual machines also when they change the physical host using Live Migration.
- Note: To monitor a virtual machine with this sensor, disable User Account Control (UAC) in the control panel of the Windows operating system which is running on this virtual machine. Otherwise, the sensor might switch into a **Down** status with the error message "The virtual machine is not running or is powered off".
- Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the virtual machines you want to monitor. PRTG creates one sensor for each VM you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VIRTUAL MACHINE SETTINGS

Virtual Machine	Select the virtual machines (VMs) you want to add a sensor for, including the ones that are not running. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Ensure the name of your VMs do not contain unsupported characters, especially avoid the hash ('#') sign. We recommend to not rename virtual machines once you have set up monitoring. For detailed information, please see **More** 958 section below.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VIRTUAL MACHINE SETTINGS

GUID	Shows the Globally Unique Identifier (GUID) of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	Shows information about the virtual machine. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

VIRTUAL MACHINE SETTINGS

Powered Off VMs	Define how to react to a virtual machine that is powered off. Choose between: • **Alarm when powered off**: The sensor will change to a **Down** 135 status if the virtual machine is powered off. Note: While in Down status, a sensor does not record any data in all of its channels. • **Ignore powered off state**: The sensor will not change to a **Down** status if the virtual machine is powered off. It will report zero values instead.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.59 Hyper-V Virtual Network Adapter Sensor

The Hyper-V Network Adapter sensor monitors virtual network adapters running on a Microsoft Hyper-V host server via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Sent, received, and totally transferred bytes
- Sent and received packets per second
- Sent and received broadcast packets per second
- Sent and received directed packets per second
- Sent and received multicast packets per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Hyper-V Virtual Network Adapter Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hyper_v_virtual_network_adapter.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 962 Windows Server 2008 or later on the probe system.
- Requires 962 the Remote Registry Windows service to be running on the target computer.
- Uses a hybrid approach 962 with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
- Note: The parent device for this sensor must be a Hyper-V server.

- Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network adapters you want to monitor. PRTG creates one sensor for each adapter you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VIRTUAL MACHINE SETTINGS

Hyper-V Virtual Network Adapter	Select the virtual network adapters you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: We recommend that you do not rename virtual machines once you have set up monitoring. Renaming them will also change the internal virtual network adapter names, causing the monitoring to be interrupted. For detailed information about virtual machine naming, please see **More** 958 section below.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HYPER-V VIRTUAL NETWORK ADAPTER SETTINGS

Virtual Network Adapter	Shows the name of the virtual network adapter monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** [3135] section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

	▪ **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below. ▪ **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency. Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices	Dependencies** from the main menu bar.
Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

For more general information about settings, please see the **Object Settings** 159 section.

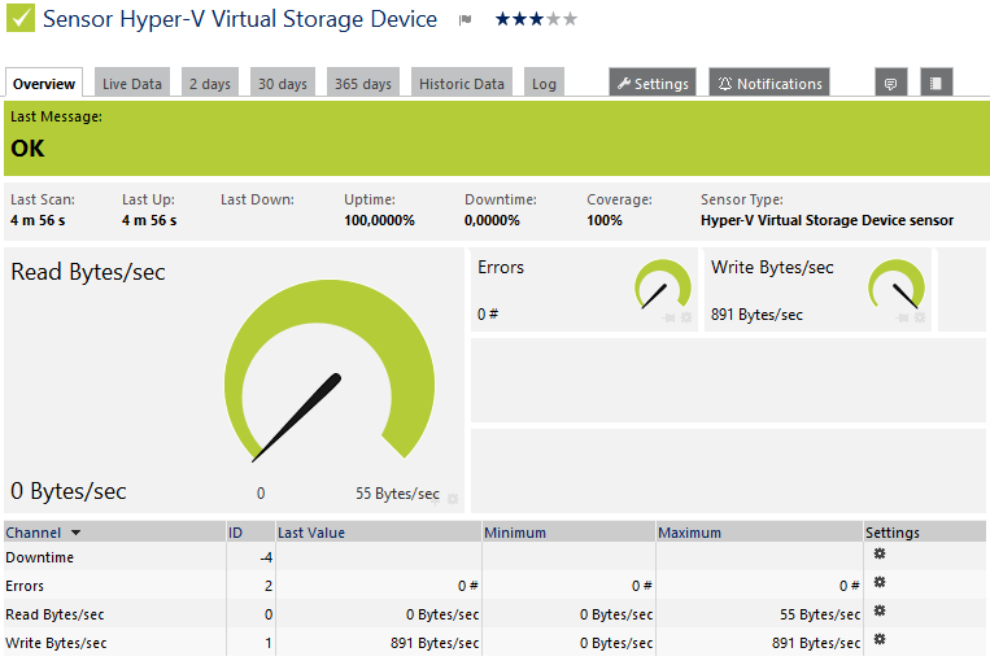
6.8.60 Hyper-V Virtual Storage Device Sensor

The Hyper-V Virtual Storage sensor monitors a virtual storage device running on a Microsoft Hyper-V host server via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It can show the following:

- Read speed in bytes per seconds
- Write speed in bytes per second
- Number of errors

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Hyper-V Virtual Storage Device Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hyper_v_virtual_storage_device.png

Remarks

- Requires credentials for Windows systems to be defined for the device you want to use the sensor on.
- Requires 972 Windows Server 2008 or later on the probe system.
- Requires 972 the Remote Registry Windows service to be running on the target computer.

- Uses a hybrid approach 972 with Windows Performance Counters and WMI as fallback to query data. Please stay below 200 WMI sensors per probe!
- Note: The parent device for this sensor must be a Hyper-V server.
- Note: This sensor does not support Live Migration.
- Knowledge Base: Why don't my Hyper-V sensors work after changing names?

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the storage devices you want to monitor. PRTG creates one sensor for each storage you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HYPER-V VIRTUAL STORAGE DEVICE SETTINGS

Hyper-V Virtual Storage Device	Select the virtual storage devices you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HYPER-V VIRTUAL STORAGE DEVICE SETTINGS

Virtual Storage Device	Shows the unique identifier of the device that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** [3135] section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

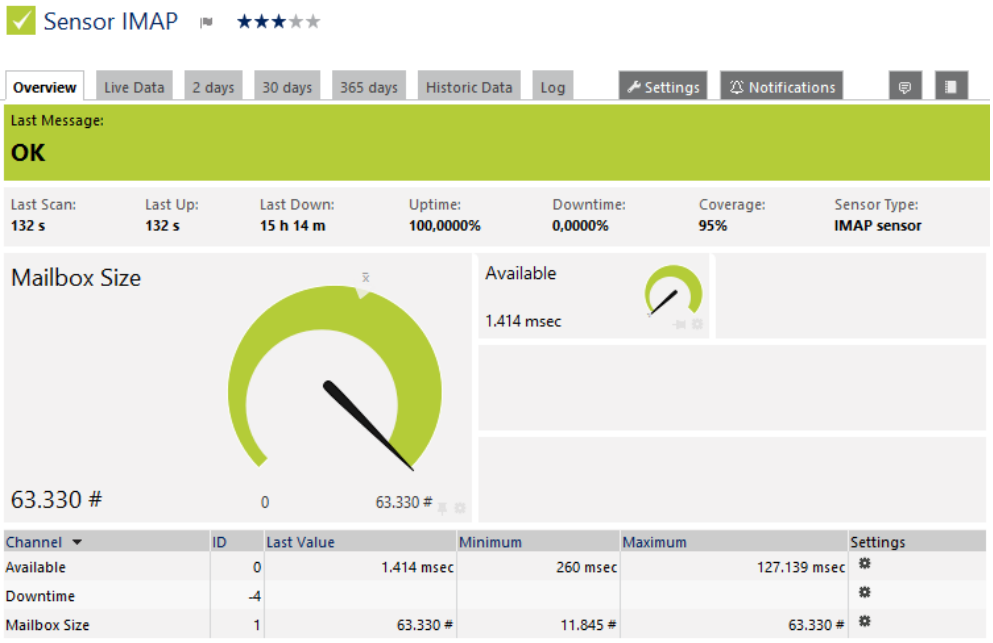
For more general information about settings, please see the **Object Settings** 159 section.

6.8.61 IMAP Sensor

The IMAP sensor monitors a mail server using Internet Message Access Protocol (IMAP).

It can show the following:

- Response time of the mail server
- Number of emails in the defined mailbox
- It can also check the content of emails for certain key words. This way, you can use this sensor to monitor backup solutions via emails that are sent out by these solutions. For more information, see section More 992.



IMAP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/imap.png

Remarks

- Note: If you use content checks, we recommend using a dedicated IMAP account that is only checked by PRTG. Editing existing mails in the mailbox of the monitored IMAP account can lead to false alarms or malfunctions of this sensor type.
- Note: This sensor type might not work properly when monitoring sub-folders of mailboxes. If it has to check subsequent emails with identical subjects, later on incoming emails might not be recognized.
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- Knowledge Base: My IMAP sensor does not process HTML emails correctly using regex. What can I do?

- Knowledge Base: How can I monitor my backup software to be sure backup succeeded last night?
- Knowledge Base: Can I analyze multipart emails using the PRTG IMAP sensor?

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IMAP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port that the sensor uses to connect via IMAP. For non-secure connections, usually port 143 is used. For SSL connections it is usually port 993. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.

AUTHENTICATION

Username	Enter a username for IMAP authentication. Please enter a string.
Password	Enter a password for IMAP authentication. Please enter a string.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: ▪ **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption. ▪ **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption. ▪ **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135. ▪ **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

TRANSPORT-LEVEL SECURITY

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

IDENTIFY EMAIL

Process Email Content

This sensor can additionally check the content of all incoming emails. Choose between:

- **Do not check email content**: Only check availability of the IMAP server and check if a login is successful (if defined). Do not process any emails in the IMAP email account.
- **Read email count**: Count the emails in the defined mailbox.
- **Process emails in this mailbox**: Log in to the IMAP email account and check the emails which it contains. Define further options below.

Mailbox Name

This field is only visible if you enable email counting or content processing above. Enter the name of the mailbox (for example, the name of the IMAP folder) that the sensor checks. Default value is **Inbox**. Unless you set a last message date check below, the sensor will always look at all emails contained in the mailbox.

Note: Ensure you do not manually edit emails in this mailbox with another email client because this can result in malfunctions of this sensor's email identification.

Identify by "From" Field

This option is only visible if you enable email content processing above. Define if you want to check the "From" field of the emails. Choose between:

- **Don't check**: Do not process this field in emails.
- **Check using string search**: Process this field in emails using simple string search.
- **Check using regular expression**: Process this field in emails using a regular expression. For more information about syntax, please see the **Regular Expressions** 3105 section.

IDENTIFY EMAIL

	When using a search, the sensor will scan all emails from the newest to the oldest. Note: The sensor finishes the scan with the first match! This means that after it finds a match in one email, there will be no further checks performed in older emails.
Search For	This field is only visible if you enable a "from" check above. Enter a search string using the method defined above.
Identify by "Subject" Field	This option is only visible if you enable content processing above. Define if you want to check the "Subject" field of the emails. Choose between: ▪ **Don't check**: Do not check this field in emails. ▪ **Check using string search**: Check this field in emails using simple string search. ▪ **Check using regular expression**: Check this field in emails using a regular expression. For more information about syntax, please see the **Regular Expressions** 3105 section. When using a search, the sensor will scan all emails from the newest to the oldest. Note: The sensor finishes the scan with the first match! This means that after it finds a match in one email, there will be no further checks performed in older emails.
Search For	This field is only visible if you enable a "subject" check above. Enter a search string using the method defined above.
Identify by Mail Body	This option is only visible if you enable content processing above. Define if you want to check the mail body of the emails. Choose between: ▪ **Don't check**: Do not check the mail body. ▪ **Check using string search**: Check the mail body using simple string search. ▪ **Check using regular expression**: Check the mail body using a regular expression. For more information about syntax, please see the **Regular Expressions** 3105 section. When using a search, the sensor will scan all emails from the newest to the oldest. Note: The sensor finishes the scan with the first match! This means that after it finds a match in one email, there will be no further checks performed in older emails.

IDENTIFY EMAIL

Search For	This field is only visible if you enable checking the mail body above. Enter a search string using the method defined above.
Check Last Message Date	This option is only visible if you enable content processing above. Define if you want to check all emails in the mailbox, or only mails that were received within the last x hours. Choose between: ▪ **Don't check message age**: Always check all emails contained in the mailbox. ▪ **Check for new messages received within the last x hours**: Only regard emails that were received in the last hours. Define below.
Error Threshold (Hours)	Enter the maximum age in hours. The sensor processes only emails that are younger. If there is no matching email in the defined time span, the sensor will show a **Down** status 135.
Warning Threshold (Hours)	Enter the maximum age in hours. The sensor processes only emails that are younger. If there is no matching email in the defined time span, the sensor will show a **Warning** status 135.

SENSOR BEHAVIOR

Set to Error	This setting is only visible if you enable email content check above. Define in which cases the sensor will show a **Down** status 135. Choose between: ▪ **Never (default)**: Never set this sensor to a **Down** status based on email content. ▪ **Always**: Always set this sensor to a **Down** status in case any emails could be identified. ▪ **If subject contains** ▪ **If subject does not contain** ▪ **If mail body contains** ▪ **If mail body does not contain**
Check Method	This setting is only visible if you select an if-condition above. Define how you want to check for the above condition. Choose between: ▪ **String search**: Check the mail body using simple string search.

SENSOR BEHAVIOR

	▪ **Regular expression**: Check the mail body using a regular expression. For more information about syntax, please see **Regular Expressions** 3105 section. When using a search, the sensor will scan all emails from the newest to the oldest. Note: The sensor finished the scan with the first match! This means that after it finds a match in one email, there will be no further checks performed in older emails.
Search Text	This setting is only visible if you select an if-condition above. Enter a search string using the method defined above.
Error Message	This setting is only visible if you select an alarm condition above. Define the message that the sensor will show for a **Down** status 135.
Set to Warning	This setting is only visible if you enable content check above. Define in which cases the sensor will show a **Warning** status 135. Choose between: ▪ **Never (default)**: Never set this sensor to a **Warning** status based on email content. ▪ **Always**: Always set this sensor to a **Warning** status in case any emails could be identified. ▪ **If subject contains** ▪ **If subject does not contain** ▪ **If mail body contains** ▪ **If mail body does not contain**
Check Method	This setting is only visible if you select an if-condition above. Define how you want to check for the above condition. Choose between: ▪ **String search**: Check the mail body using simple string search. ▪ **Regular expression**: Check the mail body using a regular expression. For more information about syntax, please see **Regular Expressions** 3105 section. When using a search, the sensor will scan all emails from the newest to the oldest. Note: The sensor finishes the scan with the first match! This means that after it finds a match in one email, there will be no further checks performed in older emails.

SENSOR BEHAVIOR

Search Text	This setting is only visible if you enable an if-condition above. Enter a search string using the method defined above.
Warning Message	This setting is only visible if you select a warning condition above. Define the message that the sensor will show for a **Warning** status 135.
No Matching Mail Behavior	This setting is only visible if you enable content check above. Define how the sensor will react if it does not find matching emails in the mailbox that it scans. Choose between: ▪ **Set sensor to "Down" status** ▪ **Set sensor to "Warning" status** ▪ **None**: Do not do anything in this case.
Message	This field is only visible if you enable a no matching behavior above. Define the message that the sensor will show if it did not find any matching emails together with a **Warning** or **Down** status as you define above.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

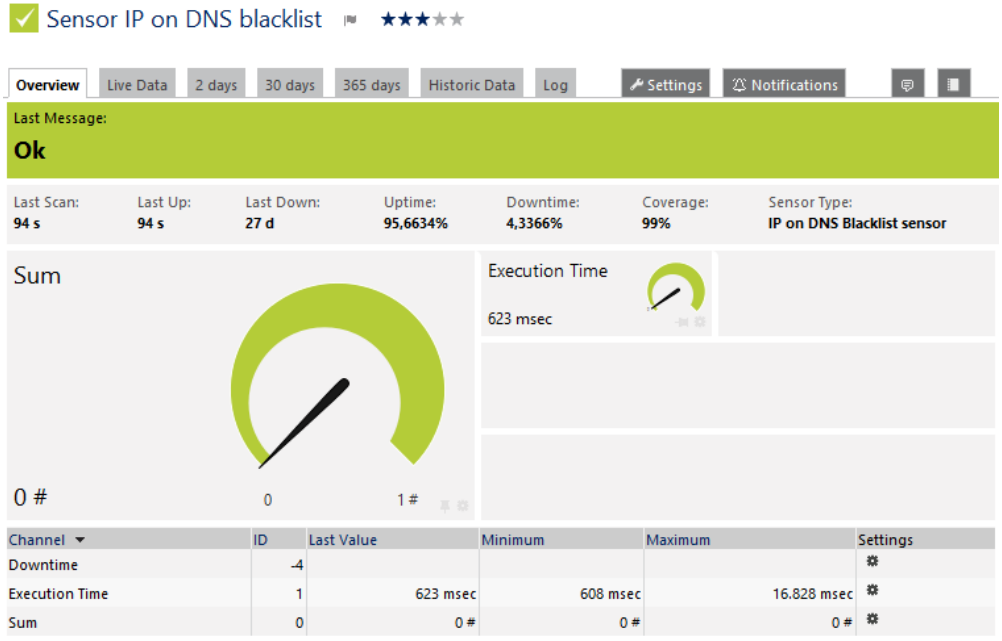
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.62 IP on DNS Blacklist Sensor

The IP on DNS Blacklist sensor checks if the IP address of its parent device is listed on specific blacklist servers.

- The sensor shows the number of blacklist hits it can find.



IP on DNS Blacklist Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ip_on_dns_blacklist.png

Remarks

- If a DNS name is used as hostname of the parent device, PRTG will resolve it to an IP address before querying blacklist servers.
- During normal operation, there should be 0 hits and the sensor should show a green **Up** status 135. If the sensor can find the IP address on at least one of the blacklist servers, it will show a yellow **Warning** status by default. Note: You can set additional thresholds in the Sensor Channels Settings 2711.
- Requires 995 .NET 4.0 or higher on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: Is there a list of anti spam black list servers?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Blacklist Servers	Define the blacklist servers that the sensor uses for the check. You can enter a comma separated list. Default is bl.spamcop.net. For a list of servers, please see **More** 1001 section below. Note: With each scanning interval, PRTG will query all servers in the list! We recommend that you do not enter more than 10 servers to make sure the check can be completed within the scanning interval of this sensor. If you use too many blacklist servers, the sensor will show a "Timeout (code: PE018)" error message.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

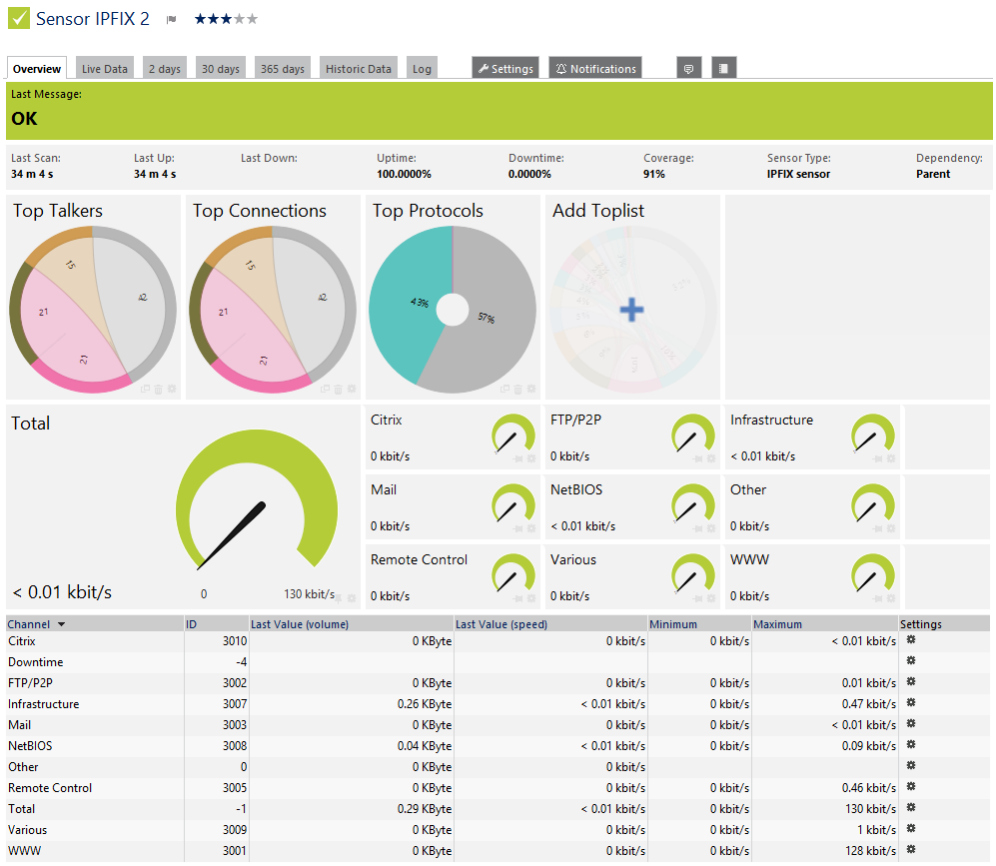
6.8.63 IPFIX Sensor

The IPFIX sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows traffic by type. There are several filter options available to divide traffic into different channels. Ensure your device supports IPFIX when using this sensor.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



IPFIX Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ipfix.png

Remarks

- Note: You have to enable IPFIX export on the device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPFIX SPECIFIC SETTINGS

Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line or in the top level box to select all. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set this one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received.

IPFIX SPECIFIC SETTINGS

Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.
- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

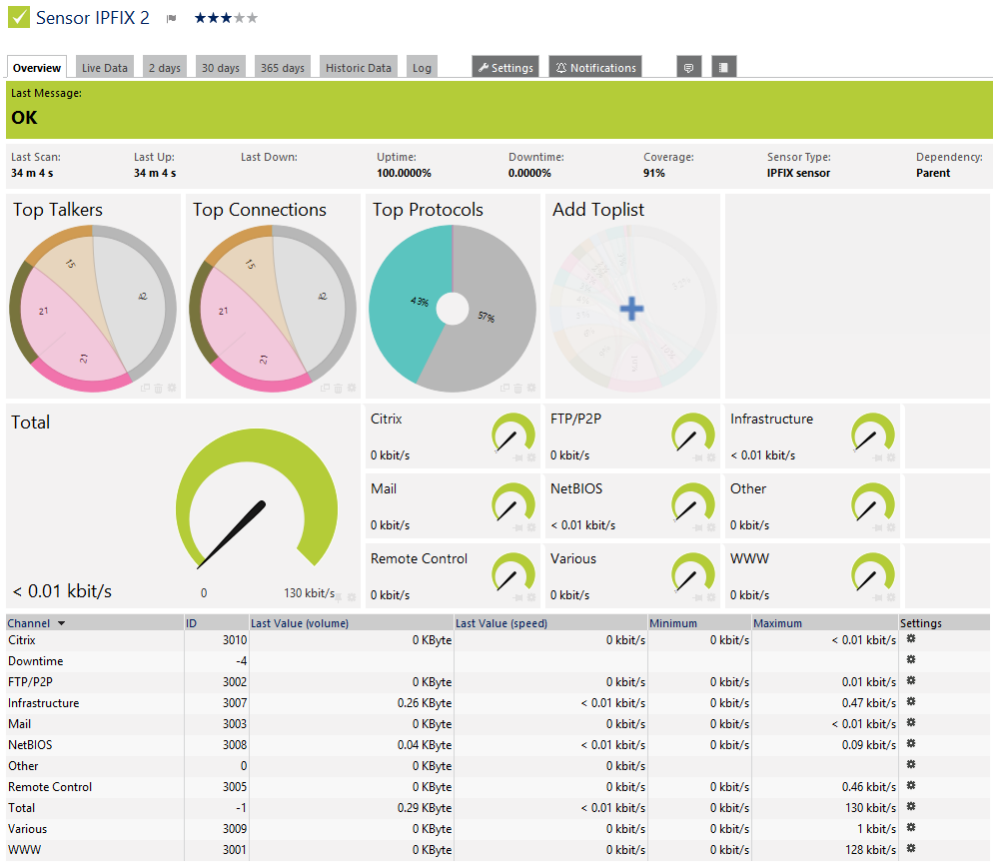
6.8.64 IPFIX (Custom) Sensor

The IPFIX (Custom) sensor receives traffic data from an IPFIX (Internet Protocol Flow Information Export) compatible device and shows the traffic by type. In this custom sensor, you can define your own channel definitions to divide traffic into different channels. Ensure your device supports IPFIX when using this sensor.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



IPFIX Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ipfix.png

Remarks

- Note: In order for this sensor to work, you have to enable IPFIX export on the device. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?

- This sensor does not support more than 50 channels 1016 officially.
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPFIX SPECIFIC SETTINGS

Receive IPFIX Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one configured in the IPFIX export options of your hardware router device. Please enter an integer value.
Sender IP	Enter the IP address of the sending device you want to receive the IPFIX data from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive IPFIX Packets on IP	Select the IP address(es) on which PRTG listens to IPFIX packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the IPFIX export options of your hardware router device.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set this one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

IPFIX SPECIFIC SETTINGS

Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Definitions for xFlow and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined will be accounted to the default channel named **Other**. Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

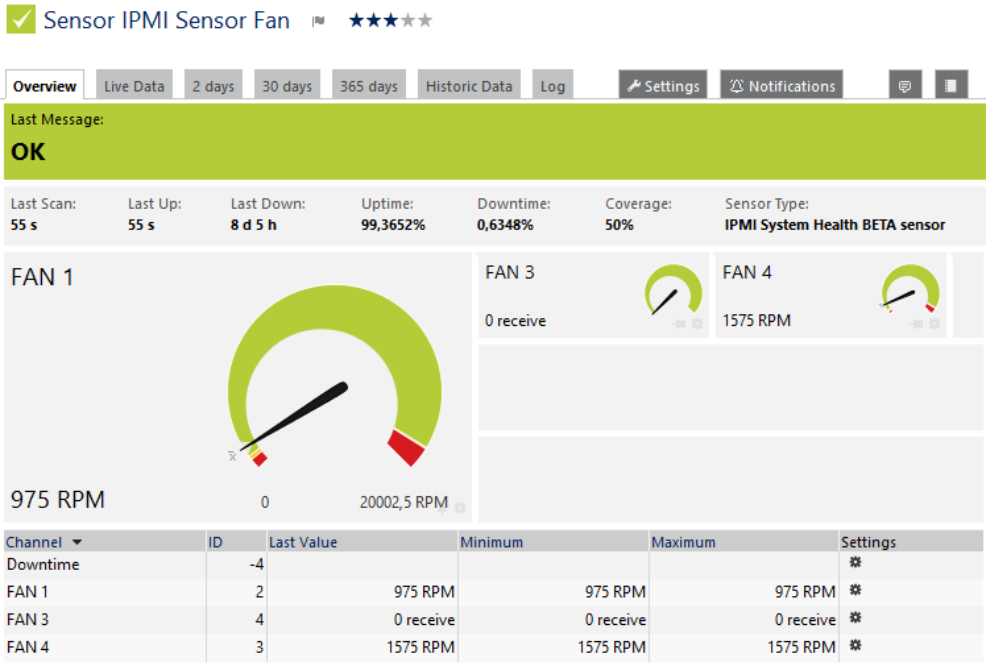
6.8.65 IPMI System Health Sensor

The IPMI System Health sensor monitors the status of a system via the Intelligent Platform Management Interface (IPMI).

It can show the following:

- Temperatures of, for example, the system or the peripheral temperature.
- Fan rotation per minute
- Voltages
- Status of a power supply

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



IPMI System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ipmi_system_health.png

Remarks

- Note: You have to explicitly specify the credentials of the IPMI in the sensor settings.
- Requires 1026 .NET 4.0 or higher on the probe system.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Before you can actually add this sensor, PRTG will ask you to provide your credentials for the Intelligent Platform Management Interface (IPMI) in the add sensor dialog 256. Enter the **Username** and the **Password** in the respective fields.

Select the metrics you want to monitor. PRTG will create one sensor for each metric you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IPMI SPECIFIC

Group	Select the measurements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IPMI CREDENTIALS

Username	Enter the username for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the username that you defined during sensor creation.
Password	Enter the password for the Intelligent Platform Management Interface (IPMI). If not changed yet, this field shows the encrypted password that you defined the sensor creation.

IPMI SPECIFIC

Group	Shows the metric that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Logfile Results	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

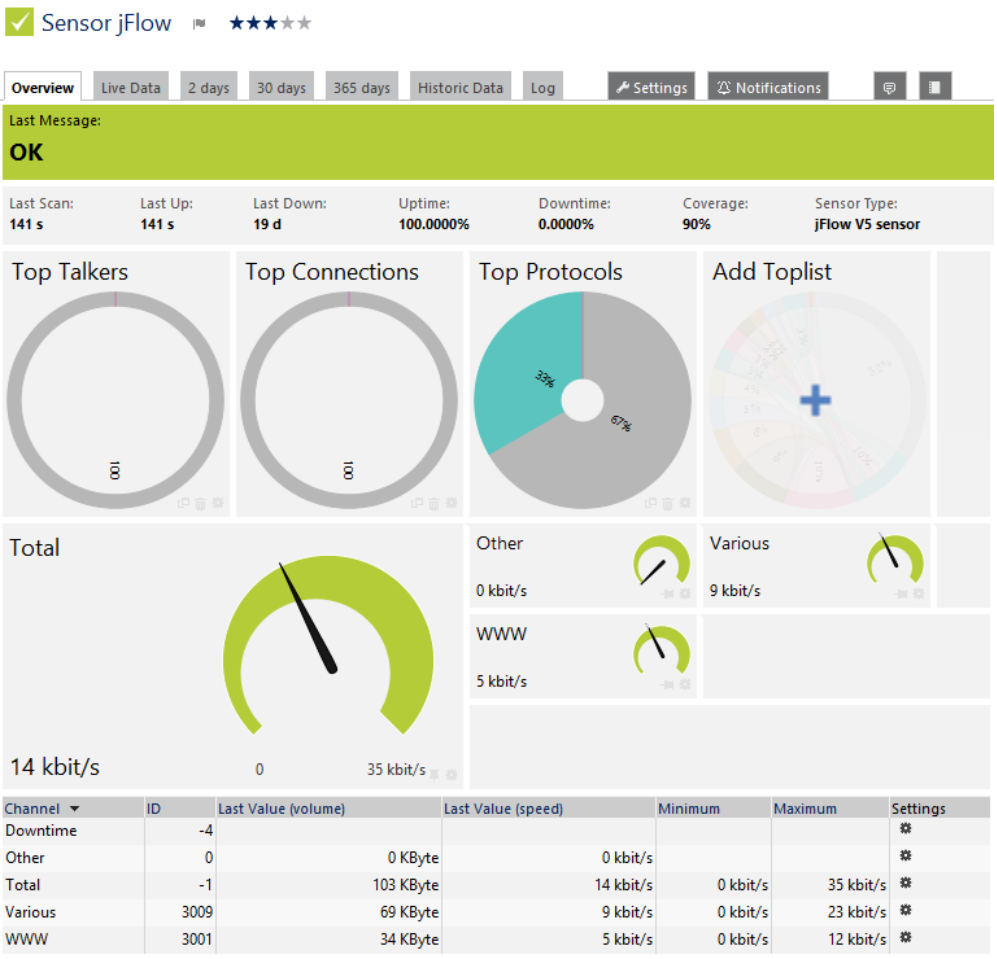
6.8.66 jFlow V5 Sensor

The jFlow V5 sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, ensure it matches jFlow V5! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



jFlow V5 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/jflow_v5.png

Remarks

- Note: You have to enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

JFLOW V5 SPECIFIC SETTINGS

Receive jFlow Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the one you have configured in the jFlow export options of your hardware router device. Please enter an integer value. Note: When you configure the export, please make sure you select the appropriate jFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive jFlow Packets on IP	Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you configured in the jFlow export options of your hardware router device. Note: When you configure the export, please make sure you select the appropriate jFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which the sensor must have received new flow data. If the timeout is reached and no new data came in, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set this one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between:

JFLOW V5 SPECIFIC SETTINGS

- **None (recommended)**: Do not write additional log files. Recommended for normal use cases.
- **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data**: Write log files for all data received.

Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.

CHANNEL CONFIGURATION

- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

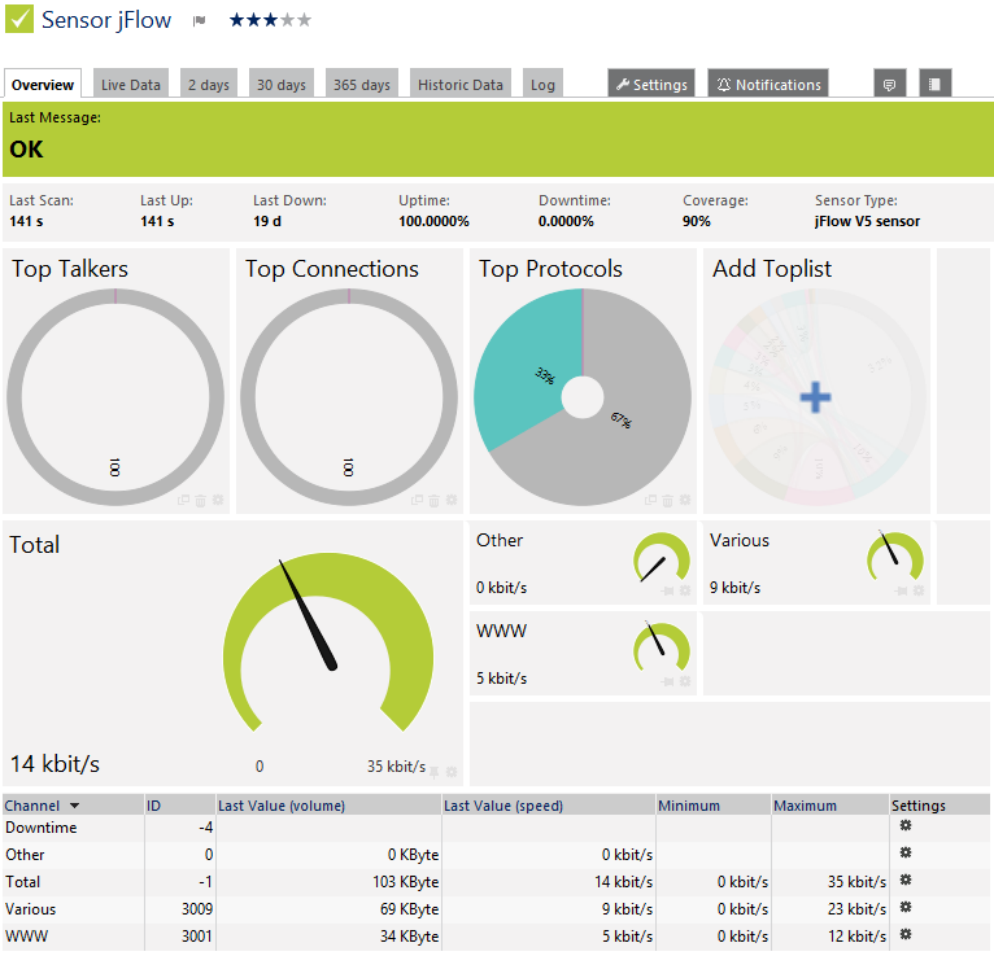
6.8.67 jFlow V5 (Custom) Sensor

The jFlow V5 (Custom) sensor receives traffic data from a jFlow V5 compatible device and shows the traffic by type. On your hardware device, please make sure it matches jFlow V5! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



jFlow V5 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/jflow_v5.png

Remarks

- Note: You have to enable jFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- This sensor does not support more than 50 channels 1048 officially.
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

JFLOW SPECIFIC SETTINGS

Receive jFlow Packets on UDP Port	Enter the UDP port number on which PRTG receives the flow packets. It must match the one you have configured in the jFlow export options of your hardware router device. Please enter an integer value. Note: When you configure the export, please make sure you select the appropriate jFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the jFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive jFlow Packets on IP	Select the IP address(es) on which PRTG listens to jFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you configured in the jFlow export options of your hardware router device. Note: When you configure the export, please make sure you select the appropriate jFlow version for this sensor.

JFLOW SPECIFIC SETTINGS

Active Flow Timeout (Minutes)	Enter a time span in minutes after which the sensor must have received new flow data. If the timeout is reached and no new data came in, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set this one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Defintions for xFlow and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined will be accounted to the default channel named **Other**. Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyse.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

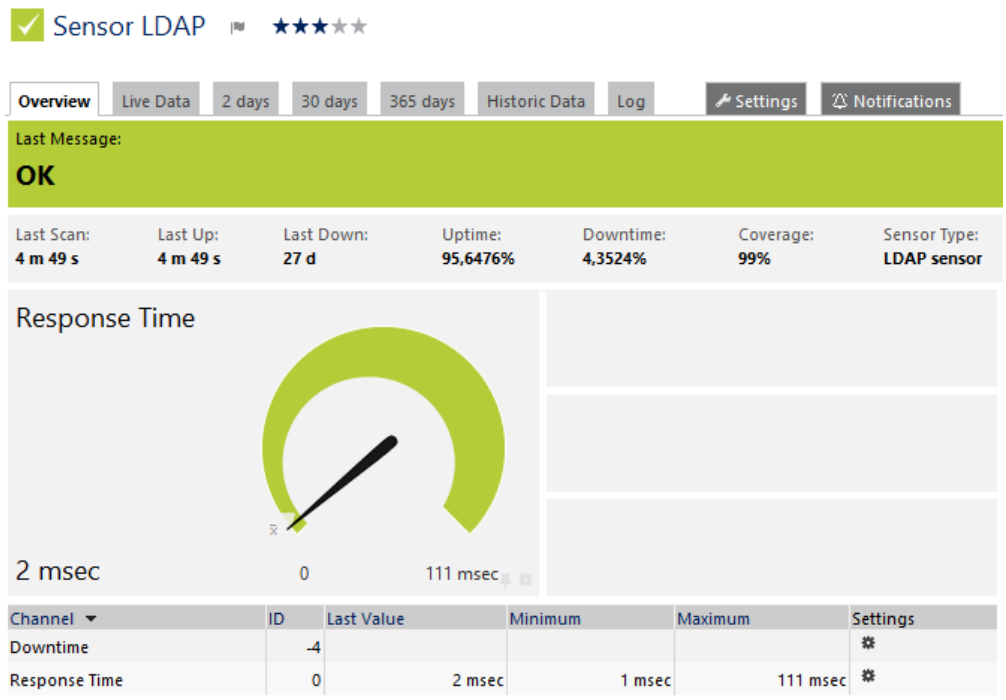
6.8.68 LDAP Sensor

The LDAP sensor monitors directory services using Lightweight Directory Access Protocol (LDAP), connecting to the server trying a "bind". If the server does not respond or authentication fails, an it will show an error message.

- The sensor shows the response time of the server.



LDAP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ldap.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

LDAP SPECIFIC

Port	Enter the LDAP port number, usually port 389 for unencrypted connections. Please enter an integer value.
Distinguished Name	Enter the Distinguished Name (DN) you want to authenticate to the LDAP server. Usually, this is the information for the user you want to authenticate with. For example, use the format **cn=Manager,dc=my-domain,dc=com** for a DN on an OpenLDAP server.
Password	Enter the password for the entered Distinguished Name.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

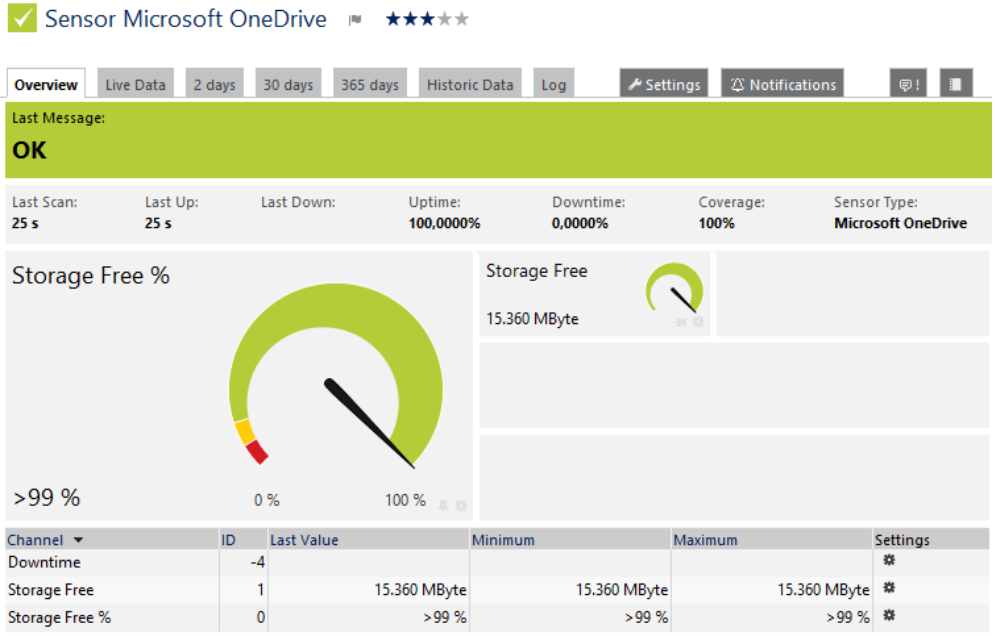
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.69 Microsoft OneDrive Sensor

The Microsoft OneDrive sensor monitors a Microsoft OneDrive account using the OneDrive Application Programming Interface (API) and OAuth2. It shows the following:

- Free storage in bytes and percent



Microsoft OneDrive Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/microsoft_onedrive.png

Remarks

- The minimum scanning interval for this sensor type is **30 minutes**.
- For details about OAuth2 authentication, please see manual section **Authentication Using OAuth2** 1073.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG requires OAuth2 authorization before you can actually add this sensor type. Provide the requested credentials in the appearing window. The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

MICROSOFT CREDENTIALS

This sensor type uses OAuth2 authentication to get access to your Microsoft account. For details about the authentication approach, please see section **Authentication Using OAuth2** 1073.

OAuth URL	Click the button **Get Access Code** to connect this sensor to your Microsoft account using OAuth2. This is necessary to allow the sensor to query data from OneDrive. A new browser window appears. Please follow the steps there and confirm the permission for PRTG to connect to your OneDrive account. OneDrive forwards you to an empty page after completing the authorization process. Copy the complete **URL** of this empty page and paste it into the **OAuth Code** field below.
OAuth Code	Paste the complete **URL** from the address bar of your browser on the empty page to which OneDrive forwards you. The empty page appears after completing the authorization process for PRTG at your OneDrive account. Click **OK** to define the sensor settings 781. Note: It is mandatory to connect this sensor to your OneDrive account to create this sensor. Please complete the OAuth approach first to get the OAuth code.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

MICROSOFT CREDENTIALS

OAuth Code	Shows the authorization code that the sensor uses to get access to your OneDrive account. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

Note: This sensor type has a fixed minimum scanning interval for performance reasons. You cannot run the sensor in shorter intervals than this minimum interval. Consequently, shorter scanning intervals as defined in **System Administration—Monitoring** 2871 are not available for this sensor.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Authentication Using OAuth2

This sensor type uses the OAuth2 security protocol to access the account from which you want to retrieve and monitor data. OAuth2 enables you to grant access to the target account without sharing your password with PRTG. In general, the authorization approach of PRTG using OAuth2 works like this:

1. **Authorization Request**
   First, you have to request authorization for this sensor to access service resources from your account. For this purpose you are asked to get an access code for this sensor in the **Add Sensor** dialog. Click the **Get Access Code** button to start the authorization process using OAuth2. This opens a new browser window on the authorization server of the target service.

2. **Verifying Identity**
   This new window contains a login form for your account that you want to monitor. Log in to your account using your credentials for this service to authenticate your identity. This is a common login to your account on the target server so PRTG will not see your password. The service will forward you to the authorization page and asks you to permit PRTG to access the data in your account.
   Note: If you are already logged in to the service with a user account, you do not have to enter credentials in this step and get directly to the access permission page.

3. **Authorizing PRTG**
   Permit PRTG to access information on your account. Note that this permission holds only for this specific sensor, not for PRTG as a whole. For each sensor of this type you add, you have to confirm the access permission anew. You can change the account permissions at any time in your account at the target service.

4. **Getting Authorization Code**
   Permitting PRTG to access your account data forwards you to a page where the service provides an **authorization code**. Copy this code and switch back to the **Add Sensor** dialog in PRTG.
   Note: The code is valid only a short period of time and expires after a few minutes. You can use a particular code only once.

5. **Providing Authorization Code**
   Paste the authorization code into the **OAuth Code** field and complete the **Add Sensor** dialog. You do not have to go through further configuration steps manually. The sensor will accomplish the following steps automatically.

6. **Requesting Access Token**
   After getting the authorization code, PRTG requests an access token from the API of the target service. For this purpose PRTG transmits the authorization code together with several authentication details. The API checks if the authorization is valid and returns the access token to PRTG. Access token are specific for one account and one application (here: PRTG). The authorization process to read data from your account is now complete.

7. **Retrieving Data**
   The sensor transmits the access token with each sensor scan in the defined scanning interval to authenticate at your account. It is not necessary to use the original account credentials anew. The used tokens are refreshed automatically from time to time.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

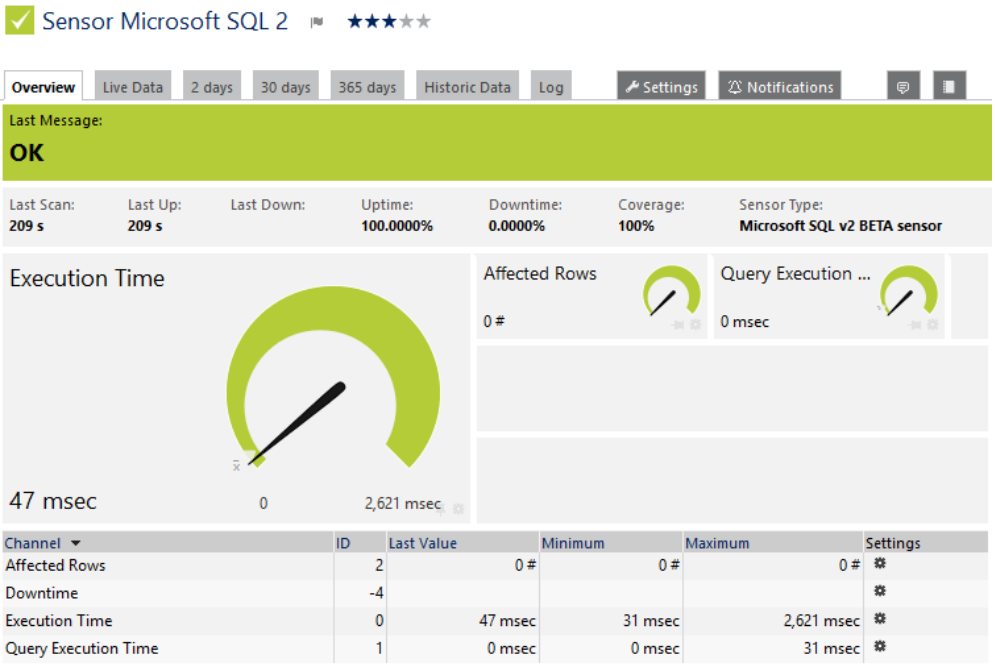
For more general information about settings, please see the **Object Settings** 159 section.

6.8.70 Microsoft SQL v2 Sensor

The Microsoft SQL v2 sensor monitors a database on a Microsoft SQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of the given query
- Number of rows which were addressed by the query (including select statements if you process data tables)
- It can also process the data table and show defined values in individual channels.



Microsoft SQL v2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/microsoft_sql_v2.png

Remarks

- Requires 1076 .NET 4.0 on the probe system.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on: If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- Save the SQL script with the query into the **\Custom Sensors\sql\mssql** subfolder of your PRTG installation. See manual section **Data Storage** 3135 for more information about how to find this path.
- This sensor type supports Microsoft SQL server 2005 or later.
- This sensor type supersedes the outdated Microsoft SQL sensor. We recommend that you use this new sensor to monitor Microsoft SQL databases.
- PRTG Manual: **Monitoring Databases** 3033 (includes an example 3034 for channel value selection)
- Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	Enter the name of the SQL database to which the sensor connects. For example, such a database's name could be MyDatabase. This is a logical entity on the database server where database objects like tables or stored procedures exist.
SQL Server Instance	Define if you want to use an instance name for the database connection. Choose between: ▪ **No instance name required (default)**: Use the default instance for the connection. ▪ **Use instance name**: Use a named instance that you can specify below.
Instance Name	This field is only visible if you enable instance name usage above. Enter the named instance you want to monitor.
Encryption	Define encryption usage for the database connection. Choose between: ▪ **Use server defaults (default)**: The database connection is only encrypted if enforced by the database server.

DATABASE SPECIFIC

- **Enforce encryption but do not validate server certificate**: Choose this option to make sure the database connection is encrypted.
- **Enforce encryption and validate server certificate**: Choose this option to force encryption and to validate the database server certificate. This approach provides highest security, for example, it helps preventing "man in the middle" attacks.
  Note: The sensor validates the certificate only if the database server enforces encryption!

DATA

SQL Query File

Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

For more information on how to find this path, please see **Data Storage** 3135 section. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: SELECT AVG (UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";".

Note: Please be aware that with each request the full result set will be transferred, so use filters and limits in your query.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default)**: No transactions will be executed.
- **Use transaction and always rollback**: Choose this option to ensure that no data in the database will be changed by the query. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.

DATA

	▪ **Use transaction and commit on success**: Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.
Data Processing	Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Just execute the query**: If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are only rows which were changed somehow with the query (for example, created, deleted, edited). ▪ **Count table rows:** Choose this option if you perform a SELECT statement and want to monitor how many rows of the data table this statement returns. ▪ **Process data table**: Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with SELECT statements as well.
Handle DBNull in Channel Values as	This setting is only visible if you selected the process data table option above. Define the sensor behavior if DBNull is returned by the query. Choose between: ▪ **Error**: The sensor will show a **Down** status if DBNull is reported. ▪ **Number 0**: The sensor will recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	This setting is only visible if you selected the process data table option above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells which will be used in the sensor channels. Choose between: ▪ **Column number**: The channel value will be determined by using the value in row 0 of the column whose number you specify below. ▪ **Column name**: The channel value will be determined by using the value in row 0 of the column whose name you specify below. ▪ **Row number**: The channel value will be determined by using the value in column 0 of the row whose number you specify below.

DATA

	▪ **Key value pair**: The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found. Please see manual section **Monitoring Databases** 3033 for an example 3034 for channel value selection.
Sensor Channel #x	This setting is only visible if you selected the process data table option above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for Channel #1 without enabling it manually. For all other possible channels, choose between: ▪ **Disable**: This channel will not be added to the sensor. ▪ **Enable**: This channel will be added to the sensor. Define the settings as described above. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Name	This setting is only visible if you selected the process data table option above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Column Number	This setting is only visible if you selected the column number option above. Provide the number of the column which will be used to determine the channel value in row 0. Please enter an integer value.
Sensor Channel #x Column Name	This setting is only visible if you selected the column name option above. Provide the name of the column which will be used to determine the channel value in row 0. Please enter a string.
Sensor Channel #x Row Number	This setting is only visible if you selected the row number option above. Provide the number of the row which will be used to determine the channel value in column 0. Please enter an integer value.

DATA

Sensor Channel #x Key	This setting is only visible if you selected the key value pair option above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.
Sensor Channel #x Mode	This setting is only visible if you selected the process data table option above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from the data table. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from the data table.
Sensor Channel #x Unit	This setting is only visible if you have selected the process data table option above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup

DATA

	For more information about the available units, please refer to the PRTG Application Programming Interface (API) Definition 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you selected the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This settings is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Use Data Table Value in Sensor Message	This setting is only visible if you selected the process data table option above. Define if the sensor message will show a value from the data table. Choose between: ▪ **Disable**: Do not use a custom sensor message. ▪ **Enable**: Define a custom sensor message with the value of a defined channel.
Sensor Message Column Number	This setting is only visible if you selected the column number and sensor message options above. Specify the number of the column whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Column Name	This setting is only visible if you selected the column name and sensor message options above. Specify the name of the column whose value will be shown in the sensor message. Please enter a string.
Sensor Message Row Number	This setting is only visible if you selected the row number and sensor message options above. Specify the number of the row whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Key	This setting is only visible if you selected the key value pair and sensor message options above. Specify the key for the value which will be shown in the sensor message. Please enter a string.
Sensor Message	This setting is only visible if you selected the sensor message option above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.

DATA

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

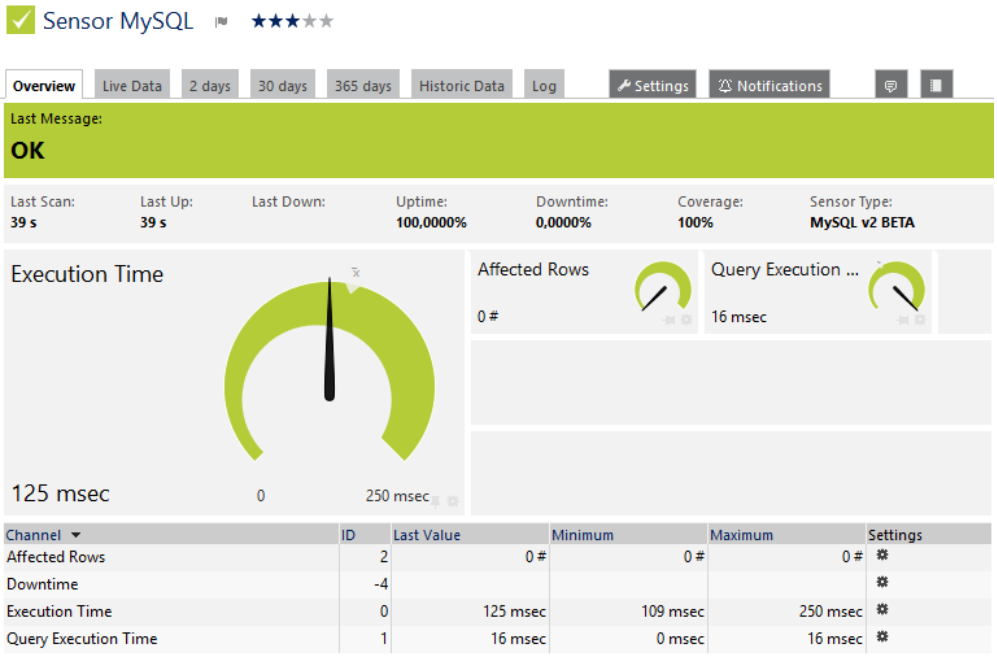
For more general information about settings, please see the **Object Settings** 159 section.

6.8.71 MySQL v2 Sensor

The MySQL v2 sensor monitors a database on a MySQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows which were addressed by the query (including select statements if you process data tables)
- It can also process the data table and show defined values in individual channels.



MySQL v2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/mysql.png

Remarks

- Requires 1091 .NET 4.0 on the probe system.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on: If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.
- Save the SQL script with the query into the **\Custom Sensors\sql\mysql** subfolder of your PRTG installation. See manual section **Data Storage** 3135 for more information about how to find this path.

- This sensor type supports MySQL server version 5.0 or later and might also work with previous versions.
- This sensor type supersedes the outdated MySQL sensor. We recommend that you to use this new sensor to monitor MySQL databases.
- PRTG Manual: **Monitoring Databases** 3033 (includes an example 3034 for channel value selection)
- Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	Enter the name of the MySQL database to which the sensor connects. For example, such a database's name could be MyDatabase. This is a logical entity on the database server where database objects like tables or stored procedures exist. The database name of a MySQL server also reflects a physical directory structure where your database objects are stored. Enter the appropriate string which is the same as you would supply when invoking the mysql.exe admin tool (with the command line switch -p) or after the login with mysql.exe with the command use.

DATA

SQL Query File	Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DATA

The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node!

For more information on how to find this path, please see **Data Storage** 3135 section. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server.

For example, a correct expression in the file could be: SELECT AVG (UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";".

Note: Please be aware that with each request the full result set will be transferred, so use filters and limits in your query.

Use Transaction

Define if you want to use transactions and if they will affect the database content. Choose between:

- **Don't use transaction (default)**: No transactions will be executed.
- **Use transaction and always rollback**: Choose this option to ensure that no data in the database will be changed by the query. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.
- **Use transaction and commit on success**: Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.

Data Processing

Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

- **Just execute the query**: If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are only rows which were changed somehow with the query (for example, created, deleted, edited).
- **Count table rows:** Choose this option if you perform a SELECT statement and want to monitor how many rows of the data table this statement returns.

DATA

	▪ **Process data table**: Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with SELECT statements as well.
Handle DBNull in Channel Values as	This setting is only visible if you selected the process data table option above. Define the sensor behavior if DBNull is returned by the query. Choose between: ▪ **Error**: The sensor will show a **Down** status if DBNull is reported. ▪ **Number 0**: The sensor will recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	This setting is only visible if you selected the process data table option above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells which will be used in the sensor channels. Choose between: ▪ **Column number**: The channel value will be determined by using the value in row 0 of the column whose number you specify below. ▪ **Column name**: The channel value will be determined by using the value in row 0 of the column whose name you specify below. ▪ **Row number**: The channel value will be determined by using the value in column 0 of the row whose number you specify below. ▪ **Key value pair**: The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found. Please see manual section **Monitoring Databases** 3033 for an example 3034 for channel value selection.
Sensor Channel #x	This setting is only visible if you selected the process data table option above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for Channel #1 without enabling it manually. For all other possible channels, choose between: ▪ **Disable**: This channel will not be added to the sensor. ▪ **Enable**: This channel will be added to the sensor. Define the settings as described above. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DATA

Sensor Channel #x Name	This setting is only visible if you selected the process data table option above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Column Number	This setting is only visible if you selected the column number option above. Provide the number of the column which will be used to determine the channel value in row 0. Please enter an integer value.
Sensor Channel #x Column Name	This setting is only visible if you selected the column name option above. Provide the name of the column which will be used to determine the channel value in row 0. Please enter a string.
Sensor Channel #x Row Number	This setting is only visible if you selected the row number option above. Provide the number of the row which will be used to determine the channel value in column 0. Please enter an integer value.
Sensor Channel #x Key	This setting is only visible if you selected the key value pair option above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.
Sensor Channel #x Mode	This setting is only visible if you selected the process data table option above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from the data table. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from the data table.
Sensor Channel #x Unit	This setting is only visible if you have selected the process data table option above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ BytesBandwidth ▪ BytesMemory

DATA

	▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you selected the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This settings is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Use Data Table Value in Sensor Message	This setting is only visible if you selected the process data table option above. Define if the sensor message will show a value from the data table. Choose between: ▪ **Disable**: Do not use a custom sensor message. ▪ **Enable**: Define a custom sensor message with the value of a defined channel.
Sensor Message Column Number	This setting is only visible if you selected the column number and sensor message options above. Specify the number of the column whose value will be shown in the sensor message. Please enter an integer value.

DATA

Sensor Message Column Name	This setting is only visible if you selected the column name and sensor message options above. Specify the name of the column whose value will be shown in the sensor message. Please enter a string.
Sensor Message Row Number	This setting is only visible if you selected the row number and sensor message options above. Specify the number of the row whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Key	This setting is only visible if you selected the key value pair and sensor message options above. Specify the key for the value which will be shown in the sensor message. Please enter a string.
Sensor Message	This setting is only visible if you selected the sensor message option above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

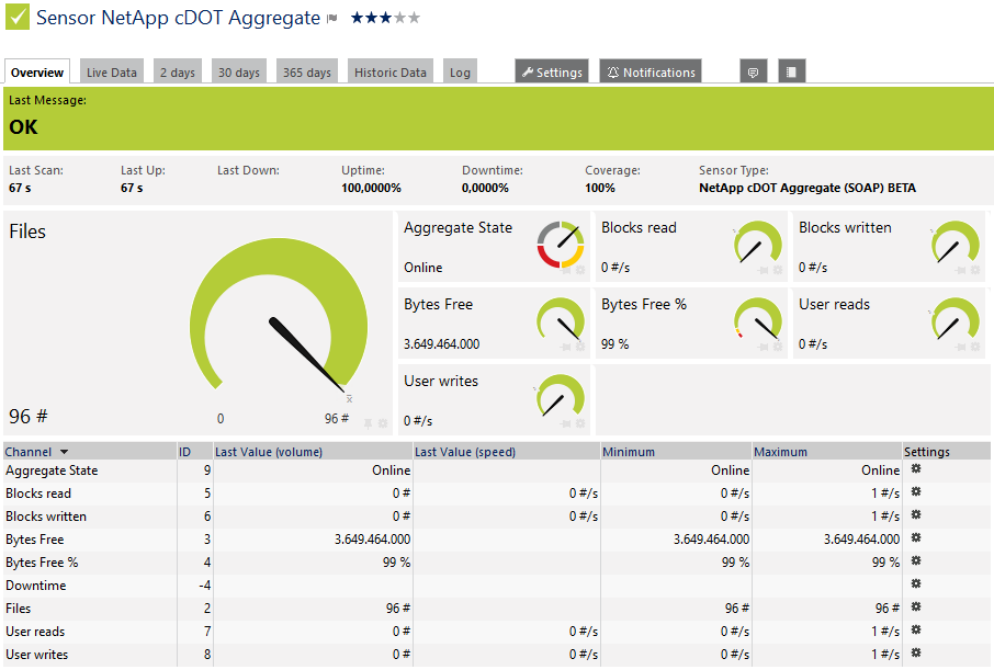
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.72 NetApp cDOT Aggregate (SOAP) Sensor

The NetApp cDOT Aggregate (SOAP) sensor monitors a NetApp clustered Data ONTAP (cDOT) storage aggregate accessing the cDOT web Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Number of files on the aggregate
- Status of the aggregate (online, restrict, offline)
- Read and written blocks per second
- User reads and writes per seconds
- Free bytes in total and percent



NetApp cDOT Aggregate (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netapp_cdot_aggregate_soap.png

Remarks

- The cDOT user account that you use with this sensor needs access to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- If API access is disabled, use the following command locally on the cluster console to enable it: services web> modify -vserver clusterd -name ontapi -enabled true
- Read-only user rights are sufficient for the cDOT user account that you use with this sensor for access to ONTAPI. Modify or add this user with the role **readonly** in the console under **Cluster | ClusterX | Configuration | Security | Users**
- This sensor type supports ONTAPI version 1.21 (included in Ontap version 8.2.x) and ONTAPI version 1.30 (included in Ontap version 8.3.x).

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

Select the aggregates you want to monitor. PRTG creates one sensor for each aggregate you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

NETAPP CDOT SPECIFIC

NetApp cDOT Aggregates	Select all aggregates for which you want to add a sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CDOT CREDENTIALS

Username	Enter a username for access to the NetApp cDOT API. Read only rights for this cDOT user account are sufficient. Please enter a string.
Password	Enter the password of the user that you enter above for access to the NetApp cDOT API. Please enter a string.
Port	Enter a port number on which you can access the NetApp cDOT API. Please enter an integer value. The default port is **443**.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP CDOT SPECIFIC

NetApp cDOT Aggregates	Shows the aggregate that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.73 NetApp cDOT I/O (SOAP) Sensor

The NetApp cDOT I/O (SOAP) sensor monitors input and output operations of a NetApp clustered Data ONTAP (cDOT) storage system accessing the cDOT web Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Number of Common Internet File System (CIFS) operations per second
- Disk read and write speed
- Number of FCP operations per second
- FCP read and write speed
- HDD read and write speed
- HTTP operations per second
- Number of internet Small Computer System Interface (iSCSI) operations per second
- iSCSI read and write speed
- Number of iSCSI partner operations per second
- iSCSI partner read and write speed
- Network read and write speed
- Number of Network File System (NFS) operations per second
- SSD read and write speed
- Tape read and write speed

NetApp cDOT I/O (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netapp_cdot_io_soap.png

Remarks

- The cDOT user account that you use with this sensor needs access to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- If API access is disabled, use the following command locally on the cluster console to enable it: services web> modify -vserver clusterd -name ontapi -enabled true
- Read-only user rights are sufficient for the cDOT user account that you use with this sensor for access to ONTAPI. Modify or add this user with the role **readonly** in the console under **Cluster | ClusterX | Configuration | Security | Users**
- This sensor type supports ONTAPI version 1.21 (included in Ontap version 8.2.x) and ONTAPI version 1.30 (included in Ontap version 8.3.x).

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

Select the cDOT system nodes which you want to monitor. PRTG creates one sensor for each node you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

NETAPP CDOT SPECIFIC

NetApp cDOT System Nodes	Select all nodes for which you want to add a sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CDOT CREDENTIALS

Username	Enter a username for access to the NetApp cDOT API. Read only rights for this cDOT user account are sufficient. Please enter a string.
Password	Enter the password of the user that you enter above for access to the NetApp cDOT API. Please enter a string.
Port	Enter a port number on which you can access the NetApp cDOT API. Please enter an integer value. The default port is **443**.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP CDOT SPECIFIC

NetApp cDOT System Nodes	Shows the ID of the system node that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

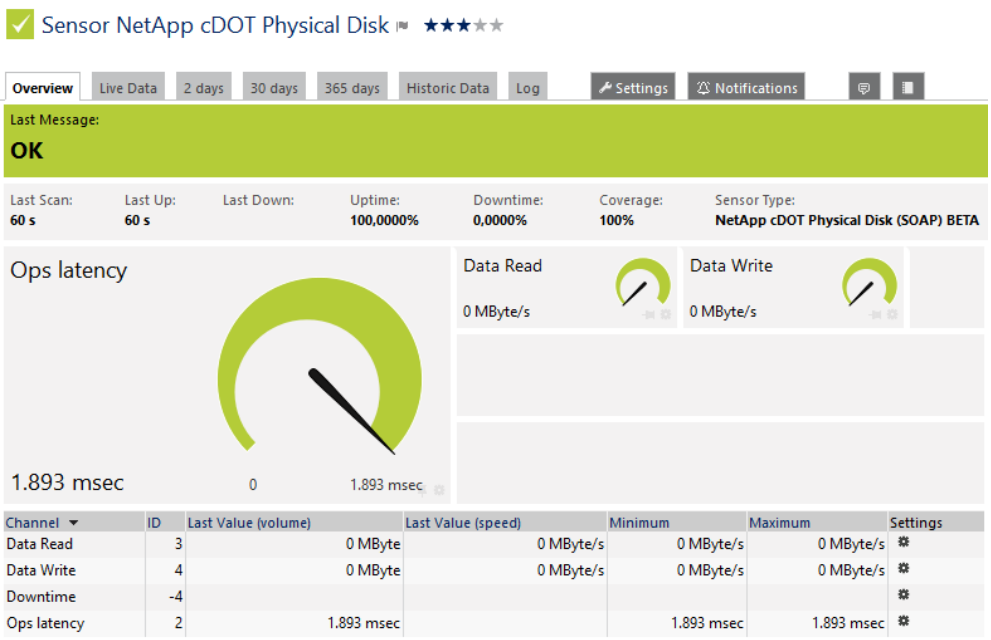
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.74 NetApp cDOT Physical Disk (SOAP) Sensor

The NetApp cDOT Physical Disk (SOAP) sensor monitors disks of a NetApp clustered Data ONTAP (cDOT) storage system accessing the cDOT web Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Latency of operations
- Data read and write speed



NetApp cDOT Physical Disk (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netapp_cdot_physical_disk_soap.png

Remarks

- The cDOT user account that you use with this sensor needs access to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- If API access is disabled, use the following command locally on the cluster console to enable it: services web> modify -vserver clusterd -name ontapi -enabled true
- Read-only user rights are sufficient for the cDOT user account that you use with this sensor for access to ONTAPI. Modify or add this user with the role **readonly** in the console under **Cluster | ClusterX | Configuration | Security | Users**
- This sensor type supports ONTAPI version 1.21 (included in Ontap version 8.2.x) and ONTAPI version 1.30 (included in Ontap version 8.3.x).
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

Select the disks you want to monitor. PRTG creates one sensor for each aggregate you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

NETAPP CDOT SPECIFIC

NetApp cDOT Disks	Select all disks for which you want to add a sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CDOT CREDENTIALS

Username	Enter a username for access to the NetApp cDOT API. Read only rights for this cDOT user account are sufficient. Please enter a string.
Password	Enter the password of the user that you enter above for access to the NetApp cDOT API. Please enter a string.
Port	Enter a port number on which you can access the NetApp cDOT API. Please enter an integer value. The default port is **443**.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP CDOT SPECIFIC

NetApp cDOT Disk	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor

NETAPP CDOT SPECIFIC

anew.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

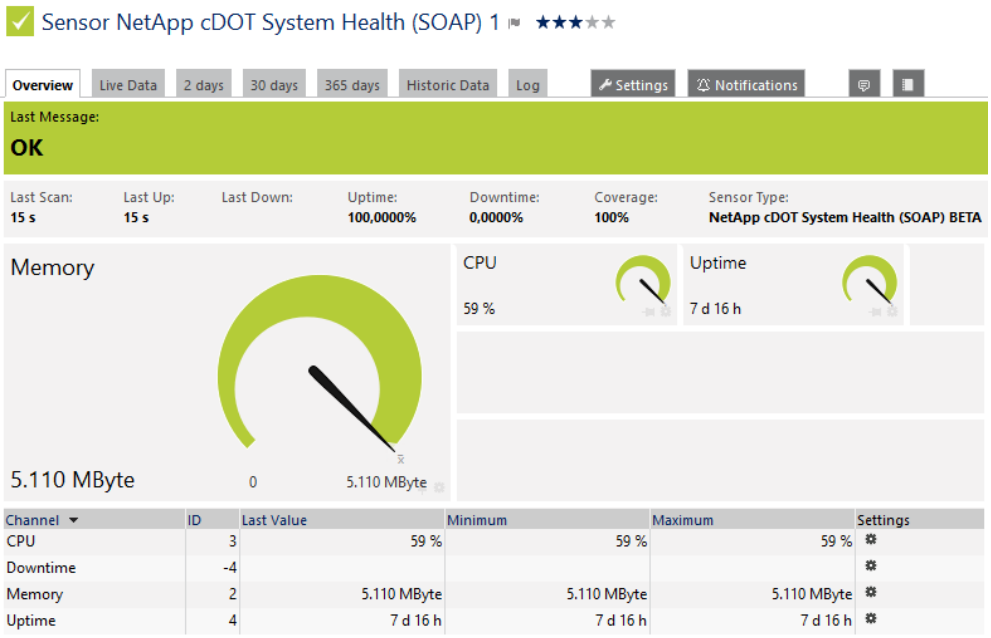
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.75 NetApp cDOT System Health (SOAP) Sensor

The NetApp cDOT System Health (SOAP) sensor monitors the health of a NetApp clustered Data ONTAP (cDOT) storage system accessing the cDOT web Application Programming Interface (API) via Simple Object Access Protocol (SOAP). It can show the following:

- Memory usage
- CPU load
- Uptime



NetApp cDOT System Health (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netapp_cdot_system_health_soap.png

Remarks

- The cDOT user account that you use with this sensor needs access to **ONTAPI** (DATA ONTAP API) so that the sensor can request data from it. The access is enabled by default.
- If API access is disabled, use the following command locally on the cluster console to enable it: services web> modify -vserver clusterd -name ontapi -enabled true
- Read-only user rights are sufficient for the cDOT user account that you use with this sensor for access to ONTAPI. Modify or add this user with the role **readonly** in the console under **Cluster | ClusterX | Configuration | Security | Users**
- This sensor type supports ONTAPI version 1.21 (included in Ontap version 8.2.x) and ONTAPI version 1.30 (included in Ontap version 8.3.x).
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG will perform a meta scan before you actually add this sensor type and requires basic information for this scan in advance. Provide the requested information in the appearing window. During the scan, PRTG will recognize all items available for monitoring based on your input. The following settings differ in comparison to the sensor's settings page:

Select the cDOT system nodes which you want to monitor. PRTG creates one sensor for each node you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

NETAPP CDOT SPECIFIC

NetApp cDOT System Nodes	Select the nodes for which you want to add a sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP CDOT CREDENTIALS

Username	Enter a username for access to the NetApp cDOT API. Read only rights for this cDOT user account are sufficient. Please enter a string.
Password	Enter the password of the user that you enter above for access to the NetApp cDOT API. Please enter a string.
Port	Enter a port number on which you can access the NetApp cDOT API. Please enter an integer value. The default port is **443**.
Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

NETAPP CDOT SPECIFIC

NetApp cDOT System Nodes	Shows the ID of the system node that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add

NETAPP CDOT SPECIFIC

	the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.76 NetFlow V5 Sensor

The NetFlow V5 sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Ensure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

NetFlow V5 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netflow_v5.png

Remarks

- Note: You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.

- Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address selected here must match the one you have configured in the NetFlow export options of your hardware router device. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown** status. Please enter an integer value. We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.

NETFLOW SPECIFIC SETTINGS

Log Stream Data to Disk (for Debugging)

Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between:

- **None (recommended)**: Do not write additional log files. Recommended for normal use cases.
- **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data**: Write log files for all data received.

Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.

CHANNEL CONFIGURATION

- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

Stack Unit — This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist — Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

6.8.77 NetFlow V5 (Custom) Sensor

The NetFlow V5 (Custom) sensor receives traffic data from a NetFlow V5 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

NetFlow V5 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netflow_v5.png

Remarks

- Note: You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?

- This sensor does not support more than 50 channels officially.
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows**.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.
Parent Tags	Shows **Tags** that this sensor inherits from its parent device, group, and probe. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags**, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you have configured in the NetFlow export options of your hardware router device. Note: When configuring export, please make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used.

NETFLOW SPECIFIC SETTINGS

	▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined will be accounted to the default channel named **Other**. Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

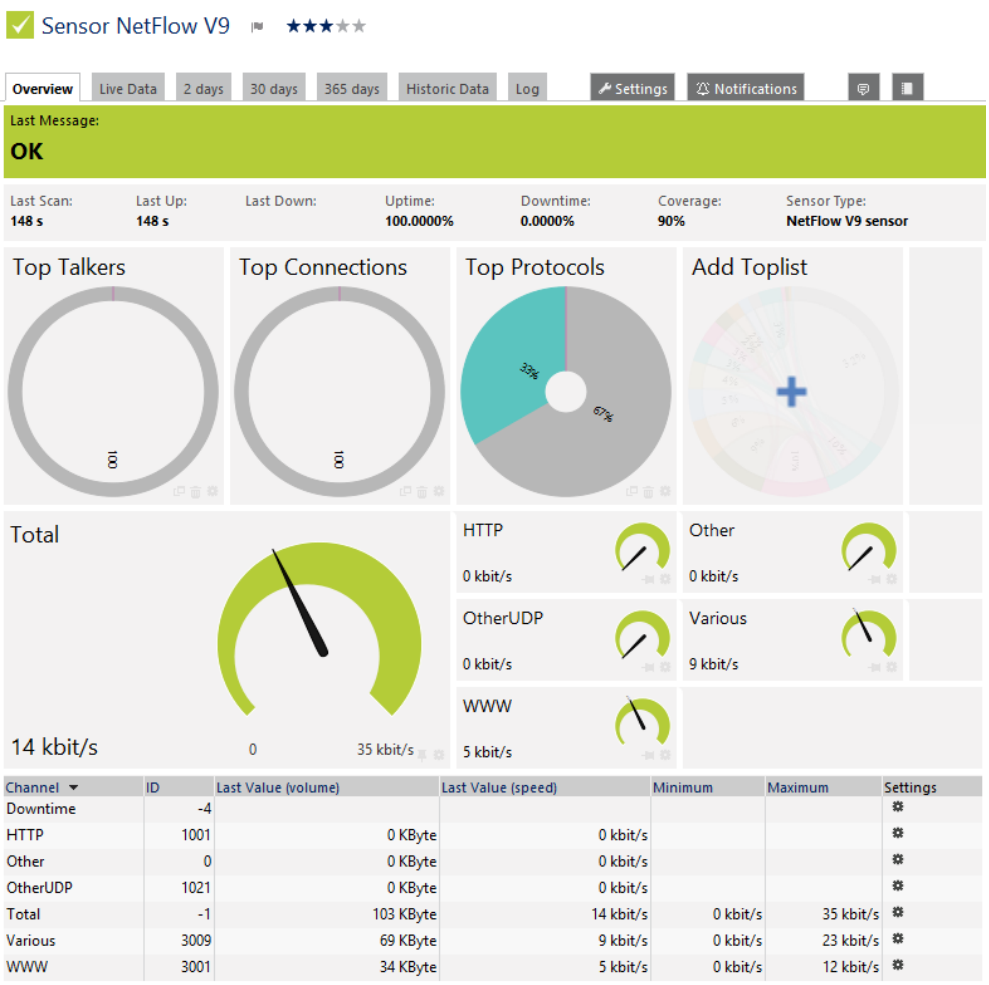
6.8.78 NetFlow V9 Sensor

The NetFlow V9 sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Downtime	-4					
HTTP	1001	0 KByte	0 kbit/s			
Other	0	0 KByte	0 kbit/s			
OtherUDP	1021	0 KByte	0 kbit/s			
Total	-1	103 KByte	14 kbit/s	0 kbit/s	35 kbit/s	
Various	3009	69 KByte	9 kbit/s	0 kbit/s	23 kbit/s	
WWW	3001	34 KByte	5 kbit/s	0 kbit/s	12 kbit/s	

NetFlow V9 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netflow_v9.png

Remarks

- Note: You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address selected here must match the one you have configured in the NetFlow export options of your hardware router device. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data was received during this time, the sensor switches to an **Unknown** status. Please enter an integer value. We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. The maximum timeout is 60 minutes. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your exporter device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between:

NETFLOW SPECIFIC SETTINGS

- **None (recommended)**: Do not write additional log files. Recommended for normal use cases.
- **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data**: Write log files for all data received.

Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.

CHANNEL CONFIGURATION

- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

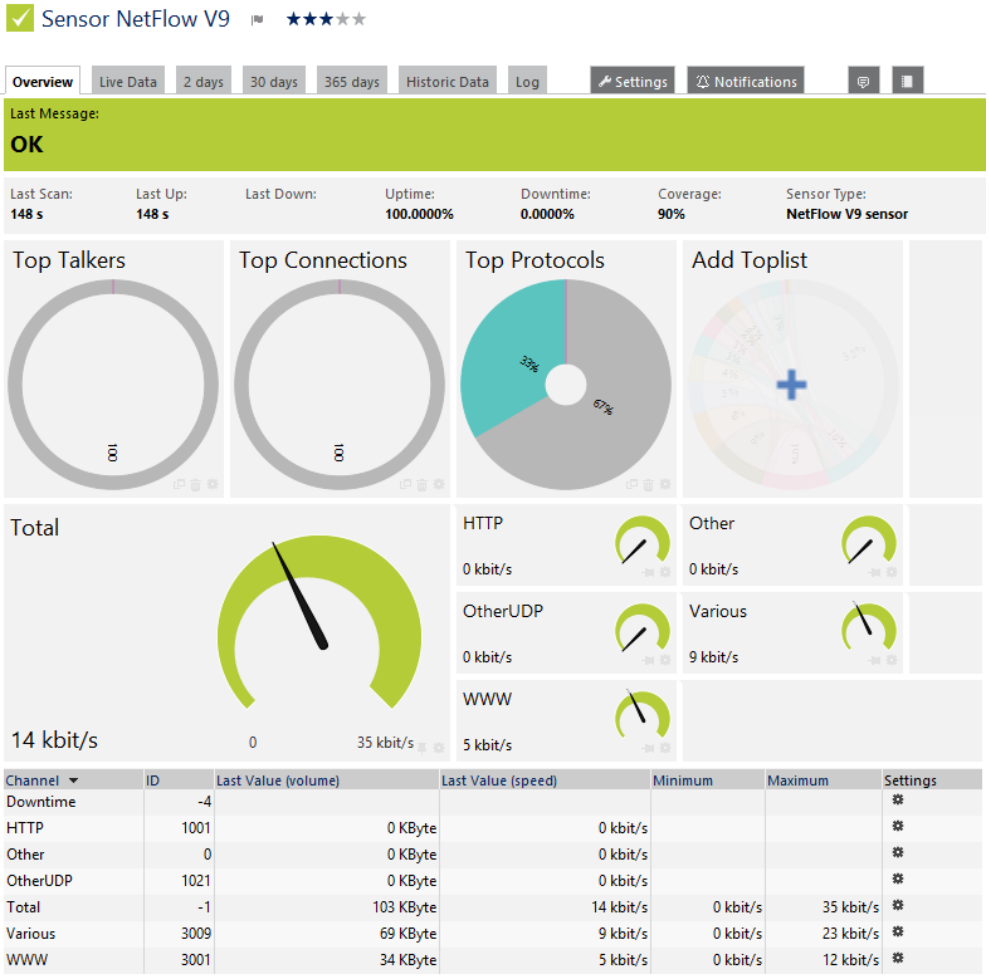
6.8.79 NetFlow V9 (Custom) Sensor

The NetFlow V9 (Custom) sensor receives traffic data from a NetFlow V9 compatible device and shows the traffic by type. Please make sure the sensor matches the NetFlow version your device is exporting! In this custom sensor, you can define your own channel definitions to divide traffic into different channels.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



NetFlow V9 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/netflow_v9.png

Remarks

- Note: You must enable NetFlow export of the respective version on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Knowledge Base: What is the Active Flow Timeout in Flow sensors?
- This sensor does not support more than 50 channels 1177 officially.
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETFLOW SPECIFIC SETTINGS

Receive NetFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the NetFlow export options of your hardware router device. Please enter an integer value. Note: When configuring export, make sure you select the appropriate NetFlow version for this sensor.
Sender IP	Enter the IP address of the sending device you want to receive the NetFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive NetFlow Packets on IP	Select the IP address(es) on which PRTG listens to NetFlow packets. The list of IP addresses you see here is specific to your setup. To select an IP address, add a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. The IP address you select here must match the one you have configured in the NetFlow export options of your hardware router device. Note: When configuring export, please make sure you select the appropriate NetFlow version for this sensor.

NETFLOW SPECIFIC SETTINGS

Active Flow Timeout (Minutes)	Enter a time span in minutes after which new flow data must be received. If the timeout is reached and no new data is received, the sensor may switch to an **Unknown** status. Please enter an integer value. We recommend that you set the timeout one minute longer than the respective timeout configured in your hardware router device. Please see section **More** for more details about this setting. Note: If you set this value too low, flow information might get lost!
Sampling Mode	Define if you want to use the sampling mode. This setting must accord to the setting in the flow exporter. Choose between: ▪ **Off**: The standard flow will be used. ▪ **On**: Switch into sampling mode and specify the sampling rate below.
Sampling Rate	This field is only visible when sampling mode is enabled above. Enter a number that matches the sampling rate in your device. If the number is different, monitoring results will be incorrect. Please enter an integer value.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Definitions for xFlow, IPFIX, and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined will be accounted to the default channel named **Other**. Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from:

PRIMARY TOPLIST

- **Top Talkers**
- **Top Connections**
- **Top Protocols**
- [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

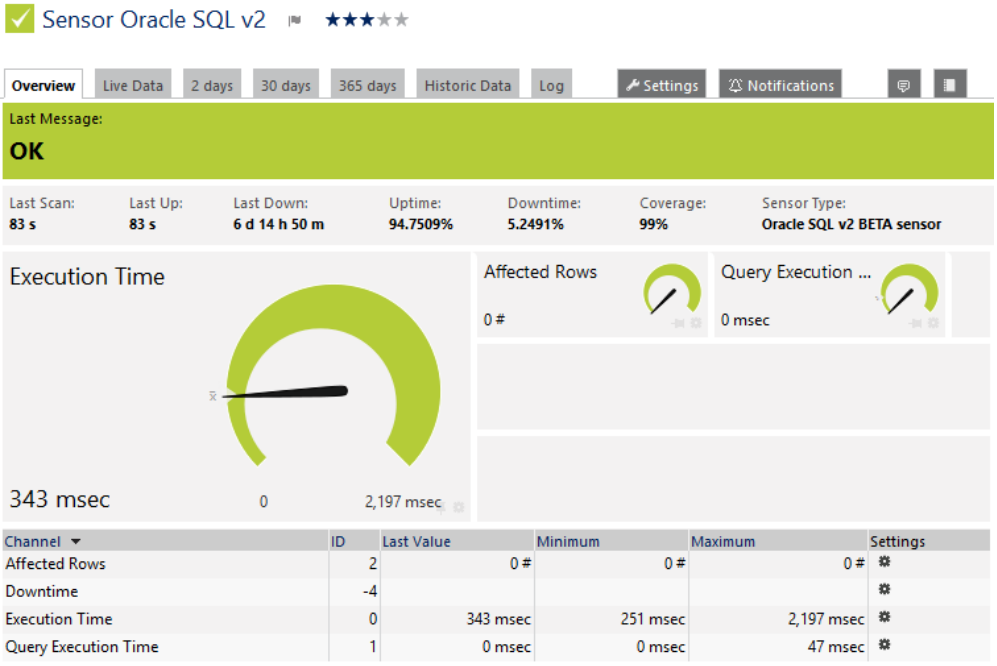
6.8.80 Oracle SQL v2 Sensor

The Oracle SQL v2 sensor monitors a database on an Oracle server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows which were addressed by the query (including select statements if you process data tables)
- It can also process the data table and show defined values in individual channels.



Oracle SQL v2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/oracle_sql_v2.png

Remarks

- Requires 1188 .NET 4.0 on the probe system.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on: If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- Save the SQL script with the query into the **\Custom Sensors\sql\oracle** subfolder of your PRTG installation. See manual section **Data Storage** 3135 for more information about how to find this path.
- This sensor type supports Oracle database servers version 10.2 or higher.
- This sensor type supersedes the outdated Oracle SQL sensor. We recommend that you use this new sensor to monitor Oracle SQL databases.
- PRTG Manual: **Monitoring Databases** 3033 (includes an example 3034 for channel value selection)
- Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Identifier	Enter the Oracle System ID (SID) or the SERVICE_NAME of the database the sensor will connect to. Specify below which type of identifier you use. By default, the sensor uses the SID as connection string. The identifier is defined in the CONNECT_DATA part of the TNSNames.ora file on the Oracle instance. For example, a system ID can look like this: orcl
Identification Method	Define which type of identifier you use to connect to the database. This type depends on the configuration of your Oracle server. Choose between: ▪ **Use SID as identifier (default)**: Connect to the database instance using a system ID as connection string. Enter the SID above. ▪ **Use SERVICE_NAME as identifier:** Connect to the database instance using a SERVICE_NAME as connection string. Enter the SERVICE_NAME above.

DATA

SQL Query File	Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see **Data Storage** 3135 section. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server. For example, a correct expression in the file could be: SELECT AVG (UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";". Note: Please be aware that with each request the full result set will be transferred, so use filters and limits in your query.
Use Transaction	Define if you want to use transactions and if they will affect the database content. Choose between: ▪ **Don't use transaction (default)**: No transactions will be executed. ▪ **Use transaction and always rollback**: Choose this option to ensure that no data in the database will be changed by the query. In the **SQL Query** field above, separate the single steps of the transaction with semicolons. ▪ **Use transaction and commit on success**: Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.
Data Processing	Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Just execute the query**: If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are only rows which were changed somehow with the query (for example, created, deleted, edited).

DATA

	▪ **Count table rows:** Choose this option if you perform a SELECT statement and want to monitor how many rows of the data table this statement returns. ▪ **Process data table**: Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with SELECT statements as well.
Handle DBNull in Channel Values as	This setting is only visible if you selected the process data table option above. Define the sensor behavior if DBNull is returned by the query. Choose between: ▪ **Error**: The sensor will show a **Down** status if DBNull is reported. ▪ **Number 0**: The sensor will recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	This setting is only visible if you selected the process data table option above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells which will be used in the sensor channels. Choose between: ▪ **Column number**: The channel value will be determined by using the value in row 0 of the column whose number you specify below. ▪ **Column name**: The channel value will be determined by using the value in row 0 of the column whose name you specify below. ▪ **Row number**: The channel value will be determined by using the value in column 0 of the row whose number you specify below. ▪ **Key value pair**: The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found. Please see manual section **Monitoring Databases** 3033 for an example 3034 for channel value selection.
Sensor Channel #x	This setting is only visible if you selected the process data table option above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for Channel #1 without enabling it manually. For all other possible channels, choose between: ▪ **Disable**: This channel will not be added to the sensor. ▪ **Enable**: This channel will be added to the sensor. Define the settings as described above.

DATA

	Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Name	This setting is only visible if you selected the process data table option above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Column Number	This setting is only visible if you selected the column number option above. Provide the number of the column which will be used to determine the channel value in row 0. Please enter an integer value.
Sensor Channel #x Column Name	This setting is only visible if you selected the column name option above. Provide the name of the column which will be used to determine the channel value in row 0. Please enter a string.
Sensor Channel #x Row Number	This setting is only visible if you selected the row number option above. Provide the number of the row which will be used to determine the channel value in column 0. Please enter an integer value.
Sensor Channel #x Key	This setting is only visible if you selected the key value pair option above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.
Sensor Channel #x Mode	This setting is only visible if you selected the process data table option above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from the data table. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from the data table.
Sensor Channel #x Unit	This setting is only visible if you have selected the process data table option above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

DATA

	▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you selected the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This settings is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Use Data Table Value in Sensor Message	This setting is only visible if you selected the process data table option above. Define if the sensor message will show a value from the data table. Choose between: ▪ **Disable**: Do not use a custom sensor message. ▪ **Enable**: Define a custom sensor message with the value of a defined channel.

DATA

Sensor Message Column Number	This setting is only visible if you selected the column number and sensor message options above. Specify the number of the column whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Column Name	This setting is only visible if you selected the column name and sensor message options above. Specify the name of the column whose value will be shown in the sensor message. Please enter a string.
Sensor Message Row Number	This setting is only visible if you selected the row number and sensor message options above. Specify the number of the row whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Key	This setting is only visible if you selected the key value pair and sensor message options above. Specify the key for the value which will be shown in the sensor message. Please enter a string.
Sensor Message	This setting is only visible if you selected the sensor message option above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a

SENSOR DISPLAY	
	channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
