- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

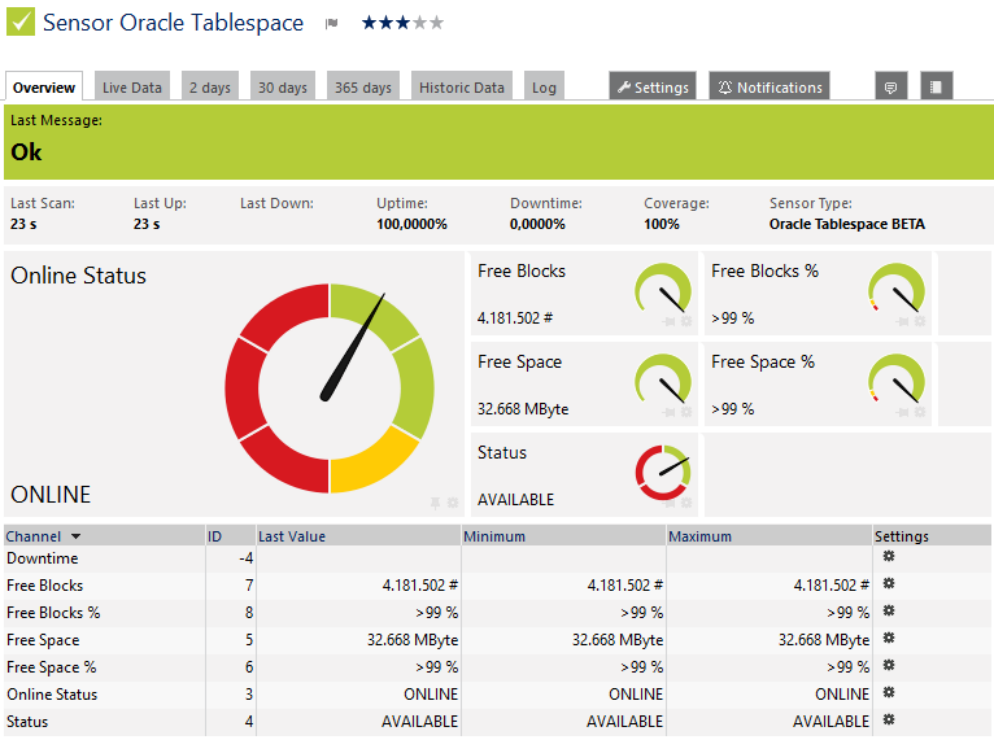
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.81 Oracle Tablespace Sensor

The Oracle Tablespace sensor monitors a tablespace on an Oracle server. It can show the following:

- Online status (online, system, recover, sysoff, offline, unknown)
- Status (available, invalid, unknown)
- Free disk space in bytes and percent
- Number of free blocks and in percent



Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Free Blocks	7	4.181.502 #	4.181.502 #	4.181.502 #	
Free Blocks %	8	>99 %	>99 %	>99 %	
Free Space	5	32.668 MByte	32.668 MByte	32.668 MByte	
Free Space %	6	>99 %	>99 %	>99 %	
Online Status	3	ONLINE	ONLINE	ONLINE	
Status	4	AVAILABLE	AVAILABLE	AVAILABLE	

Oracle Tablespace Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/oracle_tablespace.png

Remarks

- This sensor type supports Oracle database servers version 10.2 or higher.
- Requires 1202 .NET 4.0 on the probe system.
- Requires 1202 sufficient privileges for the account that you use for the connection. We recommend that you use the SYSTEM account.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- PRTG Manual: **Monitoring Databases** 3033

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Requirement: Sufficient Account Privileges

Please use an account for the connection that has the privileges to see all (or specific) views. We recommend that you use the SYSTEM account if possible, otherwise grant your DBA the SELECT_CATALOG_ROLE to the account that you use. Without sufficient privileges you may see the error message "ORA-00942: table or view does not exist".

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

In the appearing dialog box in the **Add Sensor** dialog, enter the Oracle System ID 1203 to access the tablespace selection. Select the tablespaces in the Oracle database you want to monitor. PRTG creates one sensor for each tablespace you choose. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

TABLESPACE SPECIFIC

Tablespace	Select the tablespaces you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ORACLE SPECIFIC

Identifier	Enter the Oracle System ID (SID) or the SERVICE_NAME of the database the sensor will connect to. Specify below which type of identifier you use. By default, the sensor uses the SID as connection string. The identifier is defined in the CONNECT_DATA part of the TNSNames.ora file on the Oracle instance. For example, a system ID can look like this: orcl
Identification Method	Define which type of identifier you use to connect to the database. This type depends on the configuration of your Oracle server. Choose between: ▪ **Use SID as identifier (default)**: Connect to the database instance using a system ID as connection string. Enter the SID above. ▪ **Use SERVICE_NAME as identifier:** Connect to the database instance using a SERVICE_NAME as connection string. Enter the SERVICE_NAME above.

TABLESPACE SPECIFIC

Tablespace	Shows the tablespace that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.82 Packet Sniffer Sensor

The Packet Sniffer sensor monitors the headers of data packets that pass a local network card using built-in packet sniffer. You can choose from predefined channels. The sensor analyzes only header traffic.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Packet Sniffer Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/packet_sniffer.png

Remarks

- By default, this sensor works only on a probe device.
- Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?
- For a general introduction to the technology behind packet sniffing, please see manual section **Monitoring Bandwidth via Packet Sniffing** 3010.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Note: By default, you can only monitor traffic passing the PRTG probe system on which's **Probe Device** the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) to which the switch sends a copy of all traffic. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG can analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNIFFER SPECIFIC

Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters you define in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Network Adapters	Define the network adapters that this sensor monitors. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name. You can also select and deselect all items by using the check box in the table head.
Log Stream Data to Disk (for Debugging)	Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between: ▪ **None (recommended)**: Do not write additional log files. We recommend this for normal use cases. ▪ **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel. ▪ **All stream data**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.
- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

More

Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?

- http://kb.paessler.com/en/topic/60203

6.8.83 Packet Sniffer (Custom) Sensor

The Packet Sniffer (Custom) sensor monitors the headers of data packets that pass a local network card using built-in packet sniffer. You can define your own channels. There are no predefined channels for this sensor type. This sensor analyzes only header traffic.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Downtime	-4					
Infrastructure	3007	33 KByte	5 kbit/s	2 kbit/s	5 kbit/s	
NetBIOS	3008	223 KByte	30 kbit/s	14 kbit/s	30 kbit/s	
Other	0	196 KByte	27 kbit/s	0 kbit/s	27 kbit/s	
Remote Control	3005	36 KByte	5 kbit/s	1 kbit/s	5 kbit/s	
Total	-1	3.068 KByte	419 kbit/s	0 kbit/s	419 kbit/s	
Various	3009	1.518 KByte	207 kbit/s	101 kbit/s	207 kbit/s	
WWW	3001	1.063 KByte	145 kbit/s	0 kbit/s	145 kbit/s	

Packet Sniffer Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/packet_sniffer.png

Remarks

- By default, this sensor works only on a probe device.
- This sensor does not support more than 50 channels 1223 officially.
- For a general introduction to the technology behind packet sniffing, please see manual section **Monitoring Bandwidth via Packet Sniffing** 3010.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Note: By default, you can only monitor traffic passing the PRTG probe system on which's **Probe Device** the sensor is set up (either a local or remote probe). To monitor other traffic in your network, you can configure a monitoring port (if available) to which the switch sends a copy of all traffic. You can then physically connect this port to a network card of the computer the PRTG probe (either local or remote probe) is running on. This way, PRTG will be able to analyze the complete traffic that passes through the switch. This feature of your hardware may be called Switched Port Analyzer (SPAN), port mirroring, or port monitoring.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNIFFER SPECIFIC

Include Filter	Define if you want to filter any traffic. If you leave this field empty, the sensor includes all traffic. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters you define in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow and Packet Sniffer Sensors** 3087 section.
Channel Definition	Please enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Defintions for xFlow and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined is accounted to the default channel named **Other**.

SNIFFER SPECIFIC

Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze. We recommend that you do not use more than 20 channels in graphs and tables, and not more than 100 channels in total. For performance reasons, it is better to add several sensors with less channels each.

Network Adapters

Define the network adapters that this sensor monitors. You see a list of names with all adapters available on the probe system. To select an adapter, set a check mark symbol in front of the respective name. You can also select and deselect all items by using the check box in the table head.

Log Stream Data to Disk (for Debugging)

Define if the probe will write a log file of the stream and packet data to the data folder (see **Data Storage** 3135). Choose between:

- **None (recommended)**: Do not write additional log files. Recommended for normal use cases.
- **Only for the 'Other' channel**: Only write log files of data that is not filtered otherwise and therefore accounted to the default **Other** channel.
- **All stream data**: Write log files for all data received.

Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY

	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

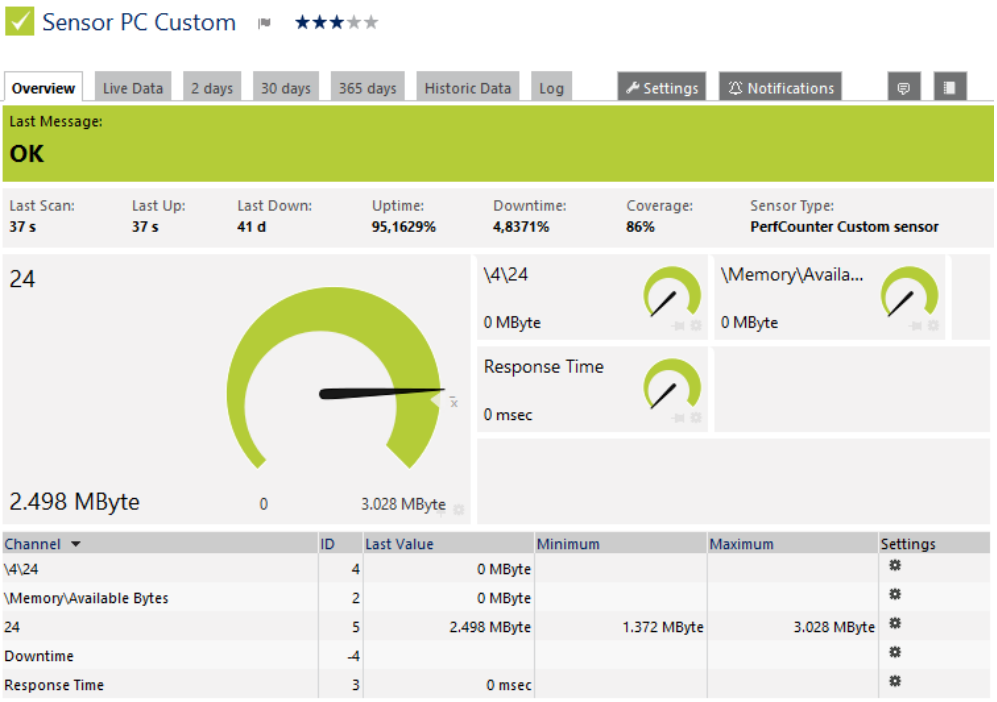
6.8.84 PerfCounter Custom Sensor

The PerfCounter Custom sensor monitors a configured set of Windows Performance Counters. You can define your own channels. There are no predefined channels available for this sensor type. To find out which performance counters are available on the target system and what their names are, please see section **More** 1241.

- This sensor can show Windows performance counters individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



PerfCounter Custom Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/perfcounter_custom.png

Remarks

- Requires 1233 Windows credentials in the parent device settings.
- Requires 1233 the Windows Remote Registry service to be running on the target computer.
- Requires 1233 Windows Server 2008 R2 or later on the probe system.
- Knowledge Base: How can I find out the names of available Performance Counters?
- Knowledge Base: My Performance Counter sensor does not work. What can I do?
- Note: You cannot add different performance counters with the same name to one sensor.
- Note: If a performance counter contains angle brackets (< or >), please do not edit the channel settings because this might cause an error.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

Note: The user account has to be a member of the Performance Monitor Users user group on the target system.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the RemoteRegistry "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 R2 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

PERFORMANCE COUNTER SETTINGS

List of Counters	Enter a list of performance counters which will be queried. Define one counter per row. PRTG will create one channel for each counter. Use the following syntax: the name of the counter, followed by two colons (::) and the unit. Example: \Processor(_Total)\% Processor Time::% Note: It is not possible to monitor different performance counters with the same name in one sensor. The sensor uses the counter as channel name, so this would create duplicate channels which PRTG does not support. If you want to monitor different performance counters with the same name, please add one sensor for each counter. You can also create a custom sensor 2707. For example, you can write a PowerShell query that connects to the target device, retrieves the desired counters with the Get-Counter cdmlet, and reports them back to PRTG as individual channels. Note: If your custom performance counter includes an angle bracket (< or >), please do not edit the **Sensor Channels Settings** 2711 (for example, limits) after creating the sensor! This might lead to a malfunctioning sensor.
Mode	Define the mode for the return value of the performance counter. This setting determines if the returning value will be displayed as absolute value or if the difference between the last and the current value will be used. Choose between: ▪ **Absolute (recommended)**: The returning value will be displayed as absolute value. ▪ **Difference**: The difference between last and current value will be displayed. Note: Please make sure that all counters which are monitored are capable of this mode if you select it.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PERFORMANCE COUNTER SETTINGS

List of Counters	Shows the performance counters that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Mode	Shows the mode in which the sensor displays the returning values. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a

SENSOR DISPLAY	
	channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: How can I find out the names of available Performance Counters?

- http://kb.paessler.com/en/topic/50673

Knowledge Base: Remote Monitoring of Specific Performance Counters

- http://kb.paessler.com/en/topic/59804

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.85 PerfCounter IIS Application Pool Sensor

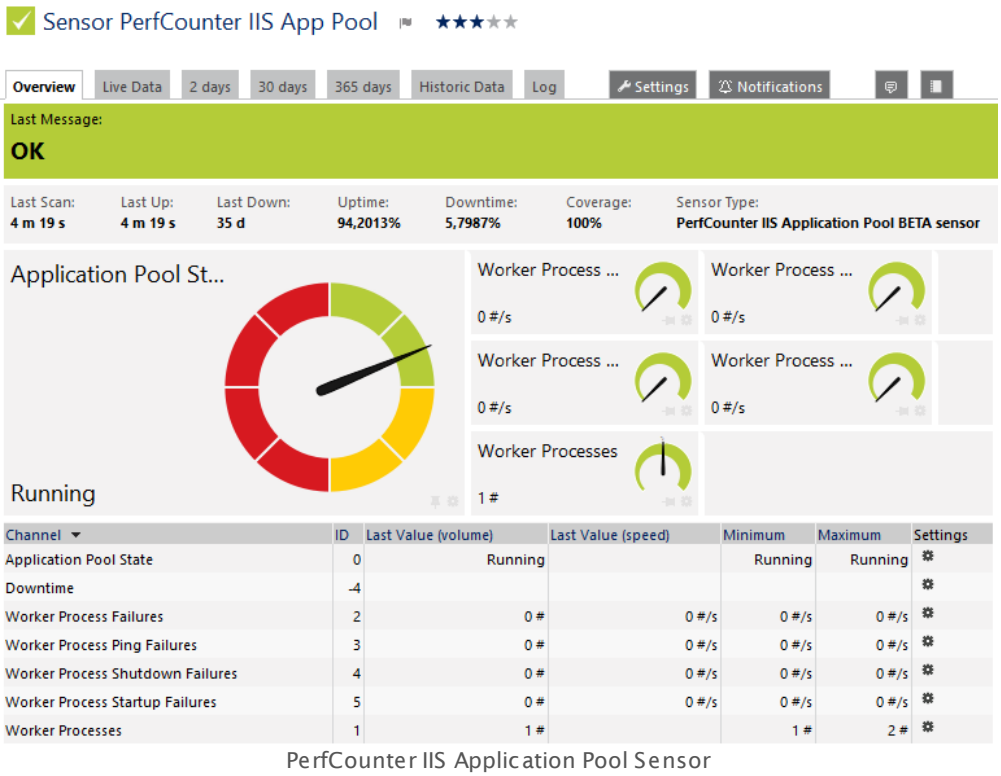
The PerfCounter IIS Application Pool sensor monitors a Microsoft Internet Information Services (IIS) application pool using Windows Performance Counters.

It can show the following:

- Overall status of the application pool: Running (sensor status 135 **Up**), Initialized or Shutdown Pending (**Warning**), or Unavailable, Uninitialized, Stopping, Stopped, or Delete Pending (**Down**)

- Number of worker processes
- Number of failures in worker processes per second
- Number of ping failures per second
- Number of shutdown failures per second
- Number of startup failures per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



PerfCounter IIS Application Pool Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/PerfCounter_IIS_Application_Pool.png

Remarks

- Requires 1243 Microsoft IIS version 7.5 or later on the target system.
- Requires 1243 Windows credentials in the parent device settings.
- Requires 1243 the Windows Remote Registry service to be running on the target computer.
- Requires 1243 Windows Server 2008 R2 or later on the probe system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Requirement: Microsoft IIS Version 7.5

In order to monitor Microsoft Internet Information Services (IIS) application pools, this sensor needs IIS version 7.5 or later to be installed on the target system.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

Note: The user account has to be a member of the Performance Monitor Users user group on the target system.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the RemoteRegistry "Remote Registry" Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 R2 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Microsoft Internet Information Services (IIS) application pools that you want to monitor. PRTG creates one sensor for each pool you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IIS APPLICATION POOL SPECIFIC

Application Pool	Select the application pools you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IIS APPLICATION POOL SPECIFIC

Application Pool	Shows the name of the application pool that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.86 Ping Sensor

The Ping sensor sends an Internet Control Message Protocol (ICMP) echo request ("Ping") from the computer running the probe to the device it is created on to monitor the availability of a device. Default is 5 pings per scanning interval.

It can show the following:

- Ping time
- Minimum ping time when using more than one ping per interval
- Maximum ping time when using more than one ping per interval
- Packet loss in percent when using more than one ping per interval

Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ping.png

Remarks

- Knowledge Base: How to create/customize statistical PING sensor?
- Knowledge Base: Can I create an inverse Ping sensor?

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PING SETTINGS

Timeout (Sec.)	Enter a timeout in seconds for the Ping. If the reply takes longer than this value defines, the sensor will cancel the request and shows an error message. The maximum timeout value is 300 seconds (5 minutes).
Packet Size (Bytes)	Enter the packet size in bytes for the Ping. You can choose any value between 1 and 10000. We recommend that you use the default value.
Ping Method	Define the kind of Ping check that the sensor performs. Choose between: ▪ **Send one single Ping**: With each scanning interval, send a single Ping only. A sensor in this setting will show the Ping time only. This setting is good for simple availability monitoring. ▪ **Send multiple Ping request**: With each scanning interval, send multiple Pings in a row. A sensor in this setting will also show minimum and maximum Ping time as well as packet loss (in percent). This setting is good if you want to create reports about average Ping times out of a series of ping requests. This is the default setting. Note: When using multiple request, all of them have to get lost to show a **Down** status 135. For example, if there is only one Ping request answered in a series of five, the sensor will still show a green **Up** status.
Ping Count	This field is only visible if you enable sending multiple Pings above. Enter the number of Pings that the sensor sends in a row for one interval. Please enter an integer value. The default value is 5.
Ping Delay (in ms)	This field is only visible if you enable sending multiple Pings above. Enter the time in milliseconds the sensor waits between two Ping requests. Please enter an integer value. The default value is 5. Note: Increase the value if the target device drops Ping packets due to denial-of-service (DOS) suspicion.
Auto Acknowledge	You can define that a **Down** status of this sensor will be acknowledged 162 automatically. ▪ **Show "Down" status on error (default)**: Do not automatically acknowledge an alarm if this sensor changes to a **Down** status. ▪ **Show "Down (Acknowledged)" status on error**: Automatically acknowledge an alarm. If this sensor changes to a **Down** status, it will automatically show **Down (Acknowledged)** instead.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Knowledge Base: How to create/customize statistical PING sensor?

- http://kb.paessler.com/en/topic/1873

Knowledge Base: Can I create an inverse Ping sensor?

- http://kb.paessler.com/en/topic/10203

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.87 Ping Jitter Sensor

The Ping Jitter sensor sends a series of Internet Control Message Protocol (ICMP) echo requests ("Pings") to the given URI to determine the statistical jitter.

This sensor shows the following:

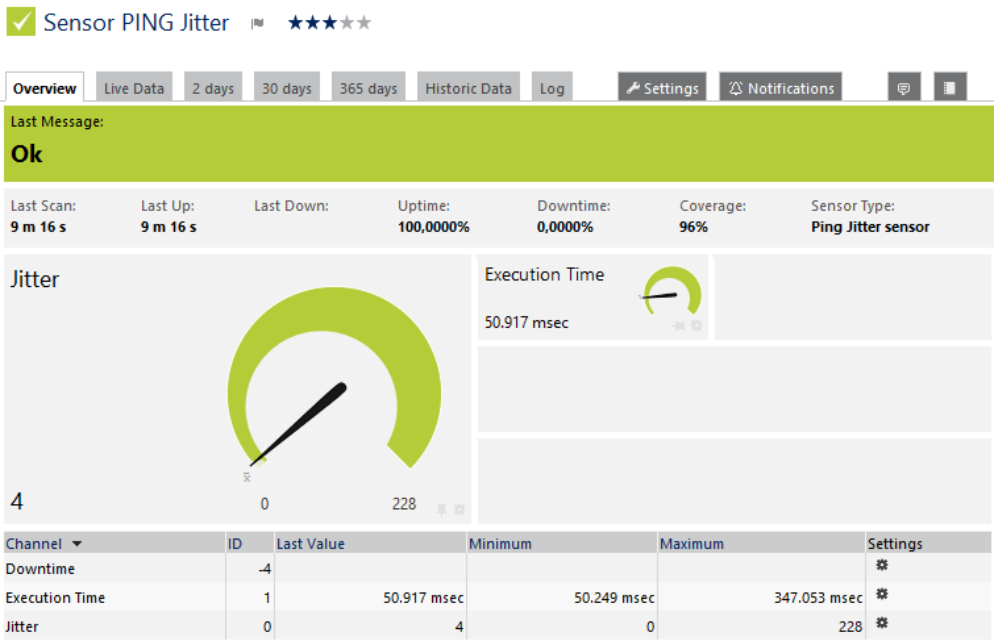
- Statistical jitter value
- Execution time

The Real Time Jitter value is updated every time a packet is received using the formula described in RFC 1889:

Jitter = Jitter + (abs(ElapsedTime – OldElapsedTime) – Jitter) / 16

The Statistical Jitter value is calculated on the first x packets received using the statistical variance formula:

Jitter Statistical = SquareRootOf(SumOf((ElapsedTime[i] – Average) ^ 2) / (ReceivedPacketCount – 1))



Ping Jitter Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ping_jitter.png

Remarks

- Requires 1262 .NET 4.0 or 4.5 on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Ping Count	Define the number of Internet Control Message Protocol (ICMP) pings that this sensor sends. Please enter an integer value.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

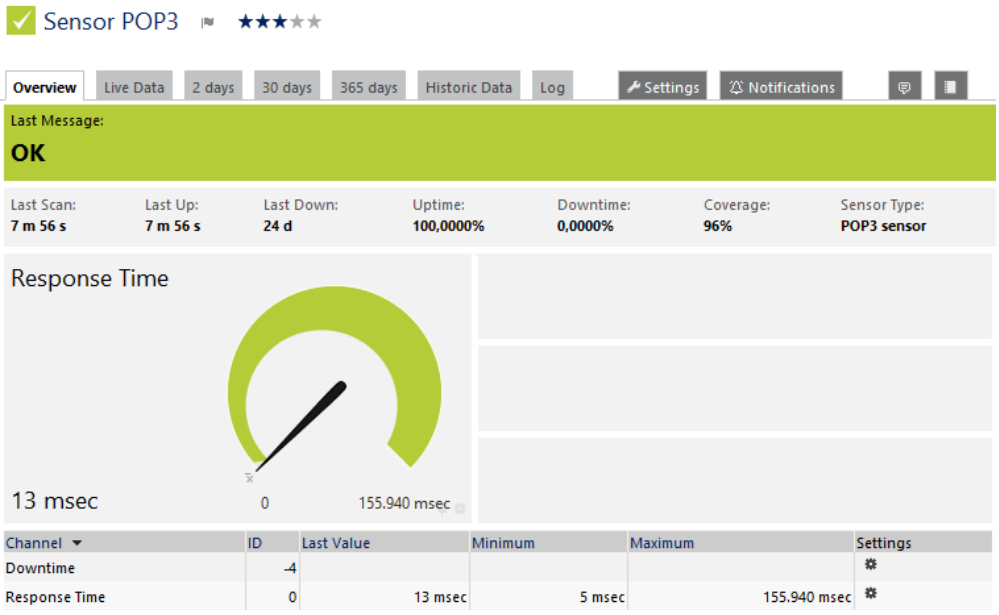
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.88 POP3 Sensor

The POP3 sensor monitors an email server using Post Office Protocol version 3 (POP3).

- It shows the response time of the server.



POP3 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/pop3.png

Remarks

- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

POP3 SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Specify the port that the sensor uses for the POP3 connection. This is usually port 110 for non-secure connections and usually port 995 for SSL connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.

TRANSPORT-LEVEL SECURITY

Sensor Specific

Define the security level for the sensor connection. Choose between:

- **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption.
- **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption.
- **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135.
- **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

POP3 AUTHENTICATION

Type	Select the kind of authentication for the POP3 connection. Choose between: • **Without login**: Monitor the connection to the POP3 server only. • **Username and password**: Log on to the POP3 server with username and password (simple login, non-secure). • **128-bit MD5 hash value (APOP)**: Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you connect to.
Username	This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.
Password	This field is only visible if you select an option with login above. Enter a password for POP3 authentication. Please enter a string.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

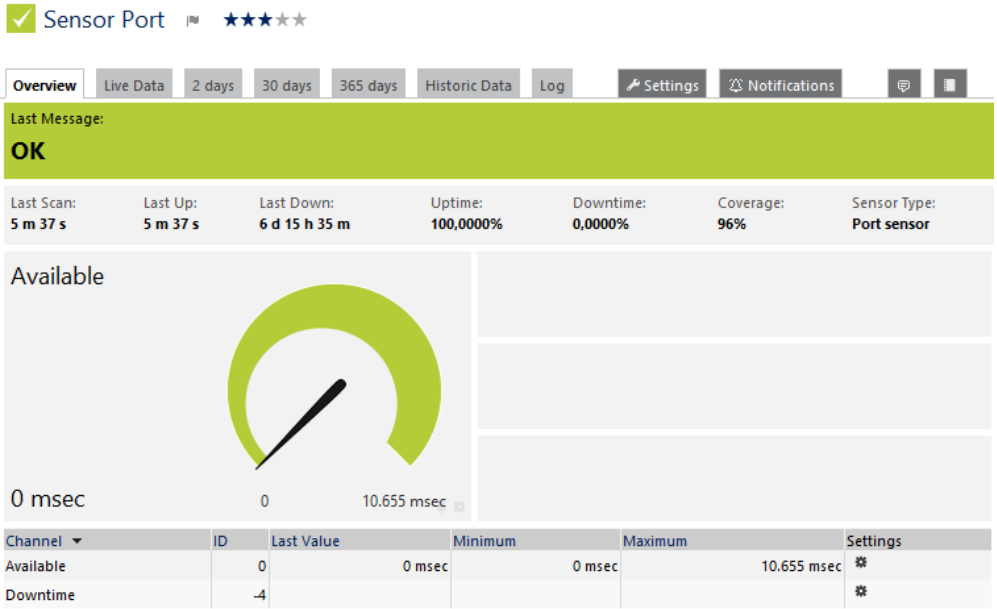
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.89 Port Sensor

The Port sensor monitors a network service by connecting to its port. It tries to connect to the specified TCP/IP port number of a device and waits for the request to be accepted. Depending on your settings, it can alert you either when the monitored port is open, or when it is closed.

- The sensor shows the time until a request to a port is accepted.



Port Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/port.png

Remarks

- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PORT SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value.

TRANSPORT-LEVEL SECURITY

Security	Define the security level for the sensor connection. Choose between: ▪ **Use Transport-Level Security (default)**: Establish the connection with the strongest TLS method that the target device provides. ▪ **Do not use Transport-Level Security**: Establish the connection without encryption.

ADVANCED SENSOR SETTINGS

Goal	Define how the sensor will report on the port defined above. Choose between: ▪ **Open**: The sensor shows a green **Up** status 135 if the port is open, and a red **Down** status if the port is closed. ▪ **Closed**: The sensor shows a green **Up** status if the port is closed, and a red **Down** status if the port is open.
Command	Define whether the sensor will send a command after opening the port. Choose between: ▪ **Don't send command**: Only check if a connection to the port is possible. ▪ **Send command**: Open a Telnet session to the respective port and send the command. Note: You cannot use this option if the target machine is a web server.
Command	This field is only visible if you enable sending a command above. Enter a command that the sensor sends in a Telnet session to the respective port. You cannot use line breaks, but a simple Telnet command in a single line only. Please enter a string.
Response	Define if the sensor will process the received response further. Choose between: ▪ **Ignore response**: Do not check the response. ▪ **Check response code (integer)**: Check if the response matches a defined response code. Define below.

ADVANCED SENSOR SETTINGS

	▪ **Check response text**: Check if the response matches a defined response text. Define below.
Allowed Code	This field is only visible if you enable response code check above. Enter a code that the target device must return. If it does not match, the sensor will show a **Down** status. Please enter an integer value.

Check For Existing Keywords (Positive)	This setting is only visible if you activated text processing above. Check if a certain keyword is part of the received value. If there is no match, the sensor shows a "Down" status. ▪ **Disable**: Do not check for positive keywords. ▪ **Enable keyword check (positive)**: Check if a certain keyword exists in the received value. Define below.
Text Must Include	This setting is only visible if you activated keyword check above. Enter a search string that the returned value must contain.
For Keyword Search Use	Define the method that you want to use for the search string. Choose between: ▪ **Plain Text**: Search for a simple string. ▪ **Regular Expression**: Search using a regular expression. For more details, see **Regular Expressions** 3105 section.
Check For Existing Keywords (Negative)	This setting is only visible if you activated text processing above. Check if a certain keyword is not part of the received value. If there is a match, the sensor shows a "Down" status. ▪ **Disable**: Do not check for negative keywords. ▪ **Enable keyword check (negative)**: Check if a certain keyword does not exist in the received value. Define below.
Text Must Not Include	This setting is only visible if you activated keyword check above. Enter a search string that the returned value must not contain.
For Keyword Search Use	Define the method you want to use for the search string. Choose between: ▪ **Plain Text**: Search for a simple string. ▪ **Regular Expression**: Search using a regular expression. For more details, see **Regular Expressions** 3105 section.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

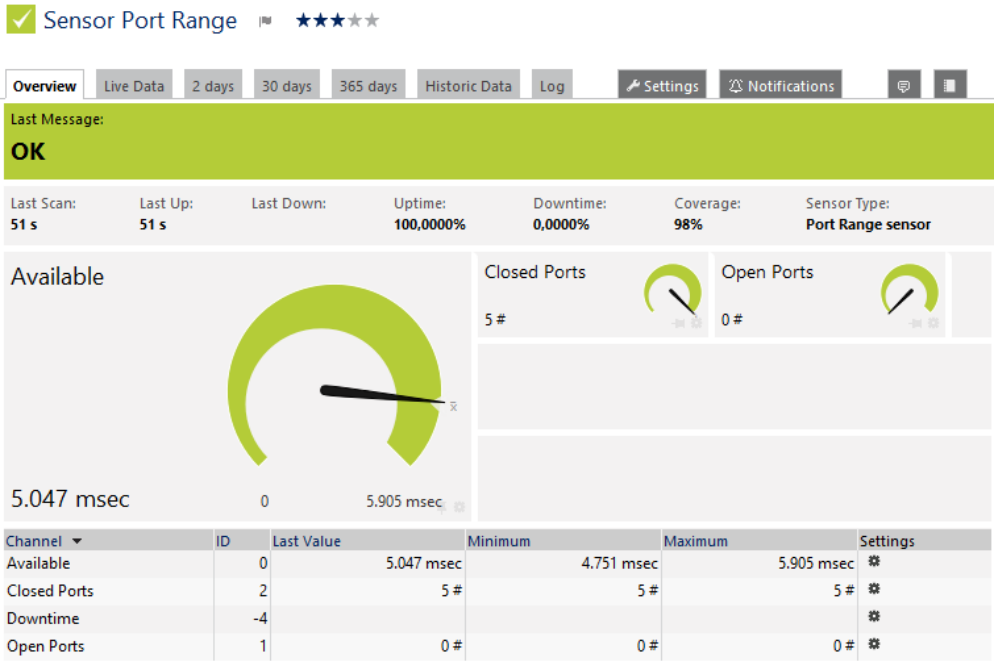
6.8.90 Port Range Sensor

The Port Range sensor monitors a network service by connecting to various TCP/IP ports. It tries to connect to the specified TCP/IP port numbers of a device in succession and waits for each request to be accepted.

It shows the following:

- Number of closed ports
- Number of open ports
- Time until requests are accepted

Optionally, you can set limits in the sensor channel settings 2711. This way you can get alerts about open/closed ports.



Port Range Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/port_range.png

Remarks

- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PORT RANGE SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port-by-Port-Delay (ms)	Specify in milliseconds how long the sensor will wait to go to the next port while running through all given ports.

PORT RANGE SPECIFIC

Port Range Selection Method	Define whether you want to monitor all ports within a range or if you want to monitor several individual ports. Choose between: ▪ **Port range with start/end:** Monitor ports within a range. ▪ **List of ports:** Monitor several individual ports.
Range Start	This field is only visible if you enable the port range method above. Enter the port number where the scan starts. Please enter an integer value.
Range End	This field is only visible if you enable the port range method above. Enter the port number where the scan ends. Please enter an integer value.
Port List	This field is only visible if you enable the list of ports method above. Enter the numbers of the ports the sensor will try to connect to. Enter one or more individual integer values, each port in one line.
If Value Changes	Define what the sensor will do if the number of closed ports or open ports changes. Choose between: ▪ **Ignore changes**: No action is taken on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

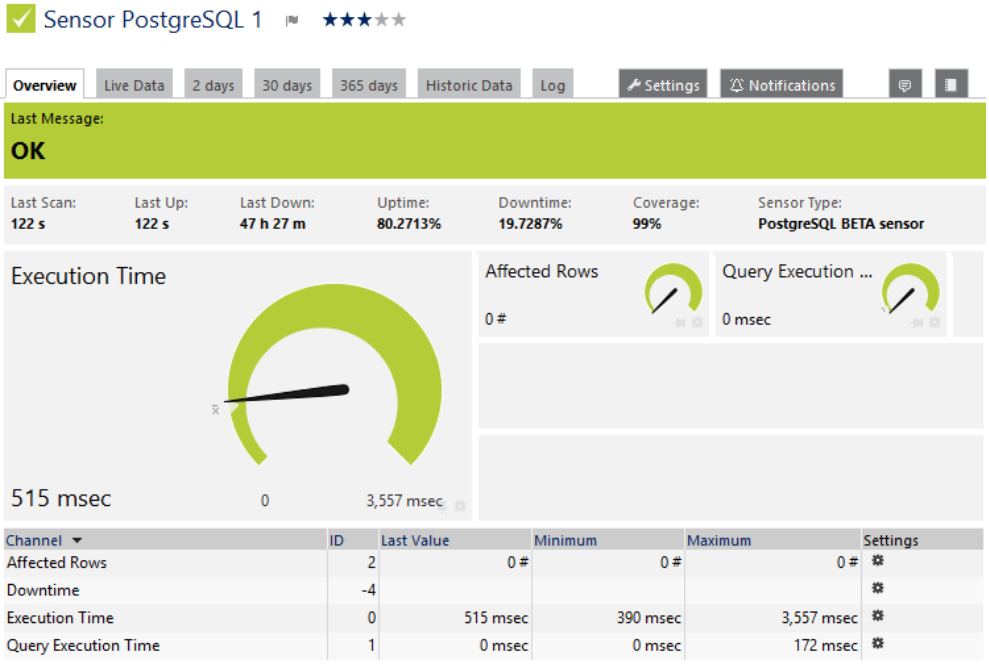
For more general information about settings, please see the **Object Settings** 159 section.

6.8.91 PostgreSQL Sensor

The PostgreSQL sensor monitors a database on a PostgreSQL server and executes a defined query.

It can show the following:

- Execution time of the whole request (including connection buildup, query execution, transaction handling, disconnection)
- Execution time of a given query
- Number of rows which were addressed by the query (including select statements if you process data tables)
- It can also process the data table and show defined values in individual channels.



PostgreSQL Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/postgresql.png

Remarks

- Requires 1298 .NET 4.0 on the probe system.
- Define **Credentials for Database Management Systems** 334 in settings that are higher in the **Object Hierarchy** 89, for example, in the parent device settings 324.
- Your SQL query must be stored in a file on the system of the probe the sensor is created on: If you use it on a remote probe, store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.

- Save the SQL script with the query into the **\Custom Sensors\sql\postgresql** subfolder of your PRTG installation. See manual section **Data Storage** 3135 for more information about how to find this path
- This sensor type supports PostgreSQL 7.x or later.
- PRTG Manual: **Monitoring Databases** 3033 (includes an example 3034 for channel value selection)
- Knowledge Base: How can I monitor strings from an SQL database and show a sensor status depending on it?

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATABASE SPECIFIC

Database	Enter the name of the PostgreSQL database to which the sensor connects. For example, such a database's name could be MyDatabase. This is a logical entity on the database server where database objects like tables or stored procedures exist.
SSL Mode	Select the PostgreSQL SSL mode for the sensor connection. PostgreSQL SSL connections require OpenSSL to be installed on both the target server and on the PRTG probe system with this sensor. The SSL mode options you can choose here are the same as the values of the PostgreSQL sslmode parameter. PRTG sends it with the sensor requests. Choose between these SSL modes: ▪ **Disable** ▪ **Allow** ▪ **Prefer** ▪ **Require** For details about the PostgreSQL SSL modes, please refer to the PostgreSQL documentation.

DATA

SQL Query File	Select an SQL script file that includes a valid SQL statement to execute on the server. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. The script will be executed with every scanning interval. The list contains SQL scripts from the database management system specific **\Custom Sensors\sql** subfolder of your PRTG installation. Store your script there. If used on a remote probe, the file must be stored on the system running the remote probe. If used on a cluster probe, you must store the file on all servers running a cluster node! For more information on how to find this path, please see **Data Storage** 3135 section. By default, there is the demo script **Demo Serveruptime.sql** available that you can use to monitor the uptime of the target server. For example, a correct expression in the file could be: SELECT AVG (UnitPrice) FROM Products. If you want to use transactions, separate the individual steps with semicolons ";". Note: Please be aware that with each request the full result set will be transferred, so use filters and limits in your query.
Use Transaction	Define if you want to use transactions and if they will affect the database content. Choose between: ▪ **Don't use transaction (default)**: No transactions will be executed. ▪ **Use transaction and always rollback**: Choose this option to ensure that no data in the database will be changed by the query. In the **SQL Query** field above, separate the single steps of the transaction with semicolons. ▪ **Use transaction and commit on success**: Choose this option to perform changes on the database with the query. The changes will only apply if all execution steps succeed without any errors. In the **SQL Query** field above, separate the single steps of the transaction with semicolons.
Data Processing	Define if you want to process data from the database. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Just execute the query**: If you select this option, the sensor will only show information about the number of affected rows and the execution time of the query. Affected rows are only rows which were changed somehow with the query (for example, created, deleted, edited).

DATA

	▪ **Count table rows:** Choose this option if you perform a SELECT statement and want to monitor how many rows of the data table this statement returns. ▪ **Process data table**: Select this option to read and analyze the queried data table. If you select this option, the sensor will count rows with SELECT statements as well.
Handle DBNull in Channel Values as	This setting is only visible if you selected the process data table option above. Define the sensor behavior if DBNull is returned by the query. Choose between: ▪ **Error**: The sensor will show a **Down** status if DBNull is reported. ▪ **Number 0**: The sensor will recognize the result DBNull as a valid value and interpret it as the number 0.
Select Channel Value by	This setting is only visible if you selected the process data table option above. Define how the desired cell in the database table will be selected. This is necessary to configure the cells which will be used in the sensor channels. Choose between: ▪ **Column number**: The channel value will be determined by using the value in row 0 of the column whose number you specify below. ▪ **Column name**: The channel value will be determined by using the value in row 0 of the column whose name you specify below. ▪ **Row number**: The channel value will be determined by using the value in column 0 of the row whose number you specify below. ▪ **Key value pair**: The channel value will be determined by searching in column 0 for the key you specify below and returning the value in column 1 of the same row where the key value was found. Please see manual section **Monitoring Databases** 3033 for an example 3034 for channel value selection.
Sensor Channel #x	This setting is only visible if you selected the process data table option above. You can define up to 10 different channels for the data processing of this sensor. You have to define at least one data channel if you process the data table, so you will see all available settings for Channel #1 without enabling it manually. For all other possible channels, choose between: ▪ **Disable**: This channel will not be added to the sensor. ▪ **Enable**: This channel will be added to the sensor. Define the settings as described above.

DATA

	Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Name	This setting is only visible if you selected the process data table option above. Enter a unique name for the channel. Please enter a string. Channels will be generated dynamically with this name as identifier. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Column Number	This setting is only visible if you selected the column number option above. Provide the number of the column which will be used to determine the channel value in row 0. Please enter an integer value.
Sensor Channel #x Column Name	This setting is only visible if you selected the column name option above. Provide the name of the column which will be used to determine the channel value in row 0. Please enter a string.
Sensor Channel #x Row Number	This setting is only visible if you selected the row number option above. Provide the number of the row which will be used to determine the channel value in column 0. Please enter an integer value.
Sensor Channel #x Key	This setting is only visible if you selected the key value pair option above. Provide the key to search for in column 0 of the data table. The value in column 1 of the same row where the key value was found will be used to determine the channel value. Please enter a string.
Sensor Channel #x Mode	This setting is only visible if you selected the process data table option above. Define how to display the determined value in the channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between: ▪ **Absolute (recommended)**: Shows the value as the sensor retrieves it from the data table. ▪ **Difference**: The sensor calculates and shows the difference between the last and the current value returned from the data table.
Sensor Channel #x Unit	This setting is only visible if you have selected the process data table option above. Define the unit of the channel value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Choose between:

DATA

	▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you selected the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This settings is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Use Data Table Value in Sensor Message	This setting is only visible if you selected the process data table option above. Define if the sensor message will show a value from the data table. Choose between: ▪ **Disable**: Do not use a custom sensor message. ▪ **Enable**: Define a custom sensor message with the value of a defined channel.

DATA

Sensor Message Column Number	This setting is only visible if you selected the column number and sensor message options above. Specify the number of the column whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Column Name	This setting is only visible if you selected the column name and sensor message options above. Specify the name of the column whose value will be shown in the sensor message. Please enter a string.
Sensor Message Row Number	This setting is only visible if you selected the row number and sensor message options above. Specify the number of the row whose value will be shown in the sensor message. Please enter an integer value.
Sensor Message Key	This setting is only visible if you selected the key value pair and sensor message options above. Specify the key for the value which will be shown in the sensor message. Please enter a string.
Sensor Message	This setting is only visible if you selected the sensor message option above. Define the sensor message. Please enter a string. Use the placeholder {0} at the position where the value will be added.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a

SENSOR DISPLAY	
	channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

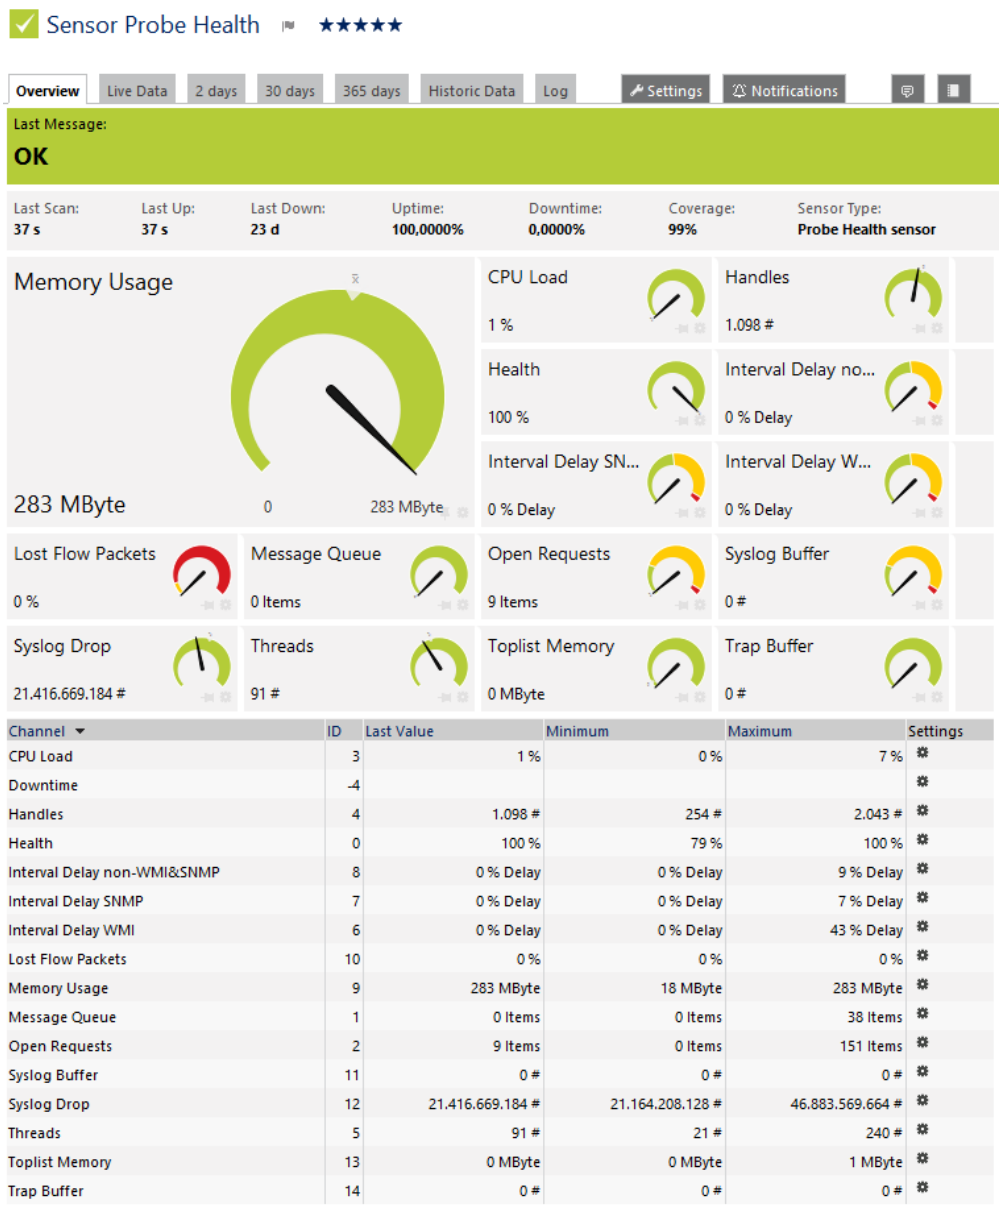
6.8.92 Probe Health Sensor

The Probe Health sensor monitors internal PRTG parameters. It shows the status of the PRTG probe (either for the local probe, a remote probe 3109, or a cluster 87 probe).

It checks various parameters of your PRTG system which can affect the quality of the monitoring results:

- **Health**: This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Probe Process CPU Load**: This channel shows the current percentage CPU load that the probe process causes. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.
- **Data Storage Free**: This channel shows the free disk space on the probe system. Approximately you need 200 KB disk space per sensor per day (with a 60 seconds scanning interval 272).
- **Handles**: This is a counter for the data structures of the operating system. It is responsible for internal resource management. Repeated obviously increasing values should be investigated.
- **Interval Delay non-WMI&SNMP**: This channel shows the percentage interval delay for all sensor types which are not from the type SNMP or WMI. If this value is over 0%, try to increase the scanning intervals 272 or distribute your sensors over multiple probes 3109.
- **Interval Delay SNMP**: This channel shows the percentage interval delay for SNMP sensors. If this value is above 0%, there are probably too many very slow SNMP V3 sensors. In this case, try to increase the monitoring intervals 272 or distribute the sensors over several probes 3109.
- **Interval Delay WMI**: This channel shows the percentage interval delay for WMI sensors. If this value is above 0%, WMI sensors could not check the target device according to their interval. 100% means that WMI sensors on the average are checked with twice their interval. For values above 0% try to increase the monitoring intervals 272 or distribute the sensors over several probes 3109 to keep the number of WMI sensors per probe below 120 (with 60 seconds interval) or 600 (with 300 seconds interval).
- **Lost Flow Packets**: This channel shows the percentage of lost flow 3012 packets. The higher this value, the less flow packages PRTG can handle. Usually, this value should be 0%. Investigate increasing values.
- **Memory Usage**: This channel shows the amount of memory being used by the PRTG probe service as reported by the memory manager. Repeated obviously increasing values should be investigated. If the value is constantly above 2 GB this indicates that PRTG runs at its limits. In this case you should distribute some sensors to Remote Probe 3109.
- **Message Queue**: This channel shows the number of monitoring results from the probe which have not been processed yet by the core. This value usually should stay below 1/10 of the sensor count.
- **Open Requests**: This channel shows the number of currently active monitoring requests. This value should stay below the maximum of 500 open requests.
- **Syslog Buffer**: This channel shows the number of buffered syslog packages. Usually, this value should be 0 (or very low). Investigate increasing values.

- **Threads**: This channel shows the number of program parts which are running simultaneously currently. This value can increase with heavy load. The number should not exceed 100 in normal operation.
- **Toplist Memory**: This channel shows the amount of RAM that the Toplists 2734 on this probe are using. Stay below 1 GB memory usage (depending on available memory on the probe system). If necessary, reduce the number of toplists or distribute them on multiple probes 3109 .
- **Trap Buffer**: This channel shows the number of buffered SNMP traps. Usually, this value should be 0 (or very low). Investigate increasing values.



Probe Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/probe_health.png

Remarks

- PRTG creates this sensor automatically and you cannot delete it.
- You can create this sensor only on a probe device (either local probe, a remote probe 3109, or a cluster 87 probe).
- Knowledge Base: My probe system is running out of disk space. What can I do?

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My probe system is running out of disk space. What can I do?

- http://kb.paessler.com/en/topic/64628

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

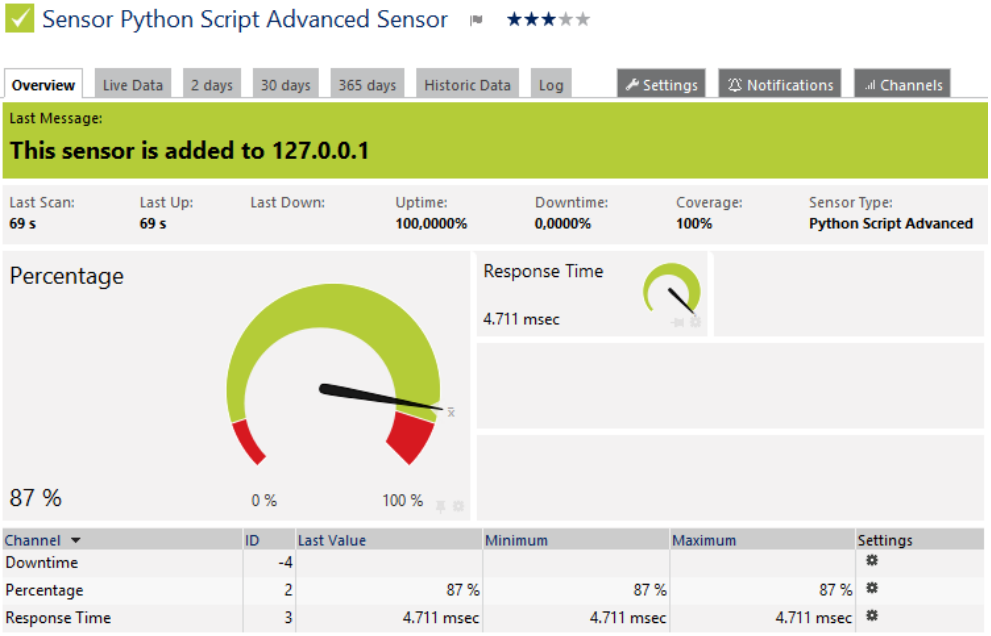
For more general information about settings, please see the **Object Settings** 159 section.

6.8.93 Python Script Advanced Sensor

The Python Script Advanced sensor executes a Python script on the computer running the local or remote probe. This option is provided as part of the PRTG Application Programming Interface (API). The return value of this sensor must be valid JSON or XML. For details about the return value format please see the **Application Programming Interface (API) Definition** 3086.

PRTG includes a CPython 3.4.2 interpreter to execute Python scripts for this sensor type. Because of this you do not have to install anything manually to use the Python Script Advanced sensor. Your Python scripts must be compatible to Python 3 to run with this interpreter. It is located in the the **\Python34** subfolder of your PRTG program directory. You can find the paepy package to easily create PRTG API conforming JSON output in the **\Python34\Lib\site-packages** folder.

- The sensor can show values returned by the Python script in multiple channels.



Python Script Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/python_script_advanced.png

Remarks

- You must store the script file on the system of the probe on which you create the sensor: If used on a remote probe, you must store the file on the system running the remote probe. In a cluster setup, copy the file to every cluster node.
- For best sensor usage we recommend that the return value is JSON encoded.
- The timeout of the sensor is its scanning interval 1323 minus 1 second. Ensure your Python script does not run longer than this.
- Print commands in the Python script are not supported and lead to an invalid JSON result.
- Exceptions in the script are not supported.

- Sensor channel values greater than 2^62 are not supported.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- This sensor does not support more than 50 channels[1319] officially.
- Knowledge Base: What is the Mutex Name in PRTG's EXE/Script Sensor's settings?

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually[256]. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Python Script	Select a Python script from the list. The sensor will execute it with every scanning interval[1323]. This list shows all Python script files available in the **\Custom Sensors\python** sub-directory of the probe system's PRTG program directory (see **Data Storage**[3135]). To appear in this list, please store the files into this folder ending in PY. To show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON. We recommend JSON encoded return values. For detailed information on how to build custom sensors and for the expected return format, please see the API documentation (**Application Programming Interface (API) Definition**[3086]). There, find detailed information on the **Custom Sensors** tab. Note: When using custom sensors on the **Cluster Probe**, please copy your files to every cluster node installation.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Python Script	Shows the Python script file that the sensor executes with each scan as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Security Context	Define the Windows user account that the sensor uses to run the Python interpreter. Choose between: ▪ **Use security context of probe service**: Run the selected file under the same Windows user account the probe is running on. By default, this is the Windows system user account (if not manually changed).

SENSOR SETTINGS

- **Use Windows credentials of parent device**: Use the Windows user account defined in the settings of the parent device on which you create this sensor. Please navigate to parent device settings 324 of this sensor to change these Windows credentials.

Device Credentials

Define if you want to transmit device credentials to the Python script. PRTG adds the device credentials to the JSON object that is passed to the script as command line parameter. Please navigate to parent device settings 324 of this sensor to change these credentials. Choose between:

- **Do not transmit device credentials**: No device credentials are given to the script.
- **Transmit Windows credentials**: Windows credentials 329 are given to the script.
- **Transmit Linux credentials**: Linux credentials 329 are given to the script.
- **Transmit SNMP credentials**: SNMP credentials 332 are given to the script.
- **Transmit all device credentials**: Windows, Linux, and SNMP credentials are all given to the script.

Note: All parameters are transmitted in plain text.

Additional Parameters

Define additional parameters to add to the JSON object that is passed to the script as command line parameter.

Please enter a string or leave the field empty.

Note: All parameters are transmitted in plain text.

Mutex Name

Define any desired mutex name for the process. All script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the **More** 1328 section below. Please enter a string or leave the field empty.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

DEBUG OPTIONS

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

Note: You can use **Write sensor result to disk** to inspect the passed JSON object that contains all parameters. This way you can find out which key you can access when you script.

Note: Transmitted passwords are masked in the log file.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: What is the Mutex Name in PRTG's EXE/Script Sensor's settings?

- http://kb.paessler.com/en/topic/6673

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

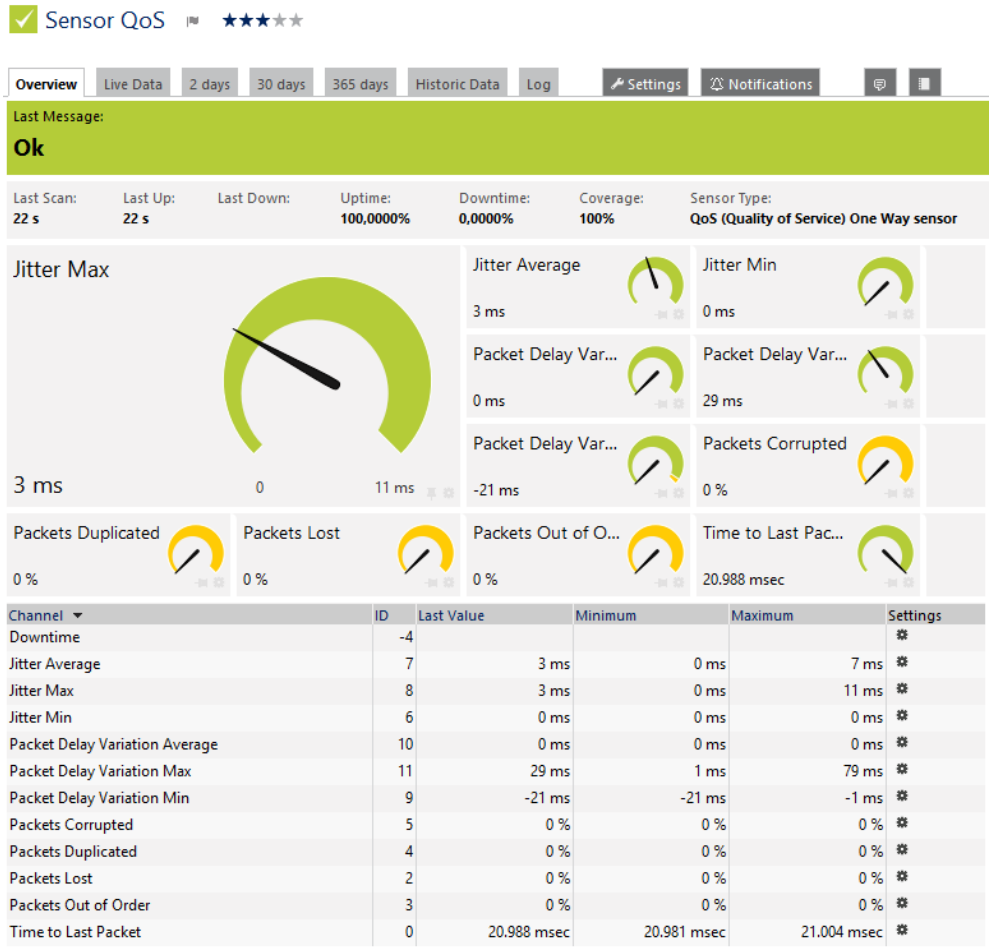
For more general information about settings, please see the **Object Settings** 159 section.

6.8.94 QoS (Quality of Service) One Way Sensor

The QoS (Quality of Service) One Way sensor monitors parameters regarding the quality of a network connection between two probes. This is important, for example, when using Voice over IP (VoIP) over this connection.

The sensor sends a series of UDP packets from the parent probe to another probe and measures these parameters:

- Jitter in milliseconds (maximum, minimum, average)
- Packet delay variation in milliseconds (maximum, minimum, average)
- Corrupted packets in percent
- Duplicated packets in percent
- Lost packets in percent
- Packets out of order in percent
- Time to last packet in milliseconds



Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Jitter Average	7	3 ms	0 ms	7 ms	
Jitter Max	8	3 ms	0 ms	11 ms	
Jitter Min	6	0 ms	0 ms	0 ms	
Packet Delay Variation Average	10	0 ms	0 ms	0 ms	
Packet Delay Variation Max	11	29 ms	1 ms	79 ms	
Packet Delay Variation Min	9	-21 ms	-21 ms	-1 ms	
Packets Corrupted	5	0 %	0 %	0 %	
Packets Duplicated	4	0 %	0 %	0 %	
Packets Lost	2	0 %	0 %	0 %	
Packets Out of Order	3	0 %	0 %	0 %	
Time to Last Packet	0	20.988 msec	20.981 msec	21.004 msec	

QoS (Quality of Service) One Way Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/qos.png

Remarks

- Note: You have to configure at least one remote probe 3108 in your setup for this sensor to work.
- You can create this sensor on the Probe Device of either a local or remote probe.
- For a general introduction to the technology behind Quality of Service monitoring, please see manual section **Monitoring Quality of Service** 3017.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QUALITY OF SERVICE MEASUREMENT

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Target Probe	Define the target probe that will receive the UDP packets. The drop down menu shows all local and remote probes of your setup. When running the sensor on the local probe, select a remote probe as **Target Probe**. If no remote probe is available, please install and connect a remote probe 3108 first. When running the sensor on a remote probe, select either another remote probe or the local probe as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe. Note: You must ensure that firewalls, NAT rules, etc. allow UDP packets to reach the target probe. The Windows firewall on the target system will be opened automatically by the probe.
Target Host/IP	Define the IP address of the target probe to which the probe the sensor is created on connects. If you do not use NAT rules, this is usually the address shown above next to the target probe's name.
Port	Define the **source** and **target** port for the UDP packets. This port is used on both the source and target probe. Use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between 1024 and 65536. Note: This port must be available on both the source and target system.
Number of Packets	Define how many packets the sensor sends with each scanning interval. Please enter an integer value. Default value is **1000**. We recommend that you use the default value.
Size of Packets (Bytes)	Define the size in bytes of the packets which the sensor sends. Please enter an integer value. Default value is **172**. We recommend that you use the default value.
Time between Packets (ms)	Define the time in milliseconds that the sensor waits between two packets. Please enter an integer value. Default value is **20**. We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.95 QoS (Quality of Service) Round Trip Sensor

The QoS (Quality of Service) Round Trip sensor monitors parameters regarding the quality of a network connection between two probes. This is important, for example, when using Voice over IP (VoIP) over this connection. The sensor sends a series of UDP packets from the source probe to a target at the 'end' of the connection line. Then, the packets are sent back to the original probe ("round trip").

The sensor measures the following parameters:

- Jitter in milliseconds (maximum, minimum, average)
- Packet delay variation in milliseconds (maximum, minimum, average)
- MOS (Mean Opinion Score)
- Corrupted packets in percent
- Duplicated packets in percent
- Lost packets in percent
- Packets out of order in percent
- Round trip time (RTT) in milliseconds (maximum, minimum, average)
- Time to last packet in milliseconds

Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Jitter Average	7	6 msec	0 msec	53 msec	
Jitter Max	8	9 msec	0 msec	738 msec	
Jitter Min	6	0 msec	0 msec	8 msec	
MOS	12	4.4	1.0	4.4	
Packet Delay Variation Average	10	0 msec	-12 msec	0 msec	
Packet Delay Variation Max	11	26 msec	6 msec	4,597 msec	
Packet Delay Variation Min	9	-27 msec	-4,555 msec	-6 msec	
Packets Corrupted	5	0 %	0 %	0 %	
Packets Duplicated	4	0 %	0 %	0 %	
Packets Lost	2	0 %	0 %	92 %	
Packets Out of Order	3	0 %	0 %	0 %	
RTT (Average)	13	2 msec	2 msec	57 msec	
RTT (Maximum)	15	28 msec	8 msec	4,601 msec	
RTT (Minimum)	14	0 msec	0 msec	0 msec	
Time to Last Packet	0	31,329 msec	4,909 msec	60,995 msec	

QoS (Quality of Service) Round Trip Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/qos_round_trip.png

Remarks

- Note: You have to configure at least one remote probe [3108] in your setup, or you need to set up the PRTG QoS Reflector tool on the target machine at the endpoint of the monitored connection.
- Knowledge Base: How can I monitor QoS roundtrips without using remote probes?
- Knowledge Base: How does PRTG calculate the MOS score for QoS sensors?
- For a general introduction to the technology behind Quality of Service monitoring, please see manual section **Monitoring Quality of Service** [3017].

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QUALITY OF SERVICE MEASUREMENT

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
QoS Target	Define the type of target that will receive the UDP packets. Choose between: ▪ **PRTG Probe (recommended)**: The connection endpoint is a PRTG probe. ▪ **Custom Target**: Choose this option if you want to use the PRTG QoS Reflector as connection endpoint. See section **More** 1346 for information about this tool.
Target Probe	This setting is only available if you select PRTG probe as QoS target. In the drop down menu, you see all local and remote probes of your setup. When running the sensor on the local probe, select a remote probe as **Target Probe**. If no remote probe is available, install and connect a remote probe 3108 first or use the QoS Reflector. When running the sensor on a remote probe, select either another remote probe or the local probe as target. The sensor will measure values for the network track between the probe the sensor is created on and the target probe. Note: You must ensure that firewalls, NAT rules, etc. will allow the UDP packets to reach the target probe. The Windows firewall on the target system will be automatically opened by the probe. For further information, see the **More** 1346 section below.
Target Host/IP	Define the IP address of the QoS target. If you use the QoS Reflector, enter the address of the machine on which the reflector script runs. If you use a probe, enter the address of the probe to which the probe the sensor is created on connects. If you do not use NAT rules, this is usually the address shown above next to the target probe's name.
Port	Define the **source** and **target** port for the UDP packets. This port will be used on both the source and target probe resp. machine. Use a different port for each QoS sensor to make sure packets can be assigned correctly. Enter an integer value between 1024 and 65536. Note: This port must be available on both the source and target system.
Number of Packets	Define how many packets the sensor sends for each scanning interval. Please enter an integer value. Default value is **1000**. We recommend that you use the default value.
Size of Packets (Bytes)	Define the size in bytes of the packets which the sensor sends. Please enter an integer value. Default value is **172**. We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

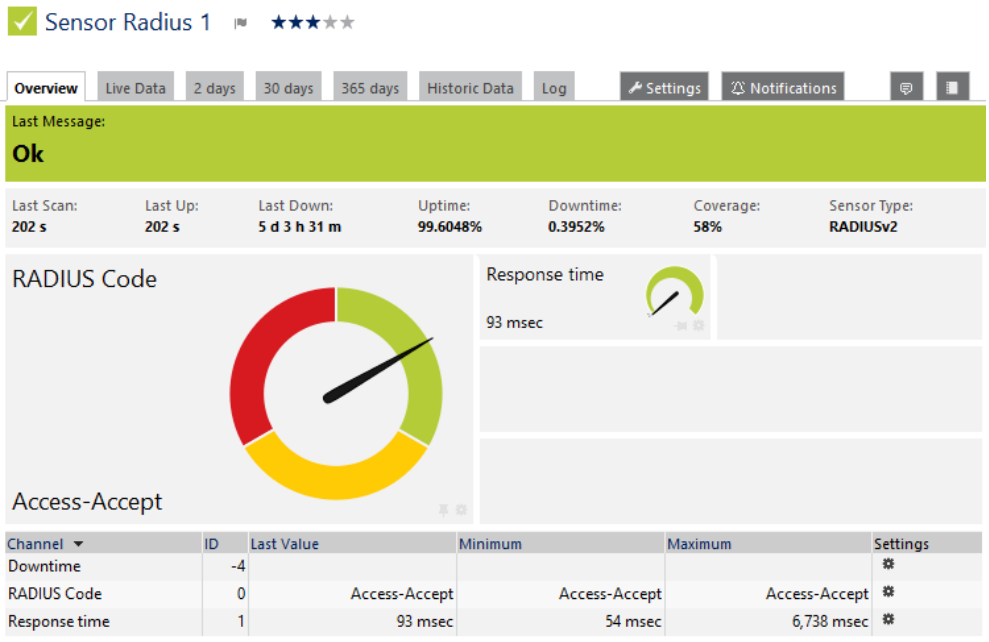
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.96 RADIUS v2 Sensor

The RADIUS v2 sensor monitors a Remote Authentication Dial-In User Service (RADIUS) server according to RFC 2865. The sensor tries to authenticate at the server and shows the following:

- Response time
- RADIUS code: Access-Accept (sensor status [135] **Up**), Access-Challenge (sensor status **Warning**), Access-Reject (sensor status **Down**)
- If authentication fails, the sensor shows a **Down** status [135].



RADIUS v2 Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/radius_v2.png

Remarks

- Note: This sensor type supersedes the outdated RADIUS sensor. We recommend that you use this new sensor to monitor RADIUS servers.
- Requires [1349] .NET 4.5 on the probe system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** [3095].

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest update): .NET 4.5 or .NET 4.6. Please see the section **More** below for details.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

RADIUS SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value, the request is aborted and an error message is triggered. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
User	Enter the username that is used for authentication at the server. Please enter a string.
Password	Enter the password that is used for authentication between the client (this is the PRTG probe on which the sensor runs) and the RADIUS server. Please enter a string.
Secret	Enter the shared secret that is used for authentication between the authenticator (this is the PRTG probe) and the server. Please enter a string.
Port	Enter the port number that is used for the connection to the server. The default value is **1812**. Please enter an integer value.
Network Access Server	Define how to identify the Network Access Server (NAS). Choose between: ▪ **Use NAS IP address**: Enter the IP address for identification below. ▪ **Use NAS identifier**: Enter the identifier below.
NAS IP Address	This field is only visible if you select **Use NAS IP address** as an identification method above. Enter a valid IP address for the Network Access Server (NAS) that originates the access request.
NAS Identifier	This field is only visible if you select **Use NAS identifier** above. Enter an identifier for the NAS that originates the access request.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

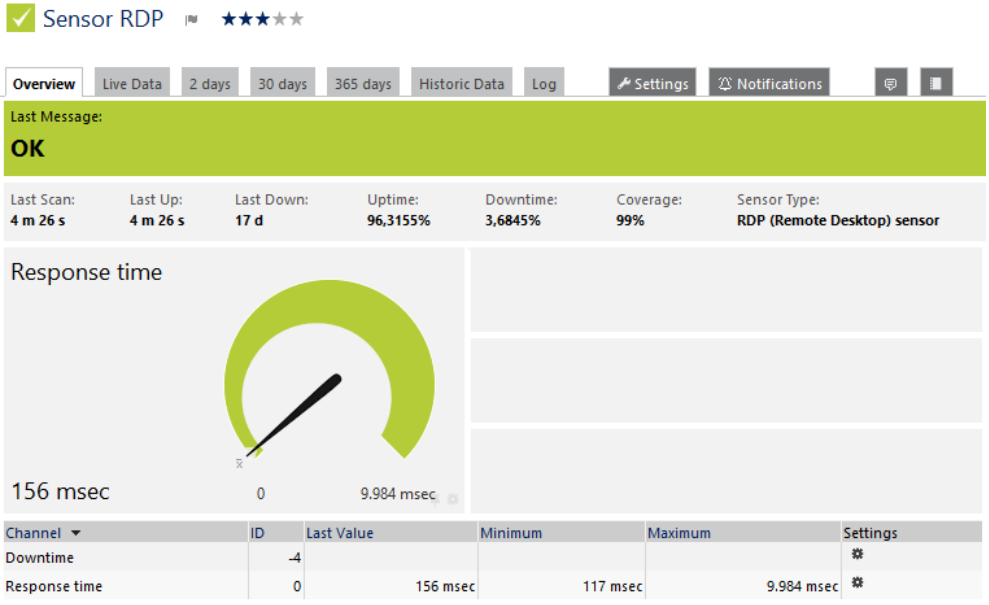
6.8.97 RDP (Remote Desktop) Sensor

The RDP (Remote Desktop) Sensor monitors remote desktop services (RDP, Terminal Services Client).

- It shows the response time of the service.



RDP (Remote Desktop) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/rdp_remote_desktop.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value. Default value is **3389**. We recommend that you use the default value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/61880

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

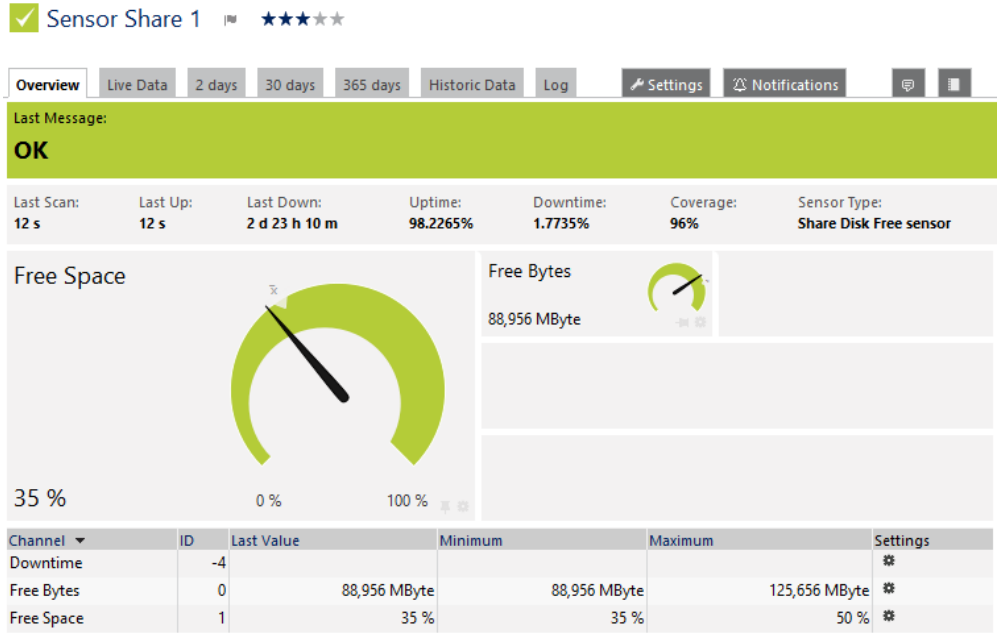
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.98 Share Disk Free Sensor

The Share Disk Free sensor monitors free disk space of a share (Windows/Samba) using Server Message Block (SMB).

- It shows the free disk space in percent and bytes.



Share Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/share_disk_free.png

Remarks

- Requires 1366 the LanmanServer Windows service to be running on the target device.
- Note: This sensor only works if no quotas are enabled on the target share. If there are quotas enabled for the user account this sensor uses to connect to the share, the absolute value will be okay, but the percentage variable will show wrong values.
- Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

Requirement: Server Service

In order to monitor shares on Windows machines, please make sure the LanmanServer "Server" Windows service is running on the target computer.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SHARE CONFIGURATION

Share	Enter the name of the share this sensor will monitor. Only a share name is allowed here (for example, enter C$). Please do not enter a complete UNC name here. The server name (\\server\) is taken from the parent device of this sensor. Note: To provide any shares under Windows, the LanmanServer "Server" Windows service must be running on the target computer. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: What can I do if PRTG doesn't succeed with monitoring a share? PE029 PE032

- http://kb.paessler.com/en/topic/513

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.99 Sensor Factory Sensor

The Sensor Factory sensor is a powerful tool that allows you to monitor whole business processes that involve several components.

You can define one or more channels that combine monitoring results from other sensors or devices. You can create your own individual sensor with channels based on data from other sensors or devices.

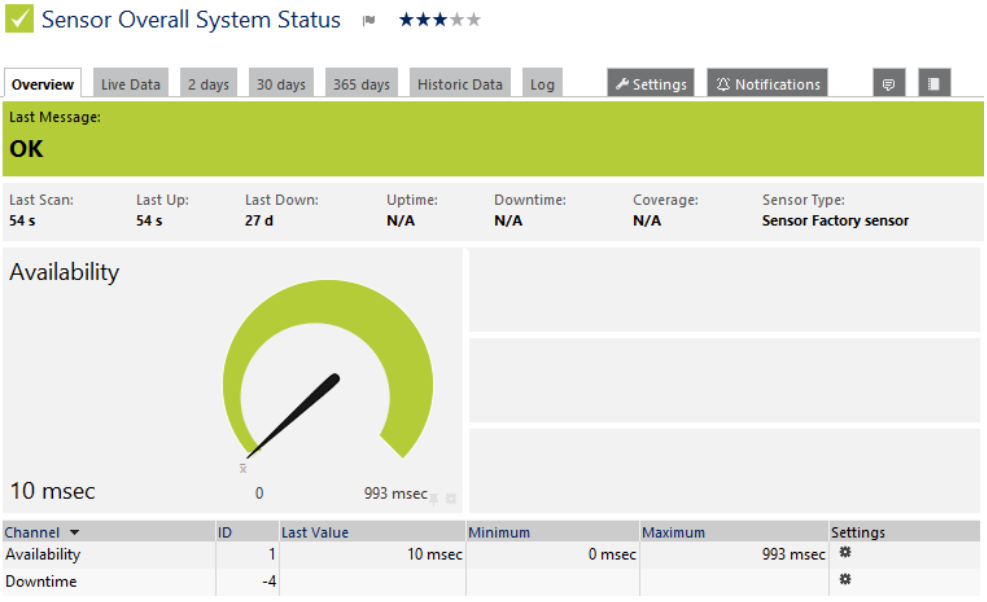
Samples for usage are:

- Show single channels of one or more sensors in one graph.
- Use the data from single channels of one or more sensors to calculate new values (for example, you can subtract, multiply, and divide).
- Create graphs with data from other sensor channels and add horizontal lines at specific vertical positions.

Note: The Sensor Factory sensor does not show values in the "Downtime" channel because they cannot be calculated for this sensor type.

Note: If you want to create only a cumulated sensor status based on specific source sensors, we recommend that you use the **Business Process Sensor** 481 instead.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Sensor Factory Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sensor_factory.png

Remarks

- This sensor does not support more than 50 channels[1375] officially.
- Ensure the scanning interval[1378] of this sensor is equal to or greater than the scanning interval of the source sensor(s) to avoid incorrect sensor behavior. For example, "no data" messages or erratic changes of the sensor status can be a result of an invalid scanning interval.
- Knowledge Base: How can I monitor the overall status of the business process "Email"?
- Note: The Sensor Factory sensor might not work with flow sensors[3012]. Sensor types using active flow timeout, this is, NetFlow and jFlow sensors[349], are not supported by the Sensor Factory sensor.
- Note: Reports[146] cannot show uptime or downtime data for this sensor type.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually[256]. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings**[324] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR FACTORY SPECIFIC SETTINGS

Channel Definition	Enter a channel definition for the sensor. Using a specific syntax, you can refer to data from channels of other sensors here. You can also calculate values. Enter one channel definition for each new channel you want to add to this sensor. Please see section **Define Sensor Channels** 1382 below.
Error Handling	Define the behavior of the sensor if one of the sensors defined above is in an error status. In this case, you can set the sensor factory sensor either to down or to warning status. Choose between:

SENSOR FACTORY SPECIFIC SETTINGS

	▪ **Factory sensor shows error status when one or more source sensors are in error status**: If at least one sensor that you use in a channel definition is in a **Down** status, the Factory sensor shows a **Down** status as well until all referred sensors leave this status. While the Factory sensor is **Down**, it will still show data of all available sensor channels. Note: If a lookup definition 3095 or an error limit 2712 triggers the error status of the source sensor, the Sensor Factory will not show a **Down** status. This is because the Sensor Factory should only show this status if it cannot calculate values. ▪ **Factory sensor shows warning status when one or more source sensors are in error status**: If at least one sensor that you use in a channel definition is in a **Down** status, the factory sensor shows a **Warning** status until all referred sensors leave the **Down** status. Note: If a lookup definition 3095 or an error limit 2712 triggers the error status of the source sensor, the Sensor Factory will not show a **Warning** status. This is because the Sensor Factory should only show this status if it cannot calculate values. ▪ **Use custom formula**: Define the status of the Factory sensor by adding a status definition in the field below.
Status Definition	This field is only visible if you enable custom formula above. Define when the sensor will switch to a **Down** status. You can use the status() function in combination with Boolean operations. For advanced users it is also possible to calculate a status value. Please see section **Define Sensor Status** 1389 below.
If a Sensor Has No Data	Choose how this Sensor Factory sensor reacts if a sensor referred to in the channel definition does not provide any data (for example, because it is paused or does not exist). Choose between: ▪ **Do not calculate factory channels that use the sensor**: For defined channels that use one or more sensor(s) that deliver no data, no data is shown. Additionally, the factory sensor shows a **Warning** status. ▪ **Calculate the factory channels and use zero as source value**: If a sensor that you use in a channel definition does not deliver any data, zero values will be filled in instead. The sensor factory calculates the channel value and shows it using these zero values.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Define Sensor Channels

The channels of a Sensor Factory sensor are controlled by the **Channel Definition** text field. Using a special syntax you can refer to other sensor channels, calculate values, and add horizontal lines. You can define factory sensor channels using data from any other sensor's channels on your PRTG core server.

Example

You see a definition of two factory sensor channels. Both use the channel() function which simply collects data from the channels of other sensors in your monitoring and displays them:

```
#1:Local Probe Health
channel(1001,0)
#2:Local Traffic Out[kbit]
channel(1004,1)
```

The first channel of the factory sensor (#1) collects data from the **Health** channel (ID 0) of the **Probe Health** sensor (ID 1001) running on the Local Probe device. The second channel (#2) collects data from the **Traffic out** channel (ID 1) of a traffic sensor (ID 1004) measuring the system's local network card. Both channels will be shown together in the factory sensor's data tables and graphs.

The basic syntax for a sensor factory channel definition looks like this:

```
#<id>:<name>[<unit>]
<formula>
```

For each channel one section is used. A section begins with the # sign. Function names in formulas are not case sensitive.

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number > 0.
- **<name>** is the name of the factory sensor's channel (displayed in graphs and tables).
- **[<unit>]** is an optional unit description for the factory sensor's channel (e.g., bytes). If you do not provide a unit, the sensor factory selects a suitable unit string automatically (recommended).
- **<formula>** contains the formula to calculate the factory sensor's channel. For the formula, you can use the following functions: **channel()** 1384, **min()** 1385, **max()** 1385, **avg()** 1385, or **percent()** 1386.

Define Sensor Channels—Formula Calculations

Within a formula, the following elements are allowed to perform calculations with the values that are returned by one or more functions:

- Basic operations: + (add), - (substract), * (multiply), / (divide)
  Example: 3 + 5 * 2
- Brackets: **( )**
  Example: 3 * (2 + 6)

- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
  If the comparison resolves to true, the value is 10,000; if false, the value is 0. For delta sensors the speed is compared.

Example

You see a Sensor Factory channel definition with calculation.

```
#1:Traffic Total x Minus Traffic Out y
( channel(2001,-1) - channel(1004,1) ) * 2
```

This full channel definition results in a factory sensor that shows a calculation with values from two channels (channel IDs -1 and 1) of two traffic sensors (sensor IDs 2001 and 1004). The returned values are subtracted and then multiplied by two.

Channels can be gauge values (e.g., ping ms) or delta values (e.g., traffic kbit/s). Not all combinations are allowed in a formula. Note: When performing percentage calculation, please use the **percent() Function** 1386 to make sure you obtain the expected values!

There are calculations you cannot do:

- You cannot add/subtract a delta from a gauge channel (and vice-versa).
- You cannot multiply two delta channels.
- You cannot compare a delta with a gauge channel.
- You cannot use a channel of (another) Sensor Factory sensor channel in the formula.

Define Sensor Channels—channel() Function

The **channel()** function allows to read the data from a channel of a different sensor. The syntax is:

```
channel(<sensorId>,<channelId>)
```

The parameters are:

- **<sensorId>** is the ID of the sensor. It is displayed on the sensor details page in the page header bar 126.
- **<channelId>** is the ID of the sensor channel. It is displayed in the respective field of the channel settings 2712.

Example

```
channel(2001,2)
```

This function reads the data from channel ID 2 of the sensor with the ID 2001.

```
#1:Sample
channel(2001,2)
```

This full channel definition reads the data from channel ID 2 of the sensor with the ID 2001 and displays it in the first factory sensor channel (#1), without any additional calculations.

Define Sensor Channels—min() and max() Functions

The **min()** and **max()** functions return the minimum or maximum of two values. The syntax is:

```
min(<a>,<b>)
max(<a>,<b>)
```

Values for **<a>** and **<b>** are either numbers or **channel()** 1384 functions.

Examples

```
min(10,5)
```

This function in the first line returns 5, because this is the smaller value out of 10 and 5.

```
min( channel(2001,1),channel(2002,1) )
```

This function returns the minimum of the values of channel 1 of the sensor with ID 2001 and channel 1 of the sensor with ID 2002.

Define Sensor Channels—avg() Function

The **avg()** function returns the average of the two values. This equals: (a+b) / 2. The syntax is:

```
avg(<a>,<b>)
```

Values for **<a>** and **<b>** are either numbers or **channel()** 1384 functions.

Examples

```
avg(20,10)
```

This function returns 15: (20+10) / 2 = 15.

```
avg( channel(2001,1),channel(2002,1) )
```

This function returns the average of channel 1 of the sensor with ID 2001 and channel 1 of the sensor with ID 2002.

Define Sensor Channels—percent() Function

The **percent()** function calculates the percent value of two given values, for example, a channel and a fixed value. The syntax is:

```
percent(<source>,<maximum>[,<unit>])
```

The parameters are:

- **<source>** is the value the percent is calculated for. This is usually a **channel()** 1384 function.
- **<maximum>** is the limit value used for the percent calculation.
- **[<unit>]** is an optional unit the maximum is provided in. You can use constants with this function (see **Constants** 1386 section below for a list). This can be used for gauge (e.g., Ping sensors) or delta (e.g., traffic sensors). If no unit is provided 1 will be used. Note: The sensor adds the unit string % automatically.

PRTG will calculate: <source> / <maximum> * <unit> * 100

Examples

```
#1:Usage Traffic In
percent(channel(2001,0),100,kilobit)
#2:Usage Traffic Out
percent(channel(2001,1),100,kilobit)
```

This full channel definition results in a factory sensor that shows two channels of a traffic sensor (sensor ID 2001): Traffic in (channel ID 0) and traffic out (channel ID 1). The sensor displays the values % of maximum bandwidth (100 kilobit/second).

```
#1:Ping %
percent(channel(2002,0),200)
```

This full channel definition results in a factory sensor that shows the **Ping Time** channel (channel ID 0) of a Ping sensor (sensor ID 2002). The sensor displays the values as a percentage of 200 ms.

Define Sensor Channels—Horizontal Lines

You can add lines to the graph using a formula without **channel()** function. Use a fixed value instead. The syntax is:

```
#<id>:<name>[<unit>]
<value>
```

The parameters are:

- **<id>** is the ID of the factory sensor's channel and must be a unique number > 1. Although the sensor does not show a horizontal line as a channel, the ID has to be unique.
- **<name>** is the name of the factory sensor's channel. PRTG does not display this name in graphs and tables, but you can use it as a comment to describe the nature of the line.
- **[<unit>]** is an optional unit description (e.g., kbit/s). If you do not provide a unit, PRTG applies the line automatically to the scale of the first factory sensor channel. If your factory sensor uses different units, provide a unit to make sure the line is added for the right scale. Enter the unit exactly as shown in your graph's legend. If you enter a unit that does not yet exist in your graph, a new scale will be added automatically.
- **<value>** contains a number defining where the line will be shown in the graph.

Examples

```
#5:Line at 100ms [ms]
100
```

This channel definition results in a graph that shows a horizontal line at the value of **100** on the **ms** scale.

```
#6:Line at 2 Mbit/s [kbit/s]
2000
```

This channel definition results in a graph that shows a horizontal line at the value of **2000** on the **kbit/s** scale.

```
#1:Ping Time
channel(2002,0)
#2:Line at 120ms [ms]
120
```

This full channel definition results in a factory sensor that shows the **Ping Time** channel (channel ID 0) of a Ping sensor (sensor ID 2002). Additionally, the sensor graphs will show a horizontal line at **120 ms**.

Define Sensor Channels—Constants

The following constants are defined and can be used in calculations:

- **one** = 1
- **kilo** = 1000
- **mega** = 1000 * kilo
- **giga** = 1000 * mega
- **tera** = 1000 * giga
- **byte** = 1
- **kilobyte** = 1024
- **megabyte** = 1024 * kilobyte
- **gigabyte** = 1024 * megabyte
- **terabyte** = 1024 * gigabyte
- **bit** = 1/8
- **kilobit** = kilo / 8
- **megabit** = mega / 8

- **gigabit** = giga / 8
- **terabit** = tera / 8

Define Sensor Status—status() Function

The status of a Sensor Factory sensor can be controlled by the **Status Definition** text field, if you enable the custom formula option in the **Sensor Settings** 1375. Using a special syntax, you can define when the factory sensor changes to a **Down** status. In all other cases, the sensor will be in an **Up** status. The syntax is:

```
status(sensorID) <boolean> status(sensorID)
```

The parameters are:

- **<sensorId>** is the ID of the sensor you want to check the status of. It is displayed on the sensor details page in the page header bar 126.
- **<boolean>** is one of the Boolean operators **AND**, **OR**, or **NOT**. If the resulting expression is true, the factory sensor will change to a **Down** status.

Examples

```
status(2031) AND status(2044)
```

This changes the factory sensor to a **Down** status if both sensors, with IDs 2031 and 2044, are **Down**. Otherwise the factory sensor shows an **Up** status.

```
status(2031) OR status(2044)
```

This changes the factory sensor to a **Down** status if at least one of the sensors with ID 2031 or ID 2044 is **Down**. Otherwise the factory sensor shows an **Up** status.

```
status(2031) AND NOT status(2044)
```

This changes the factory sensor to a **Down** status if the sensor with ID 2031 is **Down**, but the sensor with ID 2044 is not in a **Down** status. Otherwise the factory sensor shows an **Up** status.

- Note: A status() function with **NOT** has to be connected with **AND** or **OR** if it is combined with other status() functions:

```
status(sensorID) AND NOT status(sensorID)
status(sensorID) OR NOT status(sensorID)
```

```
( status(2031) AND status(2044) ) OR status(2051)
```

This changes the factory sensor to a **Down** status if both the sensor with ID 2031 and the sensor with ID 2044 is **Down**, or if the sensor with ID 2051 is **Down**. Otherwise the factory sensor shows an **Up** status.

Additionally, the following elements are allowed to perform calculations and comparisons with the values that are returned by the status functions:

- Basic operations: + (add), - (substract), * (multiply), / (divide)
  Example: 3 + 5 * 2
- Brackets: **( )**
  Example: 3 * (2 + 6)
- Compare: = (equal), <> (not equal), > (greater), < (less), >= (greater or equal), <= (less or equal)
  If the comparison resolves to true, the value is 10,000; if false, the value is 0. For delta sensors the speed is compared.

Internally, the status() function returns the downtime channel of the sensor in hundreds of percent (10,000 = 100%).

- true corresponds to a value of 10,000 which is a **Down** status.
- false corresponds to a value of 0 which is an **Up** status.

If you understand this, you are able to use more complex formulas.

Example

```
( status(1031) + status(1032) + status(1033) + status(1034) ) >= 20000
```

This changes the factory sensor to a **Down** status if at least any two of the sensors with IDs 1031, 1032, 1033, or 1034 are **Down**. Otherwise the factory sensor shows an **Up** status.

Note: You can also use the status() function in channel definitions [1382]. Using this functionality, it is possible, for example, to display the numeric status value of sensors in a factory sensor channel.

Using Factory Sensors in a Cluster Setup

If you run PRTG in Clustering [87] mode, please note these additional facts:

- If you add a Sensor Factory sensor underneath the **Cluster Probe**, and in the Sensor Factory formula you refer to a channel of a sensor running on the **Cluster Probe** as well, the Sensor Factory sensor shows the data of all cluster nodes for this sensor channel.
- If you add a Sensor Factory sensor underneath the **Local Probe**, and in the Sensor Factory formula you refer to a channel of a sensor running on the **Cluster Probe**, the Sensor Factory sensor only shows data of the primary master node for this sensor channel.

Edit Sensor Channels

To change display settings and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** [2711].

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

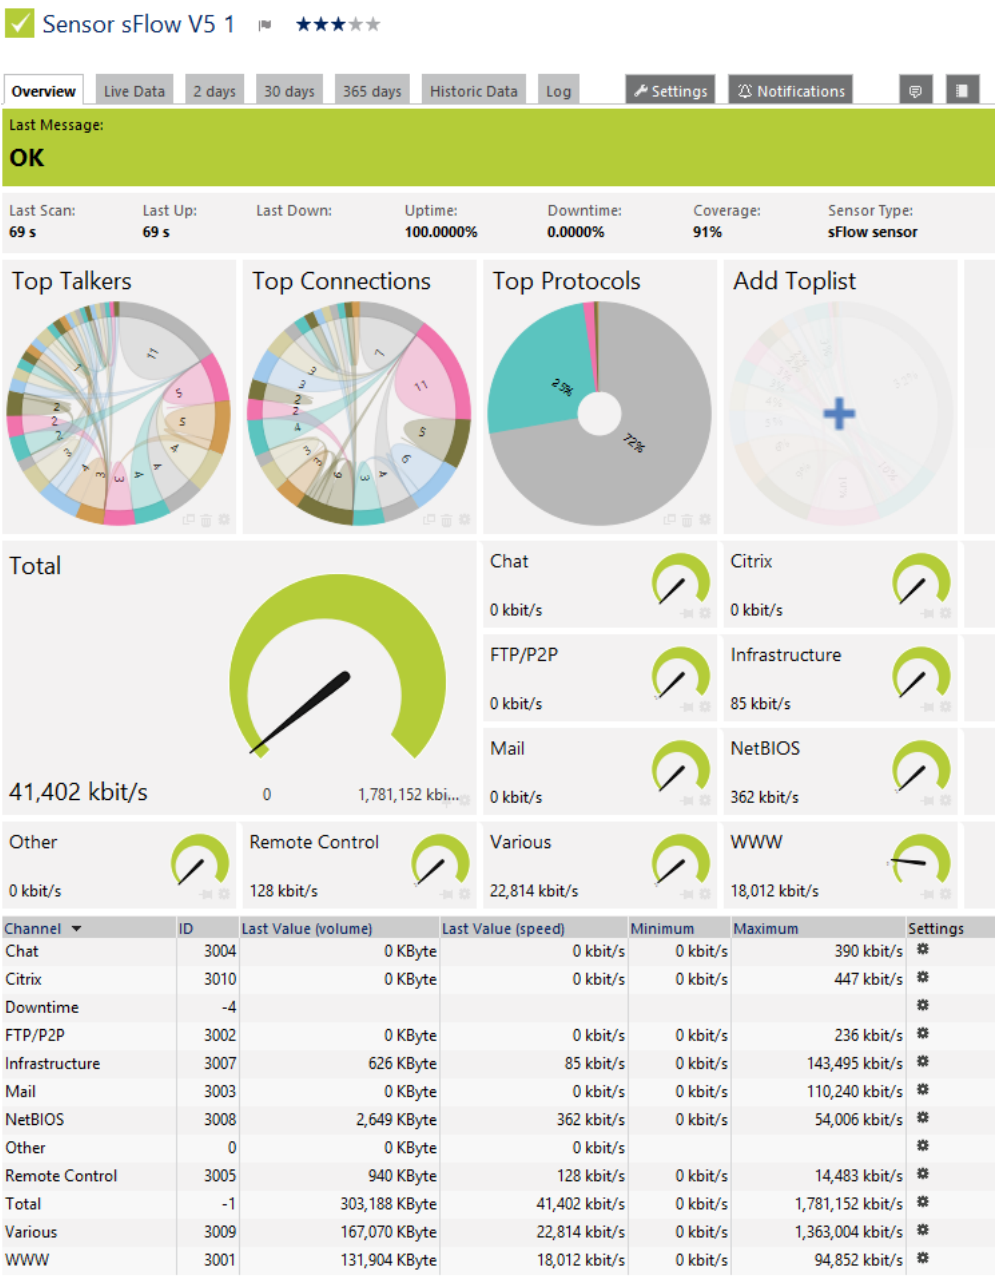
6.8.100 sFlow Sensor

The sFlow sensor receives traffic data from a sFlow V5 compatible device and shows the traffic by type. Only header traffic will be analyzed. Ensure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

This sensor can show the following traffic types in kbit per second:

- Chat (IRC, AIM)
- Citrix
- FTP/P2P (file transfer)
- Infrastructure (network services: DHCP, DNS, Ident, ICMP, SNMP)
- Mail (mail traffic: IMAP, POP3, SMTP)
- NetBIOS
- Remote control (RDP, SSH, Telnet, VNC)
- WWW (web traffic: HTTP, HTTPS)
- Total traffic
- Other protocols (other UDP and TCP traffic)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Chat	3004	0 KByte	0 kbit/s	0 kbit/s	390 kbit/s	
Citrix	3010	0 KByte	0 kbit/s	0 kbit/s	447 kbit/s	
Downtime	-4					
FTP/P2P	3002	0 KByte	0 kbit/s	0 kbit/s	236 kbit/s	
Infrastructure	3007	626 KByte	85 kbit/s	0 kbit/s	143,495 kbit/s	
Mail	3003	0 KByte	0 kbit/s	0 kbit/s	110,240 kbit/s	
NetBIOS	3008	2,649 KByte	362 kbit/s	0 kbit/s	54,006 kbit/s	
Other	0	0 KByte	0 kbit/s			
Remote Control	3005	940 KByte	128 kbit/s	0 kbit/s	14,483 kbit/s	
Total	-1	303,188 KByte	41,402 kbit/s	0 kbit/s	1,781,152 kbit/s	
Various	3009	167,070 KByte	22,814 kbit/s	0 kbit/s	1,363,004 kbit/s	
WWW	3001	131,904 KByte	18,012 kbit/s	0 kbit/s	94,852 kbit/s	

sFlow Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sflow.png

Remarks

- Note: You must enable sFlow V5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- The sensor accepts RAW data only. The stream must be sent via IPv4.

- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- There are several limitations 1395 for this sensor type.
- Paessler Website: Paessler sFlow Tester
- Knowledge Base: How can I change the default groups and channels for xFlow and Packet Sniffer sensors?
- Knowledge Base: Where is the volume line in graphs?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows** 3012.

Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" format is supported. "Extended flow" and "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

We recommend using sFlow tester for debugging (see **More** section below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is **6343**. Please enter an integer value. Note: When configuring export, ensure you select the appropriate sFlow version 5.
Sender IP	Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.
Receive sFlow Packets on IP	Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device.

SFLOW SPECIFIC SETTINGS

Note: When configuring export, ensure you select the appropriate sFlow version 5.

CHANNEL CONFIGURATION

Channel Selection

Define the categories the sensor accounts the traffic to. There are different groups of traffic available. Choose between:

- **Web**: Internet web traffic.
- **File Transfer**: Traffic caused by FTP.
- **Mail**: Internet mail traffic.
- **Chat**: Traffic caused by chat and instant messaging.
- **Remote Control**: Traffic caused by remote control applications, such as RDP, SSH, Telnet, VNC.
- **Infrastructure**: Traffic caused by network services, such as DHCP, DNS, Ident, ICMP, SNMP.
- **NetBIOS**: Traffic caused by NetBIOS communication.
- **Citrix**: Traffic caused by Citrix applications.
- **Other Protocols**: Traffic caused by various other protocols via UDP and TCP.

For each traffic group, you can select how many channels will be used for each group, i.e., how detailed the sensor divides the traffic. For each group, choose between:

- **No**: Do not account traffic of this group in an own channel. All traffic of this group is accounted to the default channel named **Other**.
- **Yes**: Count all traffic of this group and summarize it into one channel.
- **Detail**: Count all traffic of this group and further divide it into different channels. The traffic appears in several channels as shown in the **Content** column. Note: Extensive use of this option can cause load problems on your probe system. We recommend setting specific, well-chosen filters for the data you really want to analyze.

Note: You can change the default configuration for groups and channels. For details, please see section **More**.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

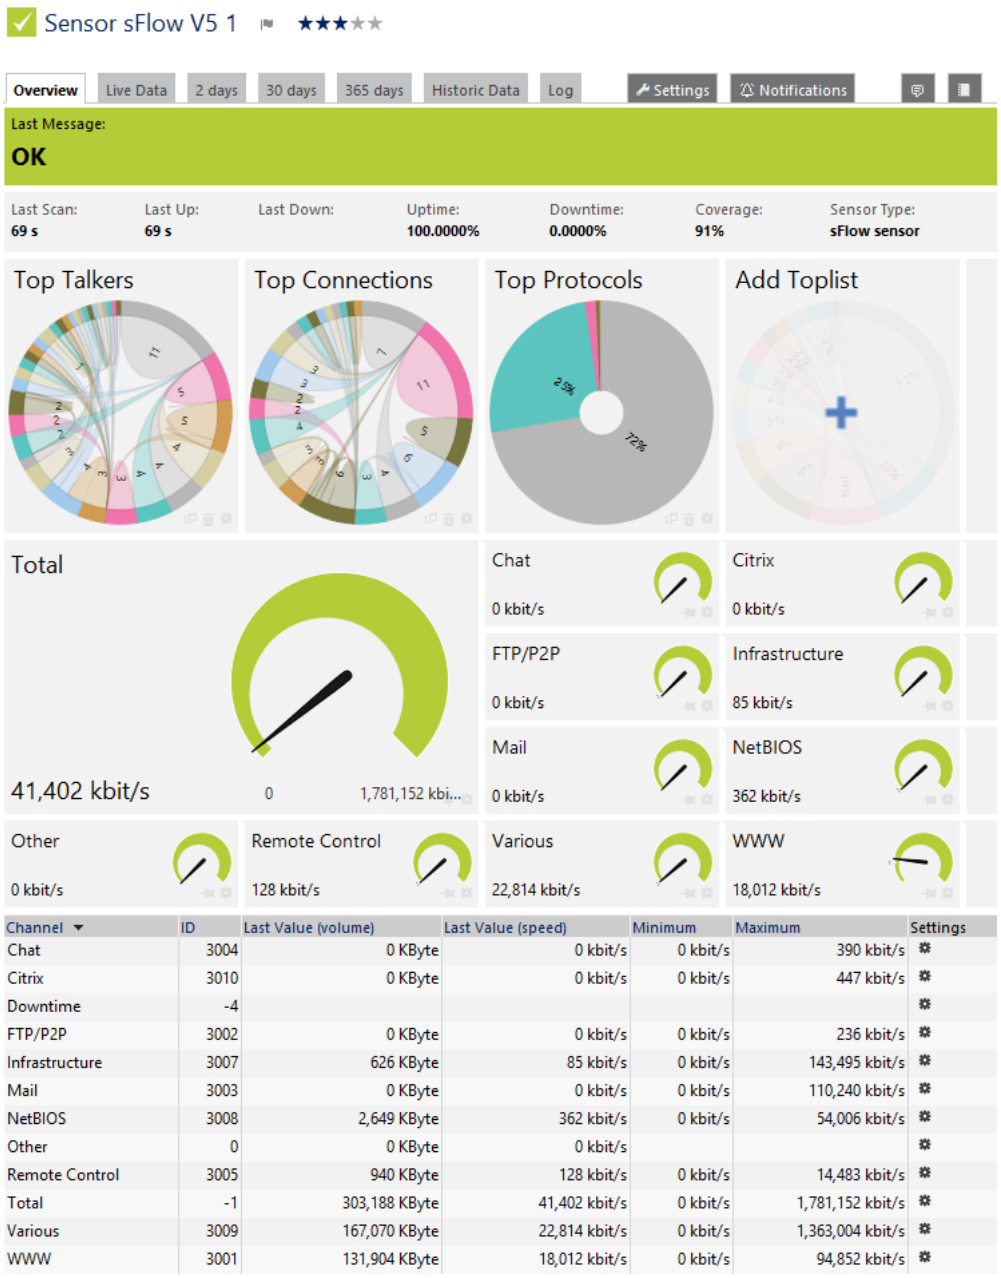
6.8.101 sFlow (Custom) Sensor

The sFlow (Custom) sensor receives traffic data from a sFlow V5 compatible device and shows the traffic by type. Please make sure the device matches the sFlow version V5! There are several filter options available to divide traffic into different channels.

- This sensor can show traffic by type individually to your needs.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Chat	3004	0 KByte	0 kbit/s	0 kbit/s	390 kbit/s	
Citrix	3010	0 KByte	0 kbit/s	0 kbit/s	447 kbit/s	
Downtime	-4					
FTP/P2P	3002	0 KByte	0 kbit/s	0 kbit/s	236 kbit/s	
Infrastructure	3007	626 KByte	85 kbit/s	0 kbit/s	143,495 kbit/s	
Mail	3003	0 KByte	0 kbit/s	0 kbit/s	110,240 kbit/s	
NetBIOS	3008	2,649 KByte	362 kbit/s	0 kbit/s	54,006 kbit/s	
Other	0	0 KByte	0 kbit/s			
Remote Control	3005	940 KByte	128 kbit/s	0 kbit/s	14,483 kbit/s	
Total	-1	303,188 KByte	41,402 kbit/s	0 kbit/s	1,781,152 kbit/s	
Various	3009	167,070 KByte	22,814 kbit/s	0 kbit/s	1,363,004 kbit/s	
WWW	3001	131,904 KByte	18,012 kbit/s	0 kbit/s	94,852 kbit/s	

sFlow (Custom) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sflow.png

Remarks

- Note: You must enable sFlow V5 export on the monitored device for this sensor to work. The device must send the flow data stream to the IP address of the PRTG probe system on which the sensor is set up (either a local or remote probe).
- The sensor accepts RAW data.

- This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- There are several limitations[1407] for this sensor type.
- Paessler Website: Paessler sFlow Tester
- Knowledge Base: Where is the volume line in graphs?
- For a general introduction to the technology behind flow monitoring, please see manual section **Monitoring Bandwidth via Flows**[3012].

Limitations of This Sensor Type

There are some limitations that you want to consider before using this sensor type:

- Only sFlow version 5 datagrams are supported
- Only IPv4 flows are supported
- Only the "raw packet header" format is supported
- Only the "Flow sample" format is supported. "Extended flow" and "Counter" formats cannot be processed
- PRTG processes only samples where the source ID matches the ifIndex of the input interface (avoiding double counted traffic) and ascending sequence numbers.
- Sample packets have to be of ethernet type "IP" (with optional VLAN tag)
- Sampled packets of type TCP and UDP are supported

We recommend using sFlow tester for debugging (see **More** section below).

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually[256]. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on UDP Port	Enter the UDP port number on which the flow packets are received. It must match the one you have configured in the sFlow export options of your hardware router device. Default value is **6343**. Please enter an integer value. Note: When configuring export, ensure you select the appropriate sFlow version 5.
Sender IP	Enter the IP address of the sending device you want to receive the sFlow from. Enter an IP address to receive data from a specific device only, or leave the field empty to receive data from any device on the specified port.

SFLOW SPECIFIC SETTINGS

Receive sFlow Packets on IP	Select the IP address(es) on which PRTG listens to sFlow packets. The list of IP addresses shown here is specific to your setup. To select an IP address, add a check mark in front of the respective line. The IP address selected here must match the one configured in the sFlow export options of your hardware router device. Note: When configuring export, ensure you select the appropriate sFlow version 5.

Channel Definition	Enter a channel definition to divide the traffic into different channels. Write each definition in one line. For detailed information, please see **Channel Defintions for xFlow and Packet Sniffer Sensors** 3092 section. All traffic for which no channel is defined will be accounted to the default channel named **Other**. Note: Extensive use of many filters can cause load problems on your probe system. We recommend defining specific, well-chosen filters for the data you really want to analyze.

FILTERING

Include Filter	Define if you want to filter any traffic. If you leave this field empty, all traffic will be included. To include specific traffic only, define filters using a special syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.
Exclude Filter	First, the filters defined in the **Include Filter** field are considered. From this subset, you can explicitly exclude traffic, using the same syntax. For detailed information, please see **Filter Rules for xFlow, IPFIX, and Packet Sniffer Sensors** 3087 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

PRIMARY TOPLIST

Primary Toplist	Define which will be your primary toplist. It will be shown in maps when adding a toplist object. Choose from: ▪ **Top Talkers** ▪ **Top Connections** ▪ **Top Protocols** ▪ [Any custom toplists you have added]

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Toplists

For all flow and packet sniffer sensors there are **Toplists** available on the **Overview** tab of a sensor's detail page. Using toplists, you can review traffic data of small time periods in great detail. For more information, please see **Toplists** 2734 section.

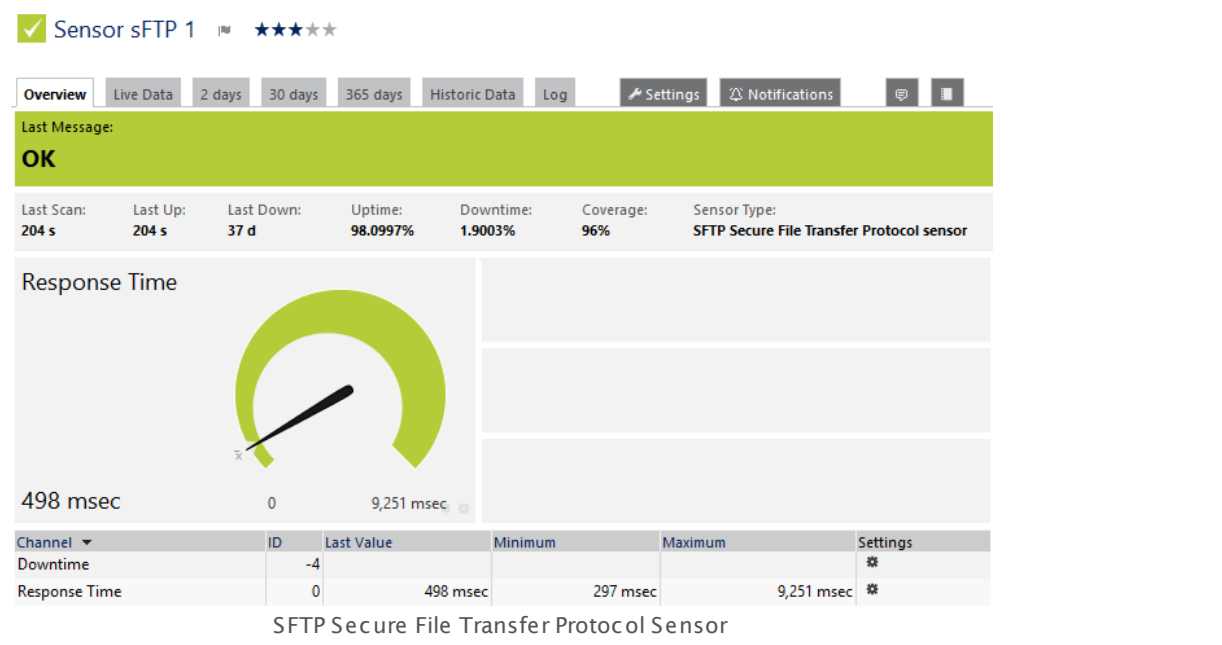
6.8.102 SFTP Secure File Transfer Protocol Sensor

The sFTP Secure File Transfer Protocol sensor monitors FTP servers of a Linux/Unix system using SSH File Transfer Protocol (FTP over SSH).

- It tries to connect and shows the response time of the server.



SFTP Secure File Transfer Protocol Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sftp_secure_file_transfer_protocol.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes). This timeout value determines the time the sensor waits to establish a connection to the host. Keep this value as low as possible.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (for example, cat /proc/loadavg).

SSH SPECIFIC

SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the SSH port number as defined in the xx/Solaris/Mac OS (SSH/WBEM) Systems section of the device on which you create this sensor. ▪ **Enter custom port number**: Do not use the port number from the parent device settings but define a different port number below.
Use Port Number	This field is only visible if you enable the custom port number setting above. Enter the port number this sensor uses for the SSH connection. Please enter an integer value.
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.103 SIP Options Ping Sensor

The SIP Options Ping sensor monitors the connectivity for a Session Initiation Protocol (SIP) server using SIP options "Ping". You can use it to monitor voice-over-IP (VoIP) services. The sensor sends "auth" and "options" requests to the SIP server. It can alert in case of an error.

It can show the following:

- Response time of the SIP server
- Response code: You can individually define the status for each individual response code by editing the lookup 3095 file **prtg.standardlookups.sip.statuscode**

SIP Options Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sip_options_ping.png

Remarks

- Requires 1426 .NET 4.0 or higher on the probe system.
- Note: An SIP server might return a "480 Service temporarily unavailable" error until at least one reachable SIP client is connected to the server.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SIP SPECIFIC

Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default UDP port is **5060**.
Username	Enter the username of the SIP account this sensor will log on to after a connection to the SIP server has been established. Please enter a string.
Password	Enter the password of the SIP account this sensor will log on to after a connection to the SIP server has been established. Please enter a string.
Timeout (Seconds)	Enter the timeout for the connection to the SIP server. Please enter an integer value. The maximum value is 300.
Retry Count	If the connection to the SIP server fails, the sensor can re-try to connect. Enter the maximum number of retries. After reaching the maximum count, the sensor will show a red **Down** status 135. Please enter an integer value.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Which .NET version does PRTG require?

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.104 SMTP Sensor

The SMTP sensor monitors a mail server using Simple Mail Transfer Protocol (SMTP) and can optionally send a test email with every check.

- It shows the response time of the server.

SMTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/smtp.png

Remarks

- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SMTP SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port that the sensor uses to send an email via SMTP. For non-secure connections usually port 25 is used and port 465 or 587 for SSL/TLS connections. The actual setting depends on the server you connect to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.

AUTHENTICATION

Type	Select whether to use an authentication method for the SMTP connection. Choose between: ▪ **None**: Do not use any authentication method. ▪ **Username and password**: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
HELO Ident	Enter a server name for the HELO part of the email protocol. For some mail servers, the HELO identifier must be the valid principal host domain name for the client host. See SMTP RFC 2821.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between: ▪ **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption. ▪ **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption. ▪ **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135. ▪ **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135. If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

TRANSPORT-LEVEL SECURITY

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

MONITORING

Send Email

Define if PRTG sends an email when connecting to the SMTP server. Choose between:

- **None**: Do not send an email, just connect to the SMTP server.
- **Send Email**: Send an email through the SMTP server. If there is an error when sending the email, an error message will be triggered and the sensor will change to a **Down** status.

From

Specify which address the sent emails contain in the from field. Please enter a valid email address.

To

Specify to which address PRTG sends the emails to. If you define more than one recipient, separate the individual email addresses by comma. Please enter a valid email address.

Topic

Specify which subject the sent emails contain. Please enter a string or leave the field empty.

Content

Specify which body the sent emails contain. Please enter a string or leave the field empty.

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

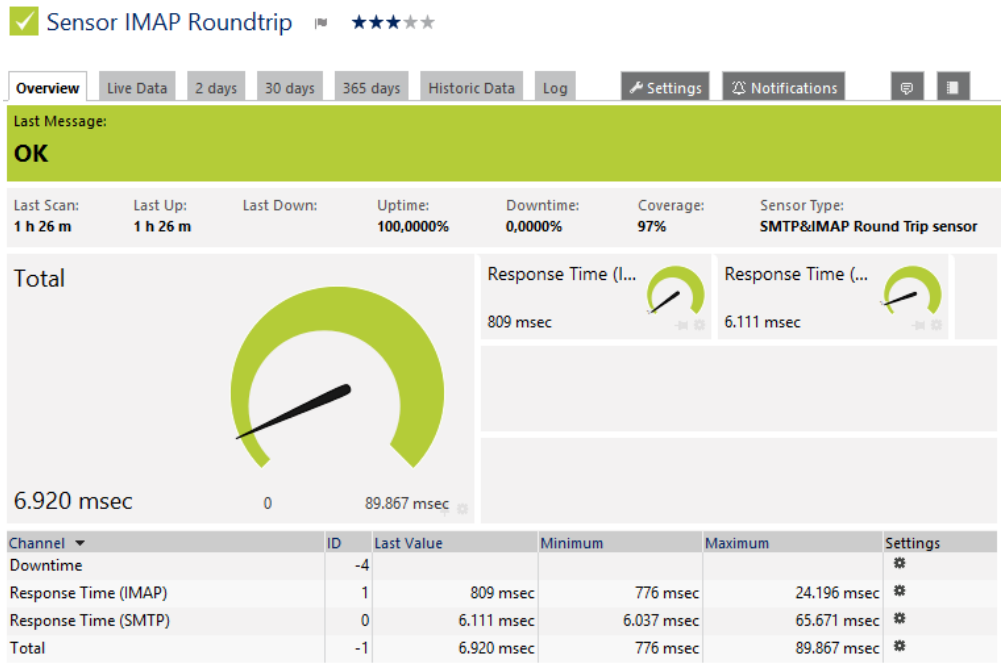
For more general information about settings, please see the **Object Settings** 159 section.

6.8.105 SMTP&IMAP Round Trip Sensor

The SMTP&IMAP Round Trip sensor monitors the time it takes for an email to reach an Internet Message Access Protocol (IMAP) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email to the parent device via SMTP and then scans a dedicated IMAP mailbox until this email comes in. The SMTP&IMAP Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor run-time.

The sensor shows the following:

- Response time of SMTP server
- Response time of IMAP server
- Sum of both response times



SMTP&IMAP Round Trip Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/smtp_imap_round_trip.png

Remarks

- Note: Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- For a general introduction to the technology behind round trip monitoring, please see **Monitoring Email Round Trip** 3022 section.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

We recommend adding this sensor to an SMTP server device only, because the settings of this sensor type are optimized for this scenario.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMAIL SETTINGS

From	Specify which address the sent emails contain in the from field. Please enter a valid email address.
To	Specify to which address PRTG sends the emails. Please enter a valid email address.
HELO Ident	Enter a server name for the HELO part of the mail protocol. For some mail servers the HELO identifier must be the valid principal host domain name for the client host. See SMTP RFC 2821.

STEP 1: SEND EMAIL TO PARENT DEVICE USING SMTP

In this step, you configure how PRTG sends the emails. As SMTP server, the sensor uses the **IP-Address/DNS Name** property's value of the device on which you add this sensor.

Port	Enter the number of the port that the sensor uses to send an email via SMTP. Please enter an integer value. For non-secure connections usually port 25 is used and port 465 or 587 for SSL/TLS connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.
Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
SMTP Authentication Type	Define if you want to use an authentication for the SMTP connection. Choose between: • **None**: Do not use any authentication method. • **Username/Password**: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	The subject part of the round trip email is created automatically by PRTG. It consists of the string "PRTG Roundtrip Mail:" followed by a unique GUID to correctly identify the email in the IMAP mailbox (for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}). Use this field to place your custom text before the automatically created text.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between:

TRANSPORT-LEVEL SECURITY

- **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption.
- **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption.
- **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135.
- **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

STEP 2: CHECK AN IMAP MAILBOX UNTIL EMAIL ARRIVES

In this step, you configure how the sent emails will be received.

IP-Address/DNS Name	Specify the IMAP server. Enter a valid IP address or DNS name.
Mailbox	Specify the IMAP Mailbox (resp. "IMAP folder") you want to check. Enter the IMAP mailbox/folder name.
Port	Specify the port that the sensor uses for the IMAP connection. For non-secure connections usually port 143 is used and port 993 for SSL/TLS connections. The actual setting depends on the server you connect to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will repeatedly check the mailbox in this interval until the email arrives. Please enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will repeatedly check the mailbox in the interval specified above until the email arrives. If it does not arrive within the maximum trip time, the sensor will trigger an error message. Please enter an integer value.
Username	Enter a username for IMAP authentication. Please enter a string.
Password	Enter a password for IMAP authentication. Please enter a string.
Search Method	Define how to search for the roundtrip email in the mailbox. Choose between: ▪ **Search email directly (default)**: Send a SEARCH command to find the roundtrip email directly on the IMAP server. ▪ **Search through all available emails**: Iterate over all available message in the mailbox on the IMAP server to find the roundtrip email.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between:

TRANSPORT-LEVEL SECURITY

- **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption.
- **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption.
- **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135.
- **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

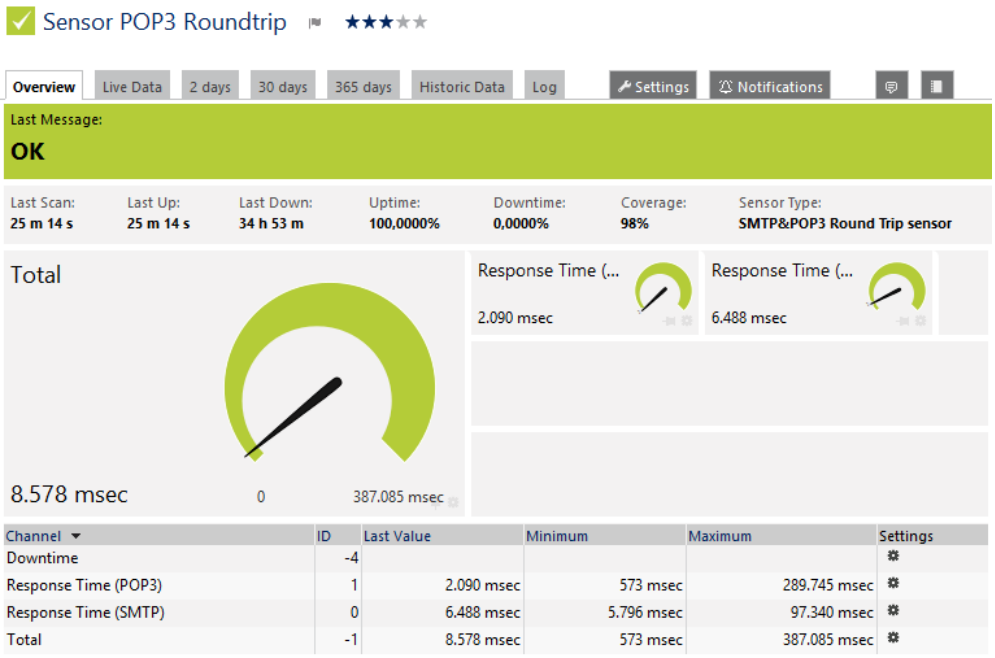
For more general information about settings, please see the **Object Settings** 159 section.

6.8.106 SMTP&POP3 Round Trip Sensor

The SMTP&POP3 Round Trip sensor monitors the time it takes for an email to reach an Post Office Protocol version 3 (POP3) mailbox after being sent using Simple Mail Transfer Protocol (SMTP). It sends an email to the parent device via SMTP and then scans a dedicated POP3 mailbox until the email comes in. The SMTP&POP3 Round Trip sensor will delete these emails automatically from the mailbox as soon as PRTG retrieves them. Emails will only remain in the mailbox particularly if a timeout or a restart of the PRTG server occurred during sensor run-time.

The sensor shows the following:

- Response time of SMTP server
- Response time of POP3 server
- Sum of both response times.



SMTP&POP3 Round Trip Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/smtp_pop3_round_trip.png

Remarks

- Note: Please use dedicated email accounts with this sensor type. If you use more sensors of this type, please make sure that each sensor uses its own email accounts.
- Note: This sensor type does not support Secure Remote Password (SRP) ciphers.
- For a general introduction to the technology behind round trip monitoring, please see **Monitoring Email Round Trip** 3022 section.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

We recommend adding this sensor on an SMTP server device only, as this sensor type's settings are optimized for this scenario.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

EMAIL SETTINGS

From	Specify which address the sent emails will contain in the from field. Please enter a valid email address.
To	Specify to which address PRTG sends the emails. Please enter a valid email address.
HELO Ident	Enter a server name for the HELO part of the mail protocol. For some mail servers the HELO identifier must be the valid principal host domain name for the client host. See SMTP RFC 2821.

STEP 1: SEND EMAIL TO THE PARENT DEVICE USING SMTP

In this step, you configure how PRTG sends the emails. As SMTP server, the sensor uses the **IP-Address/DNS Name** property's value of the device on which you add this sensor.

Port	Enter the number of the port that the sensor uses to send an email via SMTP. Please enter an integer value. For non-secure connections usually port 25 is used and port 465 or 587 for SSL/ TLS connections. The actual setting depends on the server you connect to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.
Timeout for SMTP Connection (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
SMTP Authentication Type	Define if you want to use an authentication for the SMTP connection. Choose between: • **None**: Do not use any authentication method. • **Username/Password**: Authenticate at the SMTP server via username and password.
Username	This field is only visible if you enable SMTP authentication above. Enter a username for SMTP authentication. Please enter a string.
Password	This field is only visible if you enable SMTP authentication above. Enter a password for SMTP authentication. Please enter a string.
Additional Text for Email Subject	The subject part of the round trip email is created automatically by PRTG. It consists of the string "PRTG Roundtrip Mail:" followed by a unique GUID to correctly identify the email in the POP3 mailbox (for example, PRTG Roundtrip Mail: {5E858D9C-AC70-466A-9B2A-55630165D276}). Use this field to place your custom text before the automatically created text.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose between:

TRANSPORT-LEVEL SECURITY

- **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption.
- **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption.
- **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135.
- **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

STEP 2: CHECK A POP3 MAILBOX UNTIL EMAIL ARRIVES

In this step, you configure how the sent emails will be received.

IP-Address/DNS Name	Specify the POP3 server. Enter a valid IP address or DNS name.
Port	Specify the port that the sensor uses for the POP3 connection. For non-secure connections usually port 110 is used and port 995 for SSL/TLS connections. The actual setting depends on the server you are connecting to. Please enter an integer value. We recommend that you use the default value. If you do not get a connection, please try another port number.
Connection Interval (Sec.)	Enter the number of seconds the sensor will wait between two connections to the IMAP server. PRTG will repeatedly check the mailbox in this interval until the email arrives. Please enter an integer value.
Maximum Trip Time (Sec.)	Enter the number of seconds an email may take to arrive in the IMAP mailbox. PRTG will repeatedly check the mailbox in the interval specified above until the email arrives. If it does not arrive within the maximum trip time, the sensor will trigger an error message. Please enter an integer value.
POP3 Authentication Type	Select the kind of authentication for the POP3 connection. Choose between: • **Without Login**: Monitor the connection to the POP3 server only. • **Username and Password**: Log on to the POP3 server with username and password (simple login, non-secure). • **128-bit MD5 hash value (APOP)**: Send the password in an encrypted form using APOP. This option must be supported by the POP3 server you're connecting to.
Username	This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.
Password	This field is only visible if you select an option with login above. Enter a username for POP3 authentication. Please enter a string.

TRANSPORT-LEVEL SECURITY

Sensor Specific	Define the security level for the sensor connection. Choose

TRANSPORT-LEVEL SECURITY

between:

- **Use Transport-Level Security if available using StartTLS (default)**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will try connecting without encryption.
- **Use Transport-Level Security if available**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will try connecting without encryption.
- **Enforce Transport-Level Security using StartTLS**: Choose this option to try connecting to the server using TLS and StartTLS. If the server does not support this, the sensor will show a **Down** status 135.
- **Enforce Transport-Level Security**: Choose this option to try connecting to the server using TLS. If the server does not support this, the sensor will show a **Down** status 135.

If the sensor connects to a server via StartTLS, the connection is established unencrypted first. After the connection is established, the sensor sends a certain command (StartTLS) over the unencrypted connection to negotiate a secure connection via the SSL/TLS protocol.

If the sensor uses TLS without StartTLS, the negotiation of a secure connection happens immediately (implicitly) so that no commands are sent in unencrypted plain text. If there is no secure connection possible, no communication will take place.

DEBUG OPTIONS

Sensor Result

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

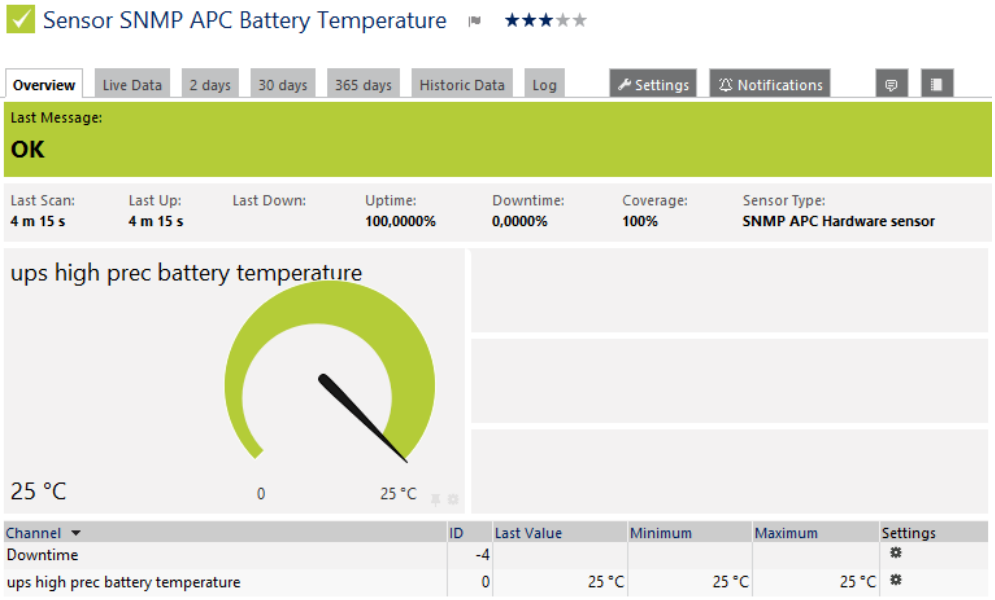
6.8.107 SNMP APC Hardware Sensor

The SNMP APC Hardware sensor monitors performance counters on an APC UPS device using Simple Network Management Protocol (SNMP).

It can show the following:

- Actual voltage of battery
- Capacity of battery
- Temperature of battery
- Remaining runtime of battery
- Input and output frequency
- Input and output voltage
- Output load

Which channels the sensor actually shows might depend on the monitored device and the sensor setup. For additional counters, please see section **More** 1474.



SNMP APC Hardware Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_apc_hardware.png

Remarks

- Knowledge Base: How can I monitor additional counters with the SNMP APC Hardware sensor?
- Knowledge Base: How can I monitor an APC UPS that does not support SNMP?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the performance counters you want to monitor. PRTG creates one sensor for each counter you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

APC UPS SPECIFIC

Library OIDs	Select the performance counters you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

APC UPS SPECIFIC

Selected Interface	Shows the name of the interface (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that the sensor monitors at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the quotient here. Please enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification [2719] whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.108 SNMP Cisco ADSL Sensor

The SNMP Cisco ADSL sensor monitors Asymmetric Digital Subscriber Line (ADSL) statistics of a Cisco router using Simple Network Management Protocol (SNMP).

It shows the following:

- Speed of downlink
- Speed of uplink
- Remote and local attenuation
- Remote and local SNR (signal-to-noise ratio)
- Remote and local power output

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

For devices with multiple performance counters, multiple sensors are created at once in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

CISCO ADSL SETTINGS

Line Index	Select the performance counters you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

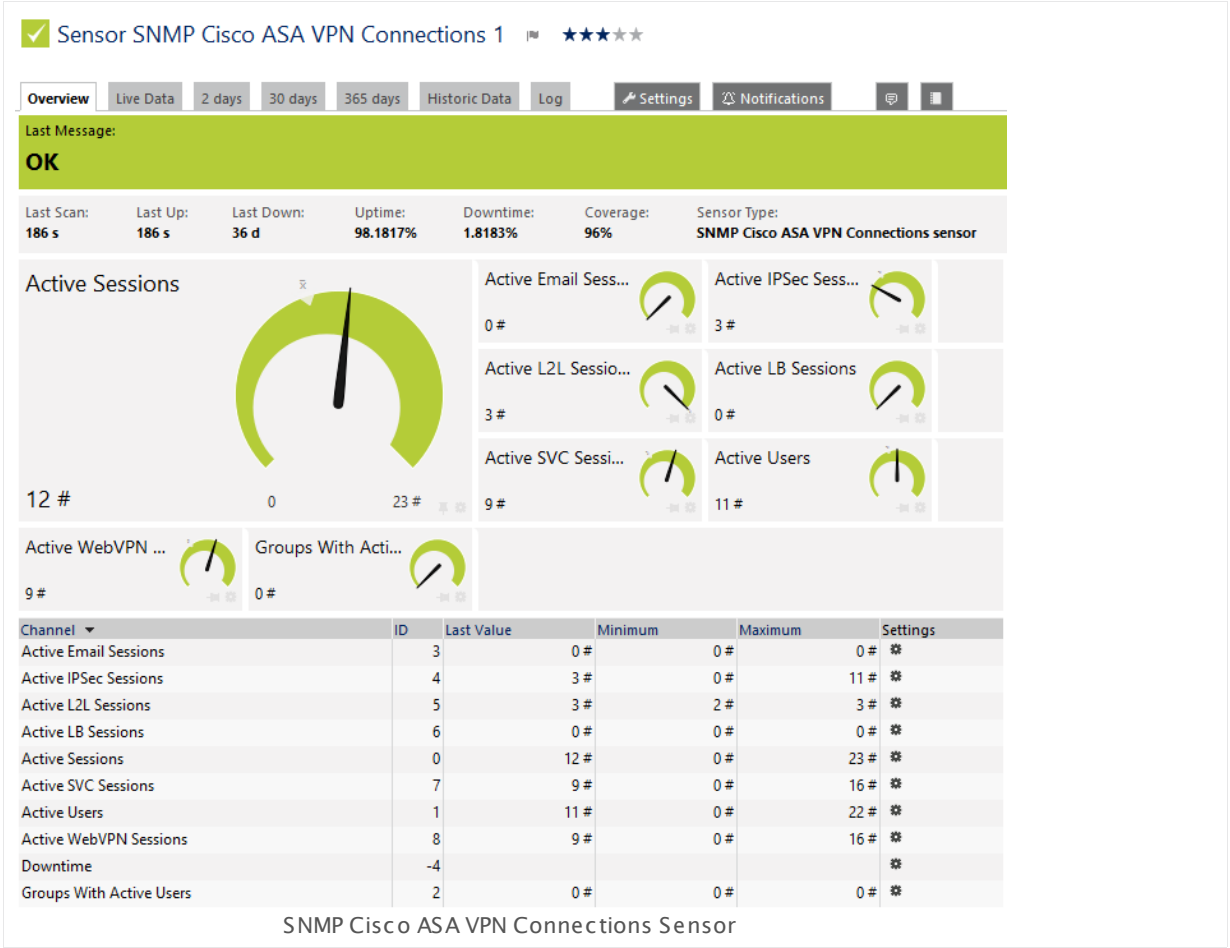
6.8.109 SNMP Cisco ASA VPN Connections Sensor

The SNMP Cisco ASA VPN Connections sensor monitors the Virtual Private Network (VPN) connections on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP).

It can show the following:

- Active email sessions
- Active Internet Protocol Security (IPsec) sessions
- Active L2L sessions
- Active LB sessions
- Active sessions in total
- Active SVC sessions
- Active users
- Groups with active users



Channel	ID	Last Value	Minimum	Maximum	Settings
Active Email Sessions	3	0 #	0 #	0 #	
Active IPSec Sessions	4	3 #	0 #	11 #	
Active L2L Sessions	5	3 #	2 #	3 #	
Active LB Sessions	6	0 #	0 #	0 #	
Active Sessions	0	12 #	0 #	23 #	
Active SVC Sessions	7	9 #	0 #	16 #	
Active Users	1	11 #	0 #	22 #	
Active WebVPN Sessions	8	9 #	0 #	16 #	
Downtime	-4				
Groups With Active Users	2	0 #	0 #	0 #	

SNMP Cisco ASA VPN Connections Sensor

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

SNMP Version	Select the SNMP version for the device connection. Choose between: ▪ **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.

CREDENTIALS FOR SNMP DEVICES

- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

User

This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

Password

This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type

This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:

- **DES**: Use Data Encryption Standard (DES) as encryption algorithm.

CREDENTIALS FOR SNMP DEVICES

	▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

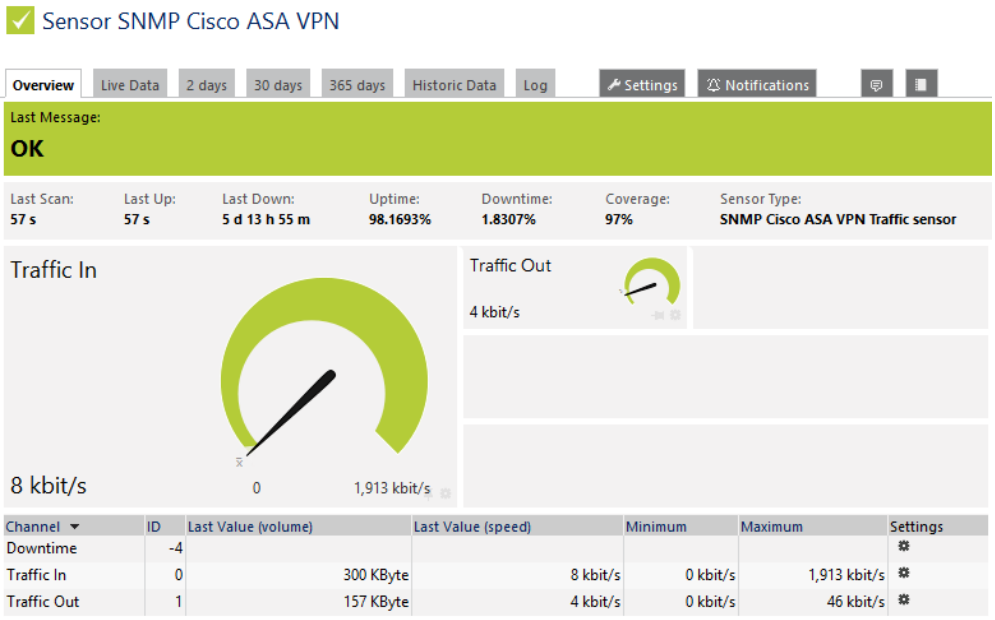
For more general information about settings, please see the **Object Settings** 159 section.

6.8.110 SNMP Cisco ASA VPN Traffic Sensor

The SNMP Cisco ASA VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) connection on a Cisco Adaptive Security Appliance using Simple Network Management Protocol (SNMP).

It shows the following:

- Incoming traffic
- Outgoing traffic



SNMP Cisco ASA VPN Traffic Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_asa_vpn_traffic.png

Remarks

- This sensor type is indented to monitor permanent connections. It will show an error if a connection is interrupted.
- This sensor can monitor IPsec connections only!
- Knowledge Base: I get the error PE123 when using the SNMP Cisco ASA VPN Traffic sensor. What can I do?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the connections you want to monitor. PRTG creates one sensor for each connection you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

ASA VPN SPECIFIC

Connections	Select the IPsec VPN connections you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: This sensor type can only monitor VPN connections based on IPsec. This means, for example, that connections using "Cisco AnyConnect" are not listed here.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ASA VPN SPECIFIC

Remote IP	Shows the IP address of the connection this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so for debugging. Wrong usage can result in incorrect monitoring data! Note: This sensor type can only monitor VPN connections based on IPsec.
Sensor Behavior	Define the status of the sensor 135 if there is no active connection available. Choose between: ▪ **Show 'Down' status if no connection is active (recommended)** ▪ **Show 'Warning' status if no connection is active** ▪ **Stay in 'Up' status if no connection is active**

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

SNMP Version	Select the SNMP version for the device connection. Choose between: ▪ **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.

CREDENTIALS FOR SNMP DEVICES

- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

User

This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

Password

This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type

This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:

- **DES**: Use Data Encryption Standard (DES) as encryption algorithm.

CREDENTIALS FOR SNMP DEVICES

	▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

6.8.111 SNMP Cisco ASA VPN Users Sensor

The SNMP Cisco ASA VPN Users sensor monitors account connections to a Virtual Private Network (VPN) on a Cisco Adaptive Security Appliance via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of currently connected accounts
- If a specific user account is currently offline or online

SNMP Cisco ASA VPN Users Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_asa_vpn_users.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

- Note: Please do not use the sensor to monitor more than 50 VPN users, especially if they are all connected simultaneously. For more information, see the **More** 1513 section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

CREDENTIALS FOR SNMP DEVICES

SNMP Version	Select the SNMP version for the device connection. Choose between: ▪ **v1**: Use the simple v1 protocol for SNMP connections. This protocol only offers clear-text data transmission, but it is usually supported by all devices. Note: SNMP v1 does not support 64-bit counters which may result in invalid data when monitoring traffic via SNMP.

CREDENTIALS FOR SNMP DEVICES

- **v2c (recommended)**: Use the more advanced v2c protocol for SNMP connections. This is the most common SNMP version. Data is still transferred as clear-text, but it supports 64-bit counters.
- **v3**: Use the v3 protocol for SNMP connections. It provides secure authentication and data encryption.

Note for SNMP v3: Due to internal limitations you can only monitor a limited number of sensors per second using SNMP v3. The limit is somewhere between 1 and 50 sensors per second (depending on the SNMP latency of your network). This means that using an interval of 60 seconds you are limited to between 60 and 3000 SNMP v3 sensors for each probe. If you experience an increased "Interval Delay" or "Open Requests" with the **Probe Health Sensor** 1311, you need to distribute the load over multiple probes. SNMP v1 and v2 do not have this limitation.

Community String

This setting is only visible if you select SNMP version **v1** or **v2c** above. Enter the community string of your devices. This is a kind of "clear-text password" for simple authentication. We recommend that you use the default value.

Authentication Type

This setting is only visible if you select SNMP version v3 above. Choose between:

- **MD5**: Use Message-Digest Algorithm 5 (MD5) for authentication.
- **SHA**: Use Secure Hash Algorithm (SHA) for authentication.

The type you choose must match the authentication type of your device.

Note: If you do not want to use authentication, but you need SNMP v3, for example, because your device requires context, you can leave the field password empty. In this case, SNMP_SEC_LEVEL_NOAUTH is used and authentication deactivated entirely.

User

This setting is only visible if you select SNMP version v3 above. Enter a username for secure authentication. This value must match the username of your device.

Password

This setting is only visible if you select SNMP version v3 above. Enter a password for secure authentication. This value must match the password of your device.

Encryption Type

This setting is only visible if you select SNMP version v3 above. Select an encryption type. Choose between:

- **DES**: Use Data Encryption Standard (DES) as encryption algorithm.

CREDENTIALS FOR SNMP DEVICES

	▪ **AES**: Use Advanced Encryption Standard (AES) as encryption algorithm. Note: AES 192 and AES 256 are not supported by Net-SNMP because they lack RFC specification. The type you choose must match the encryption type of your device.
Data Encryption Key	This setting is only visible if you select SNMP version **v3** above. Enter an encryption key here. If you provide a key in this field, SNMP data packets are encrypted using the encryption algorithm selected above, which provides increased security. The key that you enter here must match the encryption key of your device. Note: If the key you enter in this field does not match the key configured on the target SNMP device, you will not get an error message about this! Please enter a string or leave the field empty.
Context Name	This setting is only visible if you select SNMP version **v3** above. Enter a context name only if it is required by the configuration of the device. Context is a collection of management information accessible by an SNMP device. Please enter a string.
SNMP Port	Enter the port for the SNMP communication. We recommend that you use the default value.
SNMP Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than the value you enter here, the request is aborted and an error message triggered.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

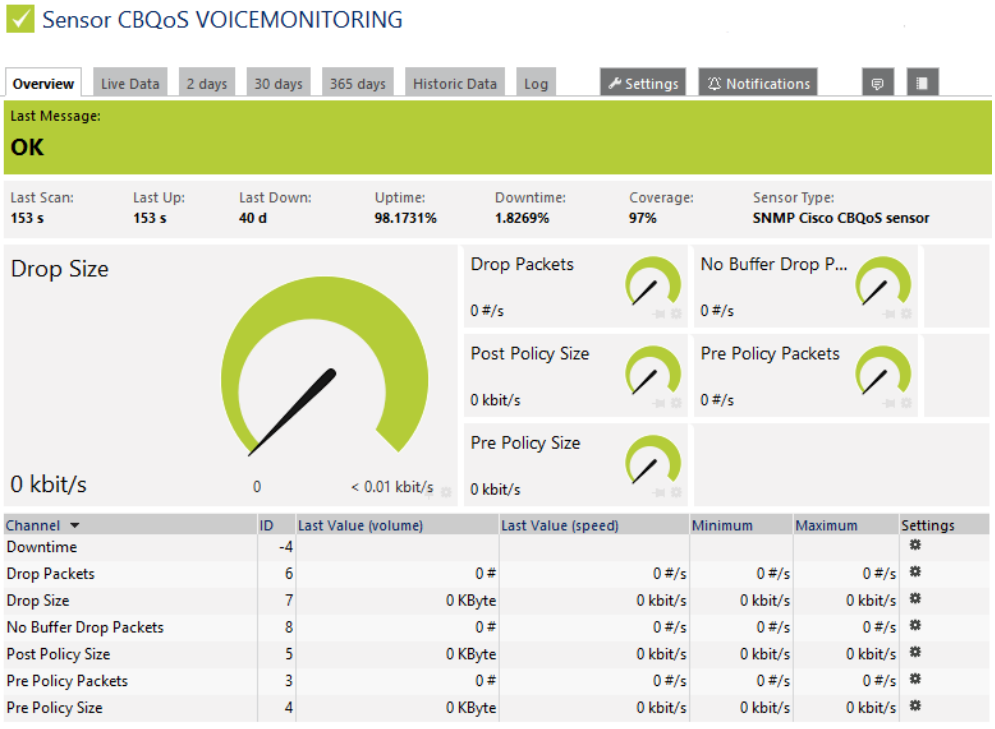
6.8.112 SNMP Cisco CBQoS Sensor

The SNMP Cisco CBQoS sensor monitors network parameters using Cisco's Class Based Quality of Service (CBQoS) via Simple Network Management Protocol (SNMP). It supports the classes Class Map, Match Statement, and Queueing.

The sensor can show the following depending on the particular class type:

- Current and maximum queue depth
- Pre policy packets
- Pre and post policy size
- Drop packets and size
- Drop packets without buffer
- Fragment packets and size.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Cisco CBQoS Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_cbqos.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.
- For a general introduction to the technology behind Quality of Service monitoring, please see manual section **Monitoring Quality of Service** 3017.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the CBQoS entries you want to monitor. To monitor Quality of Service (QoS) via compatible devices, PRTG creates one sensor for each CBQoS entry you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

CLASS BASED QOS SPECIFIC

CBQoS Entries	Select the measurements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CLASS BASED QOS SPECIFIC

Object Type Interface	Shows further information about the parameter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
BitMask	
ObjectID	
ConfigID	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

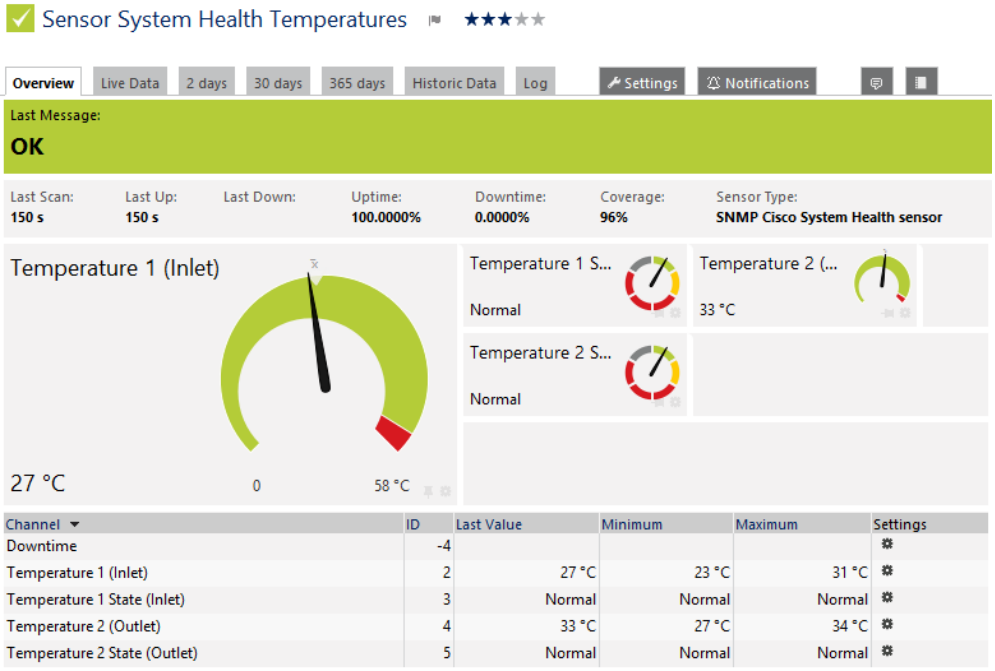
6.8.113 SNMP Cisco System Health Sensor

The SNMP Cisco System Health sensor monitors the system health of a Cisco device via Simple Network Management Protocol (SNMP).

It can show the following depending on the available components of your device:

- CPU load in percent
- Available memory in absolute and percentage values
- Status of power supplies
- Current temperature and temperature status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Cisco System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_system_health.png

Remarks

- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the components you want to monitor. To monitor the system health of a Cisco device, PRTG creates one sensor for each measurement you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

CISCO SYSTEM HEALTH SPECIFIC

Measurement	Select the measurements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

CISCO SYSTEM HEALTH SPECIFIC

Measurement	Shows the ID of the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

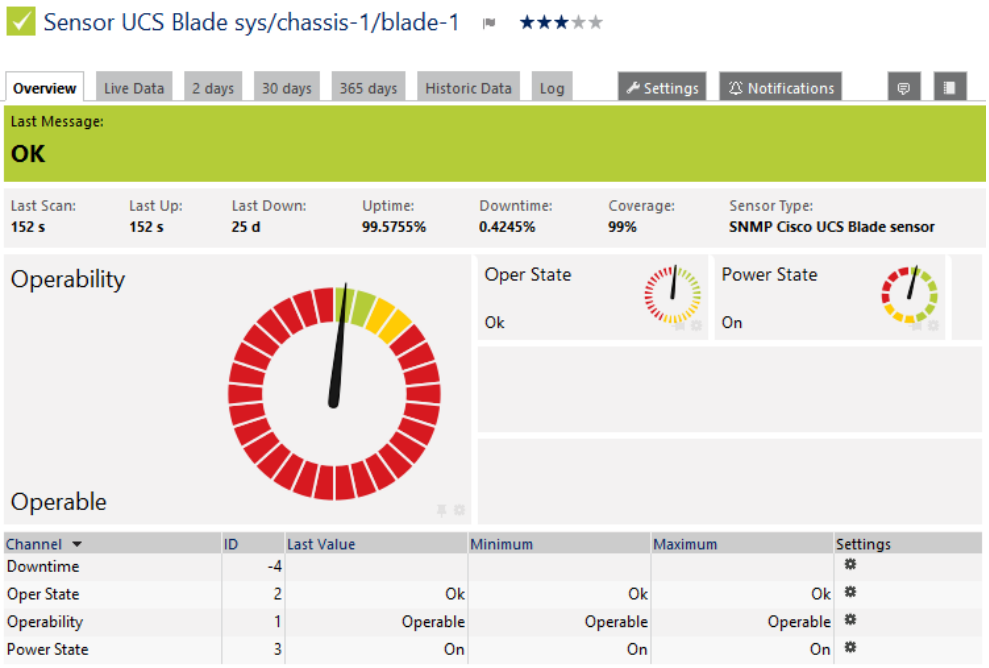
For more general information about settings, please see the **Object Settings** 159 section.

6.8.114 SNMP Cisco UCS Blade Sensor

The SNMP Cisco UCS Blade sensor monitors the health status of a Cisco Unified Computing System (UCS) blade server via Simple Network Management Protocol (SNMP).

It can show the following states:

- Operability
- Oper state
- Power state



SNMP Cisco UCS Blade Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_ucs_blade.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the blade servers you want to monitor. PRTG creates one sensor for each blade you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Blade Server	Select the blades you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Blade Server	Shows information about the blade server that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Channel Mask	
Model	
Serial Number	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

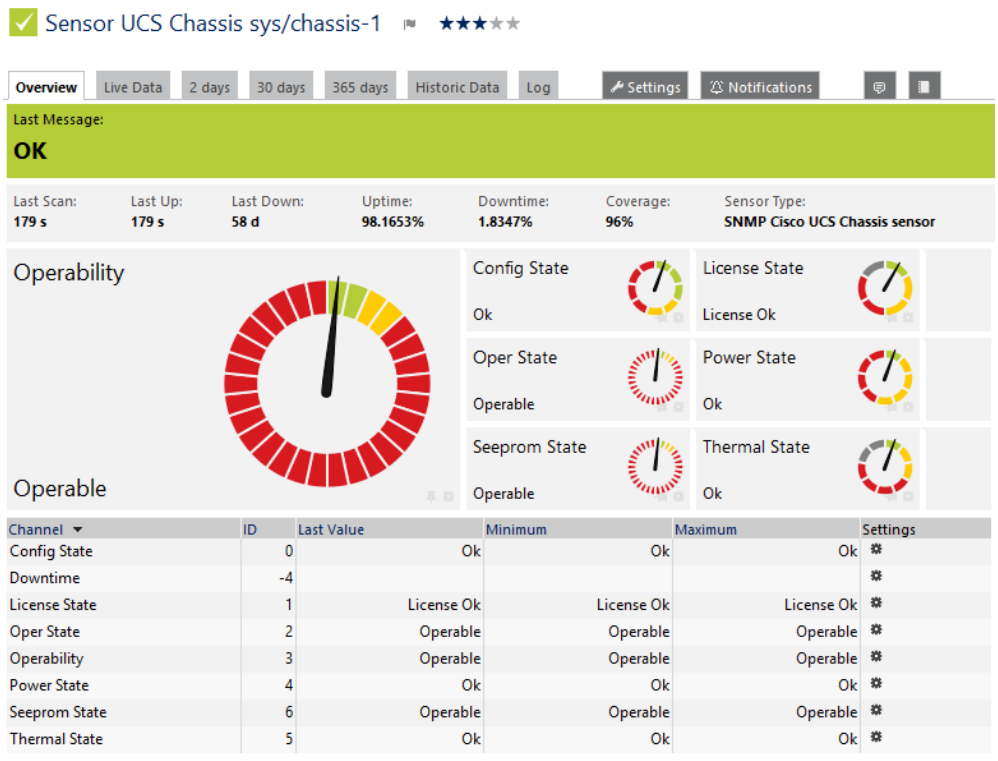
6.8.115 SNMP Cisco UCS Chassis Sensor

The SNMP Cisco UCS Chassis sensor monitors the health status of the chassis of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the states of the following properties:

- Configuration
- License
- Oper
- Operability
- Power
- Thermal
- Serial electronic erasable programmable read-only memory (SEEPROM)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Cisco UCS Chassis Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_ucs_chassis.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the chassis you want to monitor. PRTG creates one sensor for each chassis you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Chassis	Select the chassis you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Chassis	Shows the chassis that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.116 SNMP Cisco UCS Physical Disk Sensor

The SNMP Cisco UCS Physical Disk sensor monitors a physical disk of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the following:

- Operability status of the disk
- Connection status of the disk

SNMP Cisco UCS Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_ucs_physical_disk.png

Remarks

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

In order to monitor physical disks in a UCS device, PRTG will create one sensor for each disk you choose. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

UCS PHYSICAL DISK

Disks	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Only working disks (with the current status **Up** or **Warning**) will be shown here.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

UCS PHYSICAL DISK

Disk	Shows the disk which this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Display Name	Shows the display name of the physical disk which this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

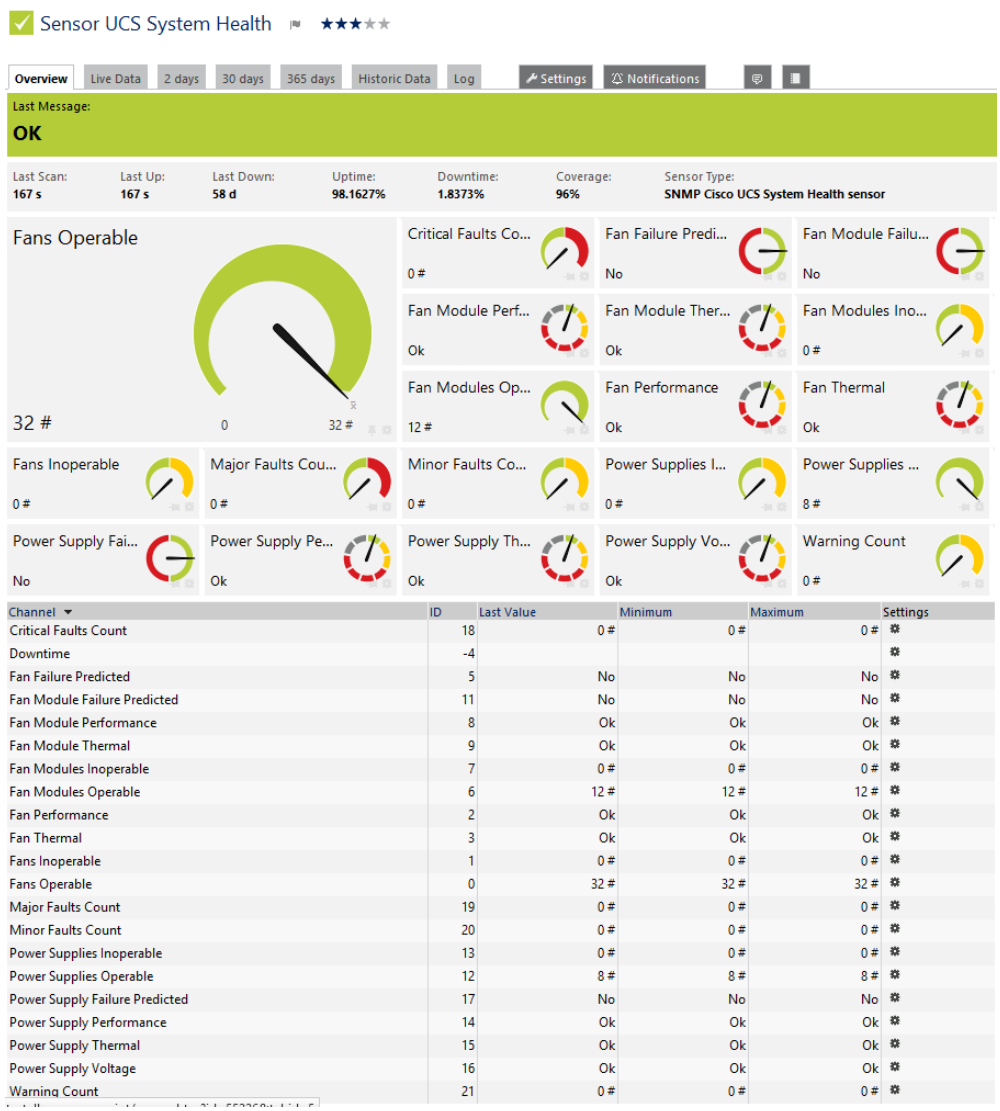
6.8.117 SNMP Cisco UCS System Health Sensor

The SNMP Cisco UCS System Health sensor monitors the system health of a Cisco Unified Computing System (UCS) device via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of operable resp. inoperable fans
- Status of fan performance, fan thermal, and fan voltage
- If a fan failure is predicted
- Number of operable resp. inoperable fan modules
- Status of fan module performance, fan module thermal, and fan module voltage
- If a fan module failure is predicted
- Number of operable resp. inoperable power supplies
- Status of power supply performance, power supply thermal, and power supply voltage
- If a power supply failure is predicted
- Number of minor, major, and critical faults (which are not acknowledged yet in the UCS logs)
- Number of warnings (which are not acknowledged yet in the UCS logs)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Cisco UCS System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cisco_ucs_system_health.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.118 SNMP CPU Load Sensor

The SNMP CPU Load sensor monitors the system load using Simple Network Management Protocol (SNMP).

- It shows the load of several CPUs in percent.

Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Processor 1	2	12 %	0 %	92 %	
Processor 10	11	9 %	0 %	96 %	
Processor 11	12	11 %	1 %	99 %	
Processor 12	13	11 %	1 %	100 %	
Processor 13	14	16 %	1 %	74 %	
Processor 14	15	10 %	1 %	81 %	
Processor 15	16	13 %	1 %	81 %	
Processor 16	17	11 %	1 %	87 %	
Processor 17	18	14 %	1 %	87 %	
Processor 18	19	12 %	1 %	100 %	
Processor 19	20	15 %	1 %	97 %	
Processor 2	3	9 %	0 %	99 %	
Processor 20	21	12 %	1 %	100 %	
Processor 21	22	18 %	1 %	85 %	
Processor 22	23	9 %	1 %	100 %	

SNMP CPU Load Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_cpu_load.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

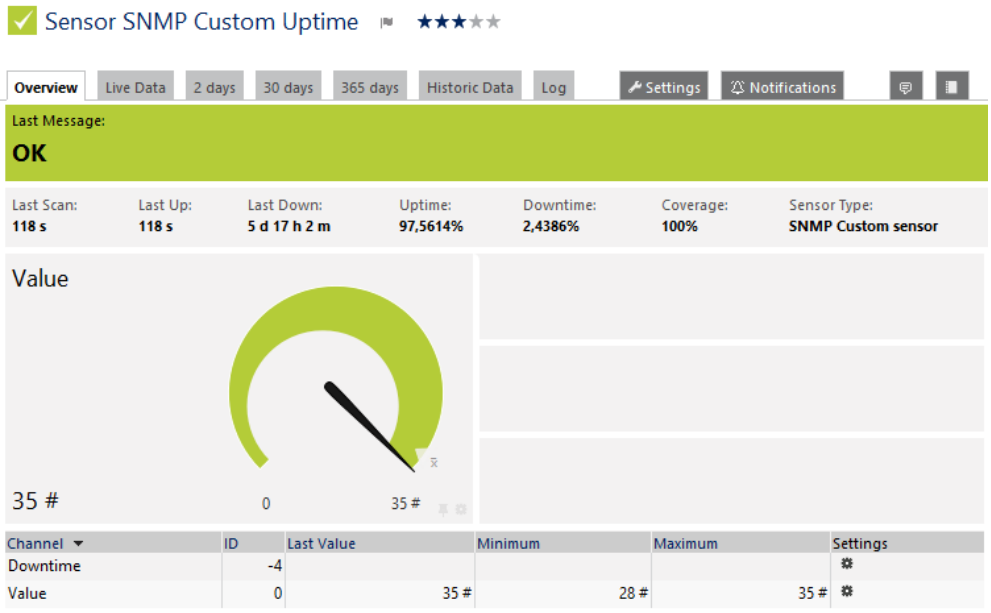
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.119 SNMP Custom Sensor

The SNMP Custom sensor monitors a numerical value returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP).

- It shows the numerical value at a given OID of an SNMP device.



SNMP Custom Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_custom.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: How do I find out what OID I need to use for a custom sensor?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

OID VALUES

Channel Name	Enter a name for the channel in which the sensor shows the results at the given OID. Please enter a string. You can change this value later in the respective channel settings 2711 of this sensor.
Value Type	Select the expected numeric type of the results at the given OID. Choose between: ▪ **Gauge (unsigned Integer)**: For integer values, such as 10 or 120. ▪ **Gauge (signed integer)**: For integer values, such as -12 or 120. ▪ **Gauge (float)**: For float values, such as -5.80 or 8.23. ▪ **Delta (Counter)**: For counter values. PRTG will calculate the difference between the last and the current value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags**, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value	Enter the OID of the SNMP object you want to receive numerical data from. Note: Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry entirely, add the string **norfccheck:** to the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.
Unit String	Define the unit of the numerical data that this sensor receives from the given OID. Please enter a string.
Value Type	Shows the value type of the numerical data that this sensor receives from the given OID. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Multiplication	If you want to multiply the received data with a certain value, enter the multiplier here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer value. Otherwise, use the default value 1 to not change the received value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between:

OID VALUES

- **Ignore changes (default)**: The sensor takes no action on change.
- **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

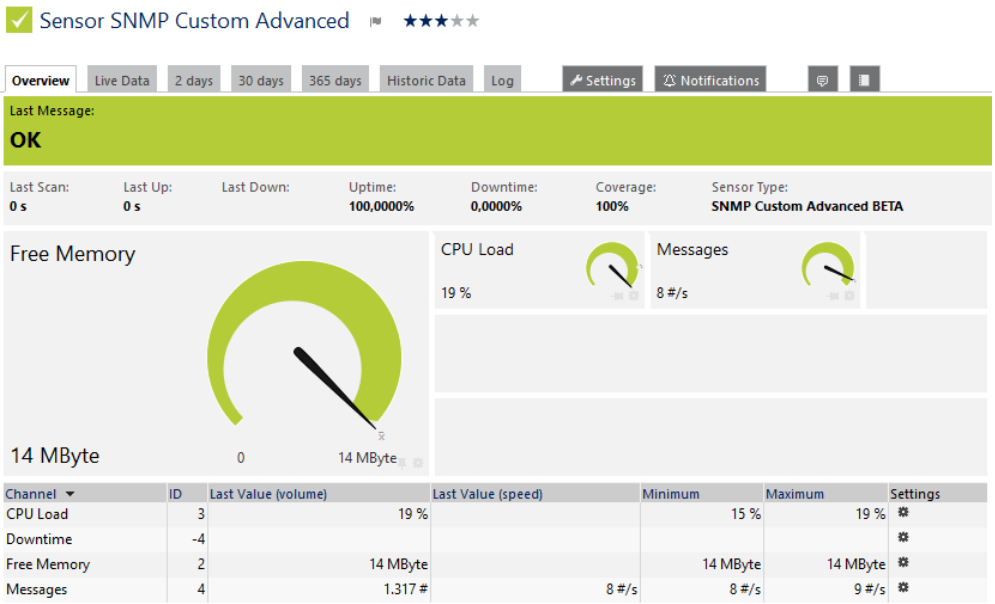
6.8.120 SNMP Custom Advanced Sensor

The SNMP Custom Advanced sensor monitors numerical values returned by one or more specific Object Identifiers (OIDs) using Simple Network Management Protocol (SNMP).

- It can show numerical values at given OIDs on an SNMP device in up to 10 different channels.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Custom Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_custom_advanced.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: How do I find out what OID I need to use for a custom sensor?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

OID VALUES

Value Type	Select the expected numeric type of the results at the given OID. Choose between: ▪ **Gauge (unsigned Integer)**: For integer values, such as 10 or 120. ▪ **Gauge (signed integer)**: For integer values, such as -12 or 120. ▪ **Gauge (float)**: For float values, such as -5.80 or 8.23. ▪ **Delta (Counter)**: For counter values. PRTG will calculate the difference between the last and the current value. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #2 – #10	You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for Sensor Channel #1 without enabling it manually. Additionally you can define Sensor Channel #2 up to Sensor Channel #10. To do so, choose between: ▪ **Disable**: The sensor will not create this channel. ▪ **Enable**: The sensor will create this channel. Specify name, OID, value type, and unit for this channel below. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. It is not possible to enable or disable sensor channels after creation of this sensor!

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

Sensor Channel #x Name	Enter a name for the channel in which the sensor shows the results at the given OID. Please enter a string.
Sensor Channel #x OID	Enter the OID of the SNMP object you want to receive numerical data from. Note: Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry during your typing entirely, add the string **norfccheck:** to the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.

OID VALUES

Sensor Channel #x Value Type	Shows the value type of the numerical data that this sensor receives from the given OID. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Unit	Define the unit of the numerical data that this sensor receives from the given OID. Choose between: ▪ BytesBandwidth ▪ BytesMemory ▪ BytesDisk ▪ Temperature ▪ Percent ▪ TimeResponse ▪ TimeSeconds ▪ TimeHours ▪ Count ▪ CPU ▪ BytesFile ▪ SpeedDisk ▪ SpeedNet ▪ Custom ▪ Value Lookup For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you select the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This setting is only visible if you select the **Value Lookup** option above. Choose a lookup 3095 file that you want to use with this channel.

OID VALUES

Sensor Channel #y	This field shows the option you chose for this channel in the **Add Sensor** 1587 dialog, **Enable** or **Disable**. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. If you created this channel, you can define the settings of this channel as described above.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: How do I find out what OID I need to use for a custom sensor?

- http://kb.paessler.com/en/topic/903

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

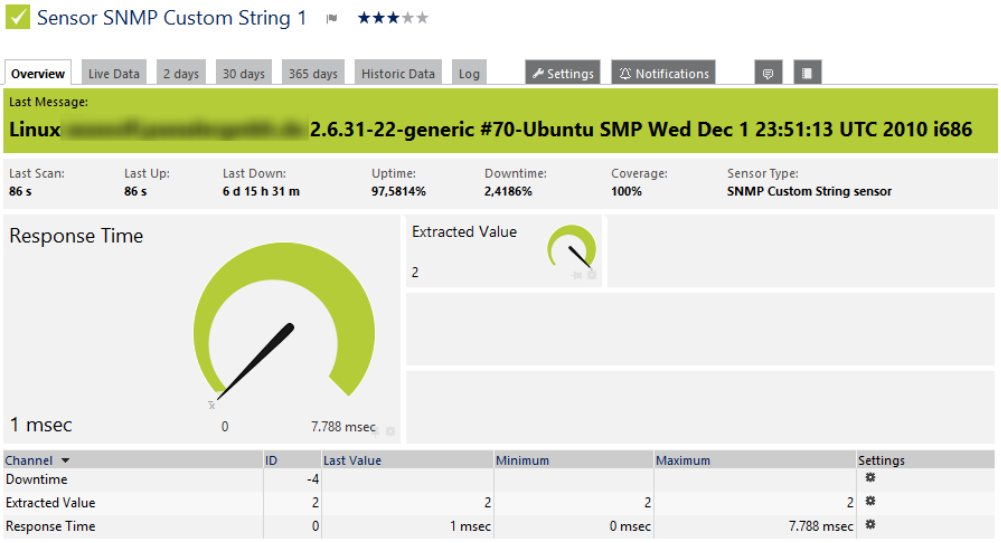
For more general information about settings, please see the **Object Settings** 159 section.

6.8.121 SNMP Custom String Sensor

The SNMP Custom String sensor monitors a string returned by a specific Object Identifier (OID) using Simple Network Management Protocol (SNMP). It can check for keywords. If you want to use limits for the sensor channel value, you can also extract a numeric value contained in the string.

This sensor shows the following:

- Response time of the monitored device
- Optionally a value extracted from the string
- In the sensor message, the sensor shows the string you search [1598] for and which is the reason for a current **Warning** or **Down** status.



SNMP Custom String Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_custom_string.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG [244] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: How do I find out what OID I need to use for a custom sensor?
- Example: Number Extraction with Regular Expression [1605]
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** [3001].

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value	Enter the OID of the SNMP object you want to receive a string from. Note: Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry entirely, add the string **norfccheck:** at the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.
Maximum Length of String	Define the maximum allowed length of the string to be received from the SNMP object at the given OID. If the string is longer than this value, the sensor shows a **Down** status 135. Please enter an integer value or leave the field empty.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

KEYWORD SEARCH

Response Must Include (Error State)	Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a **Regular Expression** 3105. If the data does not include the search pattern, the sensor shows a **Down** status 135. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. ▪ **Regular Expression**: Treat the search pattern as a **Regular Expression** 3105.

Response Must Not Include (Error State)	Define which string must not be part of the data that is received form the SNMP object at the given OID. You can either enter plain text or a **Regular Expression** 3105. If the data does include the search pattern, the sensor shows a **Down** status 135. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. ▪ **Regular Expression**: Treat the search pattern as a **Regular Expression** 3105.
Response Must Include (Warning State)	Define which string must be part of the data that is received from the SNMP object at the given OID. You can either enter plain text or a **Regular Expression** 3105. If the data does not include the search pattern, the sensor shows a **Warning** status 135. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search. ▪ **Regular Expression**: Treat the search pattern as a **Regular Expression** 3105.
Response Must Not Include (Warning State)	Define which string must not be part of the data that is received form the SNMP object at the given OID. You can either enter plain text or a **Regular Expression** 3105. If the data does include the search pattern, the sensor shows a **Warning** status 135. Please enter a string or leave the field empty.
For Keyword Search Use	Define in which format you have entered the search expression in the field above. ▪ **Plain Text**: Search for the string as plain text. The characters * and ? work here as placeholder, whereas * stands for no or any number of characters and ? stands for exactly one character (as known from Windows search). This behavior cannot be disabled, so the literal search for these characters is not possible with plain text search.

- **Regular Expression**: Treat the search pattern as a **Regular Expression** 3105.

EXTENDED PROCESSING

Interpret Result as	Define the type of the received string. Choose between: ▪ **String (default)**: Handle the result as common string. ▪ **Hexadecimal bytes (as in MAC addresses)**: Handle the result as hexadecimal bytes. For example, choose this option when monitoring MAC addresses. ▪ **Decimal bytes (as in IP addresses)**: Handle the result as decimal bytes. For example, choose this option when monitoring IP addresses.
Extract Number Using Regular Expression	Define if you want to filter out a numeric value from the string received from the SNMP object at the given OID. You can convert this into a float value to use it with channel limits (see **Sensor Channels Settings** 2711). ▪ **No extraction**: Do not extract a float value. Use the result as a string value. ▪ **Extract a numeric value using a regular expression**: Use a regular expression to identify a numeric value in the string and convert it to a float value. Define below. See also the example 1605 below.
Regular Expression	This setting is only visible if you enable number extraction above. Enter a **Regular Expression** 3105 to identify the numeric value you want to extract from the string returned by the SNMP object at the given OID. You can use capturing groups here. Make sure the expression returns numbers only (including decimal and thousands separators). The result will be further refined by the settings below.
Index of Capturing Group	This setting is only visible if you enable number extraction above. If your regular expression uses capturing groups, please specify which one will be used to capture the number. Please enter an integer value or leave the field empty.
Decimal Separator	This setting is only visible if you enable number extraction above. Define which character is used as decimal separator for the number extracted above. Please enter a string or leave the field empty.

Thousands Separator	This setting is only visible if you enable number extraction above. Define which character is used as thousands separator for the number extracted above. Please enter a string or leave the field empty.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Example: Number Extraction with Regular Expression

If you want to extract a number in the response string using a regular expression, please note that the index for captures in this sensor is based on 1 (**not on 0**). Furthermore, capturing groups are not created automatically. The example below will illustrate this issue.

Consider the following string as returned by a request for CPU usage:

```
5 Sec (3.49%), 1 Min (3.555%), 5 Min (3.90%)
```

Assuming you would like to filter for the number 3.555, i.e., the percentage in the second parentheses. Then enter the following regex in the **Regular Expression** field:

```
(\d+\.\d+).*?(\d+\.\d+).*?(\d+\.\d+)
```

As **Index of Capturing Group** enter 3. This will extract the desired number 3.555.

The index has to be 3 in this case because the capturing groups here are the following:

- Group 1 contains "3.49%), 1 Min (3.555), 5 Min (3.90"
- Group 2 contains "3.49"
- Group 3 contains "3.555"
- Group 4 contains "3.90"

Please keep in mind this note about index and capturing groups when using number extraction.

Note: It is not possible to match an empty string using PRTG's regex search with sensors.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

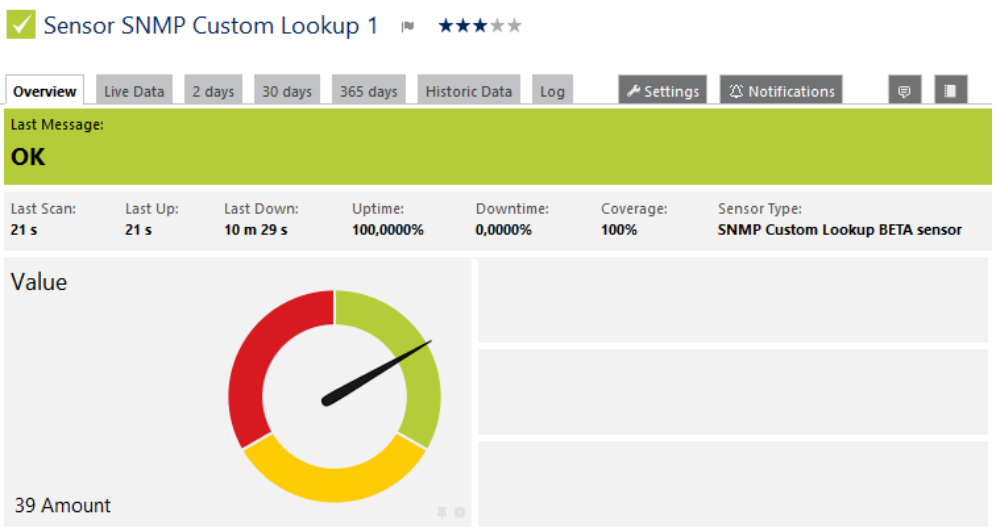
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.122 SNMP Custom String Lookup Sensor

The SNMP Custom String Lookup sensor monitors a string that a specific Object Identifier (OID) returns via Simple Network Management Protocol (SNMP). It can map the string directly to a sensor status [135] by using a defined lookup file [3095]. Basically, this sensor type does a "reverse lookup". You have to define all potential return strings in the lookup file as text values, each in one lookup entry. Graphs and data tables show the value to which the string is mapped, usually an integer (lookup type [3103] **SingleInt**). See section **Example** [1614] below.

- This sensor shows a retrieved string value with a defined status.



SNMP Custom Lookup Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_custom_lookup.png

Remarks

- See manual section **SNMP Custom String Lookup Sensor—Example** [1614] for a sample lookup definition for this sensor type.
- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG [244] with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: How do I find out what OID I need to use for a custom sensor?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** [3095].
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** [3001].
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

OID VALUES

Channel Name	Enter a name for the channel in which the sensor shows the results at the given OID. Please enter a string. You can change this value later in the respective channel settings 2711 of this sensor.
Lookup	Select a lookup file that you stored in the **\lookups\custom** subfolder of your PRTG installation. This lookup file must contain all potential strings that the monitored OID can return.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

OID VALUES

OID Value	Enter the OID of the SNMP object you want to receive a string from. Note: Most OIDs begin with 1.3.6.1. However, entering OIDs starting with 1.0, or 1.1, or 1.2 is also allowed. If you want to disable the validation of your entry entirely, add the string **norfccheck:** at the beginning of your OID, for example, **norfccheck:2.0.0.0.1**.
Lookup	Shows the lookup file that this sensor uses. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Example

You have to provide all possible return strings for this sensor in one lookup file. For example, consider an OID that can return one of the three strings Good, Deficient, or Bad. Then you have to define a lookup file 3095 for this sensor that contains all these possible string values as text, each text value in one lookup entry:

```
<?xml version="1.0" encoding="UTF-8"?>
<ValueLookup id="mylookupfile" desiredValue="0" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:
       <Lookups>
              <SingleInt state="Ok" value="0">
              Good
              </SingleInt>
              <SingleInt state="Warning" value="1">
              Deficient
              </SingleInt>
              <SingleInt state="Error" value="2">
              Bad
              </SingleInt>
    </Lookups>
</ValueLookup>
```

If a retrieved string matches one of the text values, the sensor maps it into the defined integer value ("reverse lookup") that is shown, for example, in data graphs. Depending on the integer, the sensor shows the according status and converts the integer back to the original string to show it as channel value. If the OID returns a string that the lookup definition does not contain, the sensor shows a **Down** status with a corresponding error message.

For example, you create an SNMP Custom String Lookup sensor, apply the example lookup definition from above (store it into the **\lookups\custom** subfolder of your PRTG installation), and the given OID returns the string Good. Then the sensor maps Good into the integer value 0, shown in the live graph of the sensor, for example. According to the status definition state="Ok", the sensor status is **Up** in this case. The integer 0 is converted back to the string Good which is shown as channel value.

Note: The string match is not case sensitive.

Note: Please use the lookup type **SingleInt** for this sensor. BitFields and ranges are not supported!

Note: If you imported an SNMP library 1848 (this is an oidlib file) that contains lookups 3095 (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. Use the **lookupname** of the imported SNMP library as **id** parameter in a custom lookup definition. This overrides the lookups which an oidlib might contain with your own status definitions. See section **Define Lookups—Customizing Lookups** 3101 for details about this mechanism.

More

Knowledge Base: How do I find out what OID I need to use for a custom sensor?

- http://kb.paessler.com/en/topic/903

Knowledge Base: My SNMP sensors don't work. What can I do?

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

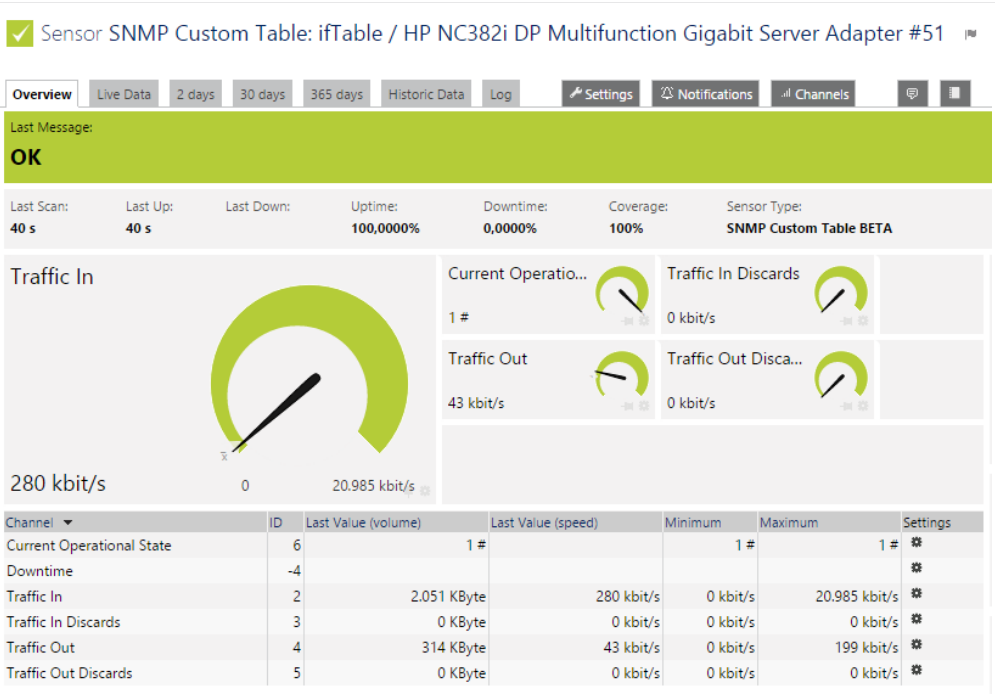
For more general information about settings, please see the **Object Settings** 159 section.

6.8.123 SNMP Custom Table Sensor

The SNMP Custom Table Sensor monitors entries from a table which is provided via Simple Network Management Protocol (SNMP). You can create one new sensor per table row. For each sensor, you can define up to ten channels. Each channel shows the value of one defined table column.

- It can show numerical values in up to 10 channels per table row.

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Custom Table Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_custom_table.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: How do I find out what OID I need to use for a custom sensor?
- Knowledge Base: What can I monitor with the SNMP Custom Tale Sensor?
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

PRTG creates one SNMP Table sensor for each table row that you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SNMP TABLE

Table OID	Enter the OID of the SNMP table you want to monitor. The OID needs to point directly to an object that represents an SNMP table. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Note: Without entering an OID you cannot proceed to the sensor and sensor channel creation.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. You can use the placeholders [tablename] and [rowidentifier]. They will be replaced with the name of the table and the identifying value of the chosen row respectively. You can choose the column that provides the row identifier in the **Identification Column** option below. You can also enter a valid OID which is part of a different SNMP table, for example, [1.3.6.1.2.1.2.2.1.2], to query information which is not contained in the current table. The same index as in the original table will be added to the OID.

TABLE SPECIFIC

Table	Choose the relevant table rows in which you find the data that you want to monitor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. PRTG shows you the table that the OID you entered before returns. To better find what you want to monitor, especially in large tables, use the search function in the upper right corner.
Identification Column	Define the identification column for the SNMP Table sensor(s) you want to create. The sensor uses this column to identify the correct table row for each object that you want to monitor. The value of the column that you choose as the identification column will appear in the sensor's name, so you can identify and distinguish all sensors that are created from the same SNMP table. Note: One new sensor is created for each table row you choose. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #2 – #10	You can create up to 10 different sensor channels for this sensor. You have to define at least one data channel, so you will see all available settings for Sensor Channel #1 without enabling it manually. Additionally you can define Sensor Channel #2 up to Sensor Channel #10. To do so, choose between: ▪ **Disable:** The sensor will not create this channel. ▪ **Enable:** Create an additional channel and define all its characteristics below, its name, column, value type, and unit. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. It is not possible to enable or disable sensor channels after the creation of this sensor! Note: All sensor channels that you define while creating an SNMP Table sensor will be the same for all sensors for each table row.
Value Type	Select the expected type of the results in this channel. Choose between: ▪ **Gauge (unsigned Integer)**: For integer values, such as 10 or 120. ▪ **Gauge (signed integer)**: For integer values, such as -12 or 120. ▪ **Gauge (float)**: For float values, such as -5.80 or 8.23.

TABLE SPECIFIC

- **Delta (Counter)**: For counter values. PRTG will calculate the difference between the last and the current value.

Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Please see below 1621 for the other channel settings that can be changed also after the sensor has been created.

Note: This sensor monitors numerical values only. Make sure that you do not select columns that return strings because they lead to a Down status 135. For example, if you monitor an ifTable, we recommend that you do not select an ifDescr-column because this will result in an error.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP TABLE

Table OID	Shows the OID of the SNMP table that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

TABLE SPECIFIC

Identifier	This is the value of the column that you selected as the **Identification Column** during the sensor's creation. It is also displayed in the sensor's name to distiguish it from other sensors you created from the same table, i.e. from other table rows. You can change the Identifier if you want to.
Identification Column	Shows the table column that you chose as the identification column. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Name	Enter a name for the channel in which the sensor shows the desired result. Please enter a string.
Sensor Channel #x Column	Select the table column that together with the table row points to the value that you want to monitor in this channel. You can choose between the available columns of the table that you monitor.
Sensor Channel #x Value Type	Shows the value type of the data that this sensor receives in this channel. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Sensor Channel #x Unit	Define the unit of the data that this sensor receives in this channel. Choose between: ▪ **BytesBandwidth** ▪ **BytesMemory**

TABLE SPECIFIC

	▪ **BytesDisk** ▪ **Temperature** ▪ **Percent** ▪ **TimeResponse** ▪ **TimeSeconds** ▪ **TimeHours** ▪ **Count** ▪ **CPU** ▪ **BytesFile** ▪ **SpeedDisk** ▪ **SpeedNet** ▪ **Custom** ▪ **Value Lookup** For more information about the available units, please refer to the PRTG **Application Programming Interface (API) Definition** 3086 for custom sensors. Note: To use lookups 3095 with this channel, choose the unit **Value Lookup** and select your lookup file below. Do not use the unit **Custom** for using lookups with this sensor!
Sensor Channel #x Custom Unit	This setting is only visible if you select the **Custom** unit option above. Define a unit for the channel value. Please enter a string.
Sensor Channel #x Value Lookup	This setting is only visible if you select the **Value Lookup** option above. Select a lookup 3095 file that you want to use with this channel.
Sensor Channel #x+1	Shows if you enabled or disabled a channel. Note: Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. You can define up to 10 different sensor channels per sensor.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

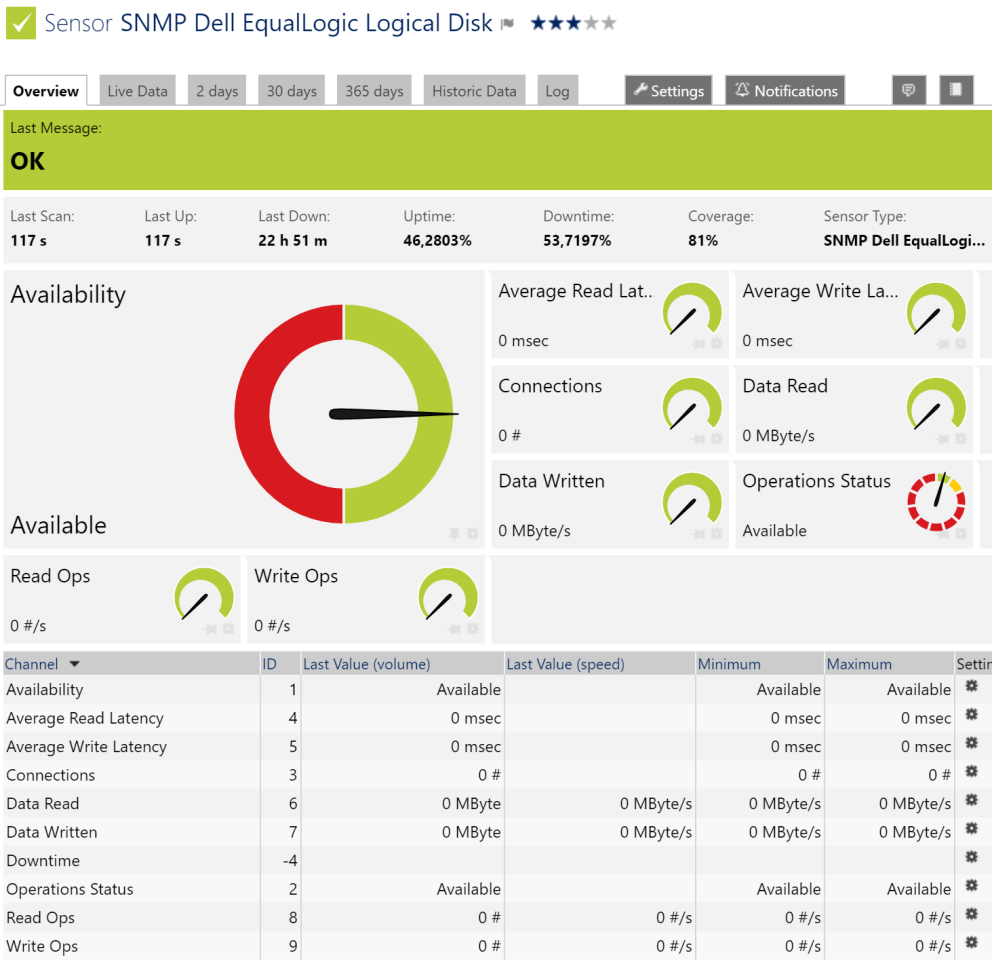
For more general information about settings, please see the **Object Settings** 159 section.

6.8.124 SNMP Dell EqualLogic Logical Disk Sensor

The SNMP Dell EqualLogic Logical Disk sensor monitors a volume of a Dell EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Availability
- Average read/write latency
- Number of connections
- Amount of read/written data
- Operational status
- Number of IOPS (Input/Output operations per second)



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settir
Availability	1	Available		Available	Available	
Average Read Latency	4	0 msec		0 msec	0 msec	
Average Write Latency	5	0 msec		0 msec	0 msec	
Connections	3	0 #		0 #	0 #	
Data Read	6	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
Data Written	7	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
Downtime	-4					
Operations Status	2	Available		Available	Available	
Read Ops	8	0 #	0 #/s	0 #/s	0 #/s	
Write Ops	9	0 #	0 #/s	0 #/s	0 #/s	

Click here to enlarge: http://media.paessler.com/prtg-screenshots/SNMP_DELL_EqualLogic_Logical_Disk.png

Remarks

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volume(s) from the storage system that you want to monitor. PRTG creates one sensor for each volume you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL EQUALLOGIC SPECIFIC

Volume	Select the volume(s) you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Volume	Shows the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the identifier of the array member. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Volume ID	Shows the ID of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Volume Description	Shows the description of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.125 SNMP Dell EqualLogic Member Health Sensor

The SNMP Dell EqualLogic Member Health sensor monitors the health of an array member of an EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Member status
- Cooling power of the fan module in rpm (rotations per minute)
- Power supply status of cooling system
- Temperature of the backplane
- Temperature measured by temperature control module
- System temperature
- Member health status
- RAID status
- Average read/write latency in milliseconds or as percentage of the largest value
- Free storage capacity
- Amount of data handled per second
- Number of spare drives available

Click here to enlarge: http://media.paessler.com/prtg-screenshots/SNMP_DELL_EqualLogic_Member_Health_Sensor.png

Remarks

- This sensor type works with SNMP v2c and SNMP v3. It does not support SNMP v1. Please ensure you set the correct **SNMP Version** in the **Credentials for SNMP Devices** settings of the parent device or inherit it from objects higher in the hierarchy 89.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk(s) on the drive you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL EQUALLOGIC SPECIFIC

Array Member	Select the array member(s) you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Array Member	Shows the name of the member this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Group ID	Shows the group ID of the disk that this sensor monitors.. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the group member ID of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

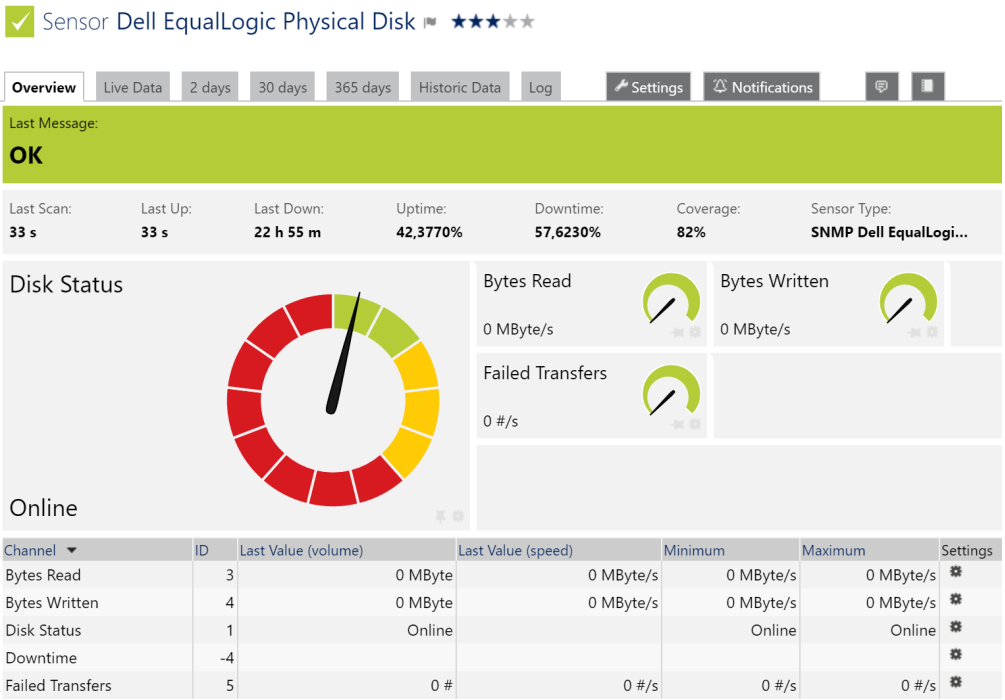
For more general information about settings, please see the **Object Settings** 159 section.

6.8.126 SNMP Dell EqualLogic Physical Disk Sensor

The SNMP Dell EqualLogic Physical Disk sensor monitors a disk in a Dell EqualLogic storage system via Simple Network Management Protocol (SNMP).

The sensor provides the following information:

- Disk status
- Bytes read/written
- Failed transfers
- Health status of disk



Click here to enlarge: http://media.paessler.com/prtg-screenshots/SNMP_DELL_EqualLogic_Physical_Disk.png

Remarks

- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the array member(s) of the Dell EqualLogic storage system you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL EQUALLOGIC SPECIFIC

Disk	Select the disk(s) you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL EQUALLOGIC SPECIFIC

Disk	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Group ID	Shows the group ID of the disk that this sensor monitors.. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Member ID	Shows the group member ID of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Disk Slot	Shows the slot number of disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Serial Number	Shows the serial number of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

Manufactured	Shows the production date of the disk that this sensor monitors. If this field is empty, the disk does not provide information about the date (this depends on the manufacturer). Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

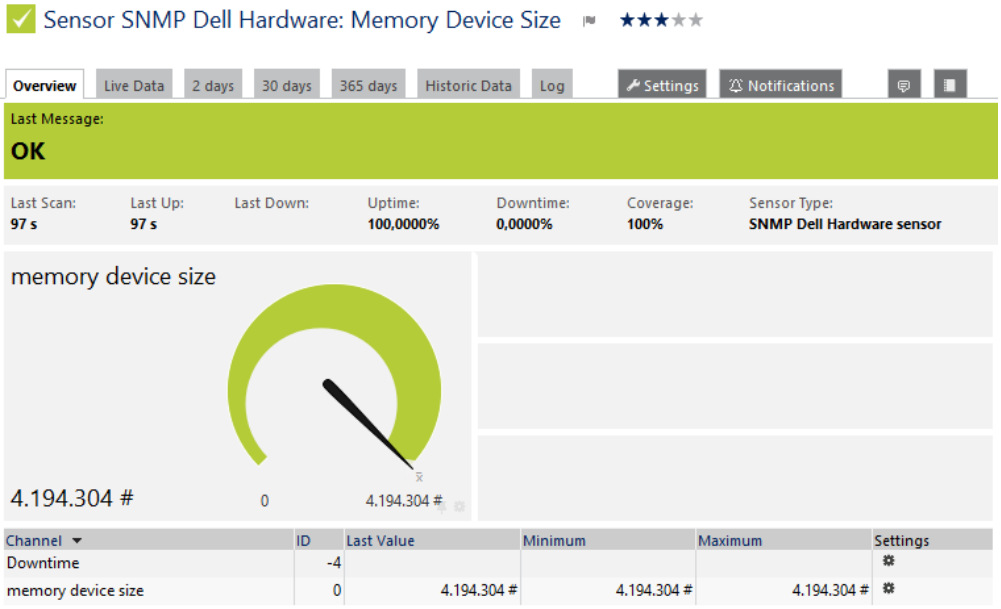
6.8.127 SNMP Dell Hardware Sensor

The SNMP Dell Hardware sensor monitors performance counters on a Dell hardware device using Simple Network Management Protocol (SNMP). The data that you can monitor with this sensor depends on the available performance counters on the target system.

This sensor shows a value returned by a specific Dell hardware OID, for example:

- Data about the system management software
- Data about system status
- Information about chassis and BIOS
- Various hardware parameters
- Other valuable data

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Dell Hardware Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_dell_hardware.png

Remarks

- Requires 1658 the Dell OpenManage Server Administrator to be installed on the monitored Dell device.
- Knowledge Base: What do I need to monitor Dell servers?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: Dell OpenManage Server Administrator

This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell hardware device to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator. For details, please see section **More** 1664 below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Dell performance counter you want to monitor. PRTG creates one sensor for each OID you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL HARDWARE SPECIFIC

Library OIDs	Select the performance counters you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: Choose the counters that you want to monitor with caution! We recommend that you select only a few counters in this dialog. Use the search function in the table head to filter for specific counters. Selecting too many library OIDs might result in thousands of sensors or in an aborted sensor creation.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL HARDWARE SPECIFIC

Selected Interface	Shows the name of the interface (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Define the unit of the numerical data that the sensor receives at the given OID. Please enter a string.
Multiplication	If you want to multiply the received data with a certain value, enter the multiplier here. Please enter an integer value.
Division	If you want to divide the received data by a certain value, enter the divisor here. Please enter an integer value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change.

- **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

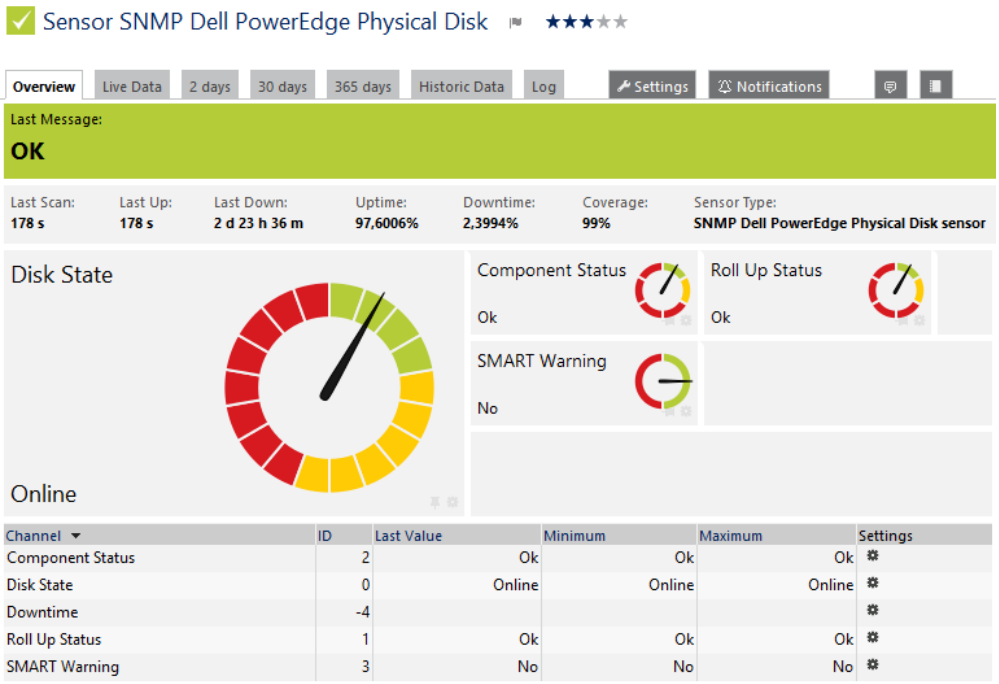
6.8.128 SNMP Dell PowerEdge Physical Disk Sensor

The SNMP Dell PowerEdge Physical Disk sensor monitors a physical disk in a Dell PowerEdge server using Simple Network Management Protocol (SNMP).

It can show the following:

- Disk status
- Roll up status
- Component status
- If there is currently a warning regarding the Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status



SNMP Dell PowerEdge Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_dell_poweredge_physical_disk.png

Remarks

- Requires 1677 iDRAC 7 or the Dell OpenManage Server Administrator to be installed on the monitored server.
- Knowledge Base: What do I need to monitor Dell servers?
- Knowledge Base: I can't add Dell PowerEdge sensors to PRTG. What can I do?
- Knowledge Base: My Dell PowerEdge sensor fails to validate disks and I can't add it. What can I do?

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: Dell OpenManage Server Administrator or iDRAC 7

This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell PowerEdge server to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator. For details, please see section **More** below. Note: You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks you want to monitor. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL POWEREDGE PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL POWEREDGE PHYSICAL DISK SETTINGS

Disk	Shows the name of the disk that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface which is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

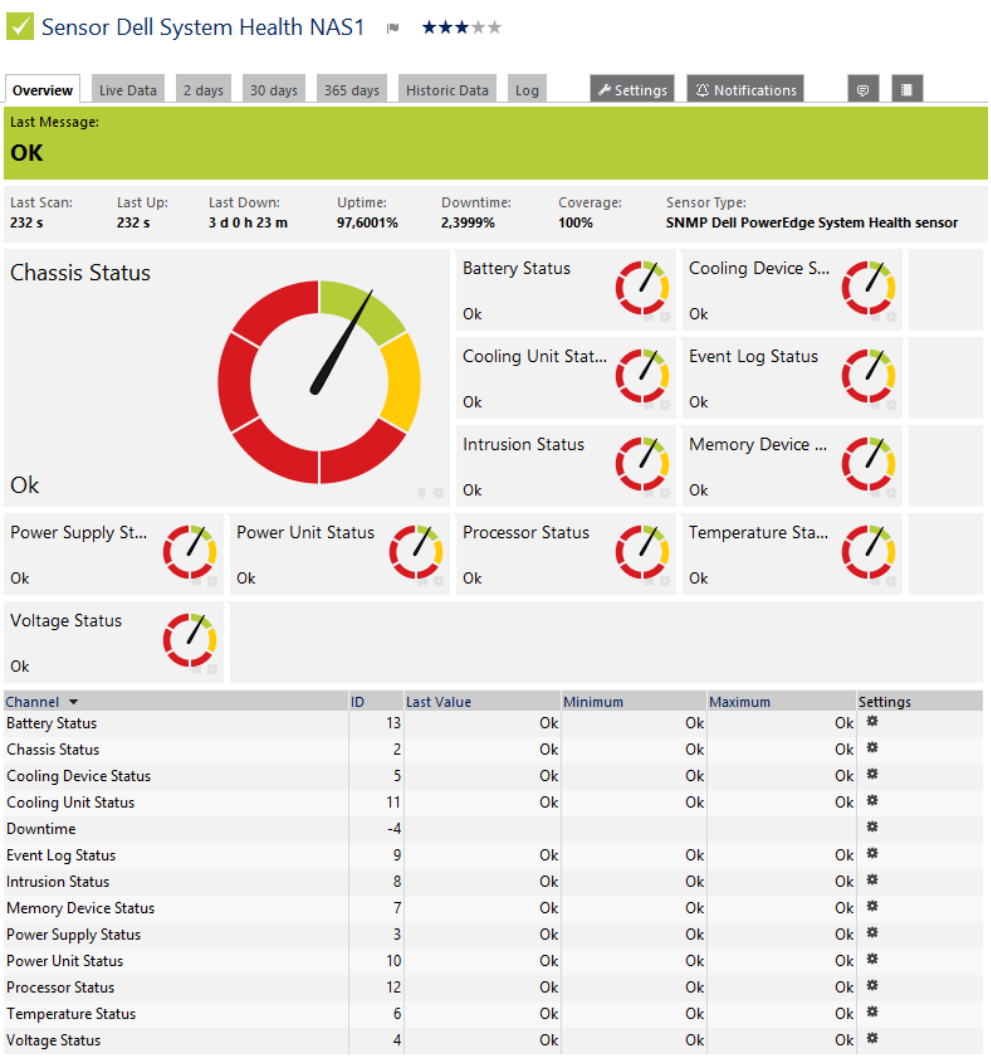
6.8.129 SNMP Dell PowerEdge System Health Sensor

The SNMP Dell PowerEdge System Health sensor monitors the system health of a Dell PowerEdge server using Simple Network Management Protocol (SNMP).

It can show the states of the following components, depending on their availability:

- Global system
- Power supply
- Temperature
- Cooling device
- Memory device
- Voltage

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Dell PowerEdge System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_dell_poweredge_system_health.png

Remarks

- Requires 1677 iDRAC 7 or the Dell OpenManage Server Administrator to be installed on the monitored server.
- Knowledge Base: What do I need to monitor Dell servers?
- Knowledge Base: I can't add Dell PowerEdge sensors to PRTG. What can I do?
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: Dell OpenManage Server Administrator or iDRAC 7

This sensor needs the Dell OpenManage Server Administrator tool to be installed on the Dell PowerEdge server to monitor it. Please make sure that you enable SNMP in the OpenManage Server Administrator. For details, please see section **More** below. Note: You can also monitor Dell PowerEdge servers with this sensor type via Integrated Dell Remote Access Controller (iDRAC) 7.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Dell PowerEdge chassis you want to monitor. PRTG creates one sensor for each chassis you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL POWEREDGE SYSTEM HEALTH SPECIFIC

Chassis	Select the chassis you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DELL POWEREDGE SYSTEM HEALTH SPECIFIC

Chassis	Shows the chassis that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Channel Mask	Shows the channel mask that describes which sensors are available. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Data Source	Shows the interface which is used to get monitoring data. This is either Dell OpenManage Server Administrator (OMSA) or Integrated Dell Remote Access Controller (iDRAC).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

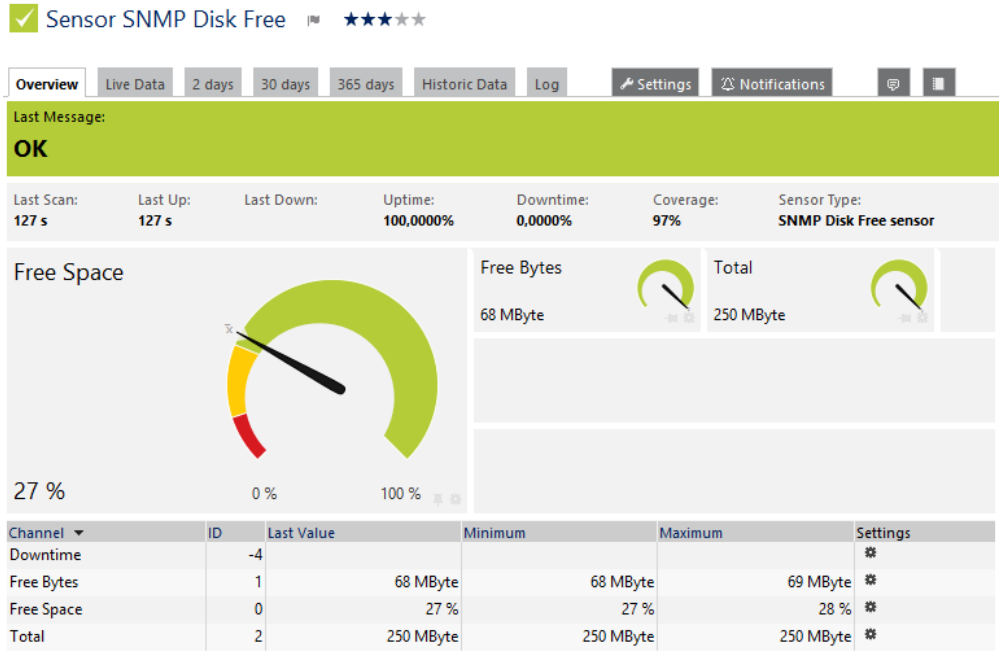
For more general information about settings, please see the **Object Settings** 159 section.

6.8.130 SNMP Disk Free Sensor

The SNMP Disk Free sensor monitors the free disk space on a logical disk via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in percent
- Free disk space in bytes
- Total disk space



SNMP Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_disk_free.png

Remarks

- This sensor uses more generic Object Identifier (OID) values compared to the **SNMP Linux Disk Free Sensor** 1857.
- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk(s) you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DISK FREE SETTINGS

Disk	Select one or more disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DISK FREE SETTINGS

Disk	Shows the name of the disk that this sensor is monitoring. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so for debugging. Wrong usage can result in incorrect monitoring data!

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

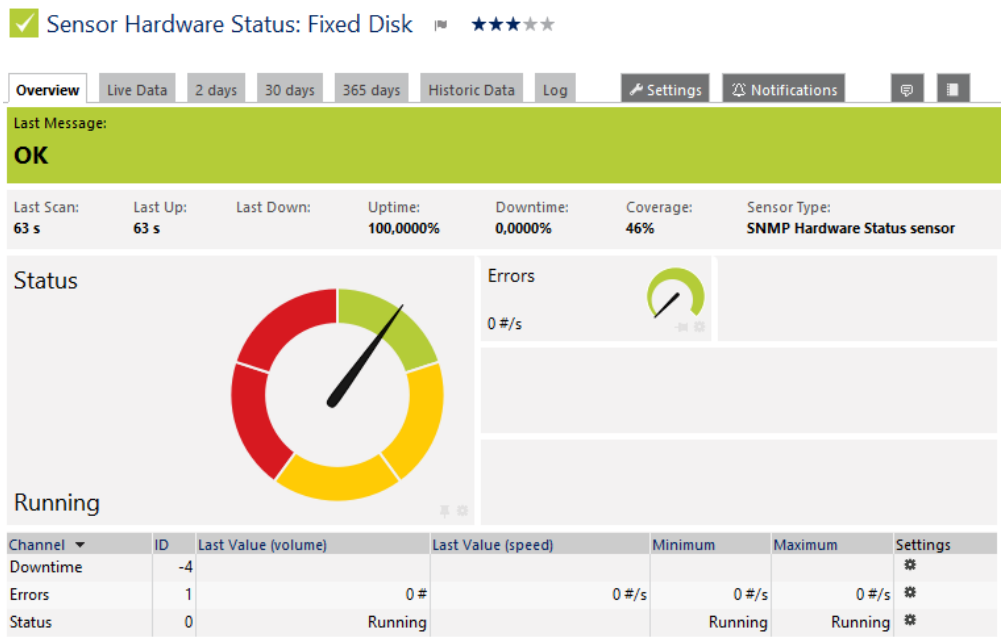
For more general information about settings, please see the **Object Settings** 159 section.

6.8.131 SNMP Hardware Status Sensor

The SNMP Hardware Status sensor monitors the status of a hardware component of a server via Simple Network Management Protocol (SNMP).

It shows the following:

- Current status of the monitored hardware component
- Number of errors per time period



SNMP Hardware Status Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hardware_status.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the hardware components you want to monitor. PRTG creates one sensor for each component you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HARDWARE SPECIFIC

Hardware Component	Select the hardware components you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HARDWARE SPECIFIC

Hardware Component	
Product ID	Shows further information about the hardware component. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Description	
Type	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

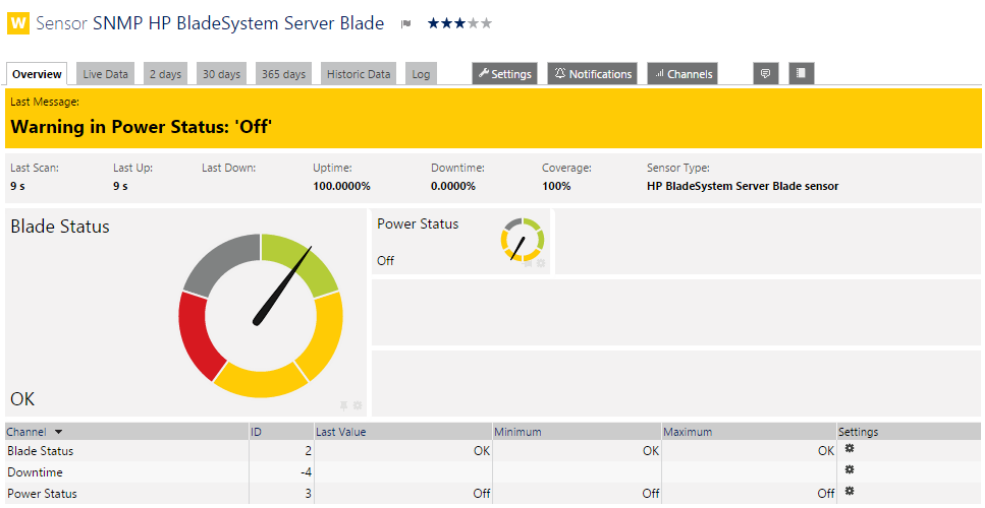
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.132 SNMP HP BladeSystem Blade Sensor

The SNMP HP BladeSystem Blade Sensor monitors the status of an HP BladeSystem via Simple Network Management Protocol (SNMP). It can show the following:

- Blade status (OK, degraded, unknown, failed, other)
- Power status (OK, on, off, power stagged off, unknown, other)



HP BladeSystem Server Blade Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hp_bladesystem_server_blade.png

Remarks

- Note: Make sure you add this sensor to a device whose IP/DNS name points to the HP BladeSystem Enclosure hosting the Onboard Administrator!
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the server blades you want to monitor. PRTG creates one sensor for each blade you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HP BLADESYSTEM SPECIFIC

Server Blade	Select the blades you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP BLADESYSTEM SPECIFIC

Server Blade	Shows the server blade that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

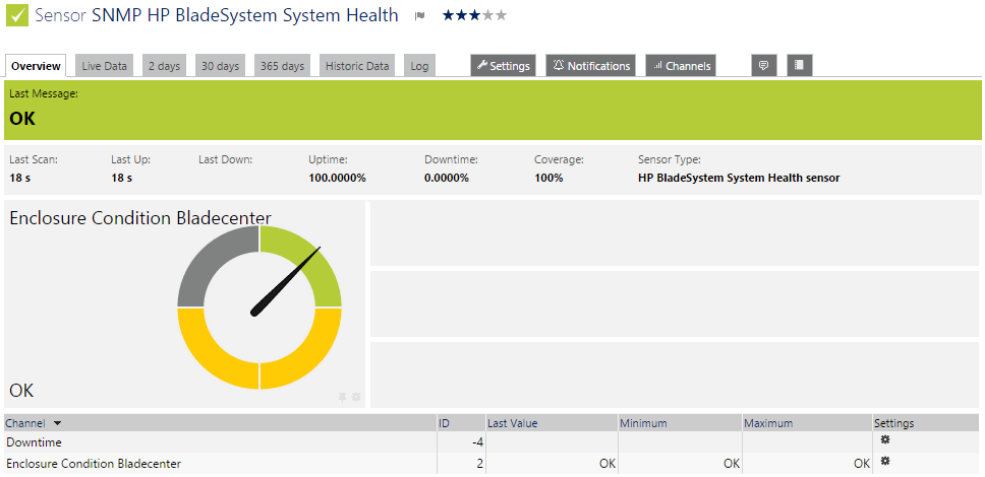
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.133 SNMP HP BladeSystem Enclosure System Health Sensor

The SNMP HP BladeSystem Enclosure System Health sensors monitors the system health of an HP BladeSystem device via Simple Network Management Protocol (SNMP). It can show the following:

- Enclosure condition of the BladeCenter (OK, degraded, failed, unknown, other)



HP BladeSystem System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/hp_bladesystem_system_health.png

Remarks

- Note: Make sure you add this sensor to a device whose IP/DNS name points to the HP BladeSystem Enclosure hosting the Onboard Administrator!
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

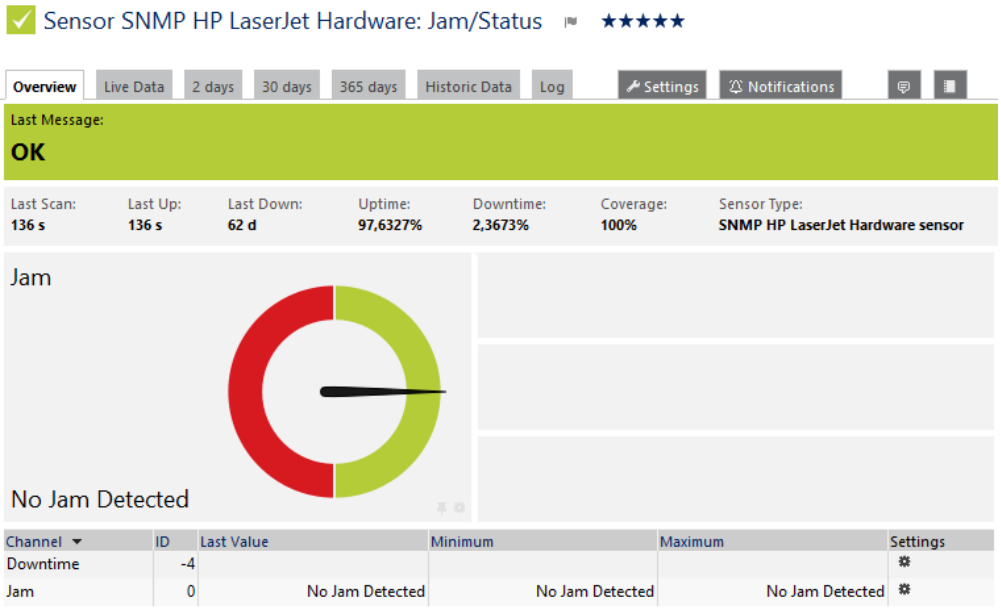
For more general information about settings, please see the **Object Settings** 159 section.

6.8.134 SNMP HP LaserJet Hardware Sensor

The SNMP HP LaserJet Hardware sensor monitors performance counters on a HP LaserJet hardware device using Simple Network Management Protocol (SNMP).

It can show the following, depending on what category you monitor:

- Status of toner
- Status of paper
- Paper jam status



SNMP HP LaserJet Hardware Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hp_laserjet_hardware.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the categories you want to monitor. PRTG creates one sensor for each category you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DELL HARDWARE SPECIFIC

Library OIDs	Select the categories you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. The following performance counters for your printer are available: ▪ **Toner/Status** ▪ **Paper/Status** ▪ **Jam/Status**

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP LASERJET SPECIFIC

Selected Interface	Shows the name of the category (performance counter) that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

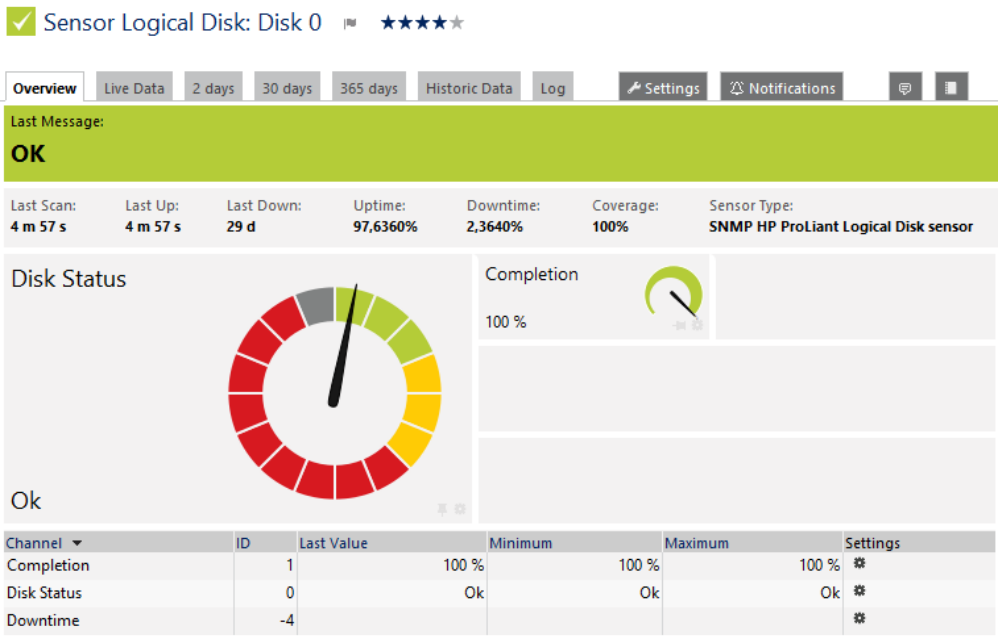
For more general information about settings, please see the **Object Settings** 159 section.

6.8.135 SNMP HP ProLiant Logical Disk Sensor

The SNMP HP ProLiant Logical Disk sensor monitors a logical disk in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Disk status
- Completion in percent: This is only important when the disk status is "Reconstructing" or "Expanding" and illustrates the progress of this task.



SNMP HP ProLiant Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hp_proliant_logical_disk.png

Remarks

- Requires 1730 HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- Knowledge Base: Monitor HP ProLiant via SNMP?
- If the sensor shows a "cannot find such device types" error message, use an HP iLO interface 1730 as parent device for this sensor (if available).
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** because this version applies its own dedicated SNMP counters while iLO 3 only forwards SNMP counters from the particular operating system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: HP Insight Management Agents for Windows Server 2003/2008. To receive SNMP data from RAID controllers, you additionally need HP Insight Management WBEM Providers. For more details and download links please refer to the subsection **More** below.

Note: Some of the HP Object Identifiers (OIDs) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks in the HP server you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HP PROLIANT LOGICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT LOGICAL DISK SETTINGS

Disk	Shows the name of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

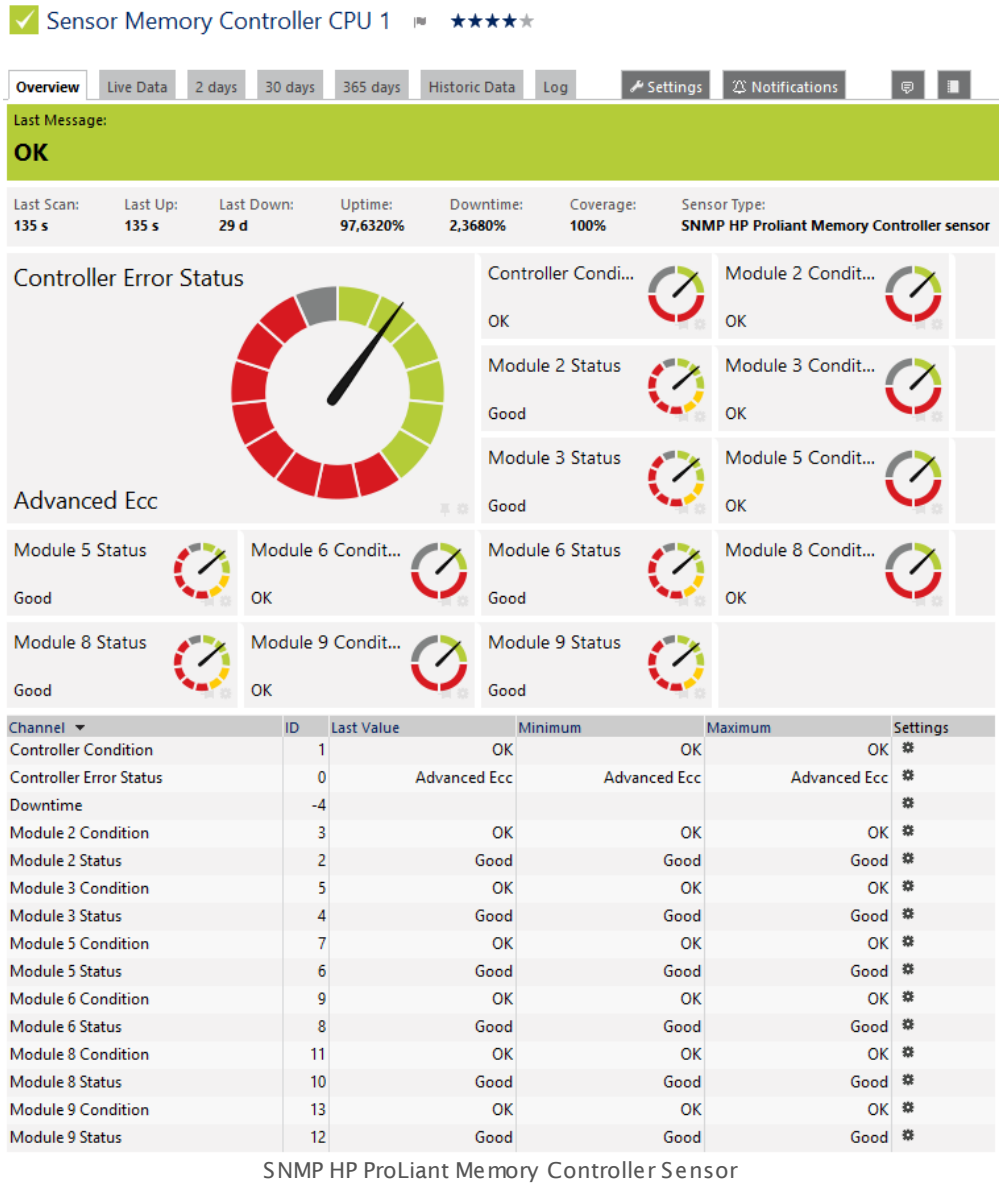
For more general information about settings, please see the **Object Settings** 159 section.

6.8.136 SNMP HP ProLiant Memory Controller Sensor

The SNMP HP ProLiant Memory Controller sensor monitors a memory controller in an HP server via Simple Network Management Protocol (SNMP).

It shows the following:

- Error status of the controller
- Condition of the controller
- States and conditions of available modules.



Channel	ID	Last Value	Minimum	Maximum	Settings
Controller Condition	1	OK	OK	OK	
Controller Error Status	0	Advanced Ecc	Advanced Ecc	Advanced Ecc	
Downtime	-4				
Module 2 Condition	3	OK	OK	OK	
Module 2 Status	2	Good	Good	Good	
Module 3 Condition	5	OK	OK	OK	
Module 3 Status	4	Good	Good	Good	
Module 5 Condition	7	OK	OK	OK	
Module 5 Status	6	Good	Good	Good	
Module 6 Condition	9	OK	OK	OK	
Module 6 Status	8	Good	Good	Good	
Module 8 Condition	11	OK	OK	OK	
Module 8 Status	10	Good	Good	Good	
Module 9 Condition	13	OK	OK	OK	
Module 9 Status	12	Good	Good	Good	

SNMP HP ProLiant Memory Controller Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hp_proliant_memory_controller.png

Remarks

- Requires 1739 HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- Knowledge Base: Which lookup values are supported by the SNMP HP ProLiant Memory Controller Sensor?
- Knowledge Base: Monitor HP ProLiant via SNMP?
- Note: If modules are inserted at a later point, you have to add this sensor anew.
- If the sensor shows a "cannot find such device types" error message, use an HP iLO interface 1730 as parent device for this sensor (if available).
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** because this version applies its own dedicated SNMP counters while iLO 3 only forwards SNMP counters from the particular operating system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: HP Insight Management Agents for Windows Server 2003/2008. To receive SNMP data from RAID controllers, you additionally need HP Insight Management WBEM Providers. For more details and download links please refer to the subsection **More** below.

Note: Some of the HP Object Identifiers (OIDs) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory controllers in the HP server you want to monitor. PRTG creates one sensor for each controller you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HP PROLIANT MEMORY CONTROLLER SETTINGS

Controller	Select the controllers you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT MEMORY CONTROLLER SETTINGS

Controller	Shows the name of the controller that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

6.8.137 SNMP HP ProLiant Network Interface Sensor

The SNMP HP ProLiant Network Interface sensor monitors a network interface in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Traffic in
- Traffic out
- Number of transmitted and received good frames
- Number of transmitted and received bad frames
- Alignment errors
- FCS (Frame Check Sequence) errors
- Late and excessive collisions
- Carrier sense errors
- If frames are too long

Remarks

- Requires 1747 HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- Note: When adding the sensor, the status of each available network interface is shown. If this status is **Link Failure**, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface will not work correctly. The error message in this case will be "No Such Name (SNMP error # 2)".
- Knowledge Base: Monitor HP ProLiant via SNMP?
- If the sensor shows a "cannot find such device types" error message, use an HP iLO interface 1748 as parent device for this sensor (if available).
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** because this version applies its own dedicated SNMP counters while iLO 3 only forwards SNMP counters from the particular operating system.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: HP Insight Management Agents for Windows Server 2003/2008. To receive SNMP data from RAID controllers, you additionally need HP Insight Management WBEM Providers. For more details and download links please refer to the subsection **More** below.

Note: Some of the HP Object Identifiers (OIDs) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network interfaces in the HP server you want to monitor. PRTG creates one sensor for each interface you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HP PROLIANT NETWORK INTERFACE SETTINGS

Network Interface	Select the interfaces you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. Note: If this status is **Link Failure**, it is still possible to add a sensor for the respective interface. Though, most likely the sensor for this interface will not work correctly. The error message in this case will be "No Such Name (SNMP error # 2)".

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT NETWORK INTERFACE SETTINGS

Network Interface	Shows the name of the interface that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how to show different channels for this sensor.

SENSOR DISPLAY

	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. ▪ **Show in and out traffic as positive and negative area chart**: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. Note: You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the **Sensor Channels Settings** 2711).
Stack Unit	This setting is only available if you choose stacked graphs above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.138 SNMP HP ProLiant Physical Disk Sensor

The SNMP HP ProLiant Physical Disk sensor monitors a physical disk in an HP server via Simple Network Management Protocol (SNMP).

It can show the following:

- Read and written sectors
- Hard and corrected read errors
- Hard and corrected write errors
- Disk status
- Drive condition
- Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status
- If the threshold is passed

Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Corrected Read Errors	3	0 #	0 #/s	0 #/s	0 #/s	
Corrected Write Errors	5	0 #	0 #/s	0 #/s	0 #/s	
Disk Status	6	OK		OK	OK	
Downtime	-4					
Drive Condition	7	OK		OK	OK	
Hard Read Errors	2	0 #	0 #/s	0 #/s	< 0,01 #/s	
Hard Write Errors	4	0 #	0 #/s	0 #/s	0 #/s	
S.M.A.R.T. Status	8	OK		OK	OK	
Sektors Read	0	8.192 #	27 #/s	0 #/s	90.041 #/s	
Sektors Written	1	7.824 #	26 #/s	0 #/s	9.787 #/s	
Threshhold passed	9	No		No	No	

SNMP HP ProLiant Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hp_proliant_physical_disk.png

Remarks

- Requires 1757 HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- Knowledge Base: Monitor HP ProLiant via SNMP?
- If the sensor shows a "cannot find such device types" error message, use an HP iLO interface 1757 as parent device for this sensor (if available).
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** because this version applies its own dedicated SNMP counters while iLO 3 only forwards SNMP counters from the particular operating system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: HP Insight Management Agents for Windows Server 2003/2008. To receive SNMP data from RAID controllers, you additionally need HP Insight Management WBEM Providers. For more details and download links please refer to the subsection **More** below.

Note: Some of the HP Object Identifiers (OIDs) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the HP server you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

HP PROLIANT PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

HP PROLIANT PHYSICAL DISK SETTINGS

Disk	Shows the identifier of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

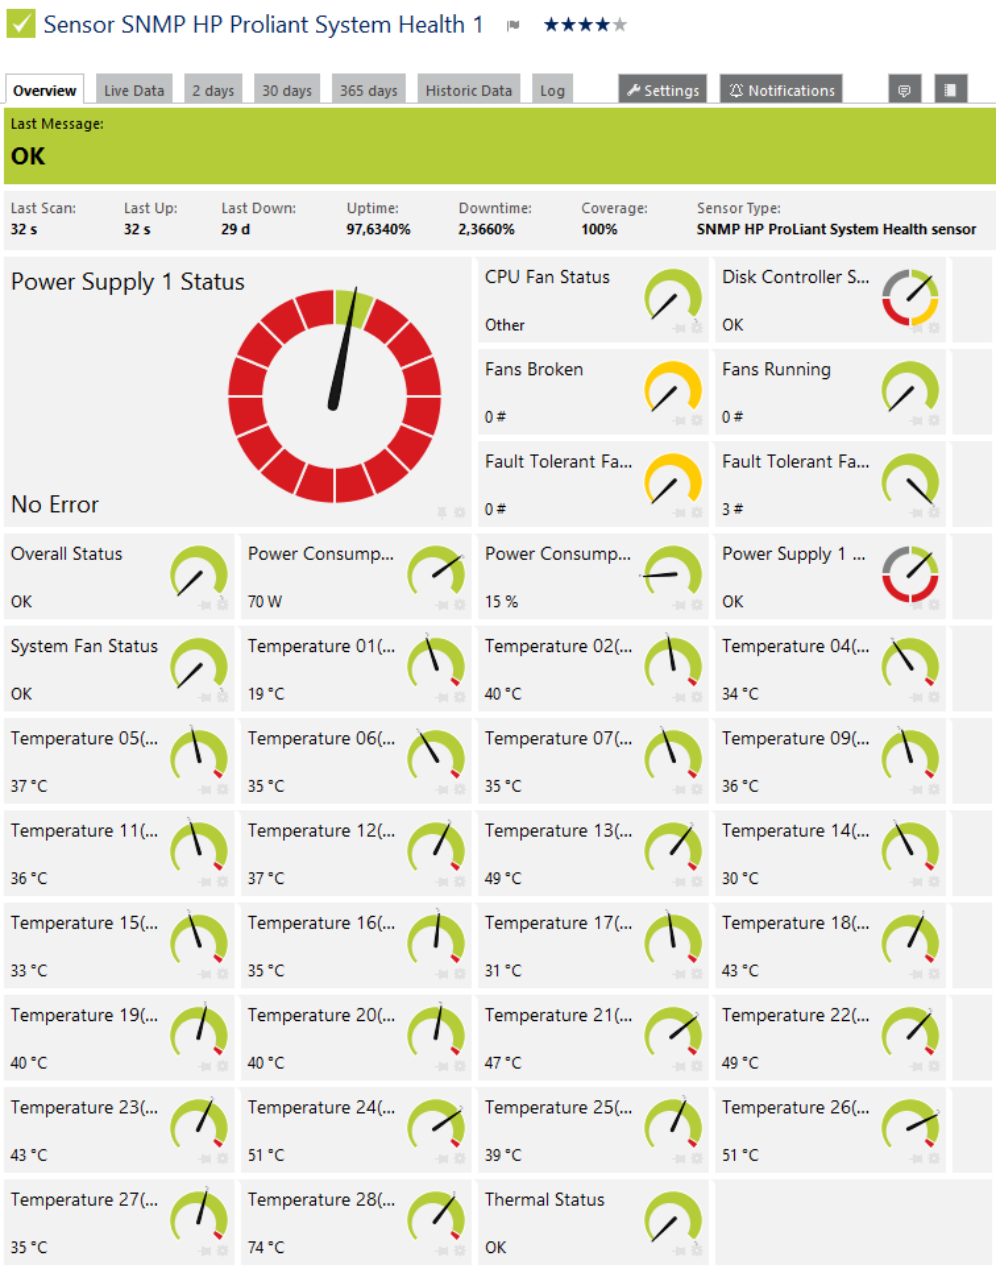
6.8.139 SNMP HP ProLiant System Health Sensor

The SNMP HP ProLiant System Health sensor monitors the system health of an HP ProLiant server via Simple Network Management Protocol (SNMP).

It can show the following:

- Overall status
- Thermal status
- System fan status
- CPU fan status
- Number of broken and running fans
- Number of broken and running fans that are fault tolerant
- Status and condition of the power supply
- Temperatures for various components of the server, for example, memory, power supply, CPU, system, and storage.
- Power consumption
- Disk controller status
- Integrated Management Log (IML) status: OK, Degraded, Failed, Other. This channel can help to determine the reason for a **Down** status of the sensor.

These channels are created at run-time, depending on the available measurement components. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP HP ProLiant System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_hp_proliant_system_health.png

Remarks

- Requires 1767 HP Insight Management Agents and HP Insight Management WBEM Providers to be installed on the target device.
- Knowledge Base: Monitor HP ProLiant via SNMP?
- This sensor has predefined limits for temperatures and broken frames. You can change these limits individually in the channel settings 2711.

- Note: RAID controllers which have no hard disks assigned might cause a **Down** status [135]. In this case, deactivate the respective controller(s) in the HP ProLiant BIOS to avoid sensor errors.
- If the sensor shows a "cannot find such device types" error message, use an HP iLO interface [1767] as parent device for this sensor (if available).
- This sensor type supports monitoring HP Integrated Lights-Out (iLO) as of iLO version 3. We recommend that you use **iLO 4** because this version applies its own dedicated SNMP counters while iLO 3 only forwards SNMP counters from the particular operating system.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** [3095].
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** [3001].

Requirement: HP System Management Tools

This sensor needs a specific HP system management tool to be installed on the target device, so it reports data via SNMP: HP Insight Management Agents for Windows Server 2003/2008. To receive SNMP data from RAID controllers, you additionally need HP Insight Management WBEM Providers. For more details and download links please refer to the subsection **More** below.

Note: Some of the HP Object Identifiers (OIDs) which this sensor type uses are only accessible via the HP Integrated Lights-Out (iLO) interface. If this sensor throws an error that it cannot find "such device types", please create a device in PRTG which points to the address of the HP iLO interface (if available) and add the sensor to this device. We recommend using the Agentless Management feature with configured SNMP. You can set this up in the iLO configuration interface under **Administration | Management | SNMP Settings**.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually [256]. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** [324] for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

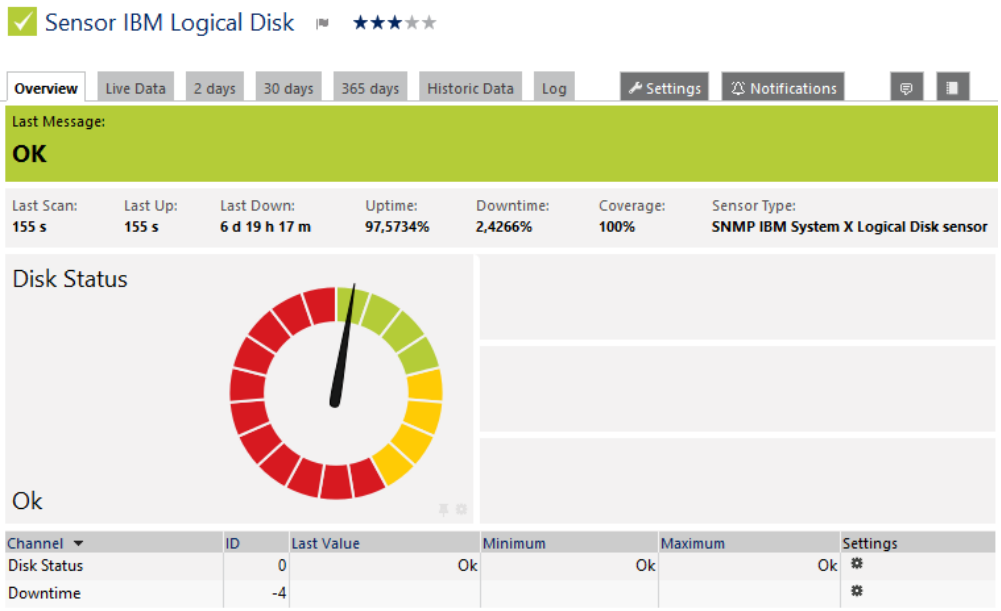
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.140 SNMP IBM System X Logical Disk Sensor

The SNMP IBM System X Logical Disk sensor monitors a logical disk in an IBM server via Simple Network Management Protocol (SNMP).

- It shows the status of a logical disk in an IBM server.



SNMP IBM System X Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_ibm_systemx_logical_disk.png

Remarks

- Requires 1775 the IBM Systems Director Platform to be installed on the target device.
- Knowledge Base: What are the requirements to monitor IBM System x?

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks of the IBM device you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IBM SYSTEM X LOGICAL DISK SETTINGS

Disk	Select the logical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X LOGICAL DISK SETTINGS

Disk	Shows the ID of the logical disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

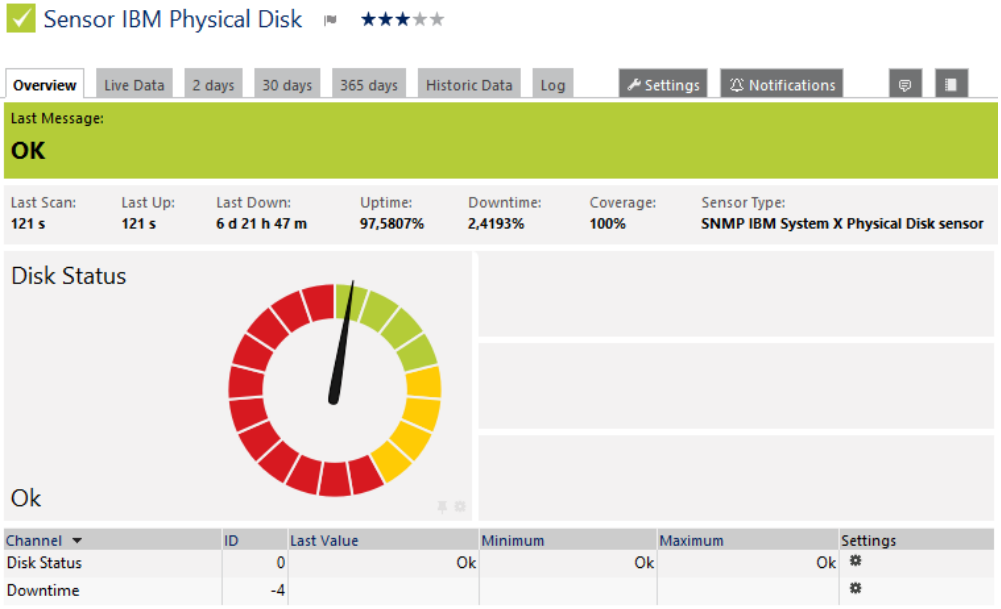
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.141 SNMP IBM System X Physical Disk Sensor

The SNMP IBM System X Physical Disk sensor monitors a physical disk in an IBM server via Simple Network Management Protocol (SNMP).

- It shows the status of a physical disk.



SNMP IBM System X Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_ibm_systemx_physical_disk.png

Remarks

- Requires 1784 the IBM Systems Director Platform to be installed on the target device.
- Knowledge Base: What are the requirements to monitor IBM System x?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks of the IBM device you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IBM SYSTEM X PHYSICAL DISK SETTINGS

Disk	Select the physical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X PHYSICAL DISK SETTINGS

Disk	Shows the ID of the physical disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

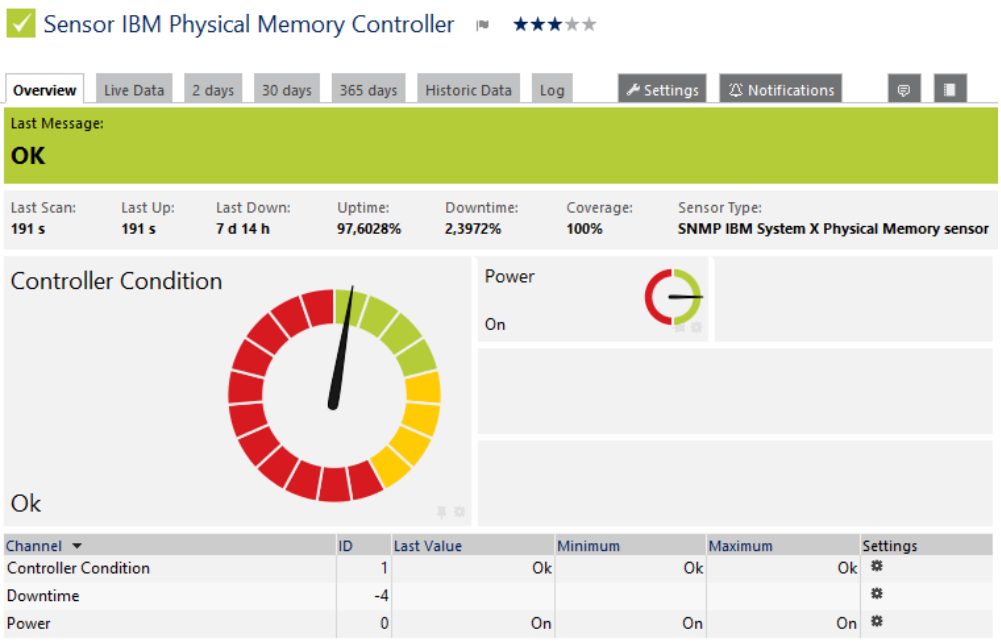
For more general information about settings, please see the **Object Settings** 159 section.

6.8.142 SNMP IBM System X Physical Memory Sensor

The SNMP IBM System X Physical Memory sensor monitors the memory modules in an IBM server via Simple Network Management Protocol (SNMP).

It shows the following:

- Condition of memory controller
- Power status (on or off)



SNMP IBM System X Physical Memory Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_ibm_systemx_physical_memory.png

Remarks

- Requires 1794 the IBM Systems Director Platform to be installed on the target device.
- Knowledge Base: What are the requirements to monitor IBM System x?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory modules of the IBM server you want to monitor. PRTG creates one sensor for each module you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IBM SYSTEM X PHYSICAL MEMORY SETTINGS

Module	Select the memory modules you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X PHYSICAL MEMORY SETTINGS

Name	
Caption	Shows further information about the module. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Serial Number	
Size	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

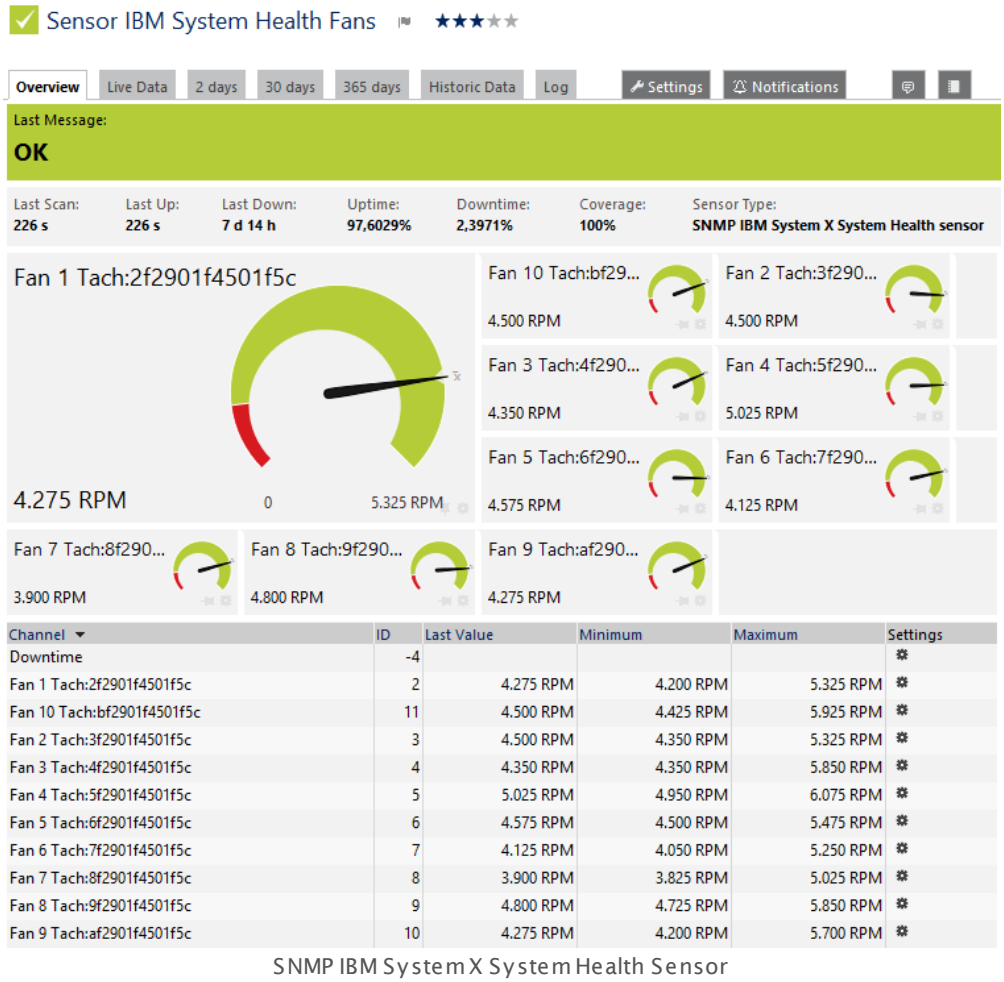
6.8.143 SNMP IBM System X System Health Sensor

The SNMP IBM System X System Health sensor monitors the system health of an IBM device via Simple Network Management Protocol (SNMP).

It can show the following, depending on what measurement you select:

- Revolutions per minute of fans (or the current percentage of the possible maximum)
- Temperature of ambient and CPUs
- Voltage of planars
- Status of power supplies

These channels are created at run-time, depending on the available measurement components. Which channels the sensor actually shows might depend on the monitored device and the sensor setup..



Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Fan 1 Tach:2f2901f4501f5c	2	4.275 RPM	4.200 RPM	5.325 RPM	
Fan 10 Tach:bf2901f4501f5c	11	4.500 RPM	4.425 RPM	5.925 RPM	
Fan 2 Tach:3f2901f4501f5c	3	4.500 RPM	4.350 RPM	5.325 RPM	
Fan 3 Tach:4f2901f4501f5c	4	4.350 RPM	4.350 RPM	5.850 RPM	
Fan 4 Tach:5f2901f4501f5c	5	5.025 RPM	4.950 RPM	6.075 RPM	
Fan 5 Tach:6f2901f4501f5c	6	4.575 RPM	4.500 RPM	5.475 RPM	
Fan 6 Tach:7f2901f4501f5c	7	4.125 RPM	4.050 RPM	5.250 RPM	
Fan 7 Tach:8f2901f4501f5c	8	3.900 RPM	3.825 RPM	5.025 RPM	
Fan 8 Tach:9f2901f4501f5c	9	4.800 RPM	4.725 RPM	5.850 RPM	
Fan 9 Tach:af2901f4501f5c	10	4.275 RPM	4.200 RPM	5.700 RPM	

SNMP IBM System X System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_ibm_systemx_system_health.png

Remarks

- Requires 1803 the IBM Systems Director Platform to be installed on the target device.
- Note: This sensor can also run directly on an Integrated Management Module (IMM) network port and can show the overall health on IMMs.
- Note: If the IBM device returns a string in an unexpected format for the percentage of fan revolutions (for example, "offline"), this sensor will show **-1%** in the corresponding channel. You can define a **Down** status 135 for this via channel limits 2712.
- Knowledge Base: What are the requirements to monitor IBM System x?
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Requirement: IBM Systems Director Platform Agent

This sensor type needs the IBM Systems Director Platform Agent to be installed on the target IBM device in order to monitor it through SNMP. For more information, please see section **More** below.

Note: The SNMP IBM System X System Health sensor can also run directly on an Integrated Management Module (IMM) network port and can show the overall health on IMMs.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the measurements of the IBM device you want to monitor. PRTG creates one sensor for each measurement you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

IBM SYSTEM X SYSTEM HEALTH SPECIFIC

Measurement	Select the measurements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

IBM SYSTEM X SYSTEM HEALTH SPECIFIC

Source	Shows the source of the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measurement	Shows the measurement that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.144 SNMP interSeptor Pro Environment Sensor

The SNMP interSeptor Pro Environment sensor queries data from a Jacarta interSeptor Pro environmental monitoring system via Simple Network Management Protocol (SNMP).

It can shows the following as measured by the Jacarta interSeptor Pro device:

- Temperature
- Humidity

Remarks

- Note: To monitor data of an interSeptor Pro device with this sensor, you have to add the IP address of your PRTG installation to **Access Control** in the interSeptor Pro control panel. Open the interSeptor Pro web interface, select **InterSeptor Pro Menu | System Configuration | Access Control**, and allow access for PRTG's IP address.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the measuring points of interSeptor Pro device you want to monitor. PRTG creates one sensor for each measuring point you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

INTERSEPTOR ENVIRONMENT SPECIFIC

Measuring Point	Select the measuring points you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

INTERSEPTOR ENVIRONMENT SPECIFIC

Name	Shows information about the measurement which this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measuring Point	Shows the measuring point which this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

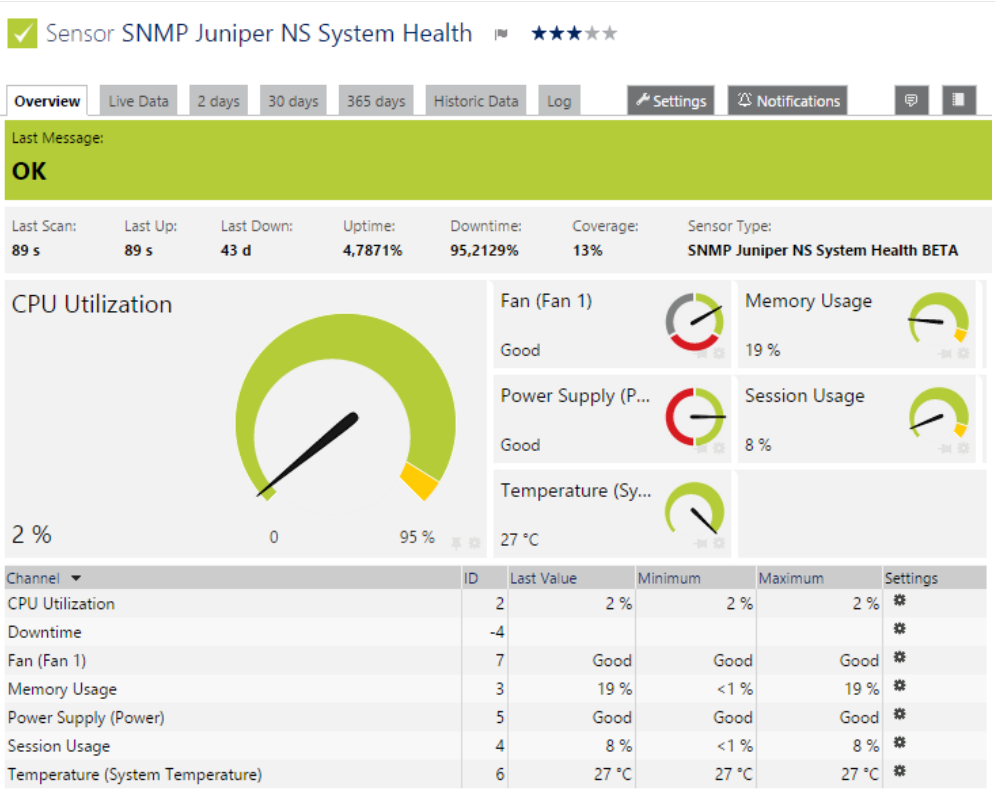
6.8.145 SNMP Juniper NS System Health Sensor

The SNMP Juniper NS System Health sensor monitors the system health of a Juniper NetScreen device using Simple Network Management Protocol (SNMP).

It can show the following:

- CPU utilization
- Fan status
- Power supply status
- System temperature
- Status of memory usage in percent
- Status of session usage in percent

These channels are created at run-time, depending on the available measurement components of your Juniper NetScreen device. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Juniper NS System Health Sensor

Click here to enlarge: http://media-s3.paessler.com.s3.amazonaws.com/prtg-screenshots/SNMP_Juniper_System_Health.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types	For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available): ▪ **Bandwidth** ▪ **Memory** ▪ **Disk** ▪ **File** ▪ **Custom** Note: Custom channel types can be set on sensor level only.

More

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.146 SNMP LenovoEMC Physical Disk Sensor

The SNMP Lenovo Physical Disk sensor monitors a physical disk in a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It shows the overall disk status.

States of the disk can be:

- Normal (sensor status 135 **Up**),
- Unknown (sensor status **Warning**)
- Foreign (sensor status **Warning**)
- Faulted (sensor status **Down**)
- Missing (sensor status **Down**)

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the LenovoEMC NAS. PRTG creates one sensor for each disk you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

LENOVOEMC PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

LENOVOEMC NAS SETTINGS

Disk	Shows the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk monitored by this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.147 SNMP LenovoEMC System Health Sensor

The SNMP LenovoEMC System Health sensor monitors the system health of a LenovoEMC Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It shows the overall status of the RAID.

Sensor states 135 can be:

- Normal (sensor status **Up**)
- Unknown (sensor status **Warning**)
- Rebuilding (sensor status **Warning**)
- Degraded (sensor status **Warning**)
- RebuildFS (sensor status **Warning**)
- Faulted (sensor status **Down**)

Furthermore, this sensor can show, for example, states of several fans, voltages, and temperatures. These channels are created at run-time depending on the available measurement components in the LenovoEMC NAS. Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

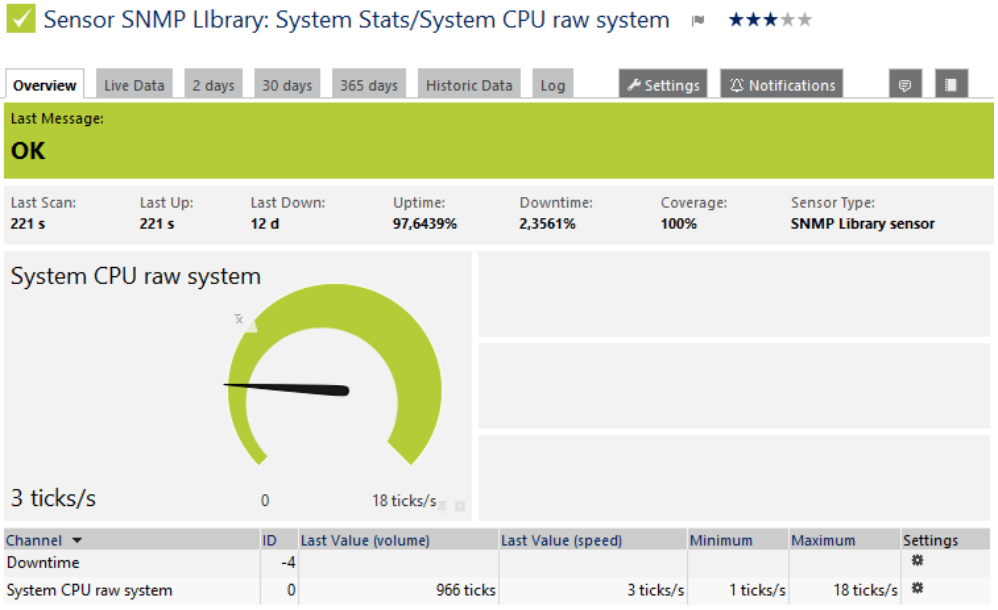
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.148 SNMP Library Sensor

The SNMP Library sensor monitors a device using Simple Network Management Protocol (SNMP) in combination with a compiled Management Information Base (MIB) library file. This provides extended monitoring beyond the standard SNMP sensors of PRTG.

To monitor any SNMP capable device, you can download the manufacturer's MIB files for these devices, convert them to the Paessler oidlib format, and import them into PRTG. To make your monitoring setup as convenient as possible, PRTG is delivered with pre-compiled oidlib library files that already contain the Object Identifier (OID) of SNMP counters for the most common devices in a network. See section **More** 1855 for details.



SNMP Library Sensor

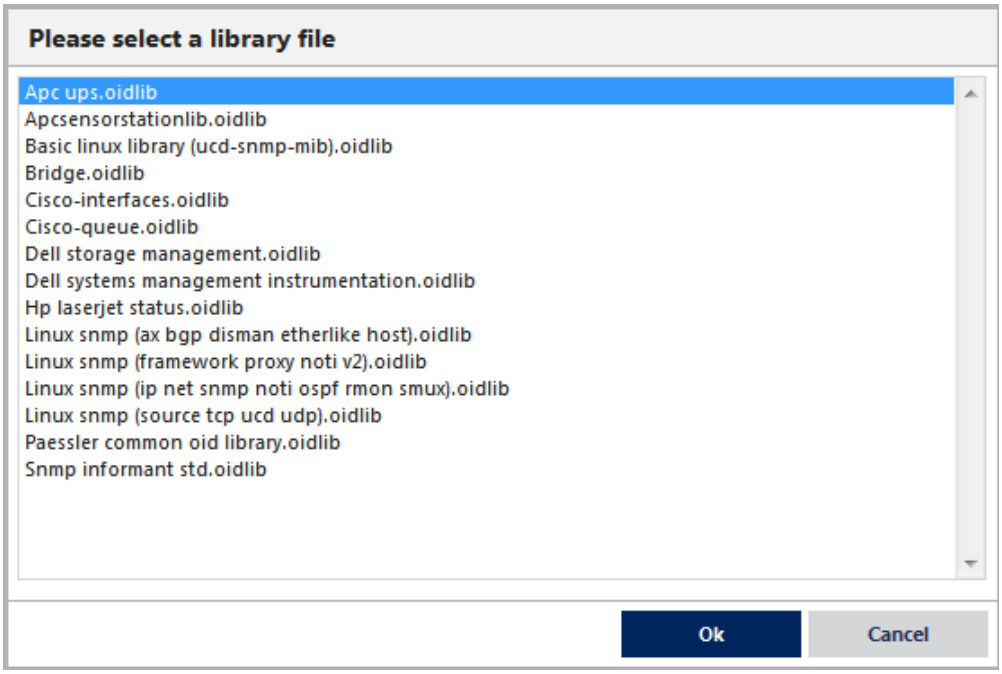
Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_library.png

Remarks

- Knowledge Base: How do SNMP, MIBs and OIDs work?
- Knowledge Base: How can I import my MIB files into PRTG?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

Manually add 256 a new sensor to an SNMP device. From the **Add Sensor** dialog, select **SNMP Library** sensor. PRTG will show a list of oidlib files available on the system. This contains all library files stored at the \snmplibs folder of your PRTG installation directory—both the ones delivered with PRTG and your own files. For details about directory paths, please see section **Data Storage** 3135.



List of SNMP Library Files

The file names in the list indicate the potential purpose. Select a name that appears appropriate for your device (for example, choose an MIB file that you imported before) and confirm with the **OK** button. Often, **Paessler common oid library.oidlib** is a good start. If the file does not fit to your device, this will result in the error message the scan for available monitoring items has failed on this device: No such object (SNMP error # 222). If you see this message, please hit the **Cancel** button and try adding the sensor with another file. If counters were found for your device, you will see the sensor's settings.

Default OIDLIB Files Overview

The following files are delivered with PRTG and allow to extend your SNMP monitoring for many devices. Please be aware that not all devices and/or parameters may be supported by the libraries.

- **APC UPS.oidlib**
  Can be used to monitor uninterruptible power supplies (UPS) from APC American Power Conversion Corp.

- **APCSensorstationlib.oidlib**
  Can be used to monitor alarm status, communication status, humidity, and temperature as shown by an APC sensor station.

- **Basic Linux Library (UCD-SNMP-MIB).oidlib**
  Can be used to monitor basic system parameters on Linux systems, such as memory, disk and swap, CPU, etc.

- **cisco-interfaces.oidlib**
  Can be used to monitor Cisco specific parameters, for example, the number of present network interfaces on a system, several states of an interface (admin, oper, speed, type, errors, discards, etc.), and more.

- **cisco-queue.oidlib**
  Can be used to monitor queues on a Cisco interface, for example, queue depth and its maximum, discarded messages from the queue, the number of the queue within the queue set, etc.

- **Dell Storage Management.oidlib**
  Can be used to monitor Dell storage devices. Possible parameters include disk arrays, battery and power supply, fan and temperature, virtual disk, etc.

- **Dell Systems Management Instrumentation.oidlib**
  Can be used to monitor the hardware of Dell systems. Possible parameters include ACPower and battery, alerts, base board, Bios, BMC, chassis, COO, cooling, event log, firmware, IDE, keyboard, memory, port, network, processor, SCSI, system, temperature, USB, UUID, etc.

- **HP LaserJet Status.oidlib**
  Can be used to monitor toner, paper, and jam status of an HP LaserJet printer.

- **Linux SNMP (AX BGP DisMan EtherLike Host).oidlib**
  Can be used to monitor different aspects of Linux systems. Note: This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.

- **Linux SNMP (Framework Proxy Noti v2).oidlib**
  Can be used to monitor different aspects of Linux systems. Note: This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.

- **Linux SNMP (IP Net SNMP Noti OSPF RMON SMUX).oidlib**
  Can be used to monitor different aspects of Linux systems. Note: This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.

- **Linux SNMP (Source TCP UCD UDP).oidlib**
  Can be used to monitor different aspects of Linux systems. Note: This file can find a very large number of possible interfaces. It may take a few seconds until the selection table is shown.

- **Paessler Common OID Library.oidlib**
  Can be used to monitor many common hardware devices. It is used for several sensors and is encrypted.

- **SNMP Informant std.oidlib**
  Can be used to monitor logical disks, processor, memory, and network interface on Windows systems.

Import MIB Files

Additionally you can create your own oidlib files by importing your device manufacturers' MIB files with the free tool Paessler **MIB Importer**. Simply convert your mib files and save the resulting oidlib files to the \snmplibs subfolder of your PRTG program directory. For details about directory paths, please see **Data Storage** 3135. For more information and download of **MIB Importer**, please see the link in the **More** 1855 section below.

Note: If your imported oidlib file contains lookups 3095 (you can see this in section **Lookup** in the MIB Importer), you can define your own sensor states for returning values. Add an SNMP Library sensor using this oidlib. PRTG creates then a lookup definition file using the **lookupname** of the chosen library as **id** parameter. Override this lookup definition with your own custom lookup as described in section **Define Lookups—Customizing Lookups** 3101.

SNMP Library Sensor—Add Sensor Settings

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SNMP LIBRARY SPECIFIC

Library	This shows the path to the oidlib file selected before. This setting is shown for your information only and cannot be changed here.
Library-OIDs	Select the aspects of the device you want to monitor. A list specific to your setup is shown. It contains all counters found in the chosen library that match your device. Select one or more items by adding a check mark in front of the respective line. You can also select and deselect all items by using the check box in the table head. For each selection, PRTG will create one sensor when you click the **Continue** button.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP LIBRARY SPECIFIC

Selected Interface	Shows the counter that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Unit String	Enter a string that represents the unit of the returned values. This is for display purposes for the sensor data only. Please enter a string.
Multiplication	Enter the multiplier if you want to multiply the received data with a certain value. Please enter an integer value.
Division	Enter the divisor if you want to divide the received data by a certain value. Please enter an integer value.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

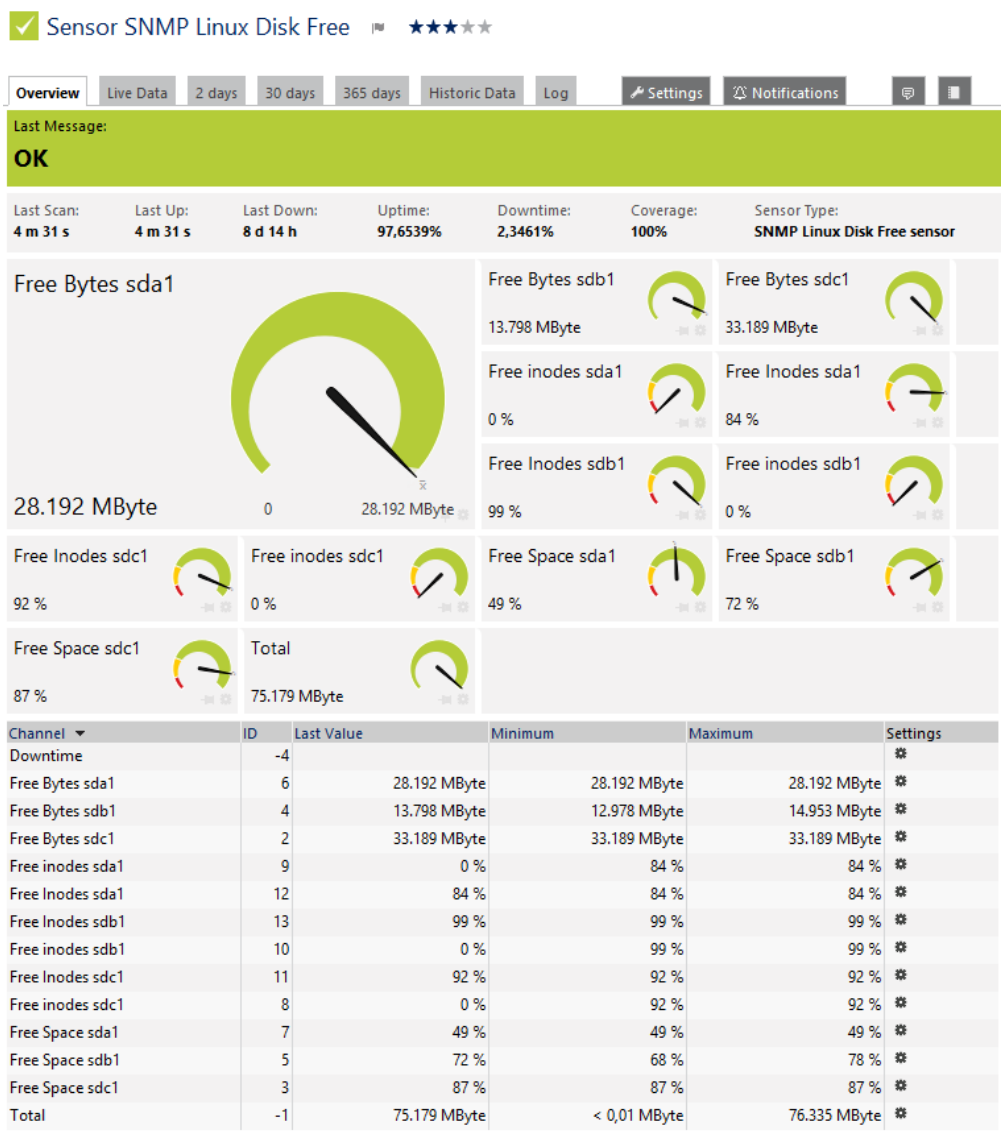
6.8.149 SNMP Linux Disk Free Sensor

The SNMP Linux Disk Free sensor monitors free space on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Free total disk space in bytes
- Free space in bytes for every mounted partition
- Free space in percent for every mounted partition
- Free inodes in percent for every mounted partition

Note: The free space returned by this sensor type shows the disk space that is not yet used. Not all of this space may be available for use, as a part of this space can be reserved by the system, for example, for redundancy purposes. For details, please see the article linked in the **More** 1868 section below.



Channel	ID	Last Value	Minimum	Maximum	Settings
Downtime	-4				
Free Bytes sda1	6	28.192 MByte	28.192 MByte	28.192 MByte	
Free Bytes sdb1	4	13.798 MByte	12.978 MByte	14.953 MByte

SNMP Linux Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_linux_disk_free.png

Remarks

- Knowledge Base: Why do SSH Disk Free and SNMP Linux Disk Free show different values for my target Linux system?
- Knowledge Base: Checklist: Setting up SNMP on Linux
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status, depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor **Channel** settings.

Note: All limits that you define here are valid additionally to the limits defined in the particular **Channels** settings! The limits are valid simultaneously, so the first limit that is breached applies.

Percentage Limit Check	Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between: ▪ **Only use the limits in the settings of the percentage channels**: Do not define sensor limits which are valid for all percentage channels. The sensor only uses limits which you define in the settings of the particular "free space in percent" channels to determine the status. ▪ **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.
Upper Error Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Warning Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Size Limit Check	Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between: • **Only use the limits in the settings of the byte size channels**: Do not define sensor limits which are valid for all byte size channels. The sensor only uses limits which you define in the settings of the particular free space in bytes channels to determine the status. • **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.
Upper Error Limit	This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Upper Warning Limit	This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: ▪ **Deactivate alarm (default)**: Select this option if you do not want an alarm for a removed disk. ▪ **Activate alarm**: Select this option if you want to be alerted if a monitored disk is removed.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

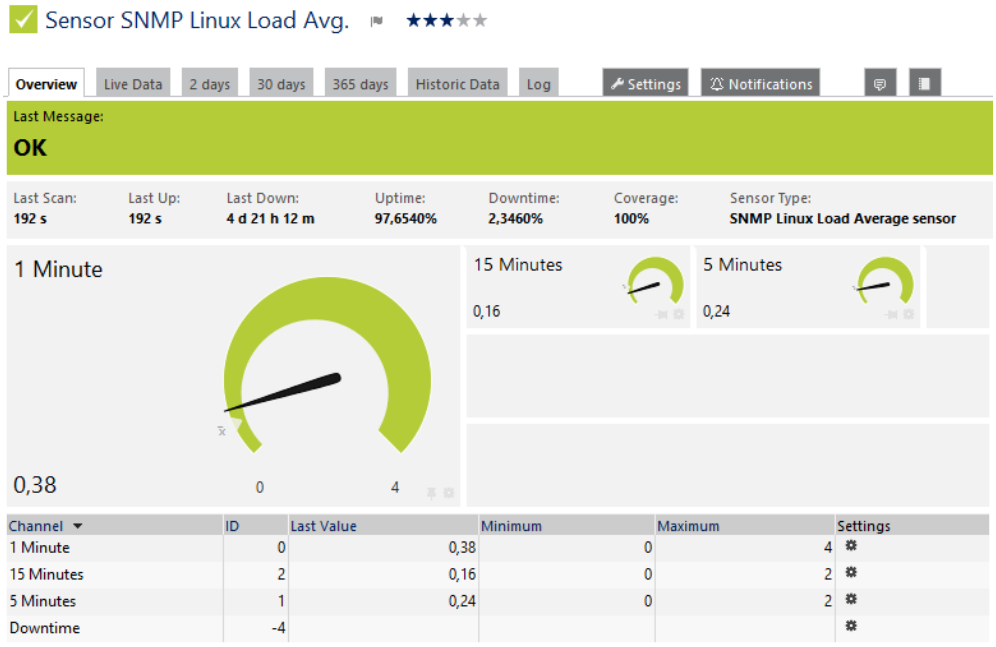
For more general information about settings, please see the **Object Settings** 159 section.

6.8.150 SNMP Linux Load Average Sensor

The SNMP Load Average sensor monitors the system load average of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Average system load within a 1 minute interval
- Average system load within a 5 minutes interval
- Average system load within a 15 minutes interval



SNMP Linux Load Average Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_linux_load_average.png

Remarks

- Knowledge Base: Checklist: Setting up SNMP on Linux
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

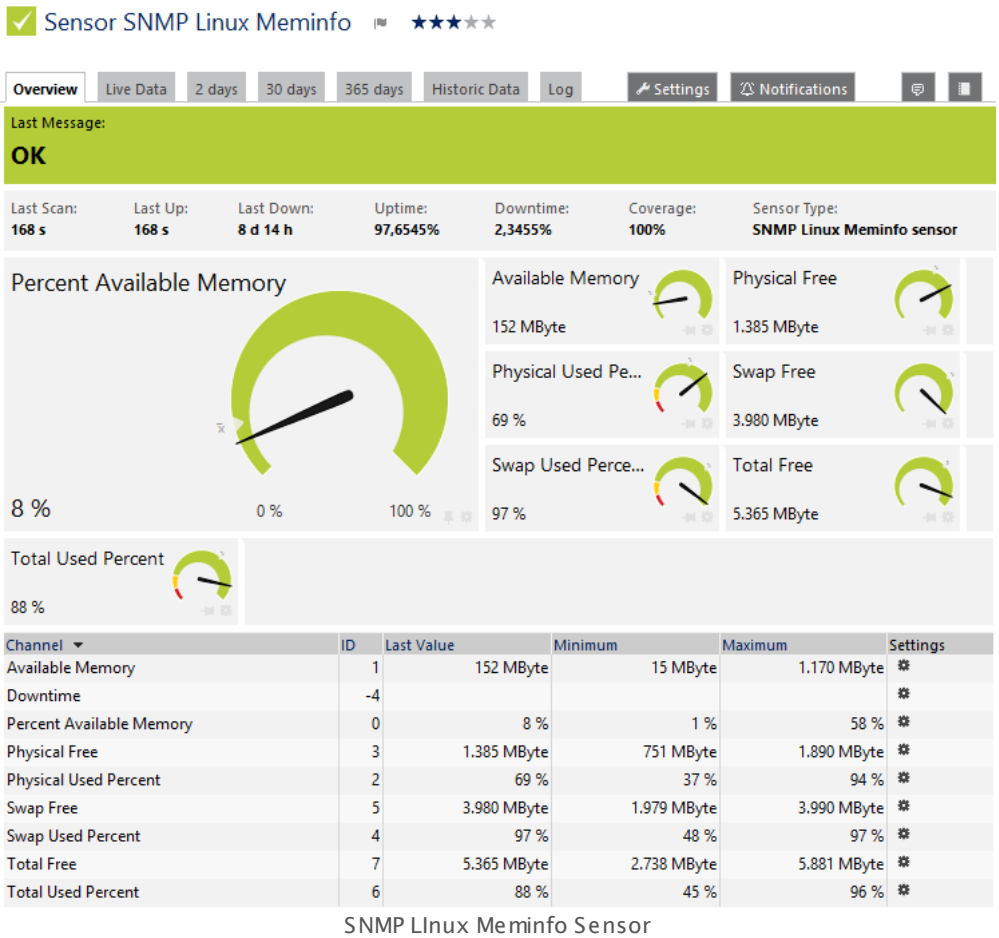
6.8.151 SNMP Linux Meminfo Sensor

The SNMP Linux Meminfo sensor monitors the memory usage of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following :

- Available memory in absolute and percentage values
- Used physical memory (free memory plus buffer plus cache) in percent
- Free physical memory (free memory plus buffer plus cache) in bytes
- Used swap memory in percent
- Free swap memory in bytes
- Used memory on the whole system (physical memory plus swap) in percent
- Free memory on the whole system (physical memory plus swap) in bytes



Channel	ID	Last Value	Minimum	Maximum	Settings
Available Memory	1	152 MByte	15 MByte	1.170 MByte	
Downtime	-4				
Percent Available Memory	0	8 %	1 %	58 %	
Physical Free	3	1.385 MByte	751 MByte	1.890 MByte	
Physical Used Percent	2	69 %	37 %	94 %	
Swap Free	5	3.980 MByte	1.979 MByte	3.990 MByte	
Swap Used Percent	4	97 %	48 %	97 %	
Total Free	7	5.365 MByte	2.738 MByte	5.881 MByte	
Total Used Percent	6	88 %	45 %	96 %	

SNMP LInux Meminfo Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_linux_meminfo.png

Remarks

- Knowledge Base: Checklist: Setting up SNMP on Linux
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

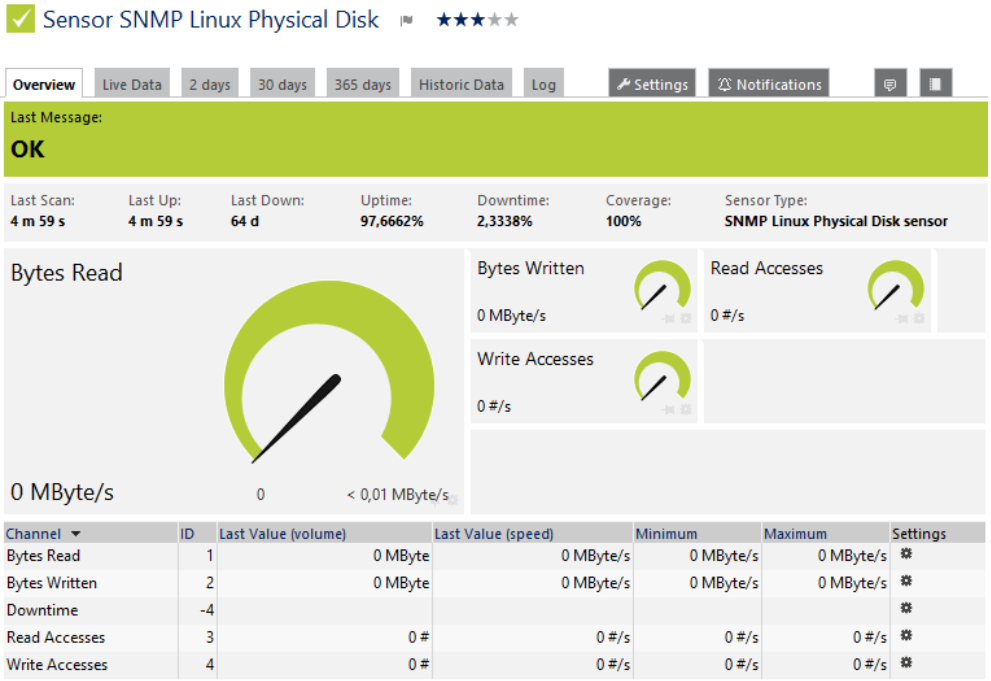
For more general information about settings, please see the **Object Settings** 159 section.

6.8.152 SNMP Linux Physical Disk Sensor

The SNMP Linux Physical Disk sensor monitors input/output (I/O) on disks of a Linux/Unix system using Simple Network Management Protocol (SNMP).

It shows the following:

- Read bytes per second
- Written bytes per second
- Number of read accesses per second
- Number of write accesses per second



SNMP Linux Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_linux_physical_disk.png

Remarks

- Knowledge Base: Checklist: Setting up SNMP on Linux
- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks of the Linux/Unix system you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

PHYSICAL DISK SETTINGS

Disk Bitmask	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** [2711] settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

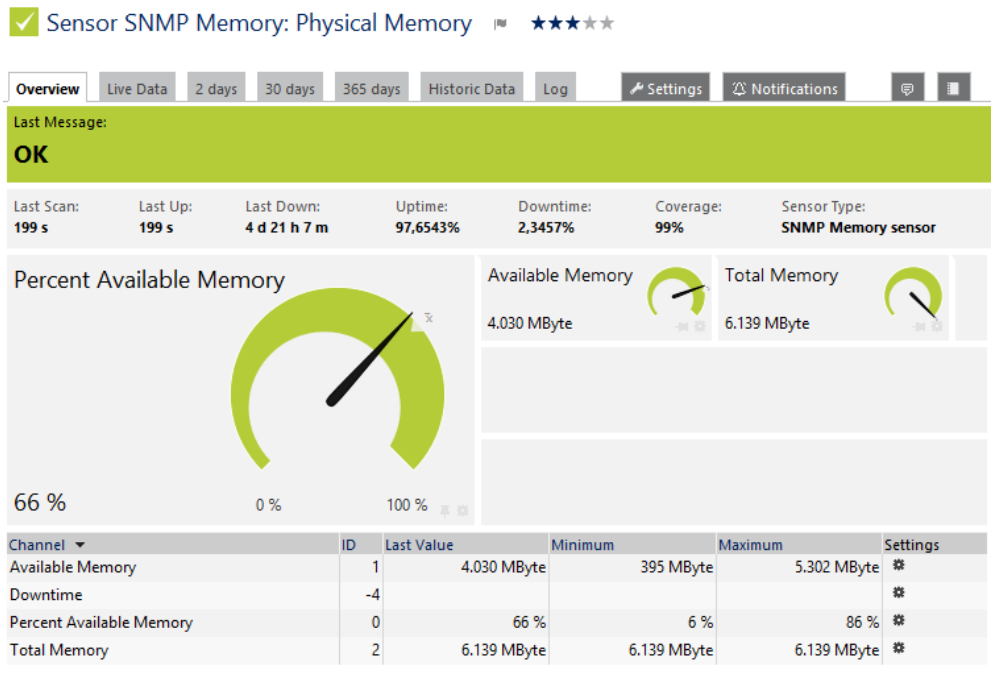
6.8.153 SNMP Memory Sensor

The SNMP Memory sensor monitors the memory usage of a system via Simple Network Management Protocol (SNMP).

It can show the following:

- Available memory in bytes
- Available memory in percent
- Total memory

Note: This sensor uses more generic Object Identifier (OID) values compared to the **SNMP Linux Meminfo Sensor** 1877.



SNMP Memory Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_memory.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the memory types you want to monitor. PRTG creates one sensor for each memory type you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

MEMORY SETTINGS

Memory	Select one or more memory types you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

MEMORY SETTINGS

Memory	Shows the type of the memory that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.154 SNMP NetApp Disk Free Sensor

The SNMP NetApp Disk Free sensor monitors free space on disks of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in bytes and percent
- Deduplication saved space in bytes and percent
- Deduplication shared space in bytes and percent
- Disk free status
- Free files in percent
- Free INodes in percent

SNMP NetApp Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_disk_free.png

Remarks

- Knowledge Base: How can I monitor capacity and used disk space on a NetApp?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disk on the NetApp you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NETAPP DISK FREE SETTINGS

File System	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP DISK FREE SETTINGS

File System	Shows the name of the disk that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Virtual Disk	Shows the name of the virtual disk that this sensor is monitoring (if applicable). Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

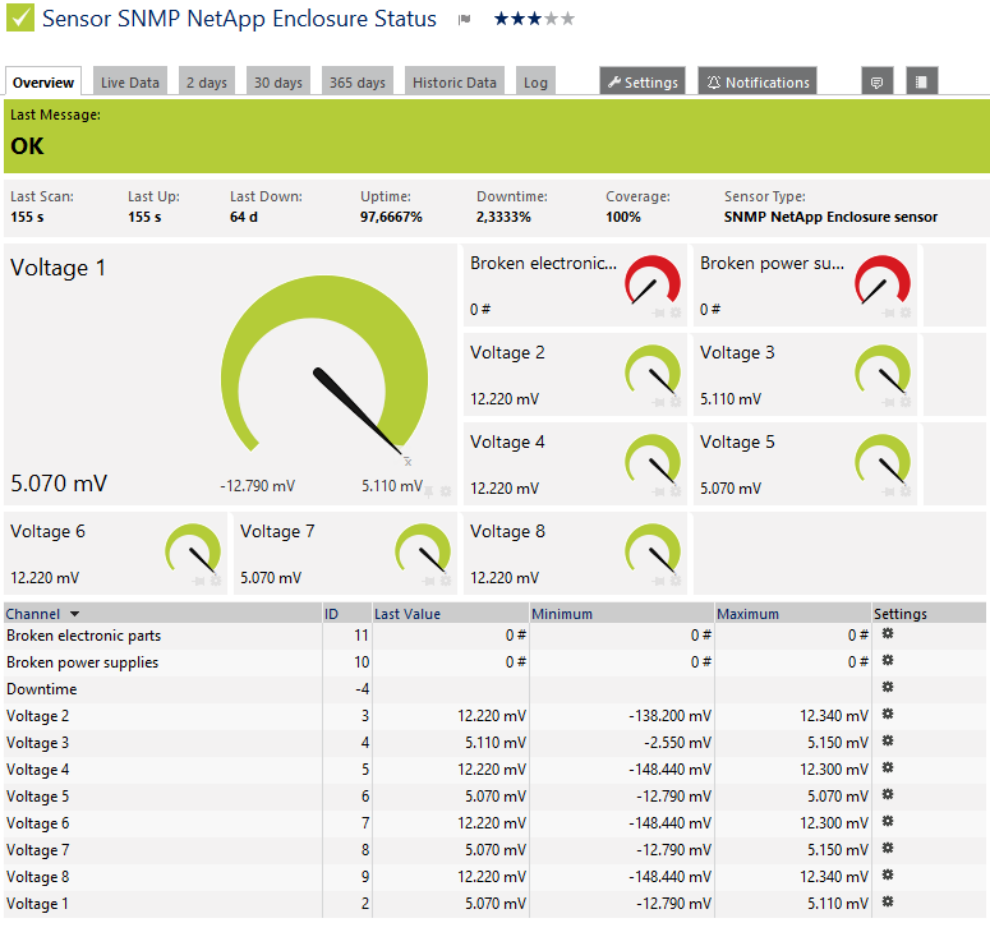
For more general information about settings, please see the **Object Settings** 159 section.

6.8.155 SNMP NetApp Enclosure Sensor

The SNMP NetApp Enclosure sensor monitors the power supply and cooling of an enclosure that is part of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following, depending on the measurements you choose:

- Temperatures
- Rotations per minute (RPM) of fans and the number of failed fans
- Voltages in mV, the number of broken electronic parts, and the number of broken power supplies
- Currents in mA



Channel	ID	Last Value	Minimum	Maximum	Settings
Broken electronic parts	11	0 #	0 #	0 #	
Broken power supplies	10	0 #	0 #	0 #	
Downtime	-4				
Voltage 2	3	12.220 mV	-138.200 mV	12.340 mV	
Voltage 3	4	5.110 mV	-2.550 mV	5.150 mV	
Voltage 4	5	12.220 mV	-148.440 mV	12.300 mV	
Voltage 5	6	5.070 mV	-12.790 mV	5.070 mV	
Voltage 6	7	12.220 mV	-148.440 mV	12.300 mV	
Voltage 7	8	5.070 mV	-12.790 mV	5.150 mV	
Voltage 8	9	12.220 mV	-148.440 mV	12.340 mV	
Voltage 1	2	5.070 mV	-12.790 mV	5.110 mV	

SNMP NetApp Enclosure Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_enclosure.png

Remarks

- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the power supply and cooling measurements of an enclosure on a NetApp you want to monitor. PRTG creates one sensor for each enclosure/measurement combination you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NETAPP ENCLOSURE SETTINGS

Enclosure	Select the enclosures with the desired measurement you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP ENCLOSURE SETTINGS

Enclosure	Shows the identifier of the enclosure that this sensor is monitoring. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measurement	Shows the monitored measurement. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

NETAPP SPECIFIC

N/A Measurements

Define the sensor behavior if the requested NetApp value is not available ("N/A" values). Choose between:

- **Interpret as error (default)**: Choose this option to set the sensor to a **Down** status if a measurement is not available. We recommend that you use this setting to not miss any hardware errors.
- **Interpret as valid**: Choose this option to handle unavailable measurements as valid sensor results to keep the sensor in **Up** status. This might be useful, for example, if a hardware sensor on the NetApp is disabled for some reason but actually there is no hardware error. If the NetApp returns an "N/A" measurement, the sensor interprets this as "0".
  We recommend that you use the lookup file **prtg.standardlookups.netapp.notavailable.ovl** for channels with unavailable measurements if you choose this option. This replaces "0" with the message "Not Available". Open the **Sensor Channels Settings** 2711 of the affected channel(s) and choose this file in section **Value Lookup**. For details, please see section **Define Lookups** 3095.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

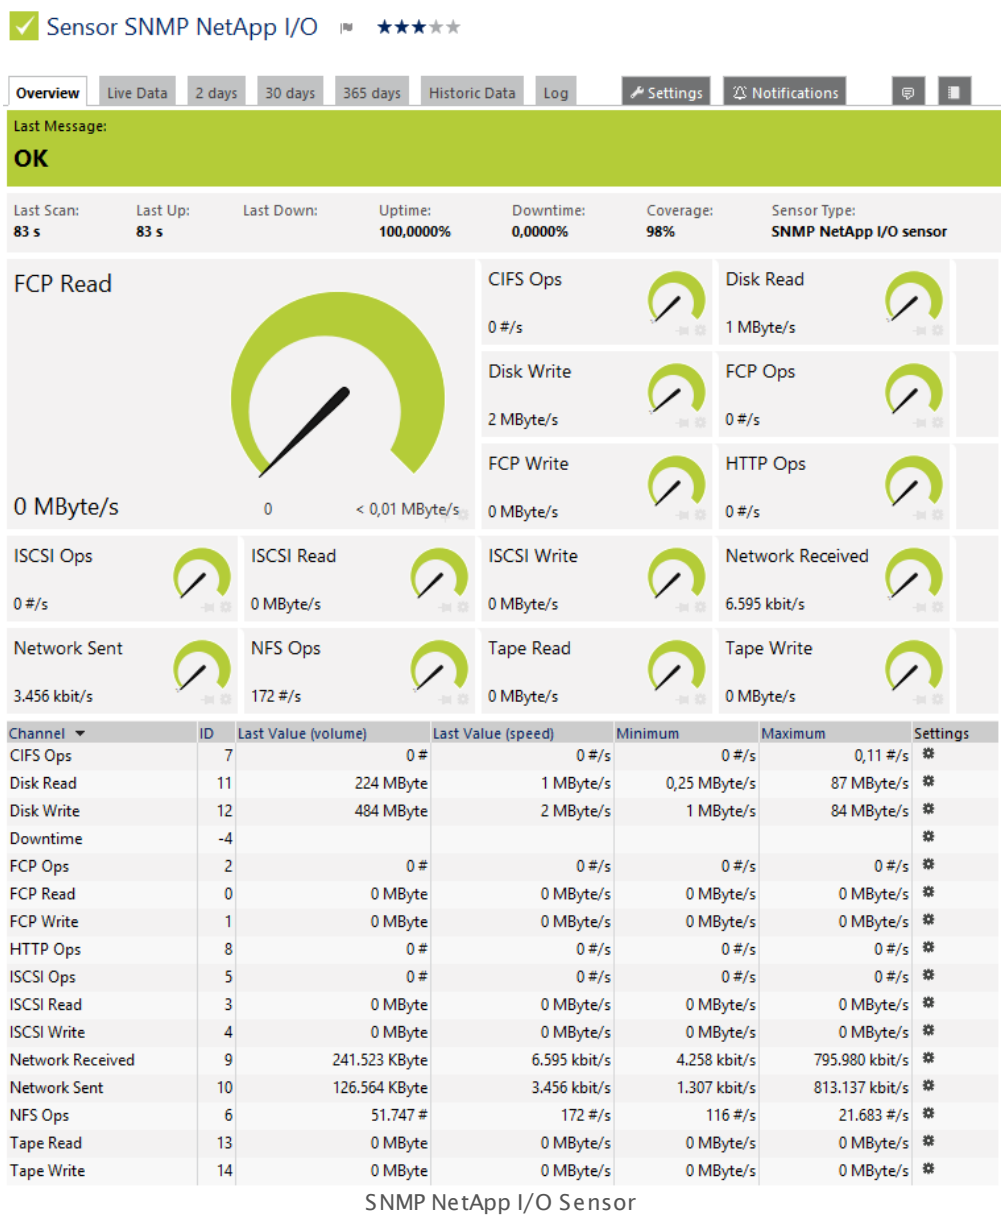
For more general information about settings, please see the **Object Settings** 159 section.

6.8.156 SNMP NetApp I/O Sensor

The SNMP NetApp I/O sensor monitors input/output operations (IOPS) on a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- FCP read speed
- CIFS operations per second
- Disk read speed
- Disk write speed
- FCP operations per second
- FCP read speed
- FCP write speed
- HTTP operations per second
- ISCSI operations per second
- ISCSI read speed
- ISCSI write speed
- Network received bytes
- Network sent bytes
- NFS operations per second
- Tape read speed
- Tape write speed



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
CIFS Ops	7	0 #	0 #/s	0 #/s	0,11 #/s	
Disk Read	11	224 MByte	1 MByte/s	0,25 MByte/s	87 MByte/s	
Disk Write	12	484 MByte	2 MByte/s	1 MByte/s	84 MByte/s	
Downtime	-4					
FCP Ops	2	0 #	0 #/s	0 #/s	0 #/s	
FCP Read	0	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
FCP Write	1	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
HTTP Ops	8	0 #	0 #/s	0 #/s	0 #/s	
ISCSI Ops	5	0 #	0 #/s	0 #/s	0 #/s	
ISCSI Read	3	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
ISCSI Write	4	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
Network Received	9	241.523 KByte	6.595 kbit/s	4.258 kbit/s	795.980 kbit/s	
Network Sent	10	126.564 KByte	3.456 kbit/s	1.307 kbit/s	813.137 kbit/s	
NFS Ops	6	51.747 #	172 #/s	116 #/s	21.683 #/s	
Tape Read	13	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	
Tape Write	14	0 MByte	0 MByte/s	0 MByte/s	0 MByte/s	

SNMP NetApp I/O Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_io.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

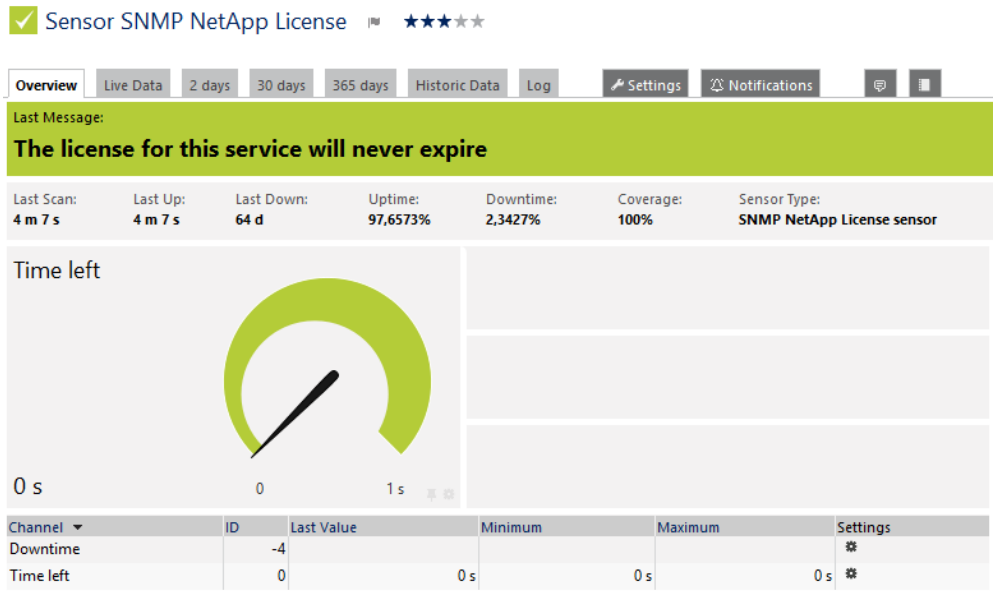
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.157 SNMP NetApp License Sensor

The SNMP NetApp License sensor monitors the licenses for the services of a NetApp storage system via Simple Network Management Protocol (SNMP).

- It shows how much time is left until the license for a service expires. This can help you to detect when a timely limited NetApp license is going to expire.



SNMP NetApp License Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_license.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the NetApp license you want to monitor. PRTG creates one sensor for each license you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NETAPP LICENSE SETTINGS

License for Service	Select the licenses you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP LICENSE SETTINGS

License for Service	Shows the name of the service whose license this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the Sensor Channels Settings 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the Root 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

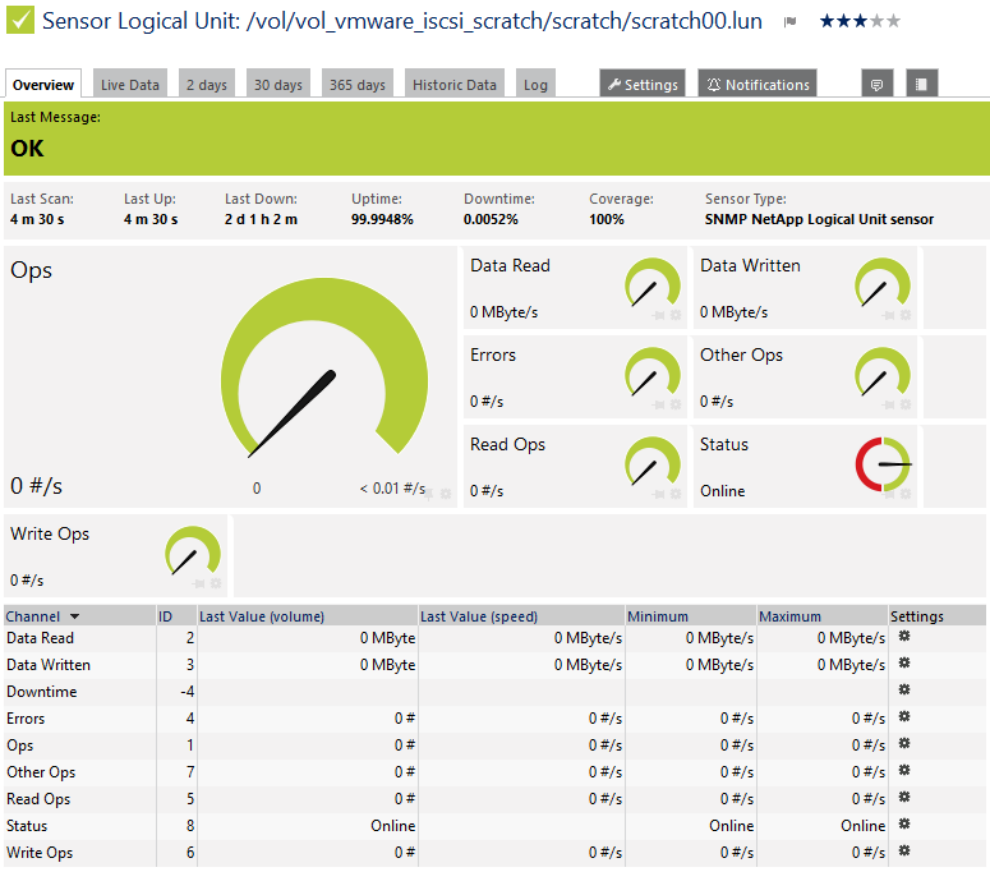
For more general information about settings, please see the **Object Settings** 159 section.

6.8.158 SNMP NetApp Logical Unit Sensor

The SNMP NetApp Logical Unit sensor monitors the input/output operations (IOPS) on a logical unit of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Total number of operations per second
- Data read speed
- Data write speed
- Number of errors per second
- Number of read operations per second
- Number of write operations per second
- Number of other operations per second
- Status of the logical unit (online or offline)



SNMP NetApp Logical Unit Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_logical_unit.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical units on the NetApp you want to monitor. PRTG creates one sensor for each unit you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NETAPP DISK FREE SETTINGS

Logical Unit	Select the logical units you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP LOGICAL UNIT SETTINGS

Logical Unit	Shows the name of the logical unit that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

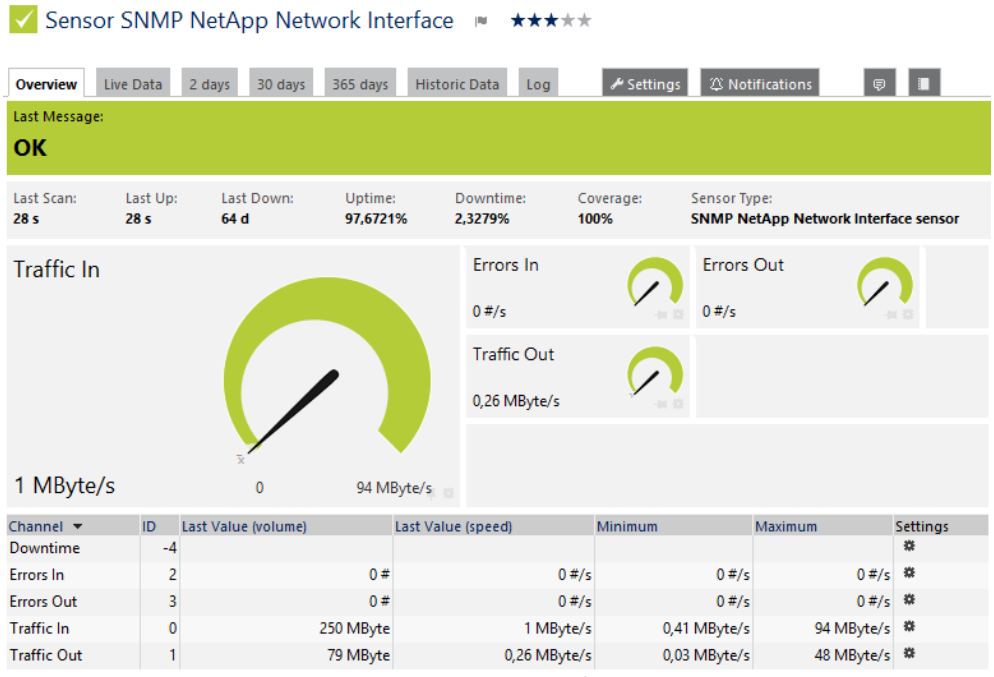
For more general information about settings, please see the **Object Settings** 159 section.

6.8.159 SNMP NetApp Network Interface Sensor

The SNMP NetApp Network Interface sensor monitors a network card of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- Traffic in
- Traffic out
- Number of errors per second (in and out).



SNMP NetApp Network Interface Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_netapp_network_interface.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the network interfaces on the NetApp you want to monitor. PRTG creates one sensor for each interface you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

NETAPP NETWORK INTERFACE SETTINGS

Network Interface	Select the interfaces you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

NETAPP NETWORK INTERFACE SETTINGS

Network Interface	Shows the name of the interface that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

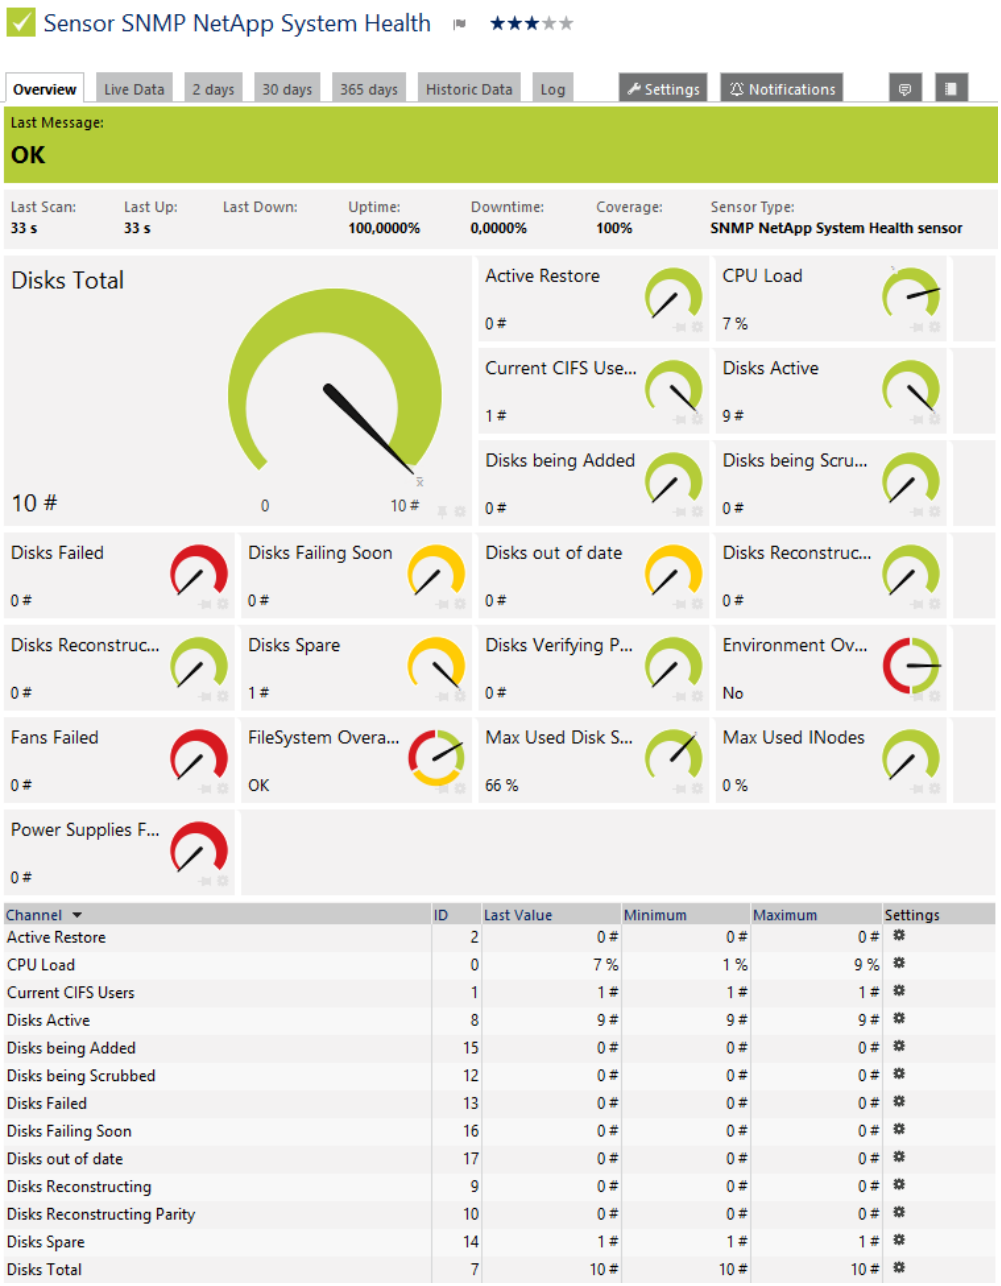
6.8.160 SNMP NetApp System Health Sensor

The SNMP NetApp System Health sensor monitors the status of a NetApp storage system via Simple Network Management Protocol (SNMP).

It can show the following:

- CPU load in percent
- Number of active restores
- Number of current CIFS users
- Number of active disks
- Number of disks being added
- Number of disks being scrubbed
- Number of failed disks
- Number of soon failing disks
- Number of disks being out of date
- Number of reconstructing (parity) disks
- Number of spare disks
- Total number of disks
- Number of verifying (parity) disks
- Number of failed fans
- Number of failed power supplies
- Maximum used disk space in percent
- Maximum used INodes in percent
- If the environment is over temperature

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP NetApp System Health Sensor

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section Monitoring via SNMP 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

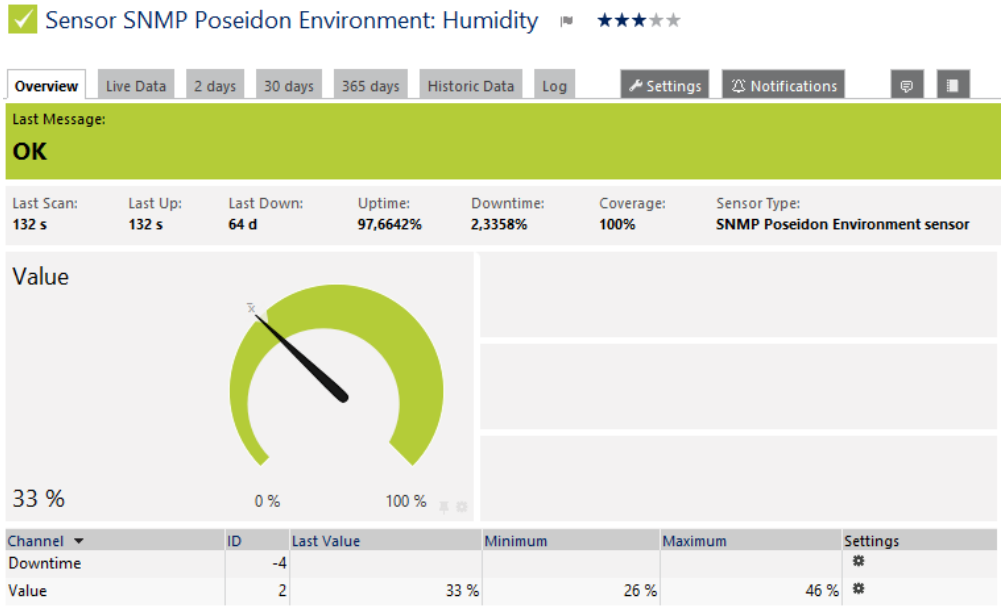
6.8.161 SNMP Poseidon Environment Sensor

The SNMP Poseidon Environment sensor monitors performance counters for environmental measurements on Poseidon hardware via Simple Network Management Protocol (SNMP).

It can show, depending on available measurement components on the hardware device and what measurement you choose:

- Humidity
- Temperature

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP Poseidon Environment Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_poseidon_environment.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

In order to monitor performance counters for environmental measurements on Poseidon hardware, PRTG will create one sensor for each measuring point you choose. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

POSEIDON ENVIRONMENT SPECIFIC

Measuring Point	Select the measurements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

POSEIDON ENVIRONMENT SPECIFIC

Name	
Unit	Shows further information about the measurement. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Measuring Point	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

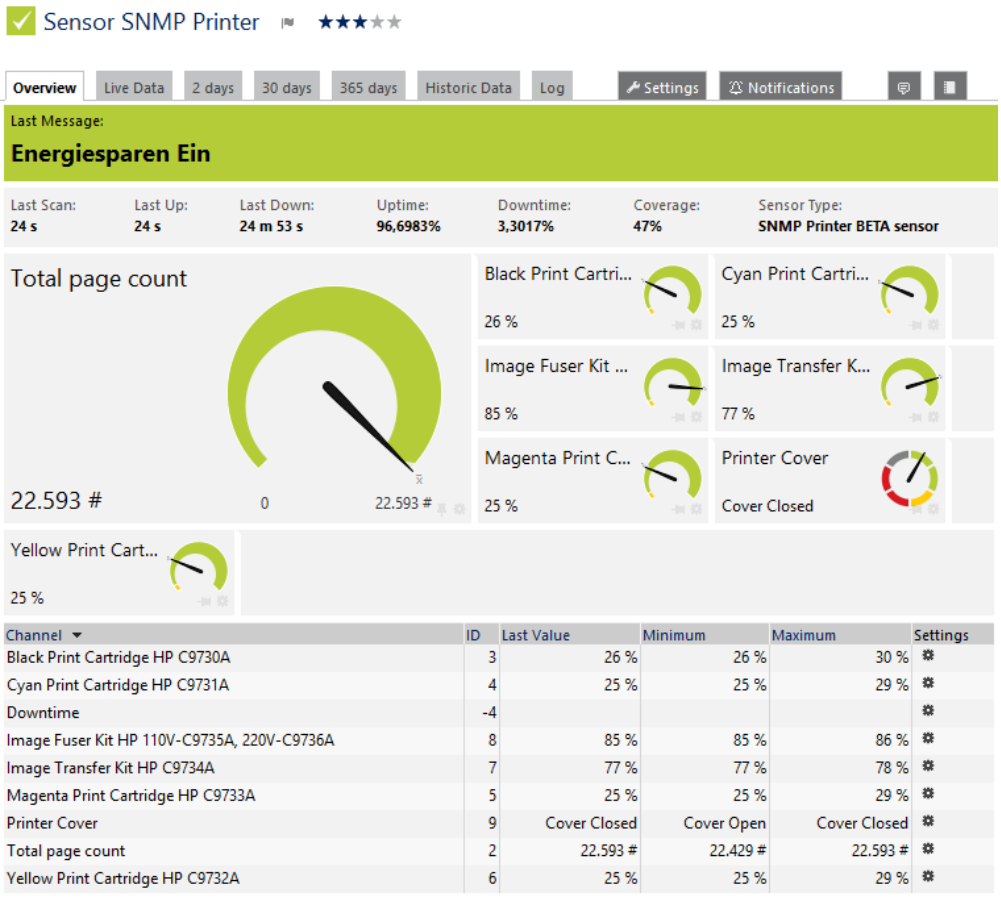
For more general information about settings, please see the **Object Settings** 159 section.

6.8.162 SNMP Printer Sensor

The SNMP Printer sensor is a generic sensor which monitors various types of printers via Simple Network Management Protocol (SNMP).

It can show the following:

- Total number of printed pages
- Fill level of cartridges and toners
- Status of the printer cover
- Additionally, the sensor shows the printer status as sensor message.



SNMP Printer Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_printer.png

Remarks

- This sensor type supports the following printers, among others: HP OfficeJet printers, HP LaserJet printers, RICOH SP 5200, SP 3410, SP C242DN, MP C3003, MP C2503

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

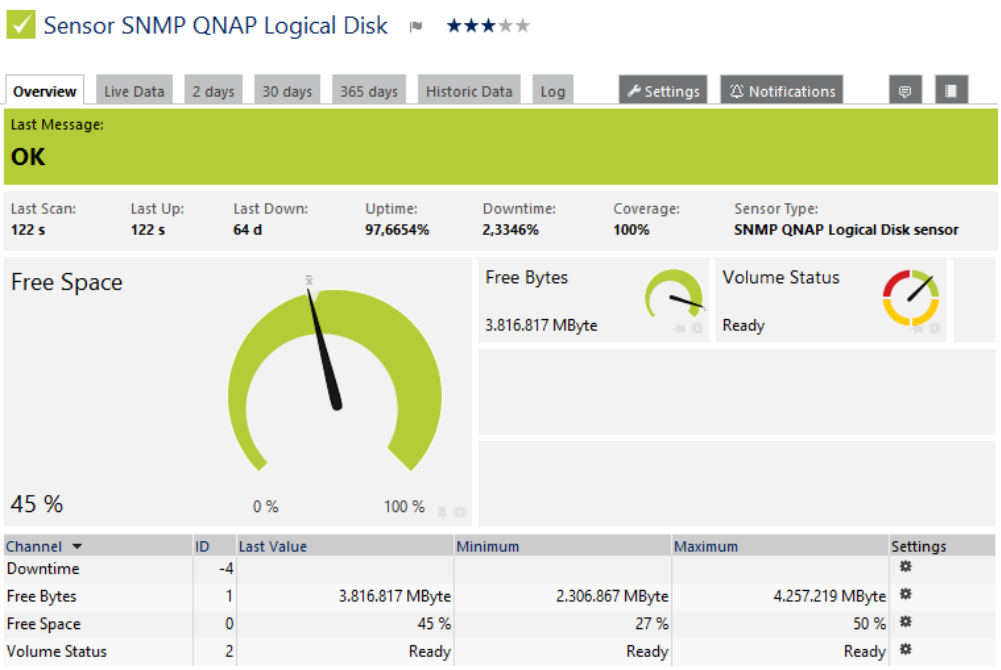
6.8.163 SNMP QNAP Logical Disk Sensor

The SNMP QNAP Logical Disk sensor monitors a logical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Free disk space in percent
- Free disk space in bytes
- Status of the volume



SNMP QNAP Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_qnap_logical_disk.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks in the QNAP NAS you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS SETTINGS

Disk	Select the logical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Disk	
Description	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
File System	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

More

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

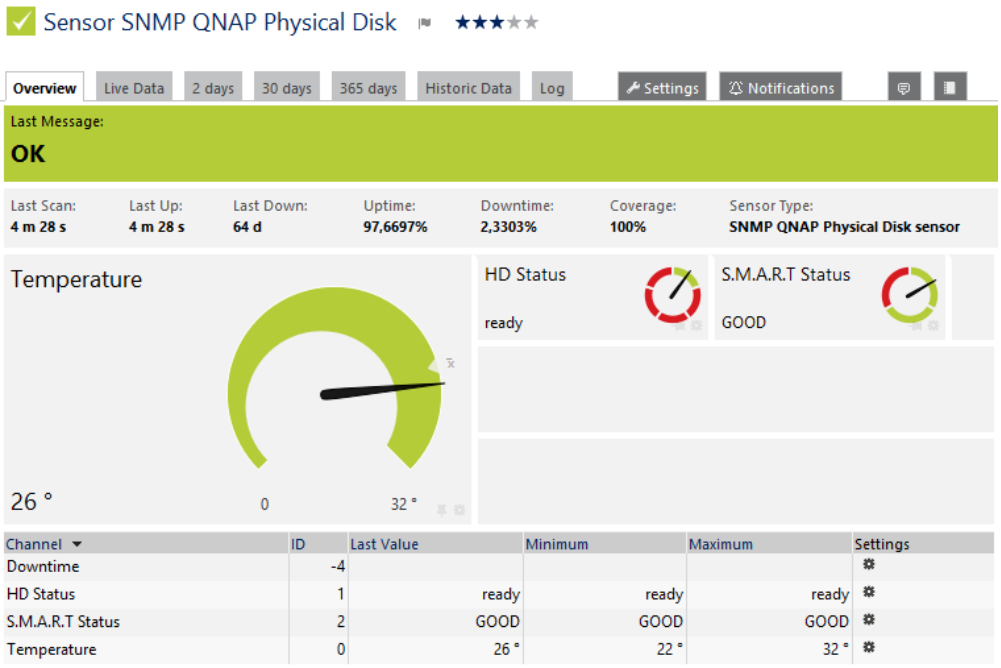
For more general information about settings, please see the **Object Settings** 159 section.

6.8.164 SNMP QNAP Physical Disk Sensor

The SNMP QNAP Physical Disk sensor monitors a physical disk in a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Temperature
- Disk status
- Self-Monitoring, Analysis and Reporting Technology (S.M.A.R.T.) status of the disk.



SNMP QNAP Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_qnap_physical_disk.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the QNAP NAS you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. You can also define the unit of the temperature measurement. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS SETTINGS

Disk	Select the physical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.
Unit	Select the unit of the temperature measurement. Choose between **Celsius** and **Fahrenheit**.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Disk	
Description	
Model	Shows further information about the disk. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Capacity	
Unit	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

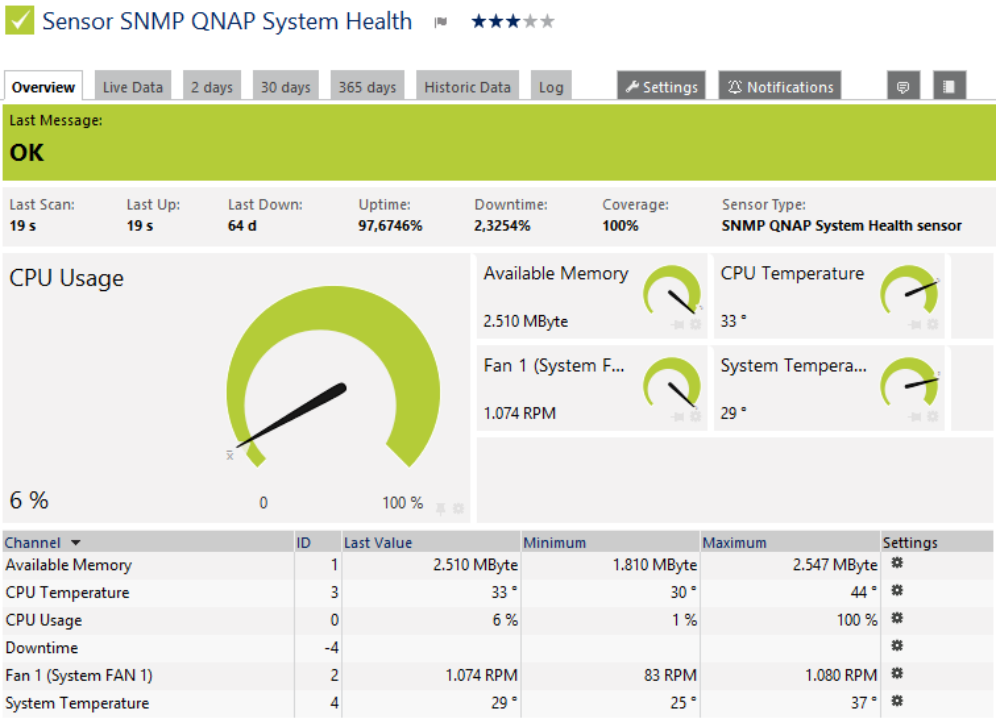
6.8.165 SNMP QNAP System Health Sensor

The SNMP QNAP System Health sensor monitors the system health of a QNAP Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following, depending on the available measurement components:

- CPU usage in percent
- Available memory in bytes
- Temperature of CPU
- Temperature of system
- Revolutions of fans per minute (RPM)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SNMP QNAP System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_qnap_system_health.png

Remarks

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

To monitor the system health of a QNAP NAS, specify the unit of the temperature measurement.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

QNAP NAS SETTINGS

Unit	Select the unit of the temperature measurement. Choose between **Celsius** and **Fahrenheit**.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value.

BASIC SENSOR SETTINGS

	You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

QNAP NAS SETTINGS

Unit	Shows the unit of temperatures as monitored with this sensor. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY

Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Knowledge Base: My SNMP sensors don't work. What can I do?

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

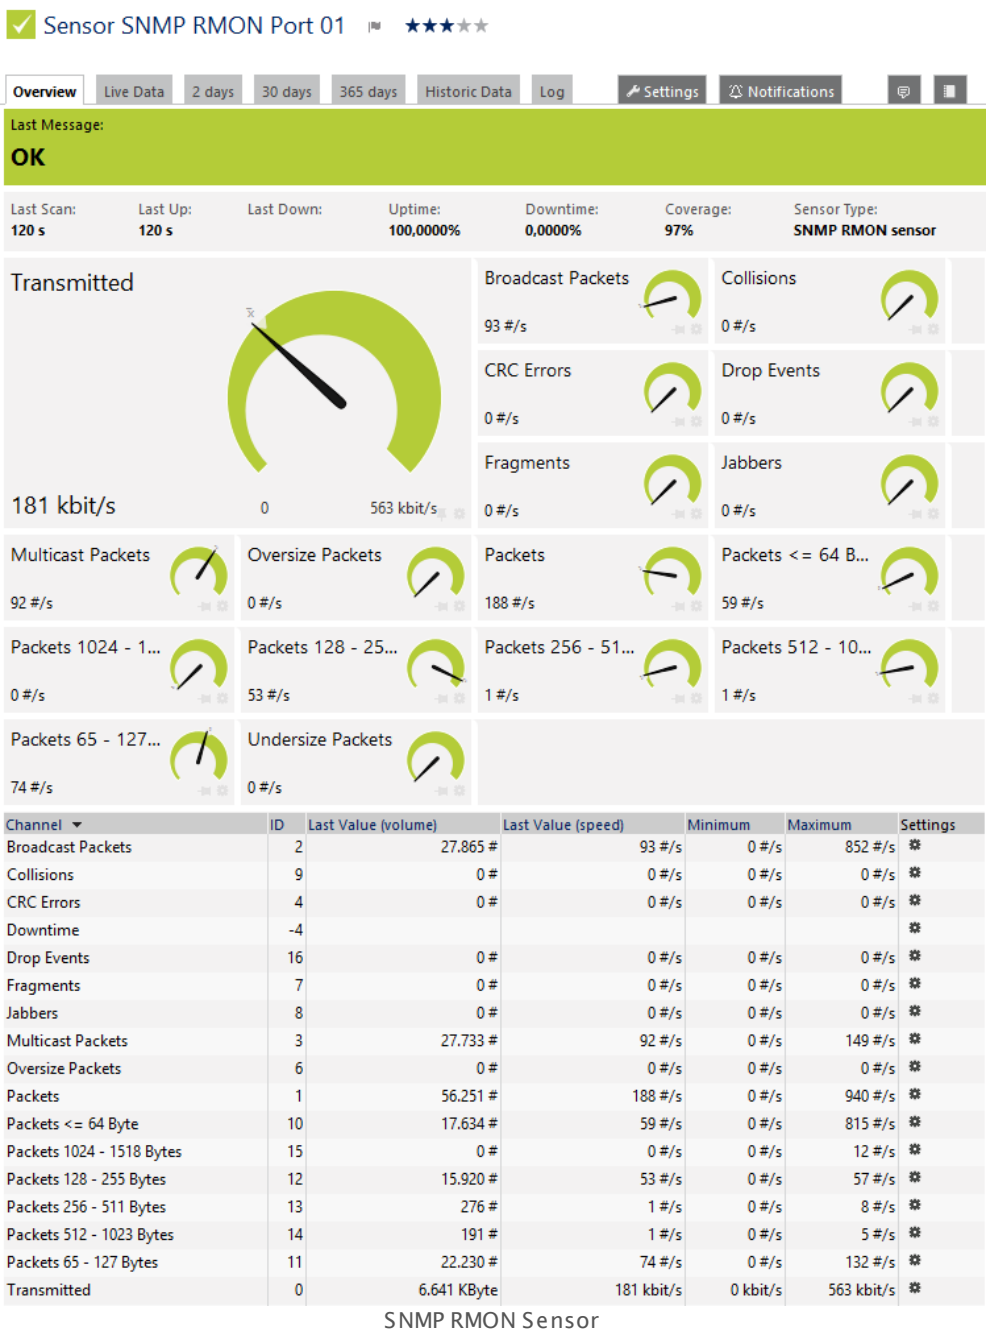
6.8.166 SNMP RMON Sensor

The SNMP RMON sensor monitors traffic on a device using the Remote Monitoring (RMON) standard via Simple Network Management Protocol (SNMP). You can create it on an SNMP compatible device that provides traffic data via RMON. Depending on the data returned by your device, traffic data for each port can be displayed in different channels, allowing detailed analysis. If available, the sensor queries 64-bit counters.

For each port, the sensor can show, for example:

- Transmitted kbit/s
- Packets (#/s)
- Broadcast Packets (#/s)
- Multicast Packets (#/s)
- CRC Errors (#/s)
- Undersize Packets (#/s)
- Oversize Packets (#/s)
- Fragments (#/s)
- Jabbers (#/s)
- Collisions (#/s)
- Packets <= 64 Byte (#/s)
- Packets 65 - 127 Bytes (#/s)
- Packets 128 - 255 Bytes (#/s)
- Packets 256 - 511 Bytes (#/s)
- Packets 512 - 1023 Bytes (#/s)
- Packets 1024 - 1518 Bytes (#/s)
- Drop Events (#/s)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Broadcast Packets	2	27.865 #	93 #/s	0 #/s	852 #/s	
Collisions	9	0 #	0 #/s	0 #/s	0 #/s	
CRC Errors	4	0 #	0 #/s	0 #/s	0 #/s	
Downtime	-4					
Drop Events	16	0 #	0 #/s	0 #/s	0 #/s	
Fragments	7	0 #	0 #/s	0 #/s	0 #/s	
Jabbers	8	0 #	0 #/s	0 #/s	0 #/s	
Multicast Packets	3	27.733 #	92 #/s	0 #/s	149 #/s	
Oversize Packets	6	0 #	0 #/s	0 #/s	0 #/s	
Packets	1	56.251 #	188 #/s	0 #/s	940 #/s	
Packets <= 64 Byte	10	17.634 #	59 #/s	0 #/s	815 #/s	
Packets 1024 - 1518 Bytes	15	0 #	0 #/s	0 #/s	12 #/s	
Packets 128 - 255 Bytes	12	15.920 #	53 #/s	0 #/s	57 #/s	
Packets 256 - 511 Bytes	13	276 #	1 #/s	0 #/s	8 #/s	
Packets 512 - 1023 Bytes	14	191 #	1 #/s	0 #/s	5 #/s	
Packets 65 - 127 Bytes	11	22.230 #	74 #/s	0 #/s	132 #/s	
Transmitted	0	6.641 KByte	181 kbit/s	0 kbit/s	563 kbit/s	

SNMP RMON Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_rmon.png

Remarks

- Note: You can define the displayed sensor name with port name templates in the **SNMP Compatibility Options** 336 of the parent device.
- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.

- Knowledge Base: What value does the "Transmitted" channel of an RMON sensor show?
- Knowledge Base: How do PRTG's automatic port name and number updates work for SNMP traffic sensors?
- Knowledge Base: Where is the volume line in graphs?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ports you want to monitor. PRTG creates one sensor for each port you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

RMON SPECIFIC

Ports	Select the ports you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

RMON SPECIFIC

Port	Shows the number of the interface port in your physical device that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Channel Mask	Describes which channels are available and might be useful for technical support. This setting is shown for your information only and cannot be changed here.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor.

SENSOR DISPLAY

	Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how to show different channels for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. ▪ **Show in and out traffic as positive and negative area chart**: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. Note: You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the **Sensor Channels Settings** 2711).
Stack Unit	This setting is only available if you choose stacked graphs above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.168 SNMP SonicWALL VPN Traffic Sensor

The SNMP SonicWALL VPN Traffic sensor monitors the traffic of an Internet Protocol Security (IPsec) Virtual Private Network (VPN) on a Dell SonicWALL Network Security Appliance (NSA) via Simple Network Management Protocol (SNMP).

It can show the following:

- Number of encrypted and decrypted packets per second
- Bytes of encrypted and decrypted transmissions per second
- Number of in- and outgoing fragmented packets per second

SNMP SonicWALL VPN Traffic Sensor

Remarks

- Knowledge Base: Why does PRTG write error messages into my SonicWALL log?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the connections of the SonicWALL VPN you want to monitor. PRTG creates one sensor for each connection you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SONICWALL VPN SPECIFIC

Connections	Select the connections you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.
Identification Method	Select the criteria to use for connection identification. PRTG always uses the first connection found that matches all criteria. Choose between: ▪ **By Index**: Every connection has a unique index. This is the safest method to identify your connection. Though, if the connection is lost and reconnected, a new index will be assigned. ▪ **By Remote IP**: If the target of the VPN has always the same IP, you can use this IP to identify the connection. ▪ **By Security Policy Name**: If you use a different Security Policy for every VPN, you can use its name to identify the connection. ▪ **By Remote IP and Security Policy Name**: You can also combine both identification methods.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SONICWALL VPN SPECIFIC

Security Policy Remote IP Index Identification Method	Shows further information about the monitored connection. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

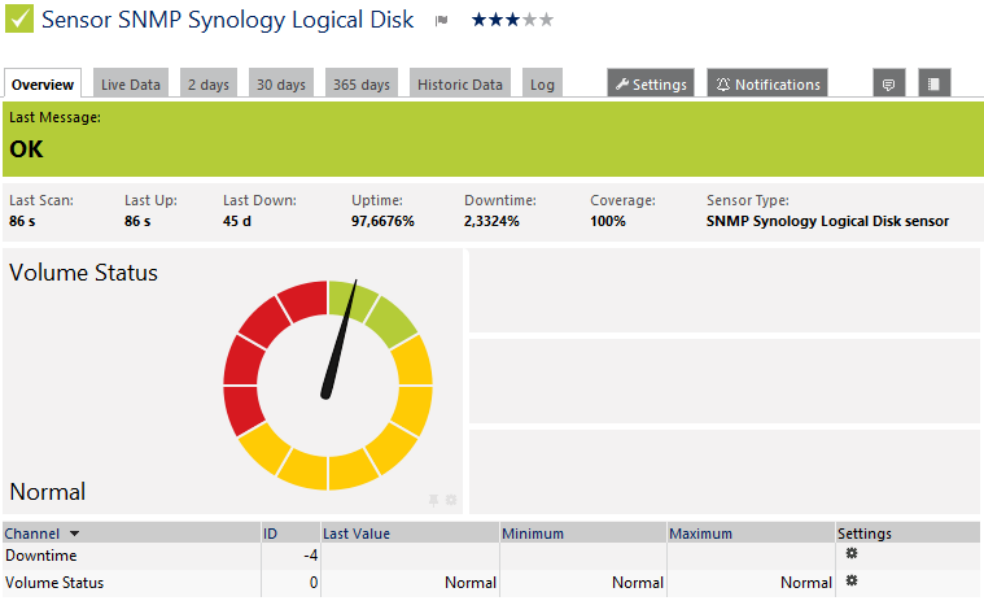
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.169 SNMP Synology Logical Disk Sensor

The SNMP Synology Logical Disk sensor monitors a logical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

- It can show the status of a volume.



SNMP Synology Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_synology_logical_disk.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the logical disks in the Synology NAS. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SYNOLOGY NAS SETTINGS

Disk	Select the logical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYNOLOGY NAS SETTINGS

Disk	
Name	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

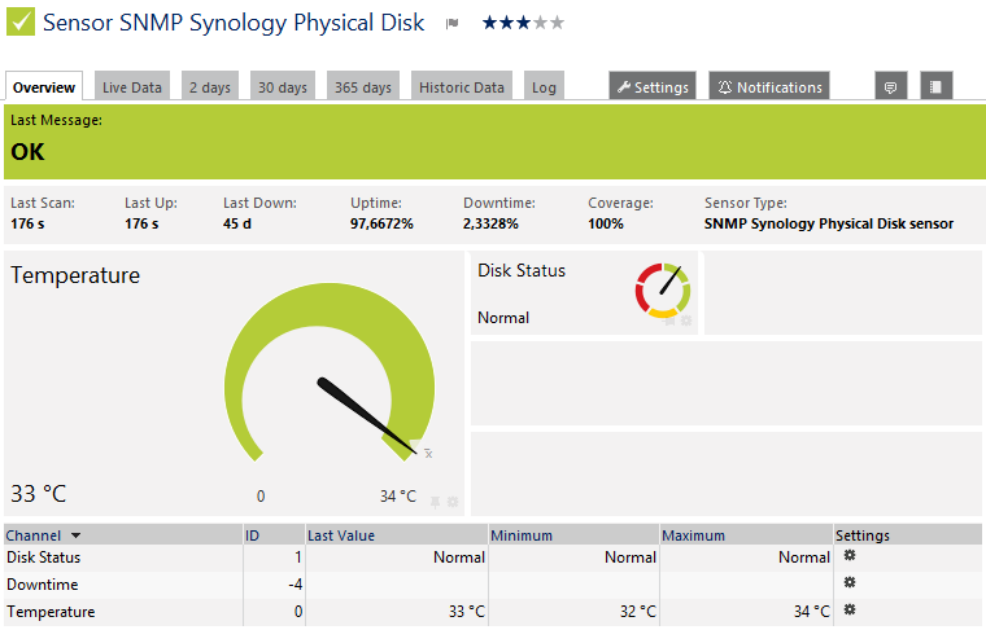
6.8.170 SNMP Synology Physical Disk Sensor

The SNMP Physical Disk sensor monitors a physical disk in a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following:

- Temperature
- Disk status



SNMP Synology Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_synology_physical_disk.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the physical disks in the Synology NAS you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SYNOLOGY NAS SETTINGS

Disk	Select the physical disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYNOLOGY NAS SETTINGS

Disk	
Name	Shows further information about the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Model	
Type	

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/46863

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

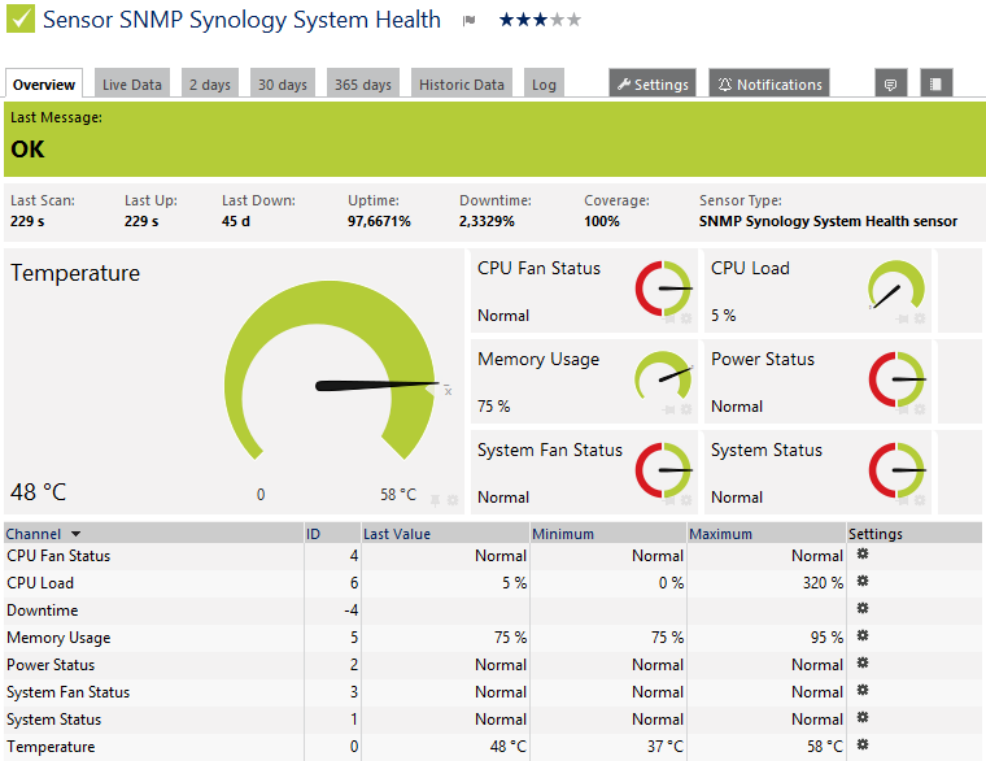
6.8.171 SNMP Synology System Health Sensor

The SNMP Synology System Health sensor monitors the system health of a Synology Network Attached Storage (NAS) via Simple Network Management Protocol (SNMP).

It can show the following, depending on the available measurement components:

- Temperature
- System status
- Power status
- Fan status
- Memory usage in percent
- CPU load in percent

Which channels the sensor actually shows might depend on the monitored device and the sensor setup. For more information about the shown memory and CPU load values, please see section **More** 2061.



SNMP Synology System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_synology_system_health.png

Remarks

- Knowledge Base: Why does my Synology System Health sensor show incorrect CPU and memory values?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

To monitor the system health of a Synology NAS, please specify the unit of the temperature measurement.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SYNOLOGY NAS SETTINGS

Unit	Select the unit of the temperature measurement. Choose between **Celsius** and **Fahrenheit**.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYNOLOGY NAS SETTINGS

Unit	Shows the unit of temperatures which this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

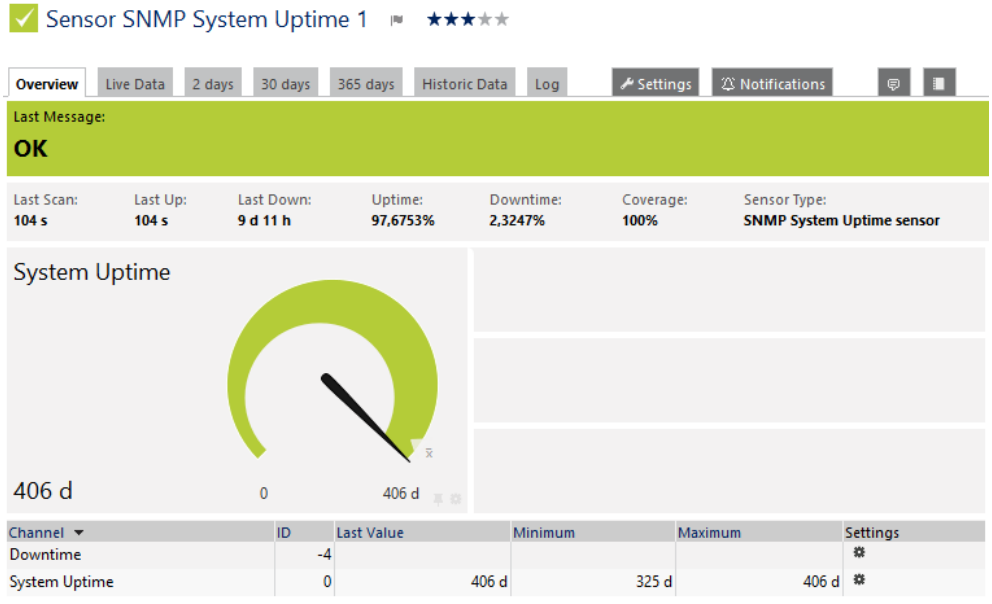
6.8.172 SNMP System Uptime Sensor

The SNMP System Uptime sensor monitors the time a device is running via Simple Network Management Protocol (SNMP).

- It reads the system uptime value of the monitored device and shows it.



SNMP System Uptime Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_system_uptime.png

Remarks

- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- Knowledge Base: Why does the SNMP System Uptime sensor report wrong values?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

6.8.173 SNMP Traffic Sensor

The SNMP Traffic sensor monitors traffic on a device using Simple Network Management Protocol (SNMP). You can create it on a device that provides traffic data, one traffic sensor for each individual port.

It can show the following:

- Traffic in
- Traffic out
- Traffic total

You can also add additional channels:

- Errors in and out
- Discards in and out
- Unicast packets in and out
- Non unicast packets in and out
- Multicast packets in and out
- Broadcast packets in and out
- Unknown protocols

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

SNMP Traffic Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_traffic.png

Remarks

- You can define the displayed sensor name with port name templates in the **SNMP Compatibility Options** 336 of the parent device.
- Note: We recommend that you choose SNMP v2c (most common) or SNMP v3 in the **Credentials for SNMP Devices** 332 of the parent device (if supported by the device that you monitor). SNMP v1 does not support 64-bit counters which may result in invalid data. For details, please the Knowledge Base: Querying 64-bit Counters with SNMP Traffic Sensors
- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.

- Knowledge Base: How do PRTG's automatic port name and number updates work for SNMP traffic sensors?
- Knowledge Base: Where is the volume line in graphs?
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ports on SNMP devices with multiple interfaces you want to monitor. PRTG creates one sensor for each port you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

TRAFFIC SPECIFIC

Interface Number	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head. You can see the connection status of an interface in the respective table column. Note: You can group-select and -unselect interfaces by using the buttons **Select all connected interfaces**, **Select all disconnected interfaces**, and **Deselect all interfaces**.
Description "IN" Channel	For the standard channel "Traffic In", enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor channel settings 2711 later.
Description "OUT" Channel	For the standard channel "Traffic Out", enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor channel settings 2711 later.
Description "TOTAL" Channel	For the standard channel "Traffic Total" enter the channel name here. The sensor shows it in graphs and tables. You can change this description and the description of all other channels in the sensor channel settings 2711 later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

TRAFFIC SPECIFIC

Interface Number	Shows the number and name of the interface in your physical device that this sensor monitors. This value is shown for reference purposes only. We strongly recommend that you only change it if Paessler support explicitly asks you to do so for debugging. Wrong usage can result in incorrect monitoring data!
Additional Channels	By default, the channels "Traffic In", "Traffic Out", and "Traffic Total" are created for each SNMP Traffic sensor. Choose additional channels for all selected interfaces. Click on the respective channel name(s) to mark them and monitor their data. You can choose from the following additional channels: ▪ **Errors In & Out**: The number of in-/outbound packets that could not be delivered because of errors. ▪ **Discards In & Out**: The number of discarded in-/outbound packets even though no errors had been detected. ▪ **Unicast Packets In & Out**: The number of unicast packets that were delivered. ▪ **Non Unicast Packets In & Out (32-bit only)**: The number of non-unicast packets that were delivered. ▪ **Multicast Packets In & Out (64-bit only)**: The number of delivered packets which were addressed to a multicast address. ▪ **Broadcast Packets In & Out (64-bit only)**: The number of delivered packets which were addressed to a broadcast address ▪ **Unknown Protocols**: The number of received packets which were discarded because of an unknown or unsupported protocol. Channels that are once created cannot be deleted later. You can disable them only.
Connection Status Handling	Define how PRTG will react when an interface is operational. A interface which is not operational is, for example, an ethernet port on a switch with no cable plugged in. This setting is valid for all interfaces selected above. You can choose between: ▪ **Show alarm for all "disconnected" states**: The sensor for the interface will always turn into a red error status for a disconnected interface. This applies if the ifOperStatus of the interface is not "up". ▪ **Show alarm when disconnected, but ignore when deactivated**: The sensor will go into an error status for a disconnected interface only if it is not deliberately deactivated in the configuration. This applies if the ifOperStatus of the interface is not "up" **and** the ifAdminStatus is "up". So the sensor will keep the **Up** status when the interface has been deactivated. ▪ **Ignore all "disconnected" states**: The sensor will not show an alarm and its status remains green. Monitoring will be discontinued without notice.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed underneath the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's overview tab.
Chart Type	Define how to show different channels for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. ▪ **Show in and out traffic as positive and negative area chart**: Show channels for incoming and outgoing traffic as positive and negative area chart. This will visualize your traffic in a clear way. Note: You cannot use this option in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711). Manual scaling is not possible if you choose this option. Note: You cannot show a positive/negative chart for a channel if you choose to display its data in percent of maximum (available in the **Sensor Channels Settings** 2711).
Stack Unit	This setting is only available if you choose stacked graphs above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

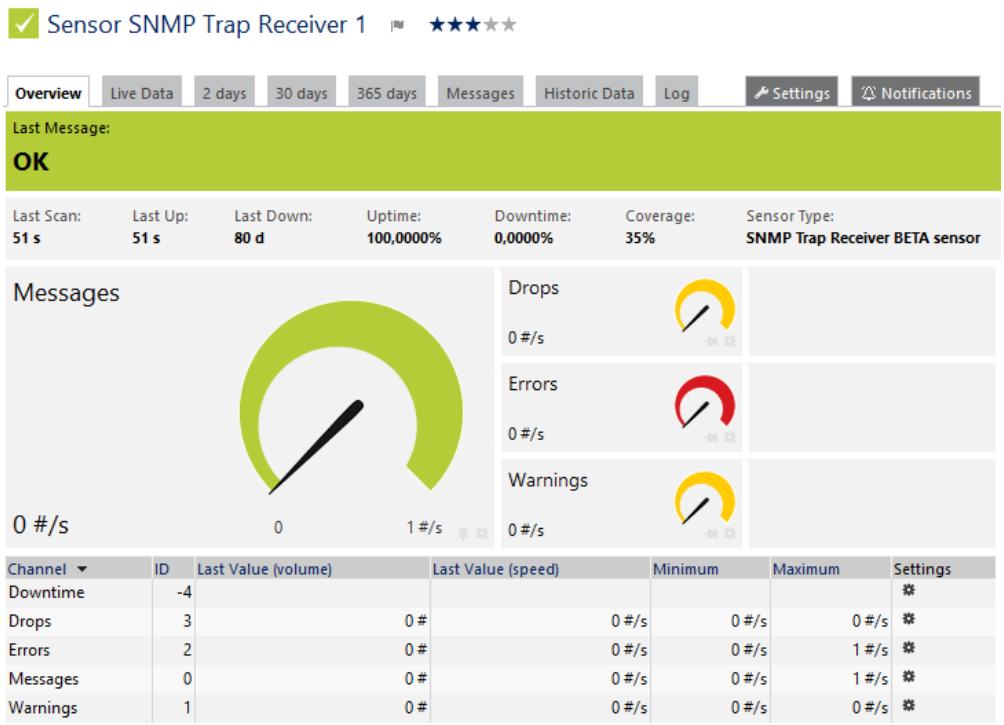
For more general information about settings, please see the **Object Settings** 159 section.

6.8.174 SNMP Trap Receiver Sensor

The SNMP Trap Receiver sensor receives and analyzes Simple Network Management Protocol (SNMP) traps.

It shows the following:

- Overall number of received traps per second
- Trap messages categorized as "warning" per second
- Trap messages categorized as "error" per second
- Number of dropped packets per second
- The actual trap messages



SNMP Trap Receiver Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_trap_receiver.png

Remarks

- With the available filter options, you can define individually which types of messages the sensor will consider for monitoring, and which messages it will categorize as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
- Add the sensor to the probe device to receive all messages of the system running the probe.

- Add the sensor to a specific device to receive all messages from this device directly. This makes this sensor type faster than just using source filters.
- You can use trap specific placeholders in email notification templates 2840 to see the messages when you receive an email notification. See the Knowledge Base: What placeholders can I use with PRTG?
- You can copy the Management Information Base (MIB) file for your traps into the **\MIB** subfolder of your PRTG installation 3135 to translate the OIDs for the traps into readable messages.
- Note: This sensor type does not support SNMP **v3** traps! Please use SNMP v1 or v2c instead.
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- Note: If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure the IP address or DNS name of the parent device matches the proper trap sender. For example, if you want to receive traps from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
- Knowledge Base: How do I test an SNMP Trap Receiver Sensor?
- For a general introduction to the SNMP trap receiver's configuration, please see manual section **Monitoring Syslogs and SNMP Traps** 3038.
- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP TRAP SPECIFIC

Listen on Port	Enter the number of the port on which the sensor waits for SNMP traps. The default port is **162**. Please enter an integer value. We recommend that you use the default value.
Purge Messages After	Define how long PRTG stores received trap messages for analysis. Choose a period of time from the drop down list.

FILTER

Include Filter	Define if you want to filter traps. If you leave this field empty or use the keyword "any", the sensor will process all data. This is the default setting. To include specific types of traps only, define filters using a special syntax. For more information, see section **Filter Rules** 2091.

FILTER

Exclude Filter	Define which types of traps the sensor will discard and not process. To exclude specific types of traps, define filters using a special syntax. For more information, see section **Filter Rules** 2091.
Warning Filter	Define which types of traps count for the **Warnings** channel. To categorize received traps as warning messages, define filters using a special syntax. For more information, see section **Filter Rules** 2091. Note: Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Warning** status after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain **Warning** at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, its status will turn **Up** again after the interval.
Error Filter	Define which types of traps count for the **Errors** channel. To categorize received traps as error messages, define filters using a special syntax. For more information, see section **Filter Rules** 2091. Note: Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Down** status after a scanning interval has finished and there was at least one error message during this interval. The status will remain **Down** at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, its status will turn **Up** again after the interval.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

DEBUGGING	
Log Data to Disk	Define if the probe will write a log file of the received data to the data folder (see **Data Storage** 3135) to the disk for debugging purposes. Choose between: ▪ **Off (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **On**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

Filter Rules for Traps

Filter rules are used for the include, exclude, warning, and error definition fields of the Trap Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which traps to monitored. Warning and error filters define how to categorize received traps. Provide these filters in the sensor settings as formulas. Formulas are fields which you can combine with boolean operators (AND, OR, NOT) and brackets.

Field	Parameter	Examples
source[ip]	Enter an IP address where the UDPs come from; IP masks and ranges 3094 are also possible.	source[10.0.23.50], source[10.0.23.10-50], source[10.0.23.10/255]
agent[ip]	Enter an IP address which specifies the object that creates the SNMP trap. Only v1 is supported.	agent[10.0.0.1]
enterprise[oid]	Enter an OID which specifies the object that originates the trap. Only v1 is supported.	enterprise [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0]
bindings[text]	Enter a substring to match all OIDs and values in the bindings.	bindings[ERROR], bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0]
bindings[oid,value]	Enter an OID and a substring to match a value in the given OID. Separate OID and value with a comma.	bindings [1.3.6.1.4.1.2.6.182.1.2.3 1.1.0,error]
gentrap[number]	Enter a number which specifies the generic trap type. Ranges are also possible.	gentrap[3], gentrap[2-6]

spectrap [number]	Enter a number which defines the specific trap code. Ranges are also possible.	spectrap[4], spectrap[0-3]
version [number]	Enter a number (**1** or **2**) which specifies the SNMP version.	version[1], version[2]
community [text]	Enter a community string for exact, case sensitive match.	community[public], community[private]

Messages Tab: Review and Analyze Traps

PRTG stores received traps as common files in the data folder (see section **Data Storage** 3135). To review and analyze all received messages, you can access the most recent data directly in a table list 178 in the PRTG web interface. You can access this list via the **Overview** tab of the sensors.

Note: Received traps are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for auto refresh 2830 is 30 seconds).

For more details and further filter options, click the **Messages** tab of the SNMP Trap Receiver sensor. You will see all received messages in a table list 178. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG loads the filtered list automatically.

Note: You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings with by clicking the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as given in section **Filter Rules for Traps** 2091. If you have provided filter parameters on the **Messages** tab, the advanced filter will already include them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

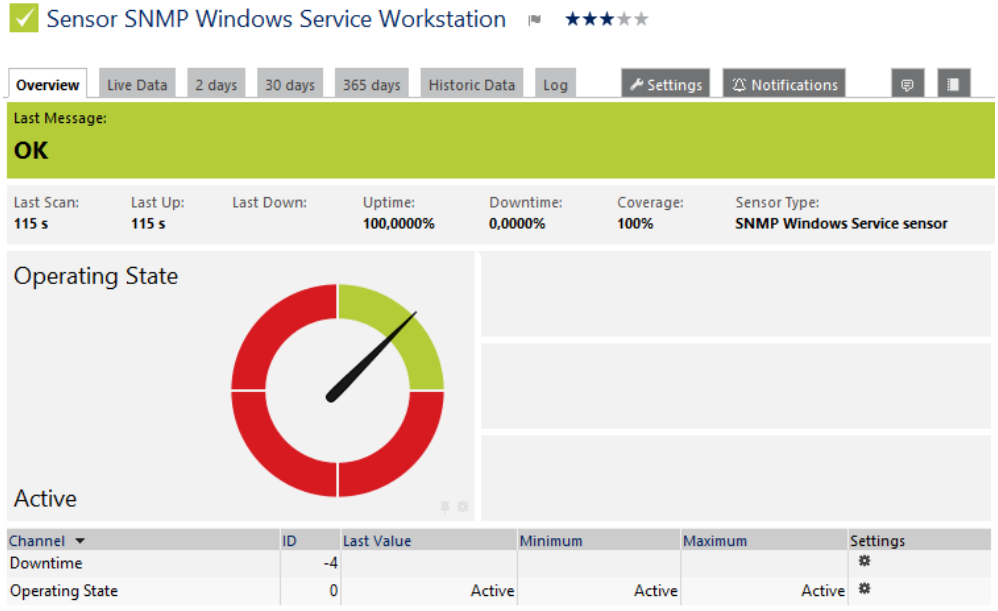
6.8.175 SNMP Windows Service Sensor

The SNMP Windows Service sensor monitors a Windows service via Simple Network Management Protocol (SNMP).

- It shows the operating status of the monitored service.

Operating states can be:

- Active (sensor status 135 **Up**)
- Continue-Pending
- Pause-Pending
- Paused (all with sensor status **Down**)



SNMP Windows Service

Click here to enlarge: http://media.paessler.com/prtg-screenshots/snmp_windows_service.png

Remarks

- This sensor type cannot distinguish the status "not installed" from "not running".
- Note: It might not work to query data from a probe device via SNMP (querying localhost, 127.0.0.1, or ::1). Add this device to PRTG 244 with the IP address that it has in your network and create the SNMP sensor on this device instead.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

- For a general introduction to the technology behind SNMP, please see the manual section **Monitoring via SNMP** 3001.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the Windows services you want to monitor. PRTG creates one sensor for each service you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SNMP WINDOWS SERVICE MONITOR

Service	Select the services you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SNMP WINDOWS SERVICE MONITOR

Service	Shows the Windows service that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

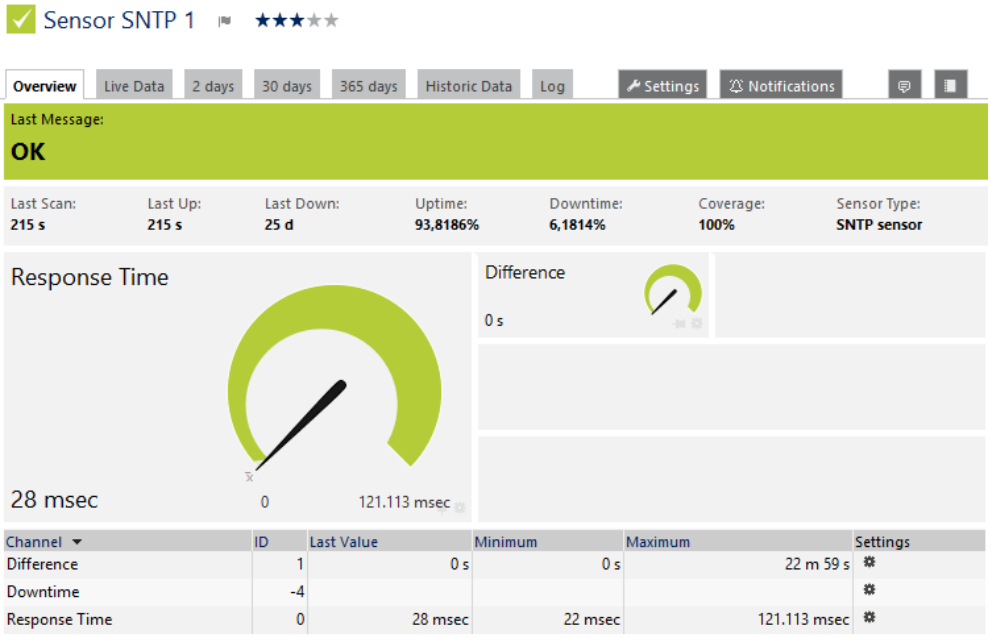
6.8.176 SNTP Sensor

The SNTP Sensor monitors a Simple Network Time Protocol (SNTP) server.

It shows the following:

- Response time of the server
- Time difference in comparison to the local system time

The sensor tries to get a valid timestamp from the server up to three times per scan until it reports an error.



SNTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/sntp.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

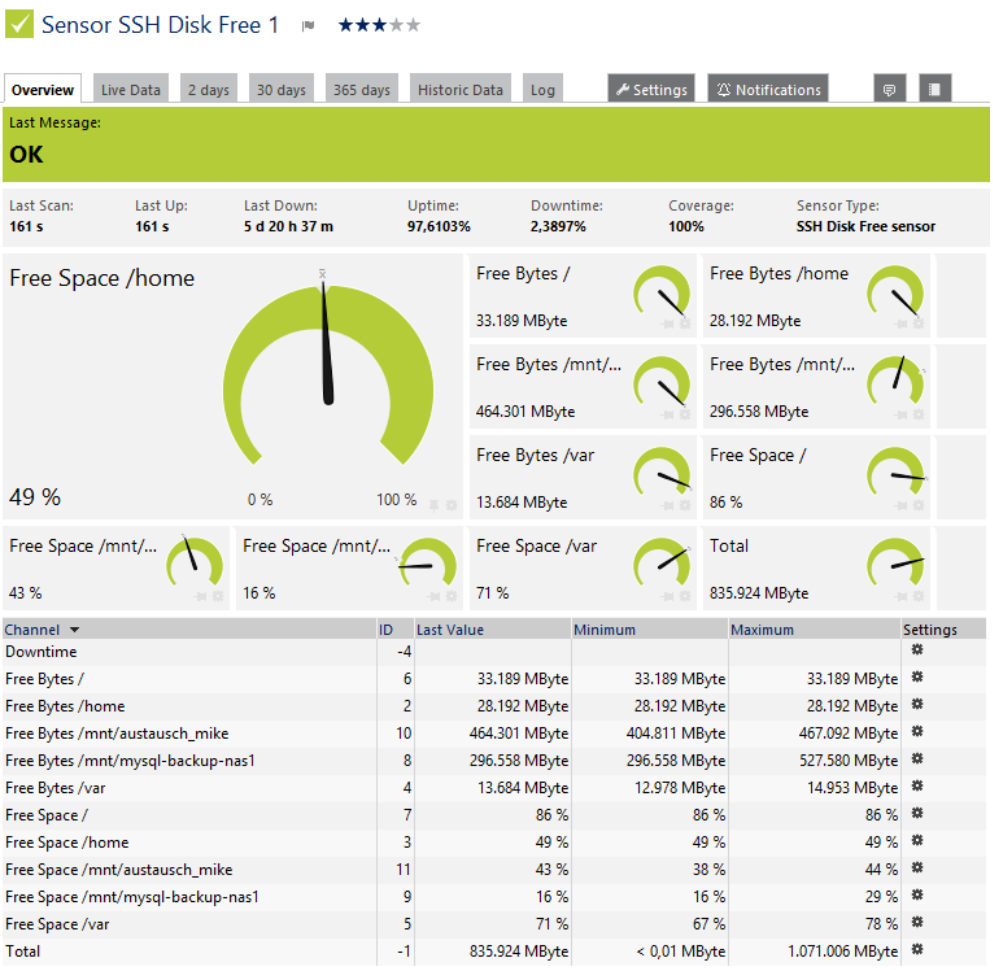
6.8.177 SSH Disk Free Sensor

The SSH Disk Free sensor monitors free space on disks of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Free disk space in bytes for every mounted partition
- Free disk space in percent for every mounted partition
- Total disk space

Note: The free space returned by this sensor type shows the available disk space of the volume, minus a reserve defined for this volume (for example, for redundancy purposes). So, this sensor shows the disk space that is actually available for use. The size of the reserved disk space can be defined with tune2fs. For details, please see the **More** section below.



SSH Disk Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_disk_free.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine.

SSH SPECIFIC

- **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option.
- **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SET LIMITS CHECKED AGAINST ALL DISKS

In this section you can set limits that are valid for all channels and all drives. By entering limits, you can define when the sensor will enter a **Warning** or **Down** status, depending on the data provided by all drives that this sensor monitors. If you want to define limits for separate channels individually please use the limit settings in the sensor **Channel** settings.

Note: All limits that you define here are valid additionally to the limits defined in the particular **Channels** settings! The limits are valid simultaneously, so the first limit that is breached applies.

SET LIMITS CHECKED AGAINST ALL DISKS

Percentage Limit Check	Enable or disable a limit check for the free space in percentage channels of all drives. By default, percentage limits are enabled with lower warning and lower error limit. Choose between: ▪ **Only use the limits in the settings of the percentage channels**: Do not define sensor limits which are valid for all percentage channels. The sensor only uses limits which you define in the settings of the particular "free space in percent" channels to determine the status. ▪ **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (percentage channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.
Upper Error Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Down** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if you enable percentage limit check above. Specify an upper limit in percent for a **Warning** status. If the free disk space of one of your drives overruns this percent value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Warning Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Warning** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to warning. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Error Limit	This field is only visible if you enable percentage limit check above. Specify a lower limit in percent for a **Down** status. If the free disk space of one of your drives undercuts this percent value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Size Limit Check	Enable or disable a limit check for the free bytes channels of all drives. By default, byte size limits are not enabled for drives. Choose between: • **Only use the limits in the settings of the byte size channels**: Do not define sensor limits which are valid for all byte size channels. The sensor only uses limits which you define in the settings of the particular free space in bytes channels to determine the status. • **Use the limits of both the sensor and the channel settings**: Define limits for the sensor which are valid for all drives (byte size channels). Additional fields appear below. The sensor enters a **Warning** or **Down** status when free space limits are undercut or overrun.
Upper Error Limit	This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Upper Warning Limit	This field is only visible if you enable byte limit check above. Specify an upper limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives overruns this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!

SET LIMITS CHECKED AGAINST ALL DISKS

Lower Warning Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Warning**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Lower Error Limit	This field is only visible if you enable byte limit check above. Specify a lower limit. Use the same unit as shown by the free bytes channels of this sensor (by default this is MByte). If the free disk space of one of your drives undercuts this bytes value, the sensor switches to **Down**. Please enter an integer value or leave the field empty. Note: The limits set here are valid for all channels of this sensor. You can additionally set individual limits for each sensor channel in the **Sensor Channels Settings** 2711. The limits set here and in the channel settings are valid simultaneously!
Alarm on Missing/ Removed Disk	If a monitored disk is removed or not found, values are set to zero. Select the alarming approach in this case. Choose between: ▪ **Deactivate alarm (default)**: Select this option if you do not want an alarm for a removed disk. ▪ **Activate alarm**: Select this option if you want to be alerted if a monitored disk is removed.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies [2751] in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector [181] to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** [324] or in the superior **Group Settings** [299].

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

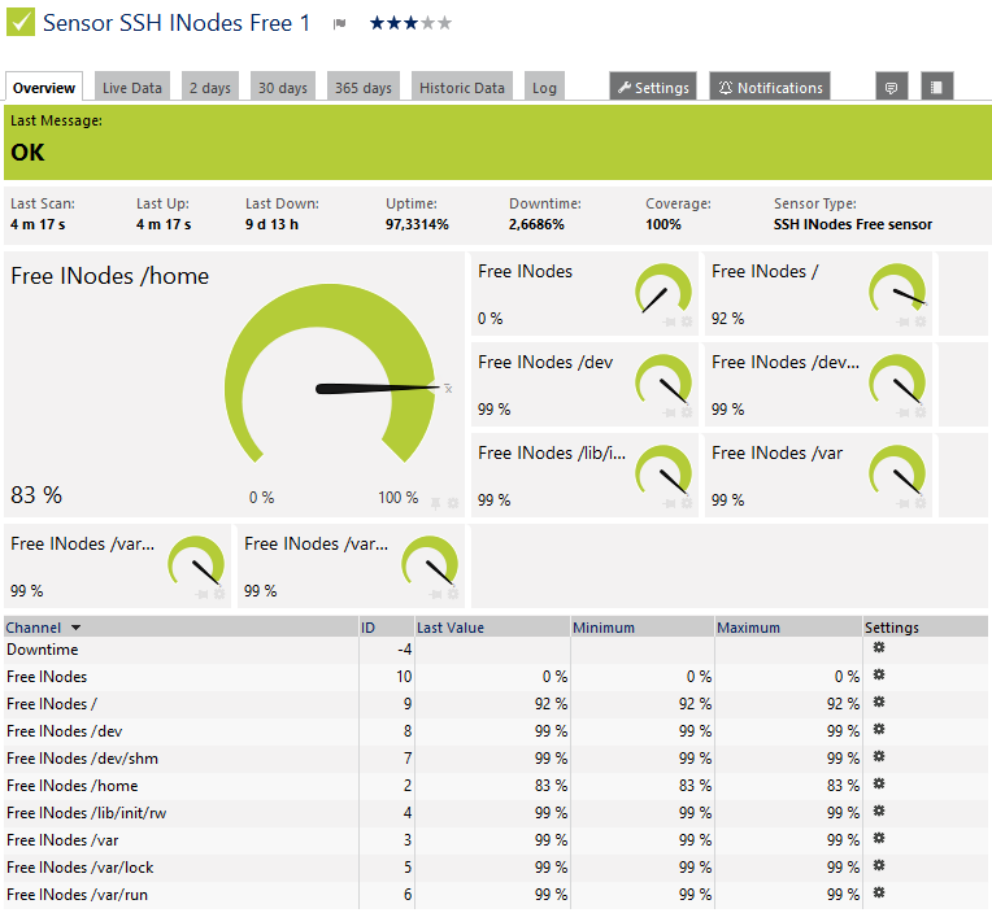
For more general information about settings, please see the **Object Settings** 159 section.

6.8.178 SSH INodes Free Sensor

The SSH INodes Free sensor monitors the free index nodes on disks of Linux/Unix and Mac OS systems via Secure Shell (SSH).

- It shows free index nodes in percent, for each mount in an own sensor channel.

UNIX file systems only allow a limited number of index nodes. If the limit is exceeded, no more data can be stored, although there might be still free space available. This sensor can help you to notice early on if one of your drives is running out of INodes.



SSH INodes Free Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_inodes_free.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: How and Where Does PRTG Store its Data?

- http://kb.paessler.com/en/topic/463

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

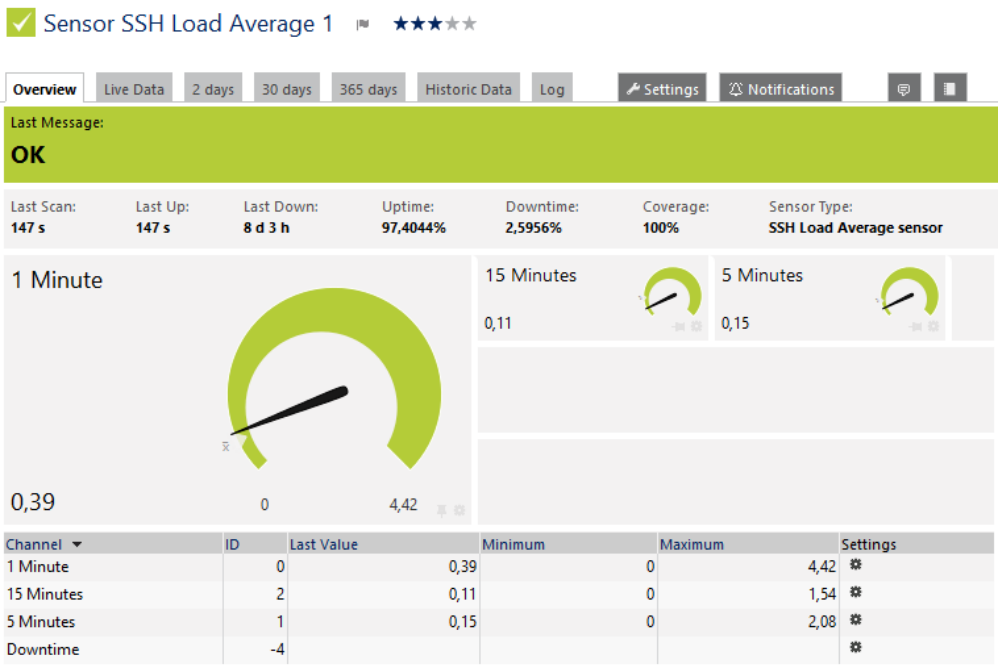
For more general information about settings, please see the **Object Settings** 159 section.

6.8.179 SSH Load Average Sensor

The SSH Load Average sensor monitors the load average of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Average system load within a 1 minute interval
- Average system load within a 5 minutes interval
- Average system load within a 15 minutes interval



SSH Load Average Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_load_average.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

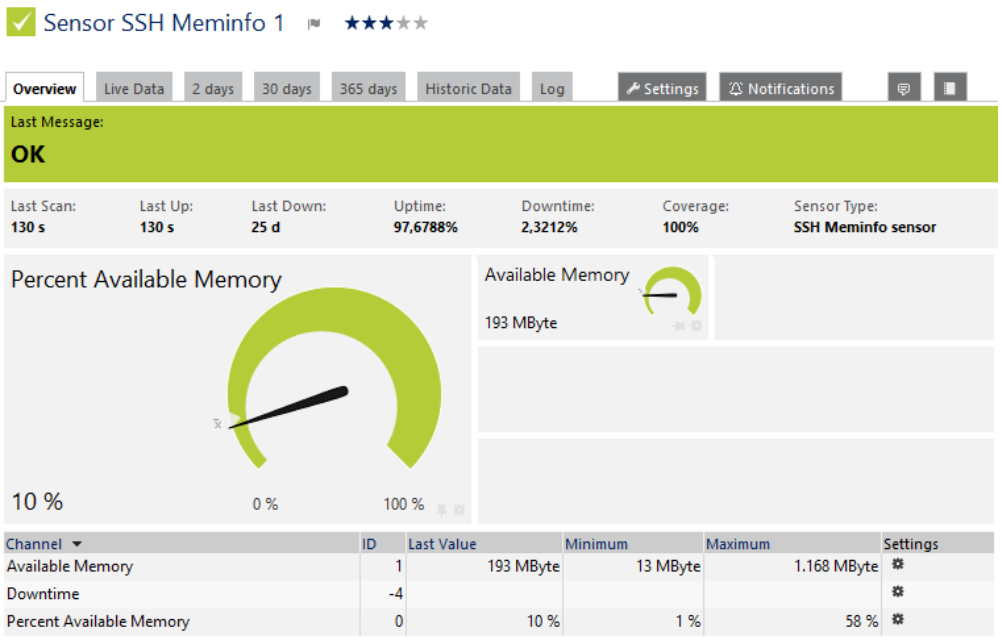
For more general information about settings, please see the **Object Settings** 159 section.

6.8.180 SSH Meminfo Sensor

The SSH Meminfo sensor monitors the memory usage of a Linux/Unix system using Secure Shell (SSH).

It shows the following:

- Available memory in bytes
- Available memory in percent



SSH Meminfo Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_meminfo.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.
- Note: This sensor type is not compatible with Mac OS systems.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: How and Where Does PRTG Store its Data?

- http://kb.paessler.com/en/topic/463

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

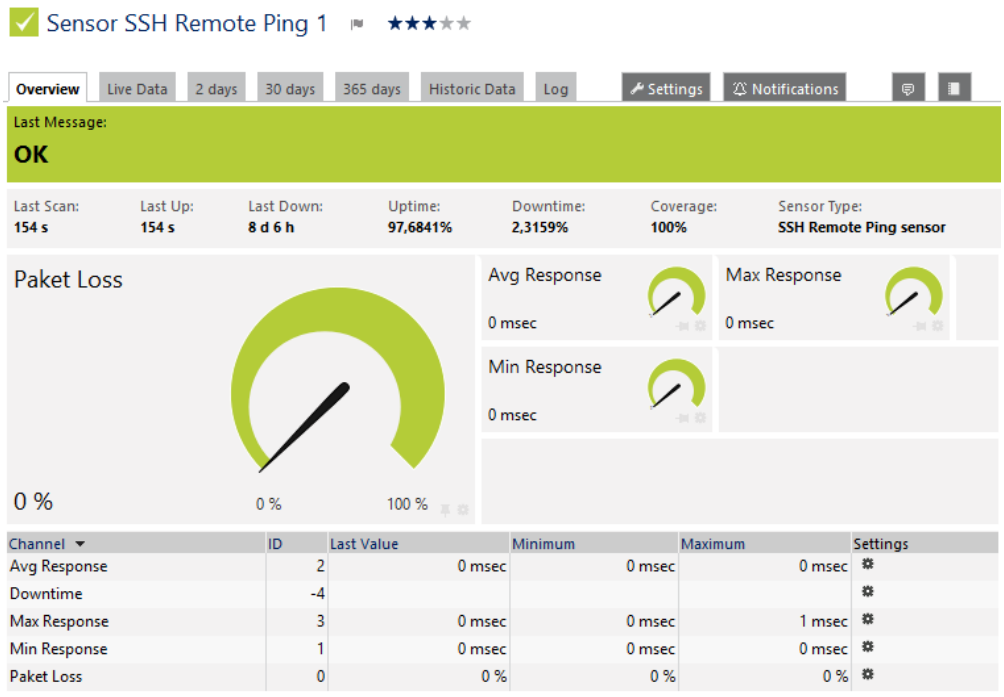
For more general information about settings, please see the **Object Settings** 159 section.

6.8.181 SSH Remote Ping Sensor

The SSH Remote Ping sensor remotely monitors the connectivity between a system running Linux/OS X and another device, using Internet Control Message Protocol (ICMP) echo requests ("Ping") and Secure Shell (SSH).

It can show the following:

- Packet loss in percent
- Minimum, maximum, and average response times measured from the remote device you connect to



SSH Remote Ping Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_remote_ping.png

Remarks

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH REMOTE PING CONFIGURATION

Target	Enter the DNS name or IP address of the target device the Ping is sent to. The sensor will remotely connect to the parent device it is created on via SSH, then perform a ping request from this remote device to the target device/server. Please enter a string.
Packet Size (Bytes)	Enter the packet size in bytes for the ping. You can choose any value between 1 and 10000. Please enter an integer value. We recommend that you use the default value.
Packet Count	Enter the number of packets that is sent with each scanning interval.
Custom Parameter	Optionally enter additional parameters that will be added at the end of the ping command. Please do not use parameters that change the output format of the result to make sure it can still be parsed. You cannot enter another command here. Please enter a string or leave the field empty.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.

SSH SPECIFIC

Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3006. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/463

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.182 SSH SAN Enclosure Sensor

The SSH SAN Enclosure sensor monitors a Storage Area Network (SAN) enclosure via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Overall status of the enclosure
- Health status of the power supplies
- Health status of the controllers

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.
- Note: It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Note: Sometimes the devices you monitor with this SSH SAN sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see the Knowledge Base: Knowledge Base: Why does my SSH SAN sensor show a wrong status?
- Note: After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the settings of the device 324 you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the **Monitoring via SSH** 3008 section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the SAN enclosures you want to monitor. PRTG creates one sensor for each enclosure you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SSH SAN ENCLOSURE SETTINGS

Enclosure	Select the enclosures you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SAN ENCLOSURE SETTINGS

Enclosure	Shows the identifier of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Durable ID	Shows the durable identifier of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Name	Shows the name of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
WWN	Shows the WWN (World Wide Name) of the enclosure that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.

SSH SPECIFIC

Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3006. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

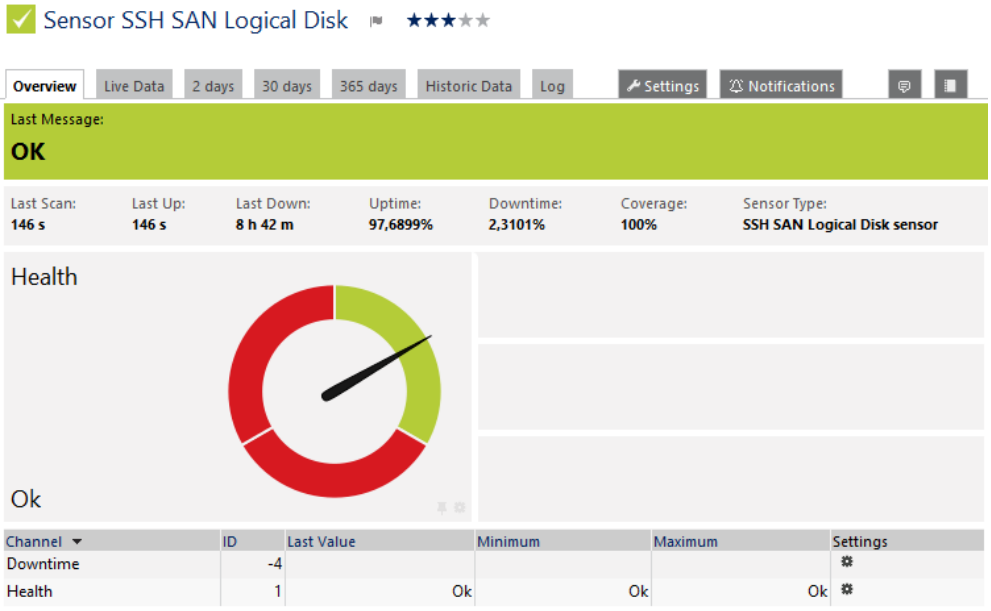
6.8.183 SSH SAN Logical Disk Sensor

The SSH SAN Logical Disk sensor monitors a logical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Health status of the disk
- Number of I/O operations per second
- Transferred data per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SSH SAN Logical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_san_logical_disk.png

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.
- Note: It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Note: Sometimes the devices you monitor with this SSH SAN sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see the Knowledge Base: Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- Note: After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the settings of the device 324 you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the **Monitoring via SSH** 3008 section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the volumes on the SAN device you want to monitor. PRTG creates one sensor for each volume you choose. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SSH SAN LOGICAL DISK SETTINGS

Volume	Select the volumes you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree [123], as well as in alarms [161], logs [169], notifications [2759], reports [2786], maps [2810], libraries [2770], and tickets [171].
Parent Tags	Shows **Tags** [96] that this sensor inherits [96] from its parent device, group, and probe [89]. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** [96], separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited [96] from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.

SSH SPECIFIC

Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SSH SAN LOGICAL DISK SETTINGS

Volume	Shows the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the volume that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Command Mode	Define the command set to use on the monitored device to get monitoring data. Choose between: ▪ **Basic (recommended)**: We recommend that you use the basic command set for best sensor performance. This setting is appropriate for most scenarios. ▪ **Advanced**: This command set enables you to monitor additional data on the target device like IOs and bandwidth. Because this setting results in higher usage of system resources and so might cause sensor instabilities, we strongly recommend that you choose this option only if this data is crucial for your monitored volume.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- http://kb.paessler.com/en/topic/60145

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

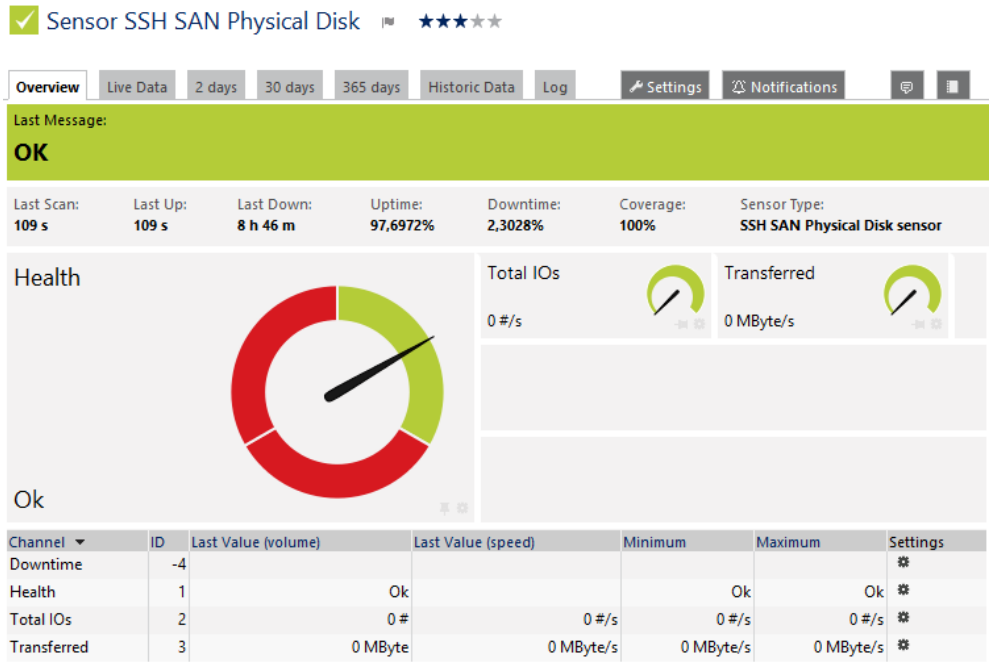
6.8.184 SSH SAN Physical Disk Sensor

The SSH SAN Physical Disk sensor monitors a physical disk on a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

It can show the following:

- Health status of the disk
- Number of I/O operations per second
- Transferred data per second

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SSH SAN Physical Disk Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_san_physical_disk.png

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.
- Note: It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.

- Note: Sometimes the devices you monitor with this SSH SAN sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see the Knowledge Base: Knowledge Base: Why does my SSH SAN sensor show a wrong status?
- Note: After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the settings of the device 324 you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the **Monitoring via SSH** 3008 section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the disks on the SAN device you want to monitor. PRTG creates one sensor for each disk you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SSH SAN PHYSICAL DISK SETTINGS

Disk	Select the disks you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree, as well as in alarms, logs, notifications, reports, maps, libraries, and tickets.
Parent Tags	Shows **Tags** that this sensor inherits from its parent device, group, and probe. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags**, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on.

SSH SPECIFIC

	▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3006. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SSH SAN PHYSICAL DISK SETTINGS

Disk	Shows the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Disk Name	Shows the label of disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Size	Shows the size of the disk that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Command Mode	Define the command set to use on the monitored device to get monitoring data. Choose between: ▪ **Basic (recommended)**: We recommend that you use the basic command set for best sensor performance. This setting is appropriate for most scenarios. ▪ **Advanced**: This command set enables you to monitor additional data on the target device like IOs and bandwidth. Because this setting results in higher usage of system resources and so might cause sensor instabilities, we strongly recommend that you choose this option only if this data is crucial for your monitored volume.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- http://kb.paessler.com/en/topic/60145

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

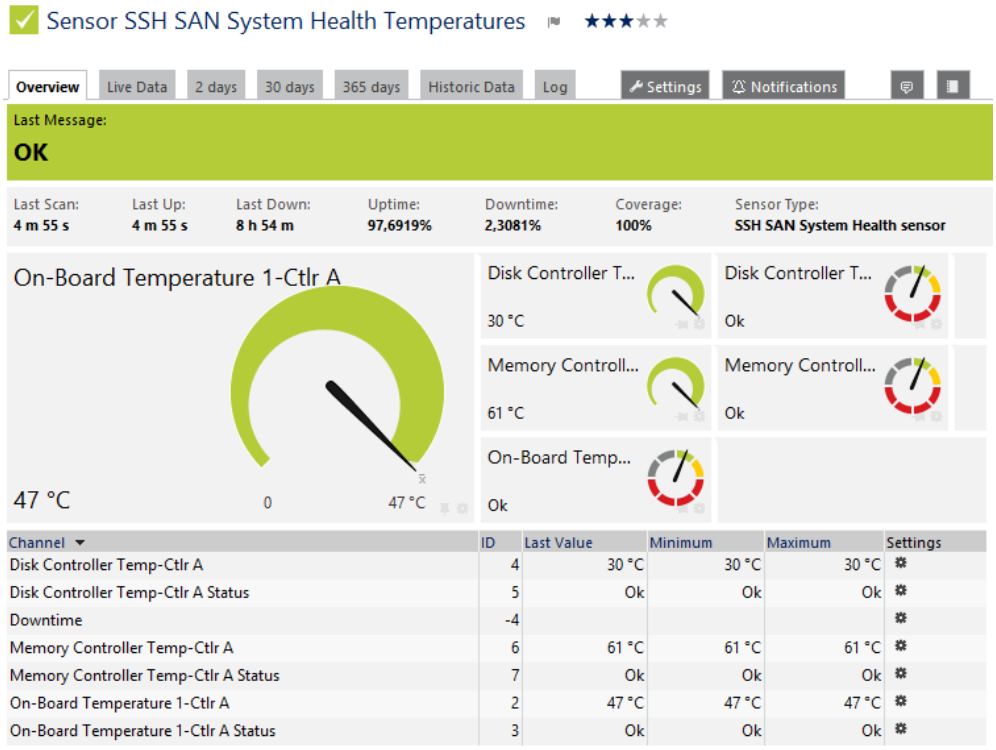
6.8.185 SSH SAN System Health Sensor

The SSH SAN System Health sensor monitors the system health of a Storage Area Network (SAN) via Secure Shell (SSH). The SAN has to provide a command-line interface (CLI) for this purpose.

The sensor can show several metrics of an SAN, depending on the available measurement components on the SAN:

- Overall unit status
- Temperature and temperature states
- Voltage and voltage states
- Capacitor charge and status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



SSH SAN System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_san_system_health.png

Remarks

- This sensor type does not support every SAN, even if it provides a CLI. The sensor only works with specific devices, for example, with the HP P2000.

- Note: It may happen that the controller of your target device breaks down. The experience shows that this issue strongly depends on the hardware model you monitor. Please increase the scanning interval to discharge the controller and try again.
- Note: Sometimes the devices you monitor with this SSH SAN sensor return status values which are not officially documented so that the shown sensor status in PRTG differs from the "real" device status. For more information regarding this issue, please see the Knowledge Base: Knowledge Base: Why does my SSH SAN sensor show a wrong status?
- Note: After a firmware update of the target device, this sensor might show incorrect channel values. Please add this sensor type anew in this case.
- For this sensor type, you must define corresponding credentials in section **Credentials for Linux/Solaris/Mac OS (SSH/WBEM) System** in the settings of the device 324 you want to use the sensor on.
- For a general introduction to SSH monitoring, please see the **Monitoring via SSH** 3008 section.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the metrics you want to monitor. PRTG creates one sensor for each metric you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SSH SAN SPECIFIC

Metric	Select the metrics you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSH SAN SPECIFIC

Metric	Shows the metric this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3008. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine.

SSH SPECIFIC

Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).

Result Handling

Define what PRTG will do with the sensor results. Choose between:

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: Why does my SSH SAN sensor show a wrong status?

- http://kb.paessler.com/en/topic/60145

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

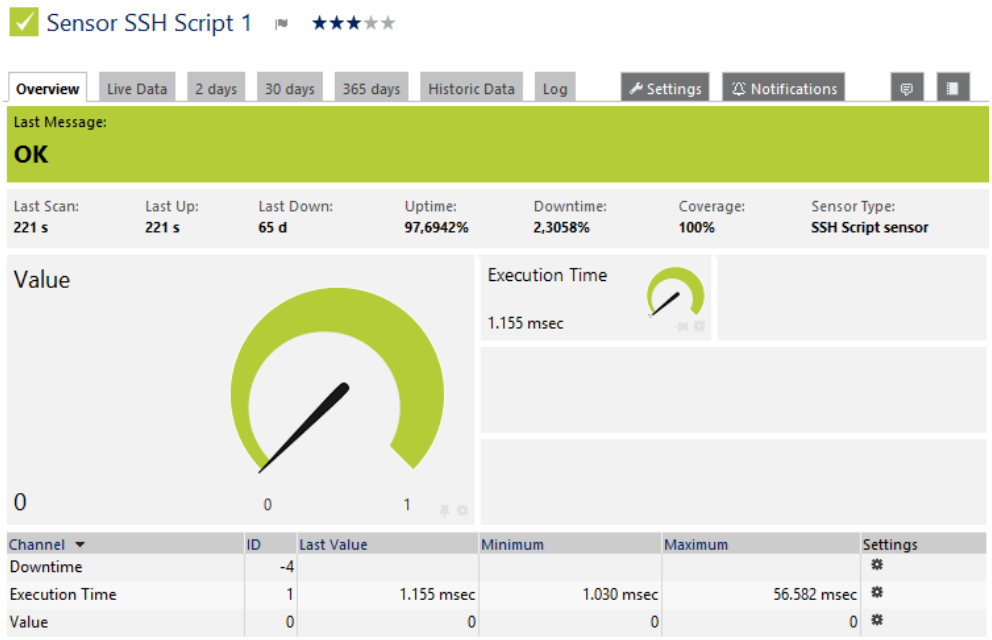
For more general information about settings, please see the **Object Settings** 159 section.

6.8.186 SSH Script Sensor

The SSH Script sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system.

The sensor shows the following:

- Execution time
- One value returned by the executable file or script (in one channel only).



SSH Script Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_script.png

Remarks

- For details about the return value format please see the **Application Programming Interface (API) Definition**.
- Note: For security reasons, you must store your script file on the target system. The file must be located in the directory **/var/prtg/scripts**. Ensure the script has executable rights. If the script is not available or it was deleted from the script folder, you get the error message "Script not found (237)".

Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.
- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Script	Select a script file from the list. The drop down menu will list all script files available in the /var/prtg/scripts directory on the target Linux/Unix system. In order for the files to appear in this list, store them into this directory. Ensure the script has executable rights. In order for the sensor to show the expected values and sensor status, your files must use the right format for the returned values (in this case, exitcode:value:message to stdout). The exit code determines the sensor status. For detailed information on the expected return format and on how to build custom sensors, please see the API documentation (**Application Programming Interface (API) Definition** 3086). There, find detailed information the the "Custom Sensors" tab. For an example script, please see **More** 2216 section below.
Value Type	Define what kind of values your script file gives back. Choose between: ▪ **Integer**: An integer is expected as return value. If the script gives back a float, PRTG will display the value **0**. ▪ **Float:** A float is expected as return value, with a dot (.) between pre-decimal position and decimal places. In this setting, the sensor will also display integer values unless they don't produce a buffer overflow. ▪ **Counter:** Your script returns an integer which increases. PRTG will show the difference between the values of two sensor scans. Note: A counter must return an integer; float is not supported here!

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Script	Shows the script that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

SENSOR SETTINGS

Parameters	If your script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation (**Application Programming Interface (API) Definition** 3086). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks '' with PowerShell scripts, and double quotes " " with all others. Please enter a string or leave the field empty.
Mutex Name	Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the **More** 709 section below. Please enter a string or leave the field empty.
Value Type	Shows the expected value type, chosen on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew. Note: The sensor cannot handle string values.
If Value Changes	Define what this sensor will do when the sensor value changes. You can choose between: ▪ **Ignore changes (default)**: The sensor takes no action on change. ▪ **Trigger 'change' notification**: The sensor sends an internal message indicating that its value has changed. In combination with a **Change Trigger**, you can use this mechanism to trigger a notification 2719 whenever the sensor value changes.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.

SSH SPECIFIC

Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.
Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3006. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between:

SSH SPECIFIC

- **Discard sensor result**: Do not store the sensor result.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.
- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

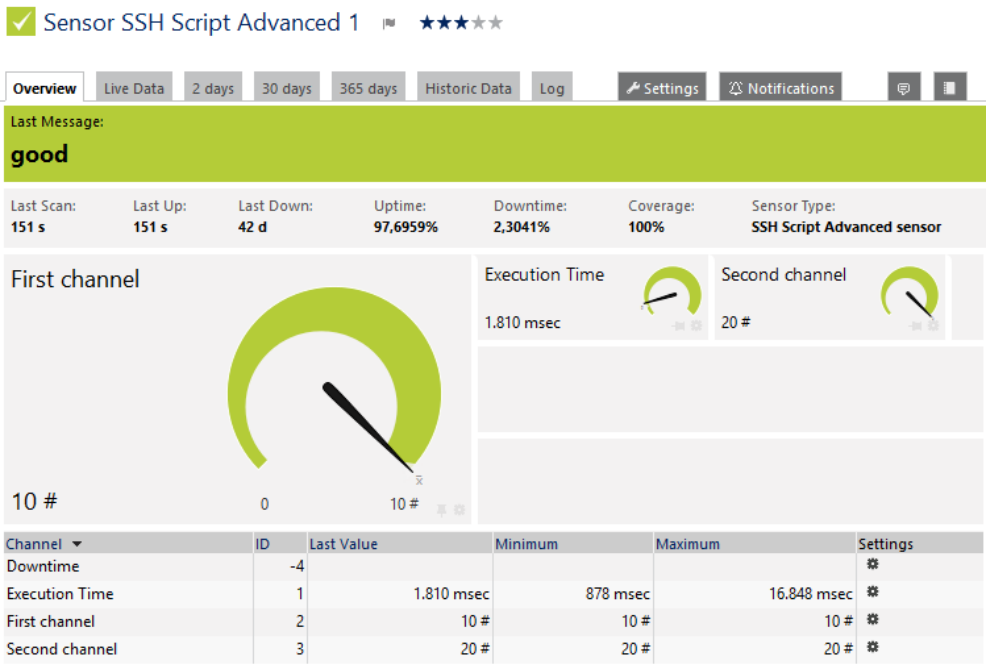
For more general information about settings, please see the **Object Settings** 159 section.

6.8.187 SSH Script Advanced Sensor

The SSH Script Advanced sensor connects to a Linux/Unix system via Secure Shell (SSH) and executes a script file located on the target system.

It can show the following:

- Execution time
- Values returned by the script in multiple channels. The return value of this sensor must be valid XML or JSON.



SSH Script Advanced Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssh_script_advanced.png

Remarks

- For details about the return value format please see the Application Programming Interface (API) Definition.
- Note: For security reasons, the script file must be stored on the target system. Please make sure the script has executable rights.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- Note: This sensor type cannot support all Linux/Unix and Mac OS distributions.

- For a general introduction to SSH monitoring, please see manual section **Monitoring via SSH** 3008.

Limited to 50 Sensor Channels

PRTG does not support more than 50 sensor channels officially. Depending on the data used with this sensor type, you might exceed the maximum number of supported sensor channels. In this case, PRTG will try to display all sensor channels. However, please be aware that you will experience limited usability and performance.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

SENSOR SETTINGS

Script	Select a script file from the list. The drop down menu will list all script files available in the /var/prtg/scriptsxml directory on the target Linux/Unix system. In order for the files to appear in this list, please store them into this directory. Please make sure the script has executable rights. In order for the sensor to show the expected values and sensor status, your files must return the expected XML or JSON format to standard output. Values and message must be embedded in the XML or JSON. For detailed information on the expected return format and on how to build custom sensors, please see the API documentation (**Application Programming Interface (API) Definition** 3086). There, find detailed information the the "Custom Sensors" tab.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

Script	Shows the script that is executed with each sensor scan, as defined on sensor creation. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Parameters	If your script file catches command line parameters, you can define them here. Placeholders can be used as well. For a full list of all placeholders please see the API documentation (**Application Programming Interface (API) Definition** 3086). Note: Please make sure you write the placeholders in quotes to ensure that they are working properly if their values contain blanks. Use single quotation marks '' with PowerShell scripts, and double quotes "" with all others. Please enter a string or leave the field empty.

SENSOR SETTINGS

Mutex Name	Define any desired mutex name for the process. All EXE/Script sensors having the same mutex name will be executed serially (not simultaneously). This is useful if you use a lot of sensors and want to avoid high resource usage caused by processes running simultaneously. For links to more information, please see the **More** 709 section below. Please enter a string or leave the field empty.
EXE Result	Define what to do with the results the executable file gives back. Choose between: • **Discard EXE result**: Do not store the requested web page. • **Write EXE result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the script to the "Logs (Sensors)" directory (on the Master node, if in a cluster). This is for debugging purposes. The file will be overridden with each scanning interval. For information on how to find the folder used for storage, please see **Data Storage** 3135 section.

SSH SPECIFIC

Connection Timeout (Sec.)	Define a timeout for the connection. This is the the time the sensor waits to establish a connection to the host. You should keep this value as low as possible. The maximum value is 900 seconds (15 minutes). Please enter an integer value.
Shell Timeout (Sec.)	Define a timeout for the shell response. This is the time in seconds the sensor waits for the shell to return a response after it has sent its specific command (e.g. cat /proc/loadavg). The maximum value is 60 seconds (1 minute). Please enter an integer value.
SSH Port	Define which port this sensor uses for the SSH connection. Choose between: ▪ **Inherit port number from parent device (default)**: Use the port number as defined in the Credentials for Linux/Solaris/Mac OS (SSH/WBEM) Systems section of the device this sensor is created on. ▪ **Enter custom port number**: Do not use the port number from the parent device settings, but define a different port number below.

SSH SPECIFIC

Use Port Number	This field is only visible if you enabled the custom port number setting above. Enter the port number (between 1 and 65535) that this sensor uses for the SSH connection. Please enter an integer value.
SSH Engine	Select the method you want to use to access data with this SSH sensor 3006. We strongly recommend that you use the default engine! For some time you still can use the legacy mode to ensure compatibility with your target systems. Choose between: ▪ **Inherit from parent device (default)**: Use the SSH engine that you have defined in the parent device settings or higher in the object hierarchy 89. If you did not change it, this is the recommended default engine. ▪ **Default**: This is the default monitoring method for SSH sensors. It provides best performance and security. It is set by default in objects that are higher in the hierarchy so usually you can keep the **Inherit from parent device (default)** option. ▪ **Compatibility Mode (deprecated)**: Try this legacy method only if the default mode does not work on a target device. The compatibility mode is the SSH engine that PRTG used in previous versions and is deprecated. We will remove this legacy option soon, so please try to get your SSH sensors running with the default SSH engine. Note: The option you select here overrides the selection of the SSH engine in a higher object (which is a parent device, group, probe, or root).
Result Handling	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt") in case of error**: Store the last result of the sensor only if it throws an error.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

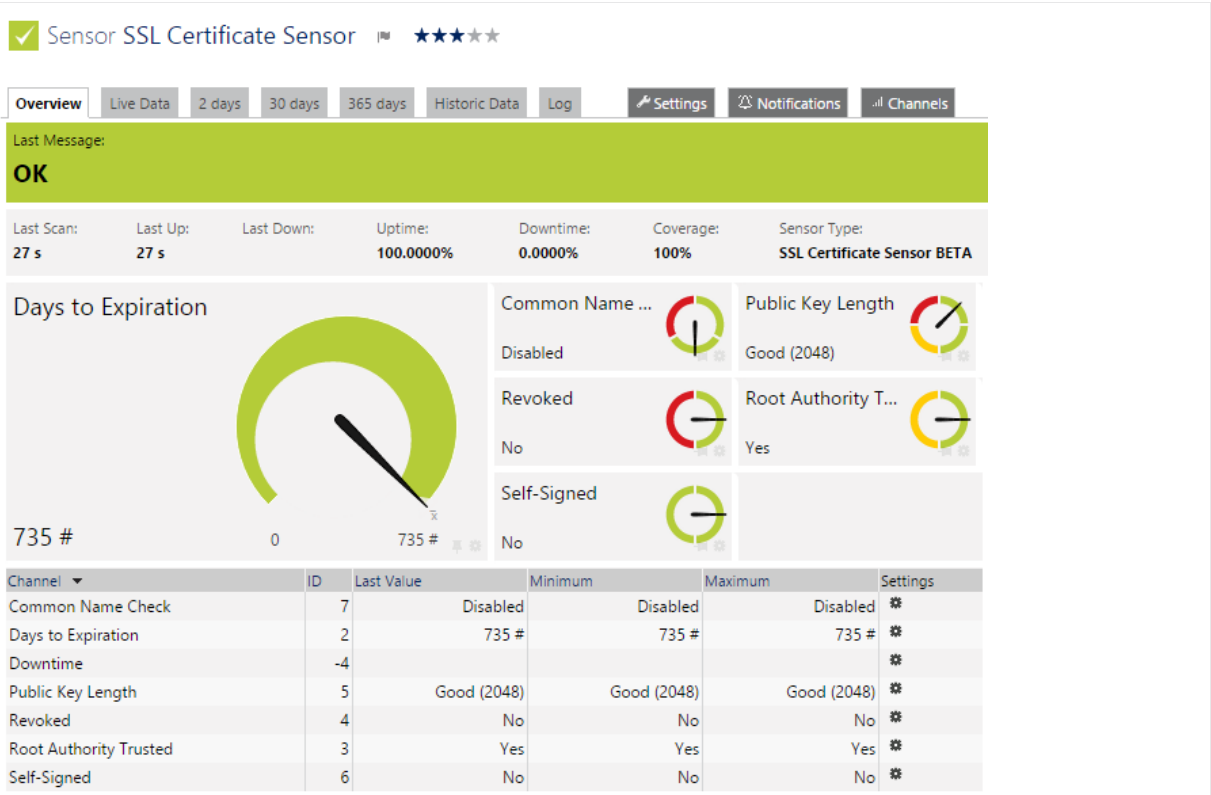
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.188 SSL Certificate Sensor

The SSL Certificate sensor monitors the certificate of a secure Secure Sockets Layer (SSL)/ Transport Layer Security (TLS) connection. It can show the following:

- Days to expiration (with predefined lower warning and error limits)
- Public key length
- If the common name check is enabled and successful or not
- If the certificate has been revoked (failing to query the certificate revocation list results in a warning status)
- If the certificate is trusted as root authority
- If the certificate is self-signed



SSL Certificate Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssl_certificate_sensor.png

Remarks

- Enter the DNS name in the parent device settings 324 exactly as written in your certificate. For example, enter "www.paessler.com" instead of "paessler.com". The short version might prevent the sensor from working properly.

- To check the revocation status of a certificate, the sensor uses the same proxy settings as configured for the Windows user account on which the PRTG probe runs. This is usually the Windows local "system" user account. If you use a proxy, for example, please edit these settings in the Internet Explorer on this system accordingly (on the computer running the probe; on all nodes if in a cluster).
- This sensor type has predefined limits for several metrics. You can change these limits individually in the channel settings. For detailed information about channel limits, please refer to the manual section **Sensor Channels Settings** 2711.
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- This sensor supersedes the HTTP Certificate Expiry sensor which is outdated. We recommend that you use this current **SSL Certificate sensor** 2228 to monitor SSL certificates.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSL CERTIFICATE SPECIFIC

Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is **443**.
Virtual Host (SNI Domain)	Choose which host name the sensor tries to query if your server presents multiple certificates on the same IP address and port combination. Please enter a string. If in the case of virtual hosting you need to identify the specific certificate for a specific domain while all domains use the same IP address, you can use Server Name Identification (SNI), which is an extension of Transport Layer Security (TLS).
Certificate Name Validation	Define if you want the sensor to validate the certificate name using the address of the parent device. Choose between: ▪ **Do not compare common name with address of parent device (default):** The sensor does not check if the certificate name is valid using the address of the parent device. ▪ **Compare and show 'down' status if common name and address do not match:** The sensor compares the certificate and the DNS name of the parent device. If they do not match, the sensor shows a **Down** status 135.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

Note: You can use the debug option to get a log file with information about the the certificate chain. Additionally certificates in the certificate chain are stored in the log folder (.cer files). This can help you, for example, if you have issues with the Root Authority Trusted channel of this sensor.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.189 SSL Security Check Sensor

The SSL Security Check sensor monitors the Secure Sockets Layer (SSL) connectivity to the port of a device. It tries connecting to the specified TCP/IP port number of a device with various SSL/TLS protocol versions and shows if a particular protocol is supported.

The sensor checks connectivity with the following protocols in particular channels 92 with the possible values **Accepted** (sensor can connect with this protocol) or **Denied** (sensor cannot connect with this protocol):

- **SSL 2.0**: weak security (warning if accepted, up if denied)
- **SSL 3.0**: weak security (warning if accepted, up if denied)
- **TLS 1.0**: strong security (up if accepted, otherwise gray)
- **TLS 1.1**: strong security (up if accepted, otherwise gray)
- **TLS 1.2**: perfect security (up if accepted, otherwise gray)

The default primary channel **Security Rating** shows the connection security to the defined port with one of the following states 135:

- **Down**: There is no secure protocol available. The sensor cannot connect with one of the given protocols.
- **Warning** (weak): The sensor can connect with at least one of the weak protocols SSL 2.0 or 3.0.
- **Up** (strong): The sensor can connect with a strong protocol only (TLS 1.0, TLS 1.1, TLS 1.2). Connecting with a weak protocol is not possible.

SSL Security Check Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/ssl_security_check.png

Remarks

- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.
- Important notice: Currently, this sensor type is in beta status. The methods of operating can change at any time, as well as the available settings. Do not expect that all functions will work properly, or that this sensor works as expected at all. Be aware that this type of sensor can be removed again from PRTG at any time.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SSL SECURITY SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port to which this sensor connects. Please enter an integer value. The default port is 443.

Virtual Host (SNI Domain)	Enter a host name that the sensor will query. The sensor uses this host to connect if the target server presents multiple certificates on the same IP address and IP port when using Server Name Identification (SNI).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

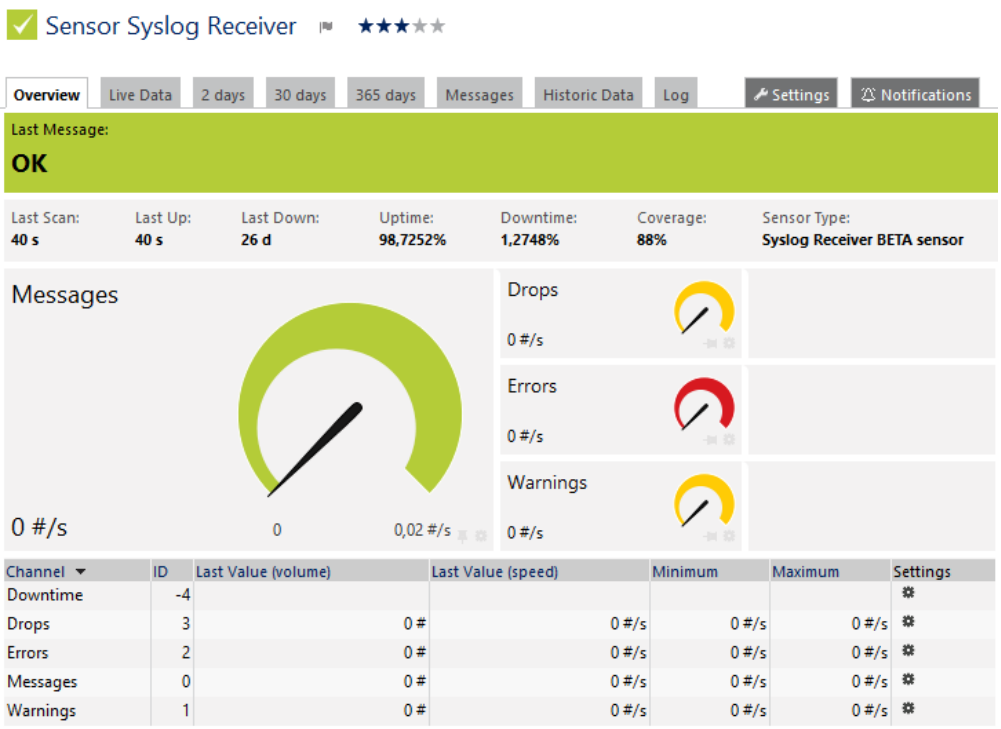
For more general information about settings, please see the **Object Settings** 159 section.

6.8.190 Syslog Receiver Sensor

The Syslog Receiver sensor receives and analyzes syslog messages.

It shows the following:

- Number of received syslog messages per second
- Number of messages categorized as "warning" per second
- Number of messages categorized as "error" per second
- Number of dropped packets per second



Syslog Receiver Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/syslog_receiver.png

Remarks

- With the available filter options, you can define individually which types of messages the sensor will consider for monitoring, and which messages it will categorize as warning or error messages. Depending on the filters, received messages are counted in the respective channels.
- Add the sensor to the probe device to receive all messages of the system running the probe.
- Add the sensor to a specific device to receive all messages from this device directly. This makes this sensor type faster than just using source filters.

- You can use syslog specific placeholders in email notification templates 2840 to see the messages when you receive an email notification. See the Knowledge Base: What placeholders can I use with PRTG?
- Note: If you do not add the sensor to a probe device but to another device in PRTG, be careful with the configuration: Ensure that the IP address or DNS name of the parent device matches the proper syslog sender. For example, if you want to receive syslogs from a Storage Area Network (SAN), you might have to add a device to PRTG using the IP address of a specific array member that sends the messages. Providing a DNS name that points to the IP address of a whole group might not work for SANs.
- Note: This sensor type cannot be used in cluster mode. You can set it up on a local probe or remote probe only, not on a cluster probe.
- For a general introduction to the syslog receiver's configuration, please see manual section **Monitoring Syslogs and SNMP Traps** 3038.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SYSLOG SPECIFIC

Listen on Port	Enter the number of the port on which the sensor waits for Syslog messages. The default port is **514**. Please enter an integer value. We recommend that you use the default value.
Purge Messages After	Define how long PRTG stores received Syslog messages for analysis. Choose a period of time from the drop down list.

FILTER

Include Filter	Define if you want to filter Syslog messages. If you leave this field empty or use the keyword "any", the sensor will process all data. To include specific types of messages only, define filters using a special syntax. For more information, see section **Filter Rules** 2254.
Exclude Filter	Define which types of Syslog messages the sensor will discard and not process. To exclude specific types of messages, define filters using a special syntax. For more information, see section **Filter Rules** 2254.
Warning Filter	Define which types of Syslog messages count for the **Warnings** channel. To categorize received messages as warning messages, define filters using a special syntax. For more information, see section **Filter Rules** 2254.

FILTER

Note: Messages are collected until a scanning interval ends. as long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Warning** status after a scanning interval has finished and there was at least one warning message (and no error message) during this interval. The status will remain **Warning** at least until the succeeding scanning interval has finished. If in this scanning interval no warning or error message occurred, the status of the sensor will turn **Up** again after the interval.

Error Filter

Define which types of syslog messages will count for the **Errors** channel. To categorize received messages as error messages, define filters using a special syntax. For more information, see section **Filter Rules** 2254.

Note: Messages are collected until a scanning interval ends. As long as the scanning interval is running, no status change will happen. By default, the sensor will turn into a **Down** status after a scanning interval has finished and there was at least one error message during this interval. The status will remain **Down** at least until the succeeding scanning interval has finished. If the sensor did not receive any warning or error message in this scanning interval, the status of the sensor will turn **Up** again after the interval.

SENSOR DISPLAY

Primary Channel

Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

Graph Type

Define how different channels will be shown for this sensor.

- **Show channels independently (default)**: Show an own graph for each channel.
- **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

DEBUGGING	
Log Data to Disk	Define if the probe will write a log file of the received data to the data folder (see **Data Storage** 3135) to the disk for debugging purposes. Choose between: ▪ **Off (recommended)**: Do not write additional log files. Recommended for normal use cases. ▪ **On**: Write log files for all data received. Note: Use with caution! When enabled, huge data files can be created. Please use for a short time and for debugging purposes only.

Filter Rules for Syslog Messages

Filter rules are used for the include, exclude, warning, and error definition fields of the Syslog Receiver sensor. They are based on the following format:

```
field[filter]
```

You can use various filters suitable to your needs. Include and exclude filters define which messages to monitor. Warning and error filters define how to categorize received messages. Provide these filters in the sensor settings as formulas. Formulas are fields which you can combine with boolean operators (AND, OR, NOT) and brackets.

Field	Parameter	Example
source[ip]	the IP address where the messages will be received from; masks and ranges are also possible	▪ source[10.0.23.50] ▪ source[10.0.23.10-50] ▪ source[10.0.23.10/255]
facility [number]	any number or range from 0 to 23 specifying the type of program sending the message	▪ facility[2] ▪ facility[5-7] ▪ facility[5] OR facility[6]
severity [number]	any number or range from 0 (emergency) to 7 (debug) specifying the type of message	▪ severity[4] ▪ severity[1-3] ▪ severity[1] AND severity [2]

hostname [text]	any string specifying the hostname of a device in the message	▪ hostname [www.example.com]
tag[text]	any string specifying the tag of a program or process in the message	▪ tag[su]
appname [text]	any string specifying the appname part of the message	▪ appname[myproc] ▪ appname[demo] AND msgid[m42]
procid [text]	any string specifying the process identifier part of the message	▪ procid[1860]
msgid[text]	any string specifying the message identifier part of the message	▪ msgid[ID47]
message [parttext]	any string specifying the message part of the message (substring will match; case insensitive!)	▪ message[Error]
data [id ,param,value]	checks the SD-ID block of the message's structured data for a parameter matching the given value	▪ data [exampleSDID@12345,eventSource,Application]
data [parttext]	checks if the given substring matches on structured data as displayed in the corresponding table	▪ data [exampleSDID@1234]
data [id,param]	checks if the parameter exists in the given ID element	▪ data [exampleSDID@1234,eventSource]

Note: String parameters (except the substring in **message**) have to match exactly the particular parts of the message. They are case sensitive!

Messages Tab: Review and Analyze Syslog Messages

PRTG stores received Syslog messages as common files in the data folder (see section **Data Storage** 3135). To review and analyze all received messages, you can access the most recent data directly in a table list 178 in the PRTG web interface. You can access this list via the **Overview** tab of the sensors.

Note: Received syslogs are only shown after an (automatic) page refresh following to a sensor scan in the table on the **Overview** tab (default for auto refresh 2830 is 30 seconds).

For more details and further filter options, click the **Messages** tab of the Syslog Receiver sensor. You will see all received messages in a table list 178. On the top, you have display filter options to drill down into the data for specific events of your interest. The filters are the same as available in the sensor settings, but you can define them without using formulas. Provide the desired parameters and PRTG loads the filtered list automatically.

Note: You can automatically add a filter by clicking the content of a column.

Advanced Filter Settings

You can open advanced filter settings by clicking the gear icon in the **Filter** row. The **Advanced Filter** will appear in a popup window. In the text field, you can define a filter using the syntax as given in section **Filter Rules for Syslog Messages** 2254. If you have provided filter parameters on the **Messages** tab, the advanced filter will already include them as a corresponding formula with the correct syntax. You can adjust this filter to your needs. You can also copy the automatically created and manually adjusted formula for usage in the filter fields of the sensor settings.

Blog Article: Introducing the New High Performance Syslog and SNMP Trap Receiver Sensors

- https://www.paessler.com/blog/2013/10/11/prtg/introducing-the-new-high-performance-syslog-and-snmp-trap-receiver-sensors

Knowledge Base: What placeholders can I use with PRTG?

- http://kb.paessler.com/en/topic/373

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

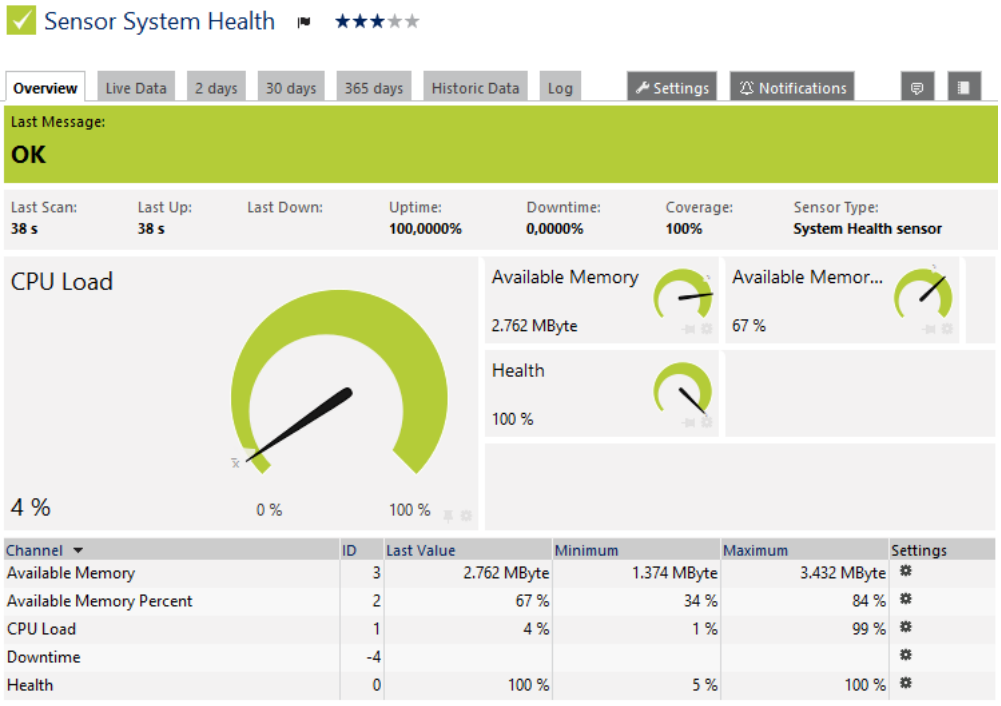
For more general information about settings, please see the **Object Settings** 159 section.

6.8.191 System Health Sensor

The System Health sensor monitors internal PRTG parameters. It shows the status of the system on which a probe runs. PRTG creates this sensor type automatically and cannot be deleted.

It checks various parameters of your PRTG system which can affect the quality of the monitoring results:

- **Health**: This index value sums up the probe state into a value between 100% (healthy) and 0% (failing). Frequent or repeated health values below 100% should be investigated.
- **Available Memory**: This channel shows the amount of free memory available on the system. This value should not fall below 500 MB. This way PRTG still can request resources during report generation, auto-discoveries, and other issues.
- **Available Memory Percent**: This channel shows the free memory available on the system in percent.
- **System CPU Load**: This channel shows the current percentage CPU load on the system with the probe. Extensive CPU load can lead to false, incomplete, and incorrect monitoring results. This value usually should stay below 50%.



System Health Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/system_health.png

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel.

SENSOR DISPLAY	
	▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

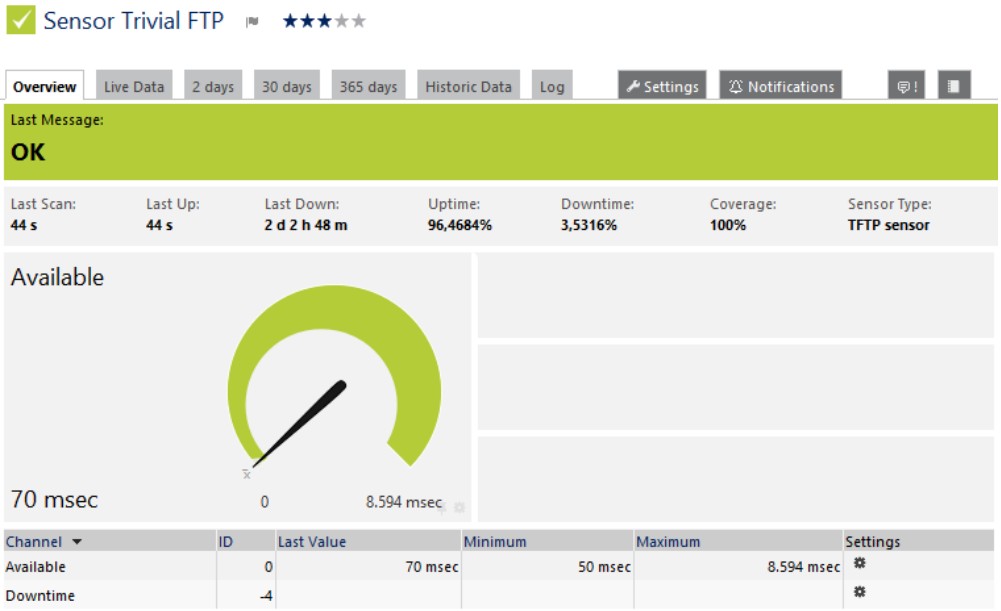
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.192 TFTP Sensor

The TFTP sensor monitors a Trivial File Transfer Protocol (TFTP) server and checks if a certain file is available for download.

- It shows the response time of the server.



TFTP Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/tftp.png

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SPECIFIC

Timeout (Sec.)	Enter a timeout in seconds for the request. If the reply takes longer than this value defines, the sensor will cancel the request and show a corresponding error message. Please enter an integer value. The maximum value is 900 seconds (15 minutes).
Port	Enter the number of the port the TFTP service is running on. The sensor connects to this port. Please enter an integer value.
Filename	Enter the name of the file that this sensor checks. If this file name is not available on the server, the sensor shows a **Down** status 135. Please enter a string.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

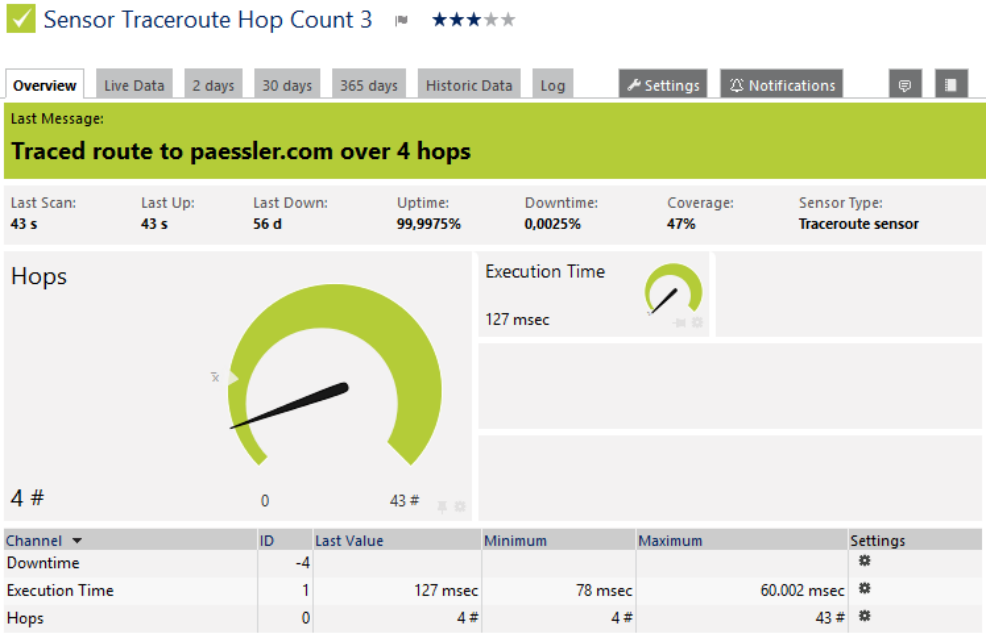
For more general information about settings, please see the **Object Settings** 159 section.

6.8.193 Traceroute Hop Count Sensor

The Traceroute Hop Count sensor traces the number of hops needed from the probe system the sensor is running on to the **IP Address/DNS Name** defined in the sensor's parent device.

It shows the following:

- Execution time
- Number of hops.
- If the number of hops (the route) changes, you can additionally define another sensor status [135].



Traceroute Hop Count Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/traceroute_hop_count.png

Remarks

- Requires [2272] .NET 4.0 or 4.5 to be installed on the probe system. Note: If the sensor shows the error PE087, please additionally install .NET 3.5 on the probe system.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.

BASIC SENSOR SETTINGS

Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

SENSOR SETTINGS

If Route Changes	Define what to do if the route has changed since the last check. Choose between: ▪ **Ignore**: Do not perform any action. ▪ **Set sensor to "Warning"**: Set the sensor to **Warning** status. ▪ **Set sensor to "Error"**: Set the sensor to **Down** status.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

- http://kb.paessler.com/en/topic/60543

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.194 VMware Datastore (SOAP) Sensor

The VMware Datastore (SOAP) sensor monitors the disk usage of a VMware data store using Simple Object Access Protocol (SOAP). It can show the following:

- Available capacity in bytes: This is the physically or virtually available size of the data store.
- Free space in bytes and percent: This is the disk space that is not used by virtual machines. Used disk space can be either thick-provisioned or used from thin-provisioned virtual disks.
- Uncommitted bytes: This is the disk space that is provisioned for thin-provisioned virtual machines but not used yet.
- Total provisioned disk space in percent: This is the sum of all potentially used disk space of thin- and thick-provisioned VM hard drives (uncommitted bytes plus used bytes).
- Accessibility of the data store

VMware Datastore (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_datastore_soap.png

Remarks

- Requires 2281 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0 or vCenter.

- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Note: This sensor type supersedes the outdated SSH VMWare ESX(i) Disk sensor. We recommend that you use this new sensor to monitor VMware data stores.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- This sensor type uses lookups to determine the status values of one or more sensor channels. This means that possible states are defined in a lookup file. You can change the behavior of a channel by editing the lookup file that this channel uses. For details, please see the manual section **Define Lookups** 3095.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3109 or when running a cluster 87 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the data stores you want to monitor. PRTG creates one sensor for each data store you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

DATASTORE SETTINGS

Datastore	Select all data stores for which you want to add a sensor. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DATASTORE SETTINGS

MoID	Shows the Managed Object ID (MoID) of the data store that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).

SENSOR DISPLAY	
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

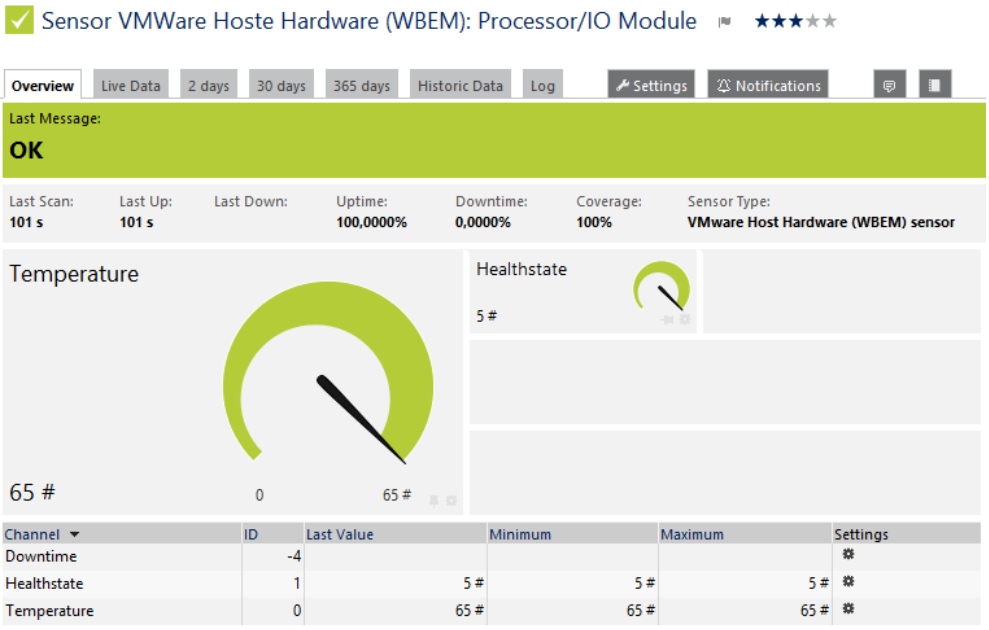
6.8.195 VMware Host Hardware (WBEM) Sensor

The VMware Host Hardware sensor monitors hardware information of a ESX/ESXi server using Web-Based Enterprise Management (WBEM).

It can show the following, depending on the selected ESX component:

- Health status
- Temperature
- Power
- Fan rotations per minute (RPM)
- Battery voltage

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.



VMWare Host Hardware (WBEM) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_host_hardware_wbem.png

Remarks

- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0.
- For this sensor type you must define credentials for Linux/Solaris/Mac OS (SSH/WBEM) systems on the device you want to use the sensor on.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the ESX components you want to monitor. PRTG creates one sensor for each hardware element you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

ESX SERVER ELEMENTS

ESX Element	Select the hardware elements you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.

BASIC SENSOR SETTINGS

Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

ESX SERVER ELEMENTS

Element	Shows the ESX element that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Automatic Sensor State	Define if the sensor will change its status dependent on the health state reading. Choose between: ▪ **Set sensor state automatically to 'Warning' or 'Down'**: Set the sensor to a **Warning** or **Down** status when the server returns respective values. The sensor will additionally change to a **Down** status if the connection to the server fails. ▪ **Just report the current reading, ignore Server Health Value**: Never change the sensor's status dependent on the values returned by the server. The sensor will only change to a **Down** status if the connection to the server fails.
Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

ESX SERVER ELEMENTS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

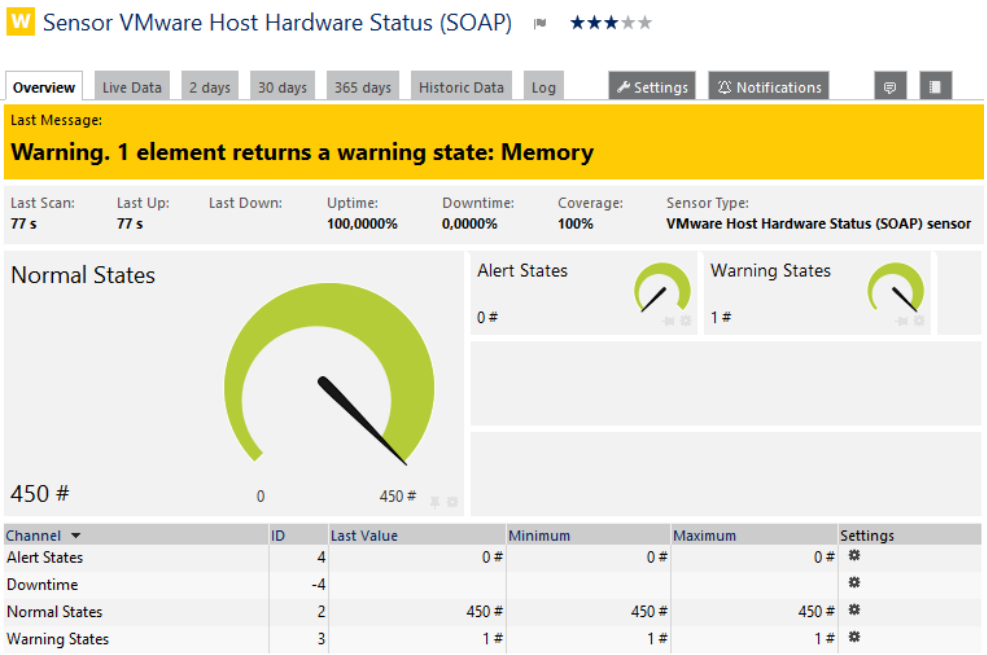
For more general information about settings, please see the **Object Settings** 159 section.

6.8.196 VMware Host Hardware Status (SOAP) Sensor

The VMware Host Hardware Status (SOAP) sensor monitors the hardware status of a VMware host server using Simple Object Access Protocol (SOAP).

- It shows the total number of items in "Normal", "Warning," and "Alert" status, just as the vSphere client reports.

This sensor is intended to give you a general status overview for your host. Any states other than "Normal" will be reported in the sensor message.



VMware Host Hardware Status (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_host_hardware_status_soap.png

Remarks

- Requires 2299 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- This sensor only shows items that report an actual status, so you might see more "sensors" in your vSphere client than the number of states available in the channels of this PRTG sensor.
- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3109 or when running a cluster 87 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the VMware hosts you want to monitor. PRTG creates on sensor for each host server you select in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VMWARE HOST SETTINGS

Host Server	Select the host server you want to add a sensor for. You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID	Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

VMWARE HOST SETTINGS

Known Warnings	Enter one or more semicolon (;) separated warning messages from the VMware host that you want to ignore. Messages that you enter here will not affect the sensor status. Please enter a string or leave the field empty. Note: We strongly recommend that you use this filter only for known issues. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this you might not get an **Up** status 135 for this sensor at all although your vSphere client does not show warnings. In this case, use this filter option and enter the known warning message(s), for example, Power Supply 7;Power Supply 8
Known Errors	Enter one or more semicolon (;) separated error messages from the VMware host that you want to ignore. Messages that you enter here will not affect the sensor status. Please enter a string or leave the field empty. Note: We strongly recommend that you use this filter only for known issues. For example, various systems (mainly HP and IBM systems) return unknown states because of errors in the the vendors' CIM extensions. Because of this you might not get an **Up** status 135 for this sensor at all although your vSphere client does not show errors. In this case, use this filter option and enter the known error message(s), for example, Power Supply 7;Power Supply 8

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.197 VMware Host Performance (SOAP) Sensor

The VMware Host Performance (SOAP) sensor monitors a VMware host server using Simple Object Access Protocol (SOAP).

It can show the following:

- CPU usage in percent
- CPU ready in percent
- Network usage
- Disk usage
- Disk read and write speed
- Active memory in bytes
- Consumed memory in bytes and percent
- Used memory swap
- Disk and data store latency (read and write)
- Network received and transmitted speed
- Power status

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

VMware Host Performance (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_host_performance_soap.png

Remarks

- Requires 2310 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).

- The parent device must be a VMware ESXi server version 5.0, 5.1, 5.5, or 6.0. We recommend that you do not use this sensor type on your vCenter. Reliable hardware information can only be provided when this sensor is created on your physical host server as parent device.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3109 or when running a cluster 87 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE HOST SETTINGS

MoID	Shows the Managed Object ID (MoID) of the host that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.198 VMware Virtual Machine (SOAP) Sensor

The VMware Virtual Machine (SOAP) sensor monitors a virtual machine on a VMware host server using Simple Object Access Protocol (SOAP).

It shows the following:

- CPU usage in percent
- CPU ready in percent
- Active memory in bytes
- Consumed memory in bytes and percent
- Disk read and write speed
- Read and write latency
- Network usage (total, received, and transmitted bytes per second)

Which channels the sensor actually shows might depend on the monitored device and the sensor setup.

Channel	ID	Last Value	Minimum	Maximum	Settings
CPU ready (Percent)	10	0,63 %	0,04 %	6,865 %	
CPU usage	2	4,48 %	0 %	46,49 %	
Datastore total ReadLatency	8	0 msec	0 msec	65 msec	
Datastore total WriteLatency	3	0 msec	14 msec	473 msec	
Disk read	11	0 Mbit/s	0 Mbit/s	92 Mbit/s	
Disk usage	13	0 Mbit/s	0 Mbit/s	255 Mbit/s	
Disk write	14	0 Mbit/s	0 Mbit/s	177 Mbit/s	
Downtime	-4				
Memory active	4	184 MByte	0 MByte	6.083 MByte	
Memory consumed	5	6.011 MByte	3.327 MByte	6.012 MByte	
Memory consumed (Percent)	12	97,84 %	54,15 %	97,85 %	
Network received	7	36 KByte/s	0 KByte/s	8.314 KByte/s	
Network transmitted	6	4 KByte/s	0 KByte/s	7.990 KByte/s	
Network usage	9	41 KByte/s	0 KByte/s	16.304 KByte/s	
Power	15	2 #	1 #	18 #	

VMware Virtual Machine (SOAP) Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/vmware_virtual_machine_soap.png

Remarks

- Requires 2320 .NET 4.0 or higher to be installed on the probe system.
- For this sensor type you must define credentials for VMware servers on the device you want to use the sensor on. Ensure you enter a user with sufficient access rights to obtain statistics (read-only usually works).
- We recommend that you use vCenter as parent device. When the monitored VM changes the host server via vMotion, PRTG can continue monitoring in this case. The sensor can monitor VMware ESXi server version 5.0, 5.1, 5.5, or 6.0.
- We recommend Windows 2012 R2 on the probe system for best performance of this sensor.

- Note: For VMware virtual machines, disk usage channels are only available as of virtual hardware version 8.
- Knowledge Base: I cannot add VMware sensors because of "wrong" password although it is correct. What can I do?
- Note: This sensor type can have a high impact on the performance of your monitoring system. Please use it with care! We recommend that you use not more than 50 sensors of this sensor type on each probe.

Requirement: .NET Framework

This sensor type requires the Microsoft .NET Framework to be installed on the computer running the PRTG probe: Either on the local system (on every node, if on a cluster probe), or on the system running the remote probe 3109. If the framework is missing, you cannot create this sensor.

Required .NET version (with latest updates): .NET 4.0 (Client Profile is sufficient), .NET 4.5, or .NET 4.6. For more information, please see the Knowledge Base article http://kb.paessler.com/en/topic/60543 (see also section **More** below).

Settings on VMware Host System

If you set up this sensor on different probes (for example, when using remote probes 3109 or when running a cluster 87 setup), you might need to change the settings of your VMware host, so it accepts more incoming connections. Otherwise you might get connection timeouts when running plenty of VMware sensors with a short scanning interval.

For details about this setting, please see **More** section below.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Note: PRTG requests a full list of all virtual machines configured on the device. Because of this, it may take a few seconds before the dialog is loaded.

Select the VMware virtual machines you want to monitor. PRTG creates one sensor for each virtual machine you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

VIRTUAL MACHINE SETTINGS

Virtual Machine	You see a list of all virtual machines (VMs) available on the host server on this device, including the ones that are not running. All VMs are listed with name and the OS it is running on. Select the desired items by adding check marks in front of the respective lines. One sensor will be created for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

VMWARE VIRTUAL MACHINE SETTINGS

MoID	Shows the Managed Object ID (MoID) of the virtual machine that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.
Handling of "Powered off" VM	Define how the sensor will react to a virtual machine that is powered off. Choose between: • **Ignore "powered off" state (default)**: The sensor will not change to a **Down** status 135 if the virtual machine is powered off. It will report zero values instead. • **Alarm when VM is "powered off"**: The sensor will change to a **Down** 135 status if the virtual machine is powered off. Note: While in Down status, a sensor does not record any data in all of its channels.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.

SENSOR DISPLAY

Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access	Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights: ▪ **Inherited**: Use the access rights settings of the parent object. ▪ **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible. ▪ **Read**: Users in this group can see the object and review its monitoring results. ▪ **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings. ▪ **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings. You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option. For more details on access rights, please see the section **User Access Rights** 101.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

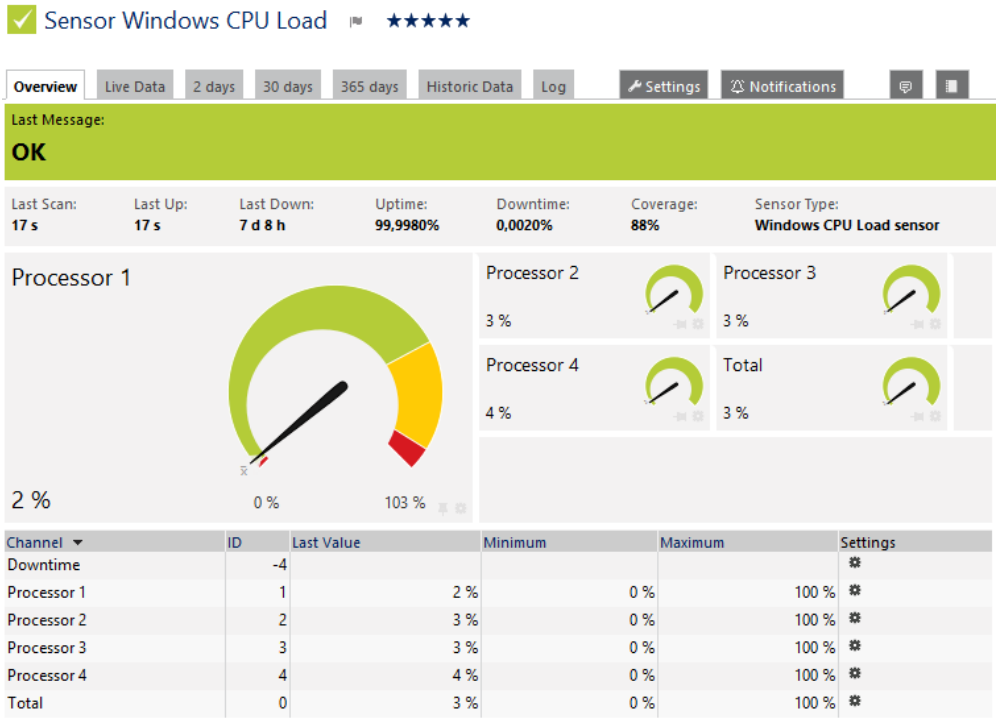
Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.199 Windows CPU Load Sensor

The Windows CPU Load sensor monitors the CPU load on a computer via Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

- It shows the CPU usage of all processors and the total load in percent.



Windows CPU Load Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_cpu_load.png

Remarks

- Requires 2330 Windows credentials in the parent device settings 324.
- Requires 2330 Windows 2008 or later on the probe system.
- Requires 2330 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2330 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

WMI ALTERNATIVE QUERY

Errors and Invalid Data	This is an extended help field only. PRTG's WMI sensors are equipped with the most efficient and accurate WMI queries. However, Microsoft has changed (and will continue to do that in the future) some WMI classes over the various Windows/ ServicePack/patchlevel versions, resulting in errors like "class not valid" or "invalid data". Wherever possible, PRTG features an alternative query that might work in your specific configuration. When you keep getting errors for this sensor, please try enabling the alternative query method below.
Alternative Query	Choose the method PRTG uses to query via WMI. For compatibility reasons, you can enable an alternative query method. We recommend that you use the default value. You can choose between: • **Use default (recommended)**: Use PRTG's standard method to query WMI. This is the best setting in most cases. • **Use alternative (if default does not work)**: Use an alternative method to query WMI. If you keep getting errors with the default setting, please try this setting.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

Knowledge Base: My Windows sensors do not work when using direct Performance Counter access. What can I do?

- http://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.200 Windows IIS 6.0 SMTP Received Sensor

The Windows IIS 6.0 SMTP Receiver Sensor monitors Microsoft's Internet Information Services regarding the number of received emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

- It shows the number and bytes of received messages.

Remarks

- Requires 2339 Windows credentials in the parent device settings 324.
- Requires 2340 Windows 2008 or later on the probe system.
- Requires 2340 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2339 to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY

	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

More

- http://kb.paessler.com/en/topic/47263

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

For more general information about settings, please see the **Object Settings** 159 section.

6.8.201 Windows IIS 6.0 SMTP Sent Sensor

The Windows IIS 6.0 SMTP Sent Sensor monitors Microsoft's Internet Information Services regarding the number of sent emails for an IIS 6.0 SMTP service (Exchange 2003) using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device.

It shows the following:

- Number and bytes of sent messages
- Number of retries per second for sent messages

Remarks

- Requires 2348 Windows credentials in the parent device settings 324.
- Requires 2349 Windows 2008 or later on the probe system.
- Requires 2349 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2348 to query monitoring data: Performance counters as standard approach and WMI as fallback.
- This service is not used by Exchange Server 2007 and higher. Exchange Server 2007 uses its own SMTP stack implemented in the Microsoft Exchange Transport service.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.

BASIC SENSOR SETTINGS

Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result. ▪ **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor.

SENSOR DISPLAY	
	▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency	This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.
Dependency Delay (Sec.)	Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value. Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.

Edit Sensor Channels

To change display settings, spike filter, and limits, switch to the sensor's **Overview** tab and click the gear icon of a specific channel. For detailed information, please see the **Sensor Channels Settings** 2711 section.

Notifications

Click the **Notifications** tab to change notification triggers. For detailed information, please see the **Sensor Notifications Settings** 2719 section.

Others

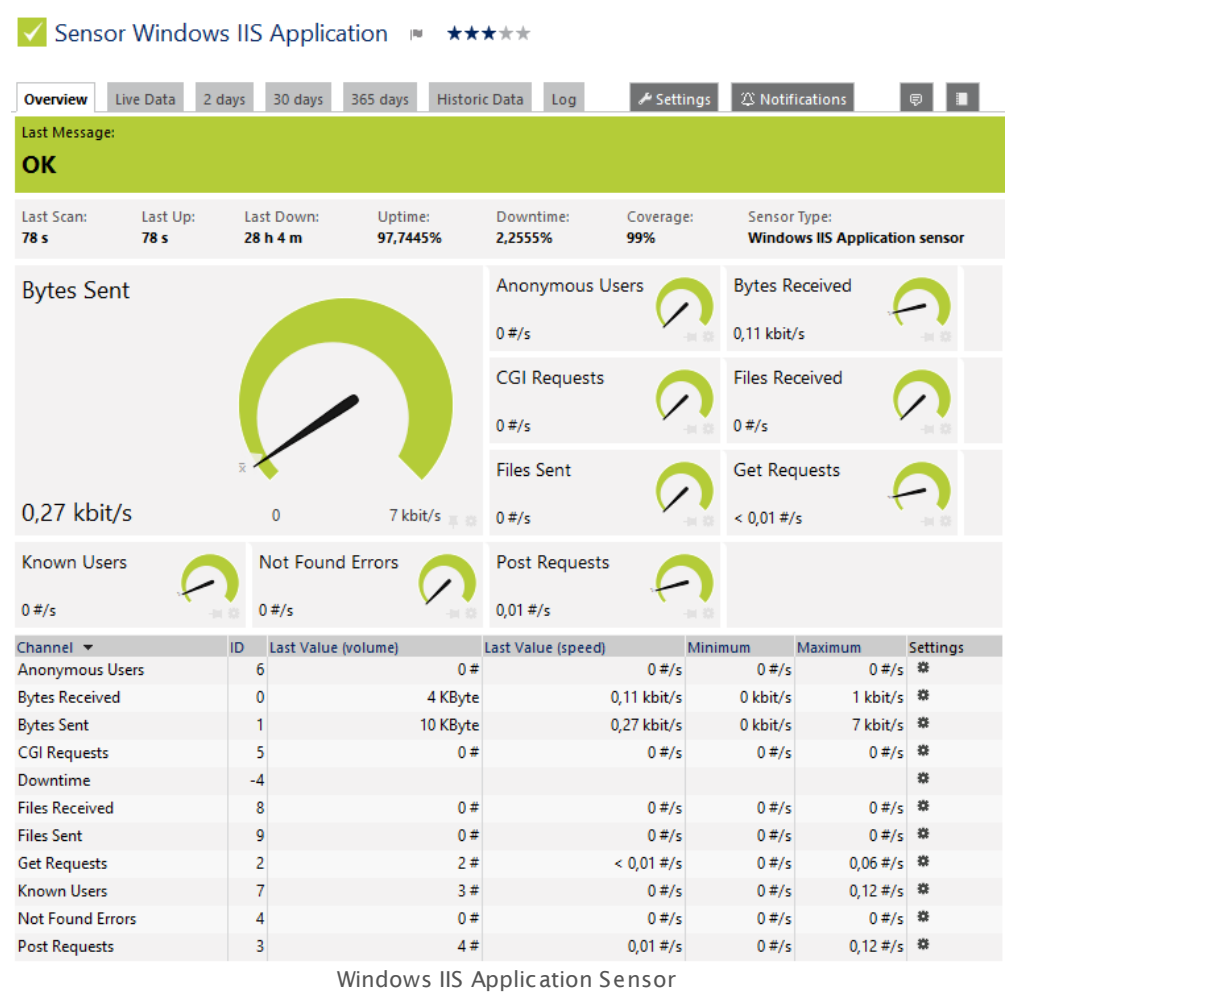
For more general information about settings, please see the **Object Settings** 159 section.

6.8.202 Windows IIS Application Sensor

The Windows IIS Application sensor monitors a Microsoft Internet Information Services server using Windows Performance Counters or Windows Management Instrumentation (WMI), as configured in the "Windows Compatibility Options" of the parent device. It can also monitor applications that use IIS, such as Microsoft SharePoint or Microsoft Reporting Services (SSRS).

It shows the following:

- Sent and received bytes per second
- Number of sent and received files per second
- Number of anonymous and known users per second
- Number of Common Gateway Interface (CGI) requests per second
- Number of GET and POST requests per second
- Number of not found errors per second



Channel	ID	Last Value (volume)	Last Value (speed)	Minimum	Maximum	Settings
Anonymous Users	6	0 #	0 #/s	0 #/s	0 #/s	
Bytes Received	0	4 KByte	0,11 kbit/s	0 kbit/s	1 kbit/s	
Bytes Sent	1	10 KByte	0,27 kbit/s	0 kbit/s	7 kbit/s	
CGI Requests	5	0 #	0 #/s	0 #/s	0 #/s	
Downtime	-4					
Files Received	8	0 #	0 #/s	0 #/s	0 #/s	
Files Sent	9	0 #	0 #/s	0 #/s	0 #/s	
Get Requests	2	2 #	< 0,01 #/s	0 #/s	0,06 #/s	
Known Users	7	3 #	0 #/s	0 #/s	0,12 #/s	
Not Found Errors	4	0 #	0 #/s	0 #/s	0 #/s	
Post Requests	3	4 #	0,01 #/s	0 #/s	0,12 #/s	

Windows IIS Application Sensor

Click here to enlarge: http://media.paessler.com/prtg-screenshots/windows_iis_application.png

Remarks

- Requires 2358 Windows credentials in the parent device settings 324.
- Requires 2358 Windows 2008 or later on the probe system.
- Requires 2359 the Windows Remote Registry service to be running on the target computer.
- Uses a hybrid approach 2358 to query monitoring data: Performance counters as standard approach and WMI as fallback.

Hybrid Approach: Performance Counters and WMI

By default, this sensor type uses a hybrid approach, first trying to query data via Windows Performance Counters (which needs less system resources), and using Windows Management Instrumentation (WMI) as a fallback if Performance Counters are not available. When running in fallback mode, the sensor will re-try to connect via Performance Counters after 24 hours. You can change the default behavior in the **Windows Compatibility Options** of the parent device's settings 335 on which you create this sensor.

Sensors using the Windows Management Instrumentation (WMI) protocol have high impact on the system performance! Try to stay below 200 WMI sensors per probe 83. Above this number, please consider using multiple **Remote Probes** 3109 for load balancing.

For a general introduction to the technology behind WMI, please see **Monitoring via WMI** 3005 section.

Requirement: Windows Credentials

Requires credentials for Windows systems to be defined for the device you want to use the sensor on. In the parent device's 329 **Credentials for Windows Systems** settings, please prefer using Windows domain credentials.

Note: If you use local credentials, please make sure the same Windows user accounts (with same username and password) exist on both the system running the PRTG probe and the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

Requirement: Windows Version

In order for this sensor to work with Windows Performance Counters, please make sure a Windows version 2008 or later is installed on the computer running the PRTG probe: This is either on the local system (on every node, if on a cluster probe), or on the system running a remote probe 3109.

Requirement: Remote Registry Service

In order for this sensor to work with Windows Performance Counters, please make sure the Remote Registry Windows service is running on the target computer. If you fail to do so, a connection via Performance Counters will not be possible. However, WMI connections may still work.

To enable the service, please log in to the respective computer and open the services manager (for example, via services.msc). In the list, find the respective service and set its Start Type to Automatic.

Add Sensor

The **Add Sensor** dialog appears when adding a new sensor on a device manually 256. It only shows the setting fields that are imperative for creating the sensor. Therefore, you will not see all setting fields in this dialog. You can change (nearly) all settings in the sensor's **Settings** tab later.

Select the web service instances you want to monitor. PRTG creates one sensor for each instance you choose in the **Add Sensor** dialog. The settings you choose in this dialog are valid for all of the sensors that are created.

The following settings for this sensor differ in the 'Add Sensor' dialog in comparison to the sensor's settings page:

WMI INTERNET INFORMATION SERVICES

Specify Instance	You see a list with the names of all items which are available to monitor. Select the desired items by adding check marks in front of the respective lines. PRTG creates one sensor for each selection. You can also select and deselect all items by using the check box in the table head.

Sensor Settings

On the details page of a sensor, click on the **Settings** tab to change its settings.

Note: Usually, a sensor connects to the **IP Address** or **DNS Name** of the parent device on which you created this sensor. See the **Device Settings** 324 for details. For some sensor types, you can define the monitoring target explicitly in the sensor settings. Please see below for details on available settings.

BASIC SENSOR SETTINGS

Sensor Name	Enter a meaningful name to identify the sensor. By default, PRTG shows this name in the device tree 123, as well as in alarms 161, logs 169, notifications 2759, reports 2786, maps 2810, libraries 2770, and tickets 171.
Parent Tags	Shows **Tags** 96 that this sensor inherits 96 from its parent device, group, and probe 89. This setting is shown for your information only and cannot be changed here.
Tags	Enter one or more **Tags** 96, separated by space or comma. You can use tags to group sensors and use tag-filtered views later on. Tags are not case sensitive. We recommend that you use the default value. You can add additional tags to it, if you like. Other tags are automatically inherited 96 from objects further up in the device tree. These are visible above as **Parent Tags**.
Priority	Select a priority for the sensor. This setting determines where the sensor is placed in sensor lists. Top priority is at the top of a list. Choose from one star (low priority) to five stars (top priority).

WMI INTERNET INFORMATION SERVICES

Instance	Shows the name of the web service instance that this sensor monitors. Once a sensor is created, you cannot change this value. It is shown for reference purposes only. If you need to change this, please add the sensor anew.

DEBUG OPTIONS

Sensor Result	Define what PRTG will do with the sensor results. Choose between: ▪ **Discard sensor result**: Do not store the sensor result.

DEBUG OPTIONS

- **Write sensor result to disk (Filename: "Result of Sensor [ID].txt")**: Store the last result received from the sensor to the "Logs (Sensor)" directory (on the Master node, if in a cluster). File names: Result of Sensor [ID].txt and Result of Sensor [ID].Data.txt. This is for debugging purposes. PRTG overrides these files with each scanning interval. For more information on how to find the folder used for storage, please see the **Data Storage** 3135 section.

SENSOR DISPLAY

Primary Channel	Select a channel from the list to define it as the primary channel. In the device tree, the last value of the primary channel will always be displayed below the sensor's name. The available options depend on what channels are available for this sensor. Note: You can set another primary channel later by clicking on the pin symbol of a channel in the sensor's **Overview** tab.
Graph Type	Define how different channels will be shown for this sensor. ▪ **Show channels independently (default)**: Show an own graph for each channel. ▪ **Stack channels on top of each other**: Stack channels on top of each other to create a multi-channel graph. This will generate an easy-to-read graph which visualizes the different components of your total traffic. Note: This option cannot be used in combination with manual Vertical Axis Scaling (available in the **Sensor Channels Settings** 2711 settings).
Stack Unit	This setting is only available if stacked graphs are selected above. Choose a unit from the list. All channels with this unit will be stacked on top of each other. By default, you cannot exclude single channels from stacking, if they use the selected unit. However, there is an advanced procedure to do so.

Inherited Settings

By default, all following settings are inherited from objects higher in the hierarchy and should be changed there, if necessary. Often, best practice is to change them centrally in the **Root** 260 group's settings. To change a setting only for this object, disable inheritance by clicking on the check mark before the corresponding setting name. You will then see the options described below.

SCANNING INTERVAL

Scanning Interval	Select a scanning interval (seconds, minutes, or hours) from the list. The scanning interval determines the time the sensor waits between two scans. You can change the available intervals in the system administration 2871.
When a Sensor Reports an Error	Define the number of scanning intervals that a sensor has time to report an error before the sensor will be set to a **Down** status 135. The sensor can try to reach a device several times, depending on the setup you can specify here, to help avoid false alarms if the monitored device has only temporary issues. For previous scanning intervals with failed requests, the sensor will show a **Warning** status. Choose between: ▪ **Set sensor to "down" immediately**: The sensor will show an error immediately after the first failed request. ▪ **Set sensor to "warning" for 1 interval, then set to "down" (recommended)**: After the first failed request, the sensor will show a yellow warning status. If the following request also fails, the sensor will show an error. ▪ **Set sensor to "warning" for 2 intervals, then set to "down"**: Show an error status only after three continuously failed requests. ▪ **Set sensor to "warning" for 3 intervals, then set to "down"**: Show an error status only after four continuously failed requests. ▪ **Set sensor to "warning" for 4 intervals, then set to "down"**: Show an error status only after five continuously failed requests. ▪ **Set sensor to "warning" for 5 intervals, then set to "down"**: Show an error status only after six continuously failed requests. Note: Sensors that monitor via Windows Management Instrumentation (WMI) always wait at least one scanning interval until they show an error. It is not possible to set a WMI sensor "down" immediately, so the first option will not apply to these sensor types (all other options can apply). Note: If a sensor has defined error limits for channels, this sensor will always be set to a **Down** status immediately, so no "wait" option will apply. Note: If a channel uses lookup 3095 values, the sensor will always be set to a **Down** status immediately, so no "wait" options will apply.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

Note: Inheritance for schedules, dependencies, and maintenance windows cannot be interrupted. The corresponding settings from the parent objects will always be active. However, you can define additional settings here. They will be active at the same time as the parent objects' settings.

Schedule	Select a schedule from the list. Schedules can be used to monitor for a certain time span (days, hours) throughout the week. With the period list option it is also possible to pause monitoring for a specific time span. You can create new schedules and edit existing ones in the account settings 2836. Note: Schedules are generally inherited. New schedules will be added to existing ones, so all schedules are active at the same time.
Maintenance Window	Specify if you want to set-up a one-time maintenance window. During a "maintenance window" period, this object and all child objects will not be monitored. They will be in a paused state instead. Choose between: ▪ **Not set (monitor continuously)**: No maintenance window will be set and monitoring will always be active. ▪ **Set up a one-time maintenance window**: Pause monitoring within a maintenance window. You can define a time span for a monitoring pause below and change it even for a currently running maintenance window. Note: To terminate a current maintenance window before the defined end date, you can change the time in **Maintenance End At** field to a date in the past.
Maintenance Begins At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the start date and time of the maintenance window.
Maintenance End At	This field is only visible if you enabled the maintenance window above. Use the date time picker to enter the end date and time of the maintenance window.
Dependency Type	Define a dependency type. Dependencies can be used to pause monitoring for an object depending on the status of another. You can choose between: ▪ **Use parent**: Pause the current sensor if the device, where it is created on, is in a **Down** status, or if the sensor is paused by another dependency.

SCHEDULES, DEPENDENCIES, AND MAINTENANCE WINDOW

- **Select object**: Pause the current sensor if the device, where it is created on, is in an **Down** status, or if the sensor is paused by another dependency. Additionally, pause the current sensor if a specific other object in the device tree is in a **Down** status, or if it is paused by another dependency. Select below.
- **Master object for parent**: Make this sensor the master object for its parent device. The sensor will influence the behavior of the device, where it is created on: If the sensor is in a **Down** status, the device will be paused. For example, it is a good idea to make a Ping sensor the master object for its parent device to pause monitoring for all other sensors on the device in case the device cannot even be pinged. Additionally, the sensor will be paused if the parent group of its parent device is in a **Down** status, or if it is paused by another dependency.

Note: Testing your dependencies is easy! Simply choose **Simulate Error Status** from the context menu of an object that other objects depend on. A few seconds later all dependent objects should be paused. You can check all dependencies 2751 in your PRTG installation by selecting **Devices | Dependencies** from the main menu bar.

Dependency

This field is only visible if the **Select object** option is enabled above. Click on the reading-glasses and use the object selector 181 to choose an object on which the current sensor will depend.

Dependency Delay (Sec.)

Define a time span in seconds for dependency delay. After the master object for this dependency comes back to an **Up** status, the beginning of the monitoring of the depending objects will be additionally delayed by the time span you define here. This can help to avoid false alarms, for example, after a server restart, by giving systems more time for all services to start up. Please enter an integer value.

Note: This setting is not available if you choose this sensor to **Use parent** or to be the **Master object for parent**. In this case, please define delays in the parent **Device Settings** 324 or in the superior **Group Settings** 299.

ACCESS RIGHTS

User Group Access

Define which user group(s) will have access to the object you're editing. A table with user groups and types of access rights is shown: It contains all user groups from your setup. For each user group you can choose from the following access rights:

- **Inherited**: Use the access rights settings of the parent object.
- **None**: Users in this group cannot see or edit the object. The object neither shows up in lists nor in the device tree. Exception: If a child object is visible to the user, the object is visible in the device tree, though not accessible.
- **Read**: Users in this group can see the object and review its monitoring results.
- **Write**: Users in this group can see the object, review its monitoring results, and edit the object's settings. They cannot edit access rights settings.
- **Full**: Users in this group can see the object, review its monitoring results, edit the object's settings, and edit access rights settings.

You can create new user groups in the **System Administration—User Groups** 2896 settings. To automatically set all objects further down in the hierarchy to inherit this object's access rights, set a check mark for the **Revert children's access rights to inherited** option.

For more details on access rights, please see the section **User Access Rights** 101.

CHANNEL UNIT CONFIGURATION

Channel Unit Types

For each type of sensor channel, define the unit in which data is displayed. If defined on probe, group, or device level, these settings can be inherited to all sensors underneath. You can set units for the following channel types (if available):

- **Bandwidth**
- **Memory**
- **Disk**
- **File**
- **Custom**

Note: Custom channel types can be set on sensor level only.
